You need to create an IPS sensor before specific signatures or filters can be choosen. The signatures can be added to a new sensor before it is saved, but it is a good practice to keep in mind that the sensor and its included filters are separte things, and therefore their creation will be treated separately.

To create a new IPS sensor

1. Go to **Security Profiles > Intrusion Protection**.
2. Select the **Create New** icon in the top of the Edit IPS Sensor window.
3. Enter the name of the new IPS sensor.
4. Optionally, you may also enter a comment. The comment will appear in the IPS sensor list and serves to remind you of the details of the sensor.
5. Select **OK**.

A newly created sensor is empty and contains no filters or signatures. You need to add one or more filters or signatures before the sensor will be of any use.

Adding an IPS filter to a sensor

While individual signatures can be added to a sensor, a filter allows you to add multiple signatures to a sensor by specifying the characteristics of the signatures to be added.

To create a new Pattern Based Signature and Filter

1. Go to **Security Profiles > Intrusion Protection**.
2. Select the IPS sensor to which you want to add the filter using the drop-down list in the top row of the Edit IPS Sensor window or by going to the list window.
3. In the **Pattern Based Signature and Filter** widget, select the **Create New** icon
4. For **Sensor Type** chose **Filter Based**.
5. Configure the filter that you require. Signatures matching all of the characteristics you specify in the filter will be included in the filter. Select Specify and choose the filter option that have the appropriate parameters.

Basic

Severity

Refers to the level of threat possed by the attack.

The options include:

- critical
- high
- medium
- low
- info

Target

Refers to the type of device targeted by the attack.

The options include:

- client
- server

OS

Refers to the Operating System affected by the attack.

The options include:

BSD	Linux	MacOS
Other	Solaris	Windows

Advanced

Application

Refers to the vendor or or type of application affected by the attack.

The options include:.

Adobe	Apache	Apple
CGI_app	Cisco	HP
IBM	IE	IIS
Mozilla	MS_Office	Novel
Oracle	PHP_app	Sun

This list can be expanded to include more options by selecting the [show more…] link. The additional options include:

ASP_app	CA	DB2
IM	Ipswitch	MailEnable
MediaPlayer	MS_Exchange	MSSQL
MySQL	Netscape	P2P
PostgreSQL	Real	Samba
SAP	SCADA	Sendmail
Veritas	Winamp	Other

Protocol

Refers to the protocol that is the vector for the attack.

The options include:

DNS	FTP	HTTP
ICMP	IMAP	LDAP
POP3	SCCP	SIP
SMTP	SNMP	SSH
SSL	TCP	UDP

This list can be expanded to include more options by selecting the [show more…] link. The additional options include:

BO	DCERPC	DHCP
DNP3	H323	IM
MSSQL	NBSS	NNTP
P2P	RADIUS	RDT
RPC	TRCP	RTP
RTSP	TELNET	TFN
Other		

6. Choose an action for when a signature is triggered.

Action	Description
Signature Default	All predefined signatures have an **Action** attribute that is set to Pass or Drop. This means that if a signature included in the filter has an **Action** setting of Pass, traffic matching the signature will be detected and then allowed to continue to its destination. Select **Accept signature defaults** use the default action for each included signature. **Note:** to see what the default for a signature is, go to the **IPS Signatures** page and enable the column **Action**, then find the row with the signature name in it.
Monitor All	Select **Monitor all** to pass all traffic matching the signatures included in the filter, regardless of their default **Action** setting.
Block All	Select Block all to drop traffic matching any the signatures included in the filter.
Reset	Select Reset to reset the session whenever the signature is triggered. In the CLI this action is referred to as Reject.
Quarantine	The quarantine based on the attacker's IP Address - Traffic from the Attacker's IP address is refused until the expiration time from the trigger is reached. 2. Expires (time frame that the quarantine will be in effect): • 5 Minute(s) • 30 Minutes(s) • 1 Hour(s) • 1 Day(s) • 1 Week(s) • 1 Month(s)
Packet Logging	Select to enable packet logging for the filter. When you enable packet logging on a filter, the unit saves a copy of the packets that match any signatures included in the filter. The packets can be analyzed later. For more information about packet filtering, see "Configuring packet logging options"

7. Select **OK**.

The filter is created and added to the filter list.

Adding Rate Based Signatures

These are a subset of the signatures that are found in the database that are normally set to monitor. This group of signetures is for vulnerabilities that are normally only considered a serious threat when the targeted connections come in multiples, a little like DoS attacks.

Adding a rate based signature is straight forward. Select the enable button in the Rate Based Signature table that corresponds with the desired signature.

Customized signatures

Customized signatures must be created before they can be added to the sensor. To get more details on customized signatures check the IPS Signatures chapter.

Updating predefined IPS signatures

The FortiGuard Service periodically updates the pre-defined signatures and adds new signatures to counter emerging threats as they appear.

Because the signatures included in filters are defined by specifying signature attributes, new signatures matching existing filter specifications will automatically be included in those filters. For example, if you have a filter that includes all signatures for the Windows operating system, your filter will automatically incorporate new Windows signatures as they are added.

Viewing and searching predefined IPS signatures

Go to **Security Profiles > Intrusion Protection.** Select **[View IPS Signatures]** to view the list of existing IPS signatures. You may find signatures by paging manually through the list, apply filters, or by using the search field.

Searching manually

Signatures are displayed in a paged list, with 50 signatures per page. The bottom of the screen shows the current page and the total number of pages. You can enter a page number and press enter, to skip directly to that page. Previous Page and Next Page buttons move you through the list, one page at a time. The First Page and Last Page button take you to the beginning or end of the list.

Applying filters

You can enter criteria for one of more columns, and only the signatures matching all the conditions you specify will be listed.

To apply filters

1. Go to **Security Profiles > Intrusion Protection.** Select **[View IPS Signatures] .**
2. Select column by which to filter.
3. Select the funnel/filter icon and enter the value or values to filter by.
4. Use additional columns as needed to refine search.

The available options vary by column. For example, Enable allows you to choose between two options, while OS has multiple options, and you may select multiple items together. Filtering by name allows you to enter a text string and all signature names containing the string will be displayed.

IPS processing in an HA cluster

IPS processing in an HA cluster is no different than with a single FortiGate unit, from the point of view of the network user. The difference appears when a secondary unit takes over from the primary, and what happens depends on the HA mode.

Active-passive

In an active-passive HA cluster, the primary unit processes all traffic just as it would in a stand-alone configuration. Should the primary unit fail, a secondary unit will assume the role of the primary unit and begin to process network traffic. By default, the state of active communication sessions are not shared with secondary units and will not survive the fail-over condition. Once the sessions are reestablished however, traffic processing will continue as normal.

If your network requires that active sessions are taken over by the new primary unit, select **Enable Session Pick-up** in your HA configuration. Because session information must be sent to all subordinate units on a regular basis, session pick-up is a resource-intensive feature and is not enabled by default.

Active-active

The fail-over process in an active-active cluster is similar to an active-passive cluster. When the primary unit fails, a secondary unit takes over and traffic processing continues. The load-balancing schedule used to distribute sessions to the cluster members is used by the new primary unit to redistribute sessions among the remaining subordinate units. If session pick-up is not enabled, the sessions active on the failed primary are lost, and the sessions redistributed among the secondary units may also be lost. If session pick-up is enabled, all sessions are handled according to their last-known state.

Configure IPS options

There are a number of CLI commands that influence how IPS functions.

Hardware Acceleration

In order to provide control over the hardware's processing of IPS there are commands to configure and control the hardware accelleration of IPS. There are two settings that can be chosen, one for the network processor and one for the content processor.

Network processor acceleration can be disabled or set to enable basic acceleration.

Content processor acceleration can be disabled or set to either basic or advanced acceleration.

These Settings are only found in the CLI:

```
config ips global
   set np-accel-mode {none | basic}
   set cp-accel-mode {none | basic | advanced}
end
```

Extended IPS Database.

Some models have access to an extended IPS Database. The extended database may affect the performance of the FortiGate unit so depending on the model of the FortiGate unit the extended database package may not be enabled by default. For example, the D-series Desktop model have this option disabled by default.

This feature can only be enbled through the CLI.

```
config ips global
   set database extended
end
```

Configuring the IPS engine algorithm

The IPS engine is able to search for signature matches in two ways. One method is faster but uses more memory, the other uses less memory but is slower. Use the `algorithm` CLI command to select one method:

```
config ips global
   set algorithm {super | high | low | engine-pick}
end
```

Specify `high` to use the faster more memory intensive method or `low` for the slower memory efficient method. The setting `super` improves the performance for FortiGate units with more than 4GB of memory. The default setting is `engine-pick`, which allows the IPS engine to choose the best method on the fly.

Configuring the IPS engine-count

FortiGate units with multiple processors can run more than one IPS engine concurrently. The `engine-count` CLI command allows you to specify how many IPS engines are used at the same time:

```
config ips global
   set engine-count <int>
end
```

The recommended and default setting is `0`, which allows the FortiGate unit to determine the optimum number of IPS engines.

Configuring fail-open

If the IPS engine fails for any reason, it will fail open by default. This applies for inspection of all the protocols inspected by FortiOS IPS protocol decoders, including but not limited to HTTP, HTTPS, FTP, SMTP, POP3, IMAP, etc. This means that traffic continues to flow without IPS scanning. If IPS protection is more important to your network than the uninterrupted flow if network traffic, you can disable this behavior using the `fail-open` CLI command:

```
config ips global
   set fail-open {enable | disable}
end
```

The default setting is disable.

Configuring the session count accuracy

The IPS engine can keep track of the number of open session in two ways. An accurate count uses more resources than a less accurate heuristic count.

```
config ips global
```

```
   set session-limit-mode {accurate | heuristic}
end
```

The default is heuristic.

Configuring IPS intelligence

If `intelligent-mode` is enabled (the default), in most cases the IPS engine will scan the first 200 kilobytes of a session (this value is hard coded).

In some cases, however, the IPS engine will still scan all traffic in a session. If `intelligent-mode` is disabled, the IPS engine scans all traffic.

```
config ips global
   set intelligent-mode [enable|disable]
end
```

Configuring the IPS buffer size

Set the size of the IPS buffer.

```
config ips global
   set socket-size <int>
end
```

The acceptable range is from 1 to 64 megabytes. The default size varies by model. In short, `socket-size` determines how much data the kernel passes to the IPS engine each time the engine samples packets.

Configuring protocol decoders

The FortiGate Intrusion Protection system uses protocol decoders to identify the abnormal traffic patterns that do not meet the protocol requirements and standards. For example, the HTTP decoder monitors traffic to identify any HTTP packets that do not meet the HTTP protocol standards.

To change the ports a decoder examines, you must use the CLI. In this example, the ports examined by the DNS decoder are changed from the default 53 to 100, 200, and 300.

```
config ips decoder dns_decoder
   set port_list "100,200,300"
end
```

You cannot assign specific ports to decoders that are set to **auto** by default. These decoders can detect their traffic on any port. Specifying individual ports is not necessary.

Configuring security processing modules

FortiGate Security Processing Modules, such as the CE4, XE2, and FE8, can increase overall system performance by accelerating some security and networking processing on the interfaces they provide. They also allow the FortiGate unit to offload the processing to the security module, thereby freeing up its own processor for other tasks. The security module performs its own IPS and firewall processing, but you can configure it to favor IPS in hostile high-traffic environments.

If you have a security processing module, use the following CLI commands to configure it to devote more resources to IPS than firewall. This example shows the CLI commands required to configure a security module in slot 1 for increased IPS performance.

```
config system amc-slot
```

```
edit sw1
   set optimization-mode fw-ips
   set ips-weight balanced
   set ips-p2p disable
   set ips-fail-open enable
   set fp-disable none
   set ipsec-inb-optimization enable
   set syn-proxy-client-timer 3
   set syn-proxy-server-timer 3
end
```

In addition to offloading IPS processing, security processing modules provide a hardware accelerated SYN proxy to defend against SYN flood denial of service attacks. When using a security module, configure your DoS anomaly check for `tcp_syn_flood` with the **Proxy** action. The **Proxy** action activates the hardware accelerated SYN proxy.

IPS signature rate count threshold

The IPS signature threshold can allow configuring a signature so that it will not be triggered until a rate count threshold is met. This provides a more controlled recording of attack activity. For example, if multiple login attempts produce a failed result over a short period of time then an alert would be sent and perhaps traffic blocked. This would be a more rational response than sending an alert every time a login failed.

The syntax for this configuration is as follows:

```
config ips sensor
   edit default
      config entries
         edit <Filter ID number>
            set rule <*id>
            set rate-count <integer between 1 - 65535>
            set rate-duration <integer between 1 - 65535>
```

The value of the rate-duration is an integer for the time in seconds.

```
set rate-mode <continuous | periodical>
```

The rate-mode refers to how the count threshold is met.

If the setting is "`continuous`", and the action is set to block, as soon as the `rate-count` is reached the action is engaged. For example, if the count is 10, as soon as the signature is triggered 10 times the traffic would be blocked.

If the setting is "periodical", the FortiGate allows up to the value of the rate-count incidents where the signature is triggered during the rate-duration. For example, if the rate count is 100 and the duration is 60, the signature would need to be triggered 100 times in 60 seconds for the action to be engaged.

```
set rate-track <dest-ip | dhcp-client-mac | dns-domain | none | src-ip>
```

This setting allows the tracking of one of the protocol fields within the packet.

Enable IPS packet logging

Packet logging saves the network packets containing the traffic matching an IPS signature to the attack log. The FortiGate unit will save the logged packets to wherever the logs are configured to be stored, whether memory, internal hard drive, a FortiAnalyzer unit, or the FortiGuard Analysis and Management Service.

You can enable packet logging in the filters. Use caution in enabling packet logging in a filter. Filters configured with few restrictions can contain thousands of signatures, potentially resulting in a flood of saved packets. This would take up a great deal of space, require time to sort through, and consume considerable system resources to process. Packet logging is designed as a focused diagnostic tool and is best used with a narrow scope.

Although logging to multiple FortiAnalyzer units is supported, packet logs are not sent to the secondary and tertiary FortiAnalyzer units. Only the primary unit receives packet logs.

To enable packet logging for a filter

1. Create a filter in an IPS sensor.
2. Before saving the filter, check the box next to **Packet Logging** just under the filter action options.
3. Select the IPS sensor in the security policy that allows the network traffic the FortiGate unit will examine for the signature.

For information on viewing and saving logged packets, see "Configuring packet logging options".

IPS examples

Configuring basic IPS protection

Small offices, whether they are small companies, home offices, or satellite offices, often have very simple needs. This example details how to enable IPS protection on a FortiGate unit located in a satellite office. The satellite office contains only Windows clients.

Creating an IPS sensor

Most IPS settings are configured in an IPS sensor. IPS sensors are selected in firewall policies. This way, you can create multiple IPS sensors, and tailor them to the traffic controlled by the security policy in which they are selected. In this example, you will create one IPS sensor.

To create an IPS sensor— web-based manager

1. Go to **Security Profiles > Intrusion Protection**.
2. Select the **Create New** icon in the top of the Edit IPS Sensor window.
3. In the **Name** field, enter `basic_ips`.
4. In the **Comments** field, enter `IPS protection for Windows clients.`
5. Select **OK**.
6. Select the **Create New** drop-down to add a new component to the sensor and for the **Sensor Type** choose **Filter** Based.
7. In the Filter Options choose the following:
   a. For **Severity**: select all of the options
   b. For **Target**: select **Client** only.
   c. For **OS**: select **Windows** only.
8. For the **Action** leave as the default.
9. Select **OK** to save the filter.

10. Select **OK** to save the IPS sensor.

To create an IPS sensor — CLI

```
config ips sensor
   edit basic_ips
      set comment "IPS protection for Windows clients"
         config entries
            edit 1
               set location client
               set os windows
         end
   end
```

Selecting the IPS sensor in a security policy

An IPS sensor directs the FortiGate unit to scan network traffic only when it is selected in a security policy. When an IPS sensor is selected in a security policy, its settings are applied to all the traffic the security policy handles.

To select the IPS sensor in a security policy — web-based manager

1. Go to **Policy > Policy > Policy**.
2. Select a policy.
3. Select the **Edit** icon.
4. Enable the **IPS** option.
5. Select the `basic_ips` profile from the list.
6. Select **OK** to save the security policy.

To select the IPS sensor in a security policy — CLI

```
config firewall policy
   edit 1
      set utm-status enable
      set ips-sensor basic_ips
   end
```

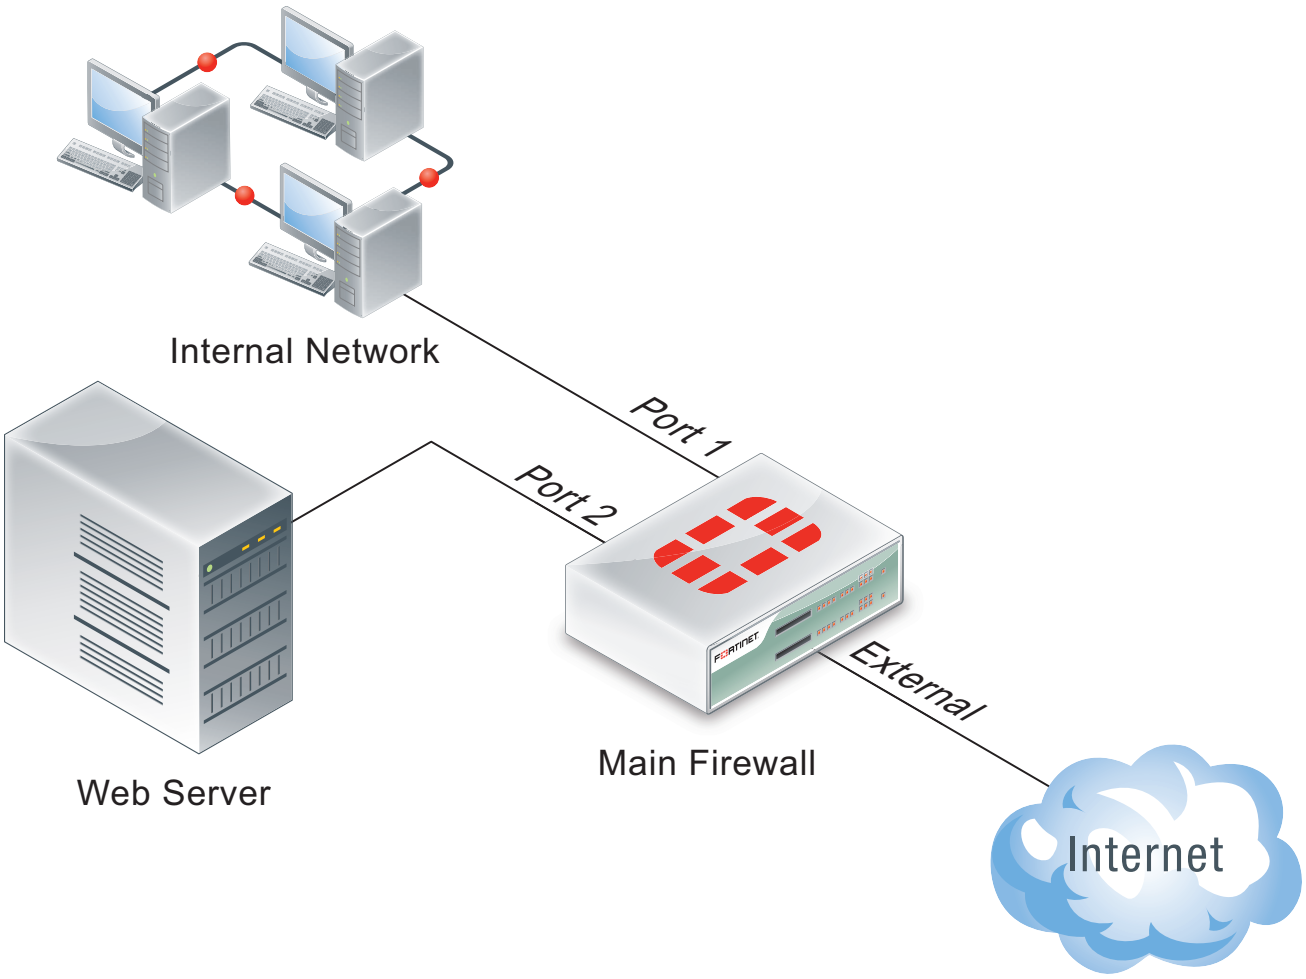
All traffic handled by the security policy you modified will be scanned for attacks against Windows clients. A small office may have only one security policy configured. If you have multiple policies, consider enabling IPS scanning for all of them.

Using IPS to protect your web server

Many companies have web servers and they must be protected from attack. Since web servers must be accessible, protection is not as simple as blocking access. IPS is one tool your FortiGate unit has to allow you to protect your network.

In this example, we will configure IPS to protect a web server. As shown below, a FortiGate unit protects a web server and an internal network. The internal network will have its own policies and configuration but we will concentrate on the web server in this example.

A simple network configuration



The FortiGate unit is configured with:

- a virtual IP to give the web server a unique address accessible from the Internet.
- a security policy to allow access to the web server from the Internet using the virtual IP.

To protect the web server using intrusion protection, you need to create an IPS sensor, populate it with filters, then enable IPS scanning in the security policy.

To create an IPS sensor

1. Go to **Security Profiles > Intrusion Protection.**
2. Select **Create New**.
3. Enter `web_server` as the name of the new IPS sensor.
4. Select **OK**.

The new IPS sensor is created but it has no filters, and therefore no signatures are included.

The web server operating system is Linux, so you need to create a filter for all Linux server signatures.

To create the Linux server filter

1. Go to **Security Profiles > Intrusion Protection.**
2. Select the `web_server` IPS sensor and select the **Edit** icon.
3. In the **Pattern Based Signatures and Filters** section, select **Create New**.
4. For **Sensor Type**, select **Filter Based.**
5. For Filter **Options**.
6. In the Filter Options choose the following:
   a. For **Severity**: select all of the options
   b. For **Target**: select **server** only.
   c. For **OS**: select **Linux** only.
7. Select **OK**.

The filter is saved and the IPS sensor page reappears. In the filter list, find the **Linux Server** filter and look at the value in the **Count** column. This shows how many signatures match the current filter settings. You can select the **View Rules** icon to see a listing of the included signatures.

To edit the security policy

1. Go to **Policy > Policy > IPv4** select security policy that allows access to the web server, and select the **Edit** icon.
2. Enable IPS option and choose the `web_server` IPS sensor from the list.
3. Select **OK**.

Since IPS is enabled and the `web_server` IPS sensor is specified in the security policy controlling the web server traffic, the IPS sensor examines the web server traffic for matches to the signatures it contains.

Create and test a packet logging IPS sensor

In this example, you create a new IPS sensor and include a filter that detects the EICAR test file and saves a packet log when it is found. This is an ideal first experience with packet logging because the EICAR test file can cause no harm, and it is freely available for testing purposes.

Create an IPS senor

1. Go to **Security Profiles > Intrusion Protection**.
2. Select **Create New**.
3. Name the new IPS sensor `EICAR_test`.
4. Select **OK**.

Create an entry

1. Select the **Create New**.
2. For **Sensor Type** choose **Specify Signatures**.
3. Rather than search through the signature list, use the name filter by selecting the search icon over the header of the **Signature** column.
4. Enter `EICAR` in the Search field.
5. Highlight the `Eicar.Virus.Test.File` signature by clicking on it.
6. Select **Block All** as the **Action**.

7. Enable **Packet Logging.**
8. Select OK to save the IPS sensor.

You are returned to the IPS sensor list. The `EICAR test` sensor appears in the list.

Add the IPS sensor to the security policy allowing Internet access

1. Go to **Policy > Policy > IPv4**.
2. Select the security policy that allows you to access the Internet.
3. Select the **Edit** icon.
4. Turn ON **Log Allowed Traffic**.
   a. Select All Sessions
5. Enable the **IPS** option.
6. Choose `EICAR test` from the available IPS sensors.
7. Select **OK**.

With the IPS sensor configured and selected in the security policy, the FortiGate unit blocks any attempt to download the EICAR test file.

Test the IPS sensor

1. Using your web browser, go to http://www.eicar.org/anti_virus_test_file.htm.
2. Scroll to the bottom of the page and select **eicar.com** from the row labeled as using the standard HTTP protocol.
3. The browser attempts to download the requested file and,
   - If the file is successfully downloaded, the custom signature configuration failed at some point. Check the custom signature, the IPS sensor, and the firewall profile.
   - If the download is blocked with a high security alert message explaining that you're not permitted to download the file, the EICAR test file was blocked by the FortiGate unit antivirus scanner before the IPS sensor could examine it. Disable antivirus scanning and try to download the EICAR test file again.
   - If no file is downloaded and the browser eventually times out, the custom signature successfully detected the EICAR test file and blocked the download.

Viewing the packet log

1. Go to **Log&Report > Security Log > AntiVirus**.
2. Locate the log entry that recorded the blocking of the EICAR test file block. The Message field data will be `tools: EICAR.AV.Test.File.Download`.
3. Select the **View Packet Log** icon in the **Packet Log** column.
4. The packet log viewer is displayed.

Configuring a Fortinet Security Processing module

The Example Corporation has a web site that is the target of SYN floods. While they investigate the source of the attacks, it's very important that the web site remain accessible. To enhance the ability of the company's FortiGate-620B to deal with SYN floods, the administrator will install an ASM-CE4 Fortinet Security Processing module and have all external access to the web server come though it.

The security processing modules not only accelerate and offload network traffic from the FortiGate unit's processor, but they also accelerate and offload security and content scanning. The ability of the security module to accelerate IPS scanning and DoS protection greatly enhances the defense capabilities of the FortiGate-620B.

Assumptions

As shown in other examples and network diagrams throughout this document, the Example Corporation has a pair of FortiGate-620B units in an HA cluster. To simplify this example, the cluster is replaced with a single FortiGate-620B.

An ASM-CE4 is installed in the FortiGate-620B.

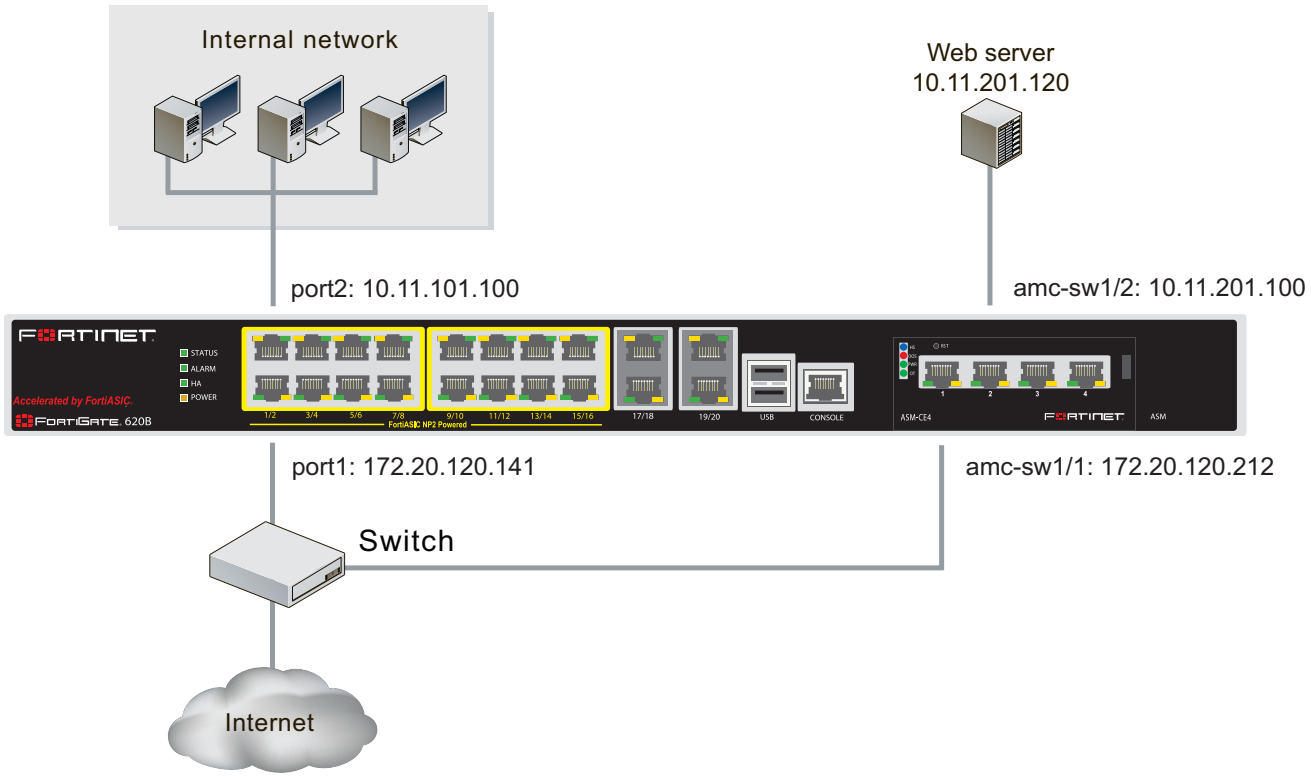
The network is configured as shown below.

Network configuration

The Example Corporation network needs minimal changes to incorporate the ASM-CE4. Interface amc-sw1/1 of the ASM-CE4 is connected to the Internet and interface amc-sw1/1 is connected to the web server.

Since the main office network is connected to port2 and the Internet is connected to port1, a switch is installed to allow both port1 and amc-sw1/1 to be connected to the Internet.

The FortiGate-620B network configuration



The switch used to connect port1 and amc-sw1/1 to the Internet must be able to handle any SYN flood, all of the legitimate traffic to the web site, and all of the traffic to and from the Example Corporation internal network. If the switch can not handle the bandwidth, or if the connection to the service provider can not provide the required bandwidth, traffic will be lost.

Security module configuration

The Fortinet security modules come configured to give equal priority to content inspection and firewall processing. The Example Corporation is using a ASM-CE4 module to defend its web server against SYN flood attacks so firewall processing is a secondary consideration.

Use these CLI commands to configure the security module in ASM slot 1 to devote more resources to content processing, including DoS and IPS, than to firewall processing.

```
config system amc-slot
   edit sw1
      set optimization-mode fw-ips
      set ips-weight balanced
      set ips-p2p disable
      set ips-fail-open enable
      set fp-disable none
      set ipsec-inb-optimization enable
      set syn-proxy-client-timer 3
      set syn-proxy-server-timer 3
   end
```

These settings do not disable firewall processing. Rather, when the security module nears its processing capacity, it will chose to service content inspection over firewall processing.

IPS Sensor

You can group signatures into IPS sensors for easy selection when applying to firewall policies. You can define signatures for specific types of traffic in separate IPS sensors, and then select those sensors in profiles designed to handle that type of traffic. For example, you can specify all of the web-server related signatures in an IPS sensor, and that sensor can then be applied to a firewall policy that controls all of the traffic to and from a web server protected by the unit.

The FortiGuard Service periodically updates the pre-defined signatures, with signatures added to counter new threats. Since the signatures included in filters are defined by specifying signature attributes, new signatures matching existing filter specifications will automatically be included in those filters. For example, if you have a filter that includes all signatures for the Windows operating system, your filter will automatically incorporate new Windows signatures as they are added.

Each IPS sensor consists of two parts: filters and overrides. Overrides are always checked before filters.

Each filter consists of a number of signatures attributes. All of the signatures with those attributes, and only those attributes, are checked against traffic when the filter is run. If multiple filters are defined in an IPS Sensor, they are checked against the traffic one at a time, from top to bottom. If a match is found, the unit takes the appropriate action and stops further checking.

A signature override can modify the behavior of a signature specified in a filter. A signature override can also add a signature not specified in the sensor's filters. Custom signatures are included in an IPS sensor using overrides.

The signatures in the overrides are first compared to network traffic. If the IPS sensor does not find any matches, it then compares the signatures in each filter to network traffic, one filter at a time, from top to bottom. If no signature matches are found, the IPS sensor allows the network traffic.

The signatures included in the filter are only those matching every attribute specified. When created, a new filter has every attribute set to **all** which causes every signature to be included in the filter. If the severity is changed to high, and the target is changed to server, the filter includes only signatures checking for high priority attacks targeted at servers.

Custom Application & IPS Signatures

Creating a custom IPS signature

The FortiGate predefined signatures cover common attacks. If you use an unusual or specialized application or an uncommon platform, add custom signatures based on the security alerts released by the application and platform vendors.

You can add or edit custom signatures using the web-based manager or the CLI.

To create a custom signature

1. Go to **Security Profiles > Intrusion Protection**.
2. Select **[View IPS Signatures]**
3. Select **Creat New** to add a new custom signature.
4. Enter a **Name** for the custom signature.
5. Enter the **Signature**. For information about completing this field, see “Custom signature syntax and keywords”.
6. Select **OK**.

Custom signature syntax and keywords

All custom signatures follow a particular syntax. Each begins with a header and is followed by one or more keywords. The syntax and keywords are detailed in the next two topics.

Custom signature syntax

A custom signature definition is limited to a maximum length of 512 characters. A definition can be a single line or span multiple lines connected by a backslash (\) at the end of each line.

A custom signature definition begins with a header, followed by a set of keyword/value pairs enclosed by parenthesis [( )]. The keyword and value pairs are separated by a semi colon (;) and consist of a keyword and a value separated by a space. The basic format of a definition is HEADER (KEYWORD VALUE;)

You can use as many keyword/value pairs as required within the 512 character limit. To configure a custom signature, go to **Security Profiles > Intrusion Protection > IPS Signatues,** select **Create New** and enter the data directly into the **Signature** field, following the guidance in the next topics.

The table below shows the valid characters and basic structure. For details about each keyword and its associated values, see “Custom signature keywords”.

Valid syntax for custom signature fields

Field	Valid Characters	Usage
HEADER	F-SBID	The header for an attack definition signature. Each custom signature must begin with this header.
KEYWORD	Each keyword must start with a pair of dashes (--), and consist of a string of 1 to 19 characters. Normally, keywords are an English word or English words connected by an underscore (_). Keywords are case insensitive.	The keyword is used to identify a parameter.
VALUE	Double quotes (") must be used around the value if it contains a space and/or a semicolon (;). If the value is NULL, the space between the KEYWORD and VALUE can be omitted. Values are case sensitive. Note: If double quotes are used for quoting the value, the double quotes are not considered as part of the value string.	The value is set specifically for a parameter identified by a keyword.

Custom signature keywords

Information keywords

attack_id

Syntax: `--attack_id <id_int>;`

Description:

Use this optional value to identify the signature. It cannot be the same value as any other custom rules. If an attack ID is not specified, the FortiGate automatically assigns an attack ID to the signature. If you are using VDOMs, custom signatures appear only in the VDOM in which you create them. You can use the same attack ID for signatures in different VDOMs.

An attack ID you assign must be between 1000 and 9999.

Example: --attack_id 1234;

name

Syntax: `--name <name_str>;`

Description:

Enter the name of the rule. A rule name must be unique. If you are using VDOMs, custom signatures appear only in the VDOM in which you create them. You can use the same rule name for signatures in different VDOMs. The name you assign must be a string greater than 0 and less than 64 characters in length.

Example: `--name "Buffer_Overflow";`

Session keywords

flow

Syntax: `--flow {from_client[,reversed] | from_server[,reversed] | bi_direction };`

Description:

Specify the traffic direction and state to be inspected. They can be used for all IP traffic.

Example: `--src_port 41523; --flow bi_direction;`

The signature checks traffic to and from port 41523.

If you enable “quarantine attacker”, the optional reversed keyword allows you to change the side of the connection to be quarantined when the signature is detected.

For example, a custom signature written to detect a brute-force log in attack is triggered when “Login Failed” is detected from_server more than 10 times in 5 seconds. If the attacker is quarantined, it is the server that is quarantined in this instance. Adding reversed corrects this problem and quarantines the actual attacker.

Previous FortiOS versions used to_client and to_server values. These are now deprecated, but still function for backwards compatibility.

service

Syntax: `--service {HTTP | TELNET | FTP | DNS | SMTP | POP3 | IMAP | SNMP | RADIUS | LDAP | MSSQL | RPC | SIP | H323 | NBSS | DCERPC | SSH | SSL};`

Description:

Specify the protocol type to be inspected. This keyword allows you to specify the traffic type by protocol rather than by port. If the decoder has the capability to identify the protocol on any port, the signature can be used to detect the attack no matter what port the service is running on. Currently, HTTP, SIP, SSL, and SSH protocols can be identified on any port based on the content.

Content keywords

byte_jump

Syntax: `--byte_jump <bytes_to_convert>, <offset>[, multiplier][, relative] [, big] [, little] [, string] [, hex] [, dec] [, oct] [, align];`

Description:

Use the `byte_jump` option to extract a number of bytes from a packet, convert them to their numeric representation, and jump the match reference up that many bytes (for further pattern matching or byte testing). This keyword allows relative pattern matches to take into account numerical values found in network data.

The available keyword options include:

- `<bytes_to_convert>`: The number of bytes to examine from the packet.
- `<offset>`: The number of bytes into the payload to start processing.
- `[multiplier]`: multiplier is optional. It must be a numerical value when present. The converted value multiplied by the number is the result to be skipped.
- `relative`: Use an offset relative to last pattern match.
- `big`: Process the data as big endian (default).
- `little`: Process the data as little endian.
- `string`: The data is a string in the packet.
- `hex`: The converted string data is represented in hexadecimal notation.
- `dec`: The converted string data is represented in decimal notation.
- `oct`: The converted string data is represented in octal notation.
- `align`: Round up the number of converted bytes to the next 32-bit boundary.

byte_test

Syntax: `--byte_test <bytes_to_convert>, <operator>, <value>, <offset> [multiplier][, relative] [, big] [, little] [, string] [, hex] [, dec] [, oct];`

Description:

Use the `byte_test` keyword to compare a byte field against a specific value (with operator). This keyword is capable of testing binary values or converting representative byte strings to their binary equivalent and testing them. The available keyword options include:

- `<bytes_to_convert>`: The number of bytes to compare.
- `<operator>`: The operation to perform when comparing the value (<,>,=,!,&).
- `<value>`: The value to compare the converted value against.
- `<offset>`: The number of bytes into the payload to start processing.
- `[multiplier]`: multiplier is optional. It must be a numerical value when present. The converted value multiplied by the number is the result to be skipped.
- `relative`: Use an offset relative to last pattern match.
- `big`: Process the data as big endian (default).
- `little`: Process the data as little endian.
- `string`: The data is a string in the packet.
- `hex`: The converted string data is represented in hexadecimal notation.
- `dec`: The converted string data is represented in decimal notation.
- `oct`: The converted string data is represented in octal notation.

depth

Syntax: `--depth <depth_int>;`

Description:

Use the depth keyword to search for the contents within the specified number of bytes after the starting point defined by the offset keyword. If no offset is specified, the offset is assumed to be equal to 0.

If the value of the depth keyword is smaller than the length of the value of the content keyword, this signature will never be matched.

The depth must be between 0 and 65535.

distance

Syntax: `--distance <dist_int>;`

Description:

Use the distance keyword to search for the contents within the specified number of bytes relative to the end of the previously matched contents. If the within keyword is not specified, continue looking for a match until the end of the payload.

The distance must be between 0 and 65535.

content

Syntax: `--content [!]"<content_str>";`

Description:

Deprecated, see pattern and context keywords. Use the content keyword to search for the content string in the packet payload. The content string must be enclosed in double quotes.

To have the FortiGate search for a packet that does not contain the specified context string, add an exclamation mark (!) before the content string.

Multiple content items can be specified in one rule. The value can contain mixed text and binary data. The binary data is generally enclosed within the pipe (|) character.

The double quote ("), pipe sign(|) and colon(:) characters must be escaped using a back slash if specified in a content string.

If the value of the content keyword is greater than the length of the value of the depth keyword, this signature will never be matched.

context

Syntax: `--context {uri | header | body | host};`

Description:

Specify the protocol field to look for the pattern. If context is not specified for a pattern, the FortiGate unit searches for the pattern anywhere in the packet buffer. The available context variables are:

- `uri`: Search for the pattern in the HTTP URI line.
- `header`: Search for the pattern in HTTP header lines or SMTP/POP3/SMTP control messages.
- `body`: Search for the pattern in HTTP body or SMTP/POP3/SMTP email body.
- `host`: Search for the pattern in HTTP HOST line.

no_case

Syntax: `--no_case;`

Description:

Use the no-case keyword to force the FortiGate unit to perform a case-insensitive pattern match.

offset

Syntax: `--offset <offset_int>;`

Description:

Use the offset keyword to look for the contents after the specified number of bytes into the payload. The specified number of bytes is an absolute value in the payload. Follow the offset keyword with the depth keyword to stop looking for a match after a specified number of bytes. If no depth is specified, the FortiGate unit continues looking for a match until the end of the payload.

The offset must be between 0 and 65535.

pattern

Syntax: `--pattern [!]"<pattern_str>";`

Description:

The FortiGate unit will search for the specified pattern. A pattern keyword normally is followed by a context keyword to define where to look for the pattern in the packet. If a context keyword is not present, the FortiGate unit looks for the pattern anywhere in the packet buffer. To have the FortiGate search for a packet that does not contain the specified URI, add an exclamation mark (!) before the URI.

Example: `--pattern "/level/" --pattern "|E8 D9FF FFFF|/bin/sh" --pattern !"|20|RTSP/"`

pcre

Syntax: `--pcre [!]"/<regex>/[ismxAEGRUB]";`

Description:

Similarly to the pattern keyword, use the pcre keyword to specify a pattern using Perl-compatible regular expressions (PCRE). A pcre keyword can be followed by a context keyword to define where to look for the pattern in the packet. If no context keyword is present, the FortiGate unit looks for the pattern anywhere in the packet buffer.

For more information about PCRE syntax, go to http://www.pcre.org.

The switches include:

- `i`: Case insensitive.
- `s`: Include newlines in the dot metacharacter.
- `m`: By default, the string is treated as one big line of characters. ^ and $ match at the beginning and ending of the string. When m is set, ^ and $ match immediately following or immediately before any newline in the buffer, as well as the very start and very end of the buffer.
- `x`: White space data characters in the pattern are ignored except when escaped or inside a character class.
- `A`: The pattern must match only at the start of the buffer (same as ^).
- `E`: Set $ to match only at the end of the subject string. Without E, $ also matches immediately before the final character if it is a newline (but not before any other newlines).

- G: Invert the “greediness” of the quantifiers so that they are not greedy by default, but become greedy if followed by ?.
- R: Match relative to the end of the last pattern match. (Similar to distance:0;).
- U: Deprecated, see the context keyword. Match the decoded URI buffers.

uri

Syntax: `--uri [!]"<uri_str>";`

Description:

Deprecated, see pattern and context keywords. Use the uri keyword to search for the URI in the packet payload. The URI must be enclosed in double quotes ("). To have the FortiGate unit search for a packet that does not contain the specified URI, add an exclamation mark (!) before the URI. Multiple content items can be specified in one rule. The value can contain mixed text and binary data. The binary data is generally enclosed within the pipe (|) character. The double quote ("), pipe sign (|) and colon (:) characters must be escaped using a back slash (\) if specified in a URI string.

within

Syntax: `--within <within_int>;`

Description:

Use this together with the distance keyword to search for the contents within the specified number of bytes of the payload.

The within value must be between 0 and 65535.

IP header keywords

dst_addr

Syntax: `--dst_addr [!]<ipv4>;`

Description:

Use the dst_addr keyword to search for the destination IP address. To have the FortiGate search for a packet that does not contain the specified address, add an exclamation mark (!) before the IP address. You can define up to 28 IP addresses or CIDR blocks. Enclose the comma separated list in square brackets.

Example: `dst_addr [172.20.0.0/16, 10.1.0.0/16,192.168.0.0/16]`

ip_id

Syntax: `--ip_id <field_int>;`

Description:

Check the IP ID field for the specified value.

ip_option

Syntax: `--ip_option {rr | eol | nop | ts | sec | lsrr | ssrr | satid | any};`

Description:

Use the ip_option keyword to check various IP option settings.

The available options include:

- `rr`: Check if IP RR (record route) option is present.
- `eol`: Check if IP EOL (end of list) option is present.
- `nop`: Check if IP NOP (no op) option is present.
- `ts`: Check if IP TS (time stamp) option is present.
- `sec`: Check if IP SEC (IP security) option is present.
- `lsrr`: Check if IP LSRR (loose source routing) option is present.
- `ssrr`: Check if IP SSRR (strict source routing) option is present.
- `satid`: Check if IP SATID (stream identifier) option is present.
- `any`: Check if IP any option is present.

ip_tos

Syntax: `--ip_tos <field_int>;`

Description:

Check the IP TOS field for the specified value.

ip_ttl

Syntax: `--ip_ttl [< | >] <ttl_int>;`

Description:

Check the IP time-to-live value against the specified value. Optionally, you can check for an IP time-to-live greater-than (>) or less-than (<) the specified value with the appropriate symbol.

protocol

Syntax: `--protocol {<protocol_int> | tcp | udp | icmp};`

Description:

Check the IP protocol header.

Example: `--protocol tcp;`

src_addr

Syntax: `--src_addr [!]<ipv4>;`

Description:

Use the src_addr keyword to search for the source IP address. To have the FortiGate unit search for a packet that does not contain the specified address, add an exclamation mark (!) before the IP address. You can define up to 28 IP addresses or CIDR blocks. Enclose the comma separated list in square brackets.

Example: `src_addr 192.168.13.0/24`

TCP header keywords

ack

Syntax: `--ack <ack_int>;`

Description:

Check for the specified TCP acknowledge number.

dst_port

Syntax: `--dst_port [!]{<port_int> | :<port_int> | <port_int>: | <port_int>:<port_int>};`

Description:

Use the `dst_port` keyword to specify the destination port number.

You can specify a single port or port range:

- `<port_int>` is a single port.
- `:<port_int>` includes the specified port and all lower numbered ports.
- `<port_int>:` includes the specified port and all higher numbered ports.
- `<port_int>:<port_int>` includes the two specified ports and all ports in between.

seq

Syntax: `--seq [operator,]<number>[,relative];`

Description:

Check for the specified TCP sequence number.

- `operator` includes =,<,>,!.
- `relative` indicates it's relative to the initial sequence number of the TCP session.

src_port

Syntax: `--src_port [!]{<port_int> | :<port_int> | <port_int>: | <port_int>:<port_int>};`

Description:

Use the src_port keyword to specify the source port number. You can specify a single port or port range:

- `<port_int>` is a single port.
- `:<port_int>` includes the specified port and all lower numbered ports.
- `<port_int>:` includes the specified port and all higher numbered ports.
- `<port_int>:<port_int>` includes the two specified ports and all ports in between.

tcp_flags

Syntax: `--tcp_flags <SAFRUP120>[!|*|+] [,<SAFRUP120>];`

Description:

Specify the TCP flags to match in a packet.

- `S`: Match the SYN flag.
- `A`: Match the ACK flag.
- `F`: Match the FIN flag.
- `R`: Match the RST flag.
- `U`: Match the URG flag.
- `P`: Match the PSH flag.
- `1`: Match Reserved bit 1.
- `2`: Match Reserved bit 2.
- `0`: Match No TCP flags set.
- `!`: Match if the specified bits are not set.
- `*`: Match if any of the specified bits are set.
- `+`: Match on the specified bits, plus any others.

The first part if the value (`<SAFRUP120>`) defines the bits that must be present for a successful match.

Example:

`--tcp_flags AP` only matches the case where both `A` and `P` bits are set.

The second part (`[,<SAFRUP120>]`) is optional, and defines the additional bits that can be present for a match.

For example `tcp_flags S,12` matches the following combinations of flags: S, S and 1, S and 2, S and 1 and 2. The modifiers !, * and + cannot be used in the second part.

window_size

Syntax: `--window_size [!]<window_int>;`

Description:

Check for the specified TCP window size. You can specify the window size as a hexadecimal or decimal integer. A hexadecimal value must be preceded by `0x`. To have the FortiGate search for the absence of the specified window size, add an exclamation mark (`!`) before the window size.

UDP header keywords

dst_port

Syntax: `--dst_port [!]{<port_int> | :<port_int> | <port_int>: | <port_int>:<port_int>};`

Description:

Specify the destination port number. You can specify a single port or port range:

- `<port_int>` is a single port.
- `:<port_int>` includes the specified port and all lower numbered ports.
- `<port_int>:` includes the specified port and all higher numbered ports.
- `<port_int>:<port_int>` includes the two specified ports and all ports in between.

src_port

Syntax: `--src_port [!]{<port_int> | :<port_int> | <port_int>: | <port_int>:<port_int>};`

Description:

Specify the destination port number. You can specify a single port or port range:

- `<port_int>` is a single port.
- `:<port_int>` includes the specified port and all lower numbered ports.
- `<port_int>:` includes the specified port and all higher numbered ports.
- `<port_int>:<port_int>` includes the two specified ports and all ports in between.

ICMP keywords

icmp_code

Syntax: `--icmp_code <code_int>;`

Description:

Specify the ICMP code to match.

icmp_id

Syntax: `--icmp_id <id_int>;`

Description:

Check for the specified ICMP ID value.

icmp_seq

Syntax: `--icmp_seq <seq_int>;`

Description:

Check for the specified ICMP sequence value.

icmp_type

Syntax: `--icmp_type <type_int>;`

Description:

Specify the ICMP type to match.

Other keywords

data_size

Syntax: `--data_size {<size_int> | <<size_int> | ><size_int>;`

Description:

Test the packet payload size. With data_size specified, packet reassembly is turned off automatically. So a signature with data_size and only_stream values set is wrong.

- `<size_int>` is a particular packet size.
- `<<size_int>` is a packet smaller than the specified size.
- `><size_int>` is a packet larger than the specified size.

Examples:

- `--data_size 300;`
- `--data_size <300;`
- `--data_size >300;`

data_at

Syntax: `--data_at <offset_int>[, relative];`

Description:

Verify that the payload has data at a specified offset, optionally looking for data relative to the end of the previous content match.

rate

Syntax: `--rate <matches_int>,<time_int>;`

Description:

Instead of generating log entries every time the signature is detected, use this keyword to generate a log entry only if the signature is detected a specified number of times within a specified time period.

- `<matches_int>` is the number of times a signature must be detected.
- `<time_int>` is the length of time in which the signature must be detected, in seconds.

For example, if a custom signature detects a pattern, a log entry will be created every time the signature is detected. If `--rate 100,10;` is added to the signature, a log entry will be created if the signature is detected 100 times in the previous 10 seconds. Use this command with `--track` to further limit log entries to when the specified number of detections occur within a certain time period involving the same source or destination address rather than all addresses.

rpc_num

Syntax: `--rpc_num <app_int>[, <ver_int> | *][, <proc_int> | *>];`

Description:

Check for RPC application, version, and procedure numbers in SUNRPC CALL requests. The * wild card can be used for version and procedure numbers.

same_ip

Syntax: `--same_ip;`

Description:

Check that the source and the destination have the same IP addresses.

track

Syntax: `--track {SRC_IP |DST_IP |DHCP_CLIENT |DNS_DOMAIN}[,block_int];`

Description:

When used with `--rate`, this keyword narrows the custom signature rate totals to individual addresses.

- `SRC_IP`: tracks the packet's source IP.
- `DST_IP`: tracks the packet's destination IP.
- `DHCP_CLIENT`: tracks the DHCP client's MAC address.
- `DNS_DOMAIN`: counts the number of any specific domain name.
- `block_int` has the FortiGate unit block connections for the specified number of seconds, from the client or to the server, depending on which is specified.

  For example, if `--rate 100,10` is added to the signature, a log entry will be created if the signature is detected 100 times in the previous 10 seconds. The FortiGate unit maintains a single total, regardless of source and destination address.

  If the same custom signature also includes `--track` client; matches are totaled separately for each source address. A log entry is added when the signature is detected 100 times in 10 seconds within traffic from the same source address.

  The `--track` keyword can also be used without `--rate`. If an integer is specified, the client or server will be blocked for the specified number of seconds every time the signature is detected.

Creating a custom signature to block access to example.com

In this first example, you will create a custom signature to block access to the example.com URL.

This example describes the use of the custom signature syntax to block access to a URL. To create the custom signature entry in the FortiGate unit web-based manager, see “Creating a custom IPS signature”.

1. Enter the custom signature basic format.

   All custom signatures have a header and at least one keyword/value pair. The header is always the same:

   ```
   F-SBID( )
   ```

   The keyword/value pairs appear within the parentheses and each pair is followed by a semicolon.

2. Choose a name for the custom signature

   Every custom signature requires a name, so it is a good practice to assign a name before adding any other keywords. Use the `--name` keyword to assign the custom signature a name. The name value follows the keyword after a space. Enclose the name value in double-quotes:

   ```
   F-SBID( --name "Block.example.com"; )
   ```

   The signature, as it appears here, will not do anything if you try to use it. It has a name, but does not look for any patterns in network traffic. You must specify a pattern that the FortiGate unit will search for.

3. Add a signature pattern

   Use the `--pattern` keyword to specify what the FortiGate unit will search for:

```
F-SBID( --name "Block.example.com"; --pattern "example.com"; )
```

The signature will now detect the example.com URL appearing in network traffic. The custom signature should only detect the URL in HTTP traffic, however. Any other traffic with the URL should be allowed to pass. For example, an email message to or from example.com should not be stopped.

4. Specify the service

   Use the `--service` keyword to limit the effect of the custom signature to only the HTTP protocol.

   ```
   F-SBID( --name "Block.example.com"; --pattern "example.com"; --service HTTP; )
   ```

   The FortiGate unit will limit its search for the pattern to the HTTP protocol. Even though the HTTP protocol uses only TCP traffic, the FortiGate will search for HTTP protocol communication in TCP, UDP, and ICMP traffic. This is a waste of system resources that you can avoid by limiting the search further, as shown below.

5. Specify the traffic type.

   Use the `--protocol tcp keyword` to limit the effect of the custom signature to only TCP traffic. This will save system resources by not unnecessarily scanning UDP and ICMP traffic.

   ```
   F-SBID( --name "Block.example.com"; --pattern "example.com"; --service HTTP; --
       protocol tcp; )
   ```

   The FortiGate unit will limit its search for the pattern to TCP traffic and ignore UDP and ICMP network traffic.

6. Ignore case sensitivity

   By default, patterns are case sensitive. If a user directed his or her browser to Example.com, the custom signature would not recognize the URL as a match.

   Use the `--no_case` keyword to make the pattern matching case insensitive.

   ```
   F-SBID( --name "Block.example.com"; --pattern "example.com"; --service HTTP; --no_
       case; )
   ```

   Unlike all of the other keywords in this example, the `--no_case` keyword has no value. Only the keyword is required.

7. Limit pattern scans to only traffic sent from the client

   The `--flow` command can be used to further limit the network traffic being scanned to only that send by the client or by the server.

   ```
   F-SBID( --name "Block.example.com"; --pattern "example.com"; --service HTTP; --no_
       case; --flow from_client; )
   ```

   Web servers do not contact clients until clients first open a communication session. Therefore, using the `--flow from_client` command will force the FortiGate to ignore all traffic from the server. Since the majority of HTTP traffic flows from the server to the client, this will save considerable system resources and still maintain protection.

8. Specify the context

   When the client browser tries to contact example.com, a DNS is first consulted to get the example.com server IP address. The IP address is then specified in the URL field of the HTTP communication. The domain name will still appear in the host field, so this custom signature will not function without the `--context host` keyword/value pair.

   ```
   F-SBID( --name "Block.example.com"; --pattern "example.com"; --service HTTP; --no_
       case; --flow from_client; --context host; )
   ```

Creating a custom signature to block the SMTP “vrfy” command

The SMTP “vrfy” command can be used to verify the existence of a single email address or to list all of the valid email accounts on an email server. A spammer could potentially use this command to obtain a list of all valid email users and direct spam to their inboxes.

In this example, you will create a custom signature to block the use of the vrfy command. Since the custom signature blocks the vrfy command from coming through the FortiGate unit, the administrator can still use the command on the internal network.

This example describes the use of the custom signature syntax to block the vrfy command. To create the custom signature entry in the FortiGate unit web-based manager, see “Creating a custom IPS signature”.

1. Enter the custom signature basic format

   All custom signatures have a header and at least one keyword/value pair. The header is always the same:

   ```
   F-SBID( )
   ```

   The keyword/value pairs appear within the parentheses and each pair is followed by a semicolon.

2. Choose a name for the custom signature

   Every custom signature requires a name, so it is a good practice to assign a name before you add any other keywords.

   Use the `--name` keyword to assign the custom signature a name. The name value follows the keyword after a space. Enclose the name value in double-quotes:

   ```
   F-SBID( --name "Block.SMTP.VRFY.CMD"; )
   ```

   The signature, as it appears here, will not do anything if you try to use it. It has a name, but does not look for any patterns in network traffic. You must specify a pattern that the FortiGate unit will search for.

3. Add a signature pattern

   Use the `--pattern` keyword to specify what the FortiGate unit will search for:

   ```
   F-SBID( --name "Block.SMTP.VRFY.CMD"; --pattern "vrfy"; )
   ```

   The signature will now detect the vrfy command appearing in network traffic. The custom signature should only detect the command in SMTP traffic, however. Any other traffic with the pattern should be allowed to pass. For example, an email message discussing the vrfy command should not be stopped.

4. Specify the service.

   Use the `--service` keyword to limit the effect of the custom signature to only the HTTP protocol.

   ```
   F-SBID( --name "Block.SMTP.VRFY.CMD"; --pattern "vrfy"; --service SMTP; )
   ```

   The FortiGate unit will limit its search for the pattern to the SMTP protocol.

   Even though the SMTP protocol uses only TCP traffic, the FortiGate will search for SMTP protocol communication in TCP, UDP, and ICMP traffic. This is a waste of system resources that you can avoid by limiting the search further, as shown below.

5. Specify the traffic type.

   Use the `--protocol tcp keyword` to limit the effect of the custom signature to only TCP traffic. This will save system resources by not unnecessarily scanning UDP and ICMP traffic.

```
F-SBID( --name "Block.SMTP.VRFY.CMD"; --pattern "vrfy"; --service SMTP; --
    protocol tcp; )
```

The FortiGate unit will limit its search for the pattern to TCP traffic and ignore the pattern in UDP and ICMP network traffic.

6. Ignore case sensitivity.

   By default, patterns are case sensitive. If a user directed his or her browser to Example.com, the custom signature would not recognize the URL as a match.

   Use the `--no_case` keyword to make the pattern matching case insensitive.

   ```
   F-SBID( --name "Block.SMTP.VRFY.CMD"; --pattern "vrfy"; --service SMTP; --no_case; )
   ```

   Unlike all of the other keywords in this example, the `--no_case` keyword has no value. Only the keyword is required.

7. Specify the context.

   The `SMTP vrfy` command will appear in the SMTP header. The `--context host` keyword/value pair allows you to limit the pattern search to only the header.

   ```
   F-SBID( --name "Block.SMTP.VRFY.CMD"; --pattern "vrfy"; --service SMTP; --no_case; -
       -context header; )
   ```

Creating a custom signature to block files according to the file's hash value

In this example, you will create a custom signature that allows you to specify a hash value (or checksum) of a file that you want to block. To block multiple files you can create a custom signature for each file with that file's hash value in it and then add all of the custom signatures to an IPS sensor and set the action to block for each one. When IPS encounters a file with a matching hash value the file is blocked.

This example uses a CRC32 checksum of the file as the hash value of the file to be blocked. You can use any utility that supports CRC32 checksums to generate the hash value.

1. Enter the custom signature basic format.

   All custom signatures have a header and at least one keyword/value pair. The header is always the same:

   ```
   F-SBID( )
   ```

   The keyword/value pairs appear within the parentheses and each pair is followed by a semicolon.

2. Choose a name for the custom signature

   Every custom signature requires a name, so it is a good practice to assign a name before adding any other keywords. Use the `--name` keyword to assign the custom signature a name. The name value follows the keyword after a space. Enclose the name value in double-quotes:

   ```
   F-SBID( --name "File.Hash.Example"; )
   ```

   The signature, as it appears here, will not do anything if you try to use it. It has a name, but does not look for any patterns in network traffic.

3. Specify the traffic type.

   Use the `--protocol tcp keyword` to limit the effect of the custom signature to only TCP traffic. This will save system resources by not unnecessarily scanning UDP and ICMP traffic.

   ```
   F-SBID( --name "File.Hash.Example"; --protocol tcp; )
   ```

   The FortiGate unit will limit its search for the pattern to TCP traffic and ignore UDP and ICMP network traffic.

4. Add the CRC32 hash value.

   Use the `--crc32` keyword. This indicates that the value that follows is a hexadecimal number that represents the CRC32 checksum of the file. The `--crc32` keyword also requires that you include the file length. The syntax is `--crc32 <checksum>,<file-length>;`. The following example shows the syntax for a file with checksum 51480492 and file length 822.

   ```
   F-SBID( --name "File.Hash.Example"; --protocol tcp; --crc32 51480492,822; )
   ```

Email filter

This section describes how to configure FortiGate email filtering for IMAP, POP3, and SMTP email. Email filtering includes both spam filtering and filtering for any words or files you want to disallow in email messages. If your FortiGate unit supports SSL content scanning and inspection, you can also configure spam filtering for IMAPS, POP3S, and SMTPS email traffic.

The following topics are included in this section:

- Email filter concepts
- Enable email filtering
- Configure email traffic types to inspect
- Configure the spam action
- Configure the tag location
- Configure the tag format
- Configuring an Email Filters
- Configure local email filters
- Email filter examples

Email filter concepts

You can configure the FortiGate unit to manage unsolicited commercial email by detecting and identifying spam messages from known or suspected spam servers.

The FortiGuard Antispam Service uses both a sender IP reputation database and a spam signature database, along with sophisticated spam filtering tools, to detect and block a wide range of spam messages. Using FortiGuard Antispam email filter profile settings, you can enable IP address checking, URL checking, email checksum checking, and spam submission. Updates to the IP reputation and spam signature databases are provided continuously via the global FortiGuard Distribution Network.

From the FortiGuard Antispam Service page in the FortiGuard Center, you can find out whether an IP address is blacklisted in the FortiGuard antispam IP reputation database, or whether a URL or email address is in the signature database.

Email filter techniques

The FortiGate unit has a number of techniques available to help detect spam. Some use the FortiGuard Antispam Service and require a subscription. The remainder use your DNS servers or use lists that you must maintain.

Black white list

These are the types of black white lists available. They include:

- **IP/Netmask**
  The FortiGate unit compares the IP address of the client delivering the email to the addresses in the IP address black/white list specified in the email filter profile. If a match is found, the FortiGate unit will take the action configured for the matching black/white list entry against all delivered email.
  The default setting of the `smtp-spamhdrip` CLI command is `disable`. If enabled, the FortiGate unit will check

all the IP addresses in the header of SMTP email against the specified IP address black/white list.

- **Email Wildcard**
  The FortiGate unit compares the sender email address, as shown in the message envelope MAIL FROM, to the pattern in the patterned field. The wildcard symbol is used in the patterned to replace the characters in the address that may vary from the pattern. If a match is found, the FortiGate unit will take the action configured for the matching black/white list entry.
- **Email Regular Expression**
  The FortiGate unit compares the sender email address, as shown in the message envelope MAIL FROM, to the pattern in the patterned field. The regular expression that can be used is much more sophisticated than a simple wildcard variable. If a match is found, the FortiGate unit will take the action configured for the matching black/white list entry.

Pattern

The pattern field is for entering the identifying information that will enable the filter to correctly identify the email messages.

- If the type is IP/Netmask the filter will be an IP address with a subnet mask.
- If the type is Email Wildcard the filter will be an email address with a wildcard symbol in place of the variable characters. For example *.example.com or fred@*.com.
- If the type is Email Regular Expression, regular expression can be used to create a more granular filter for email addresses. For example, ^[_a-z0-9-]+(\.[_a-z0-9-]+)*@(example|xmple|examp).(com|org|net) could be used filter based on a number of combinations of email domain names.

Action

- **Mark as Spam**
  If this is the selected action, the email will be allowed through but it will be tagged with an indicator that clearly marks the email as spam.
- **Mark as Clear**
  If this is the selected action, the email will be allowed to go through to its destination on the assumption that the message is not spam.
- **Mark as Reject**
  If this is the selected action, the email will be dropped at the before reaching its destination.

Status

Indicates whether this particular list is enabled or disabled

Banned word check

When you enable banned word checking, your FortiGate unit will examine the email message for words appearing in the banned word list specified in the email filter profile. If the total score of the banned word discovered in the email message exceeds the threshold value set in the email filter profile, your FortiGate unit will treat the message as spam.

When determining the banned word score total for an email message, each banned word score is added once no matter how many times the word appears in the message. Use the command `config spamfilter bword` to add an email banned word list. Use the command `config spamfilter profile` to add a banned word list to an email filtering profile.

How content is evaluated

Every time the banned word filter detects a pattern in an email message, it adds the pattern score to the sum of scores for the message. You set this score when you create a new pattern to block content. The score can be any number from zero to 99999. Higher scores indicate more offensive content. When the total score equals or exceeds the threshold, the email message is considered as spam and treated according to the spam action configured in the email filter profile. The score for each pattern is counted only once, even if that pattern appears many times in the email message. The default score for banned word patterns is 10 and the default threshold is 10. This means that by default, an email message is blocked by a single match.

A pattern can be part of a word, a whole word, or a phrase. Multiple words entered as a pattern are treated as a phrase. The phrase must appear as entered to match. You can also use wildcards or regular expressions to have a pattern match multiple words or phrases.

For example, the FortiGate unit scans an email message that contains only this sentence: “The score for each word or phrase is counted only once, even if that word or phrase appears many times in the email message.”

Banned word pattern	Pattern type	Assigned score	Score added to the sum for the entire page	Comment
word	Wildcard	20	20	The pattern appears twice but multiple occurrences are only counted once.
word phrase	Wildcard	20	0	Although each word in the phrase appears in the message, the words do not appear together as they do in the pattern. There are no matches.
word*phrase	Wildcard	20	20	The wildcard represents any number of any character. A match occurs as long as “word” appears before “phrase” regardless of what is in between them.
mail*age	Wildcard	20	20	Since the wildcard character can represent any characters, this pattern is a match because “email message” appears in the message.

In this example, the message is treated as spam if the banned word threshold is set to 60 or less.

Adding words to a banned word list

When you enter a word, set the `Pattern-type` to wildcards or regular expressions.

Wildcard uses an asterisk (“*”) to match any number of any character. For example, re* will match all words starting with “re”.

Regular expression uses Perl regular expression syntax. See http://perldoc.perl.org/perlretut.html for detailed information about using Perl regular expressions.

DNS-based Blackhole List (DNSBL)

A DNSBL is a list of IP addresses, usually maintained by a third party, which are identified as being associated with spamming.

FortiGuard-Antispam Service.

FortiGuard IP address check

The FortiGate unit queries the FortiGuard Antispam Service to determine if the IP address of the client delivering the email is blacklisted. A match will cause the FortiGate unit to treat delivered messages as spam.

The default setting of the `smtp-spamhdrip` CLI command is `disable`. When you enable FortiGuard IP address checking, your FortiGate unit will submit the IP address of the client to the FortiGuard service for checking. If the IP address exists in the FortiGuard IP address black list, your FortiGate unit will treat the message as spam.

FortiGuard URL check

When you enable FortiGuard URL checking, your FortiGate unit will submit all URLs appearing in the email message body to the FortiGuard service for checking. If a URL exists in the FortiGuard URL black list, your FortiGate unit will treat the message as spam.

FortiGuard email checksum check

When you enable FortiGuard email checksum checking, your FortiGate unit will submit a checksum of each email message to the FortiGuard service for checking. If a checksum exists in the FortiGuard checksum black list, your FortiGate unit will treat the message as spam.

Detect phishing URLs in email

When you enable FortiGuard phishing URL detection, your FortiGate unit will submit all URL hyperlinks appearing in the email message body to the FortiGuard service for checking. If a URL exists in the FortiGuard URL phishing list, your FortiGate unit will remove the hyperlink from the message. The URL will remain in place, but it will no longer be a selectable hyperlink.

FortiGuard spam submission

Spam submission is a way you can inform the FortiGuard AntiSpam service of non-spam messages incorrectly marked as spam. When you enable this setting, the FortiGate unit adds a link to the end of every message marked as spam. You then select this link to inform the FortiGuard AntiSpam service when a message is incorrectly marked.

Trusted IP Addresses

A list if IP addresses that are trusted by the FortiGate is created. Any email traffic coming in from these IP address will be exempted to perform IP based check, such as DNSBL/RBL, FortiShield SPAM IP or locally defined IP black list check.

If the FortiGate unit sits behind a company's Mail Transfer Units, it may be unnecessary to check email IP addresses because they are internal and trusted. The only IP addresses that need to be checked are those from outside of the company. In some cases, external IP addresses may be added to the list if it is known that they are not sources of spam.

MIME header

This feature filters by the MIME header. MIME header settings are configured in a separate part of the command tree but MIME header filtering is enabled within each profile.

HELO DNS lookup

Whenever a client opens an SMTP session with a server, the client sends a HELO command with the client domain name. The FortiGate unit takes the domain name specified by the client in the HELO and does a DNS lookup to determine if the domain exists. If the lookup fails, the FortiGate unit determines that any messages delivered during the SMTP session are spam.

The HELO DNS lookup is available only for SMTP traffic.

Return email DNS check

The FortiGate unit performs a DNS lookup on the If no such record exists, the message is treated as spam.

When you enable return email DNS checking, your FortiGate unit will take the domain in the reply-to email address and reply-to domain and check the DNS servers to see if there is an A or MX record for the domain. If the domain does not exist, your FortiGate unit will treat the message as spam.

Order of spam filtering

The FortiGate unit checks for spam using various filtering techniques. The order in which the FortiGate unit uses these filters depends on the mail protocol used.

Filters requiring a query to a server and a reply (FortiGuard Antispam Service and DNSBL/ORDBL) are run simultaneously. To avoid delays, queries are sent while other filters are running. The first reply to trigger a spam action takes effect as soon as the reply is received.

Each spam filter passes the email to the next if no matches or problems are found. If the action in the filter is **Mark as Spam**, the FortiGate unit tags the email as spam according to the settings in the email filter profile.

For SMTP and SMTPS, if the action is discard, the email message is discarded or dropped.

If the action in the filter is **Mark as Clear**, the email is exempt from any remaining filters. If the action in the filter is **Mark as Reject**, the email session is dropped. Rejected SMTP or SMTPS email messages are substituted with a configurable replacement message.

Order of SMTP and SMTPS spam filtering

The FortiGate unit scans SMTP and SMTPS email for spam in the order given below. SMTPS spam filtering is available on FortiGate units that support SSL content scanning and inspection.

1. IP address black/white list (BWL) check on last hop IP
2. DNSBL & ORDBL check on last hop IP, FortiGuard Antispam IP check on last hop IP, HELO DNS lookup
3. MIME headers check, E-mail address BWL check
4. Banned word check on email subject
5. IP address BWL check (for IPs extracted from “Received” headers)
6. Banned word check on email body
7. Return email DNS check, FortiGuard Antispam email checksum check, FortiGuard Antispam URL check, DNSBL & ORDBL check on public IP extracted from header.

Order of IMAP, POP3, IMAPS and POP3S spam filtering

The FortiGate unit scans IMAP, POP3, IMAPS and POP3S email for spam in the order given below. IMAPS and POP3S spam filtering is available on FortiGate units that support SSL content scanning and inspection.

1. MIME headers check, E-mail address BWL check
2. Banned word check on email subject
3. IP BWL check
4. Banned word check on email body
5. Return email DNS check, FortiGuard Antispam email checksum check, FortiGuard Antispam URL check, DNSBL & ORDBL check.

Spam actions

When spam is detected, the FortiGate unit will deal with it according to the **Spam Action** setting in the email filter profile. Note that POP3S, IMAPS and SMTPS spam filtering is available only on FortiGate units that support SSL content scanning and inspection. POP3, IMAP, POP3S and IMAPS mail can only be tagged. SMTP and SMTPS mail can be set to **Discard** or **Tagged**:

Discard

When the spam action is set to **Discard**, messages detected as spam are deleted. No notification is sent to the sender or recipient.

Pass

When the spam action is set to pass, message the spam filter is disabled for this message.

Tag

When the spam action is set to **Tagged**, messages detected as spam are labelled and delivered normally. The text used for the label is set in the **Tag Format** field and the label is placed in the subject or the message header, as set with the **Tag Location** option.

Email traffic types to inspect

The FortiGate unit examines IMAP, POP3, and SMTP email traffic. If your FortiGate unit supports content inspection, it can also examine IMAPS, POP3S, and SMTPS traffic. The options that you will see in the profile window are IMAP, POP3 and SMTP.

Configuring an Email Filters

FortiGuard email filtering techniques us FortiGuard services to detect the presence of spam among your email. A FortiGuard subscription is required to use the FortiGuard email filters. To enable email filtering an email filter needs to be created and then the filter needs to be associated with a security policy.

The filter can be created as follows:

- Go to Security **Profiles > Email Filter**.
  - Select the Create New icon (a plus symbol in a circle in the upper right hand corner).
  - Select the List icon (a page symbol in the upper right hand corner) and in the new window select **Create New**.

An existing filter can be edited as follows:

- Go to Security **Profiles > Email Filter**.
  - Select the filter that you wish to edit from the dropdown menu in the upper right corner.
  - Select the List icon (a page symbol in the upper right hand corner) and select the filter that you wish to edit from the list.

Once you are in the proper **Edit Email Filter Profile** window, you can enter a name in the Name field if it's a new filter.

The Comments field is for a discription or other information that will assist in understanding the function or purpose of the this particular filter.

Using the radio buttons for the Inspection Mode field, select either Proxy or Flow-based.

Before any of the other features or options of the filter appear the checkbox next to Enable Spam Detection and Filtering must be checked.

Spam detection by protocol

This matrix includes 3 rows that represent the email protocols IMAP, POP3 and SMTP.

There are also columns for:

Spam Action

For the client protocols, IMAP and POP3 the options are:

- **Tag** - This action will insert a tag into the email somewhere so that when the recipients view the email they will be warned that it is likely a spam.
- **Pass** - This action will allowany emails marked as spam to pass through without change. If this option is chosen, the Tag comments will be greyed out.

For the tranfer protocol, SMTP, the options are:

- **Tag** - This action will insert a tag into the email somewhere so that when the recipients view the email they will be warned that it is likely a spam.
- **Discard** - The action will drop the email before it reaches its destination.
- **Pass** - This action will allowany emails marked as spam to pass through without change. If this option is chosen, the Tag comments will be greyed out.

Tag Location

- **Subject** - The contents of the Tag Format will be inserted into the subject line. The subject line is the most commonly used.
- **MIME** - The contents of the Tag Format will be insterted in with the MIME header header.

Tag Format

The contents of this field will be entered into the tag location specified. The most common tag is something along the lines of [Spam] or **SPAM**

FortiGuard Spam Filtering

The options in the section are ones that require a FortiGuard subscription.

The options available in this section, to be selected by checkbox are:

- IP Address Check
- URL Check
- Detect Phishing URLs in Email
- Email Checksum Check
- Spam Submission

Local Spam Filtering

The options in the section are ones can be managed on the local device without the need for a FortiGuard subscription.

The options available in this section, to be selected by checkbox are:

- HELO DNS Lookup
- Return Email DNS Check
- Black White List - checking this option will produce a table that can be edited to create a number of BWL lists that can be separately configured and enabled.

Email filter examples

Configuring simple antispam protection

Small offices, whether they are small companies, home offices, or satellite offices, often have very simple needs. This example details how to enable antispam protection on a FortiGate unit located in a satellite office.

Creating an email filter profile

Most email filter settings are configured in an email filter profile. Email filter profiles are selected in firewall policies. This way, you can create multiple email filter profiles, and tailor them to the traffic controlled by the security policy in which they are selected. In this example, you will create one email filter profile.

To create an email filter profile — web-based manager

1. Go to **Security Profiles > Email Filter**.
2. Select the **Create New** icon in the Edit Email Filter Profile window title.
3. In the **Name** field, enter `basic_emailfilter`.
4. Select **Enable Spam Detection and Filtering**.
5. Ensure that **IMAP**, **POP3**, and **SMTP** are selected in the header row.

   These header row selections enable or disable examination of each email traffic type. When disabled, the email traffic of that type is ignored by the FortiGate unit and no email filtering options are available.
6. Under **FortiGuard Spam Filtering**, enable **IP Address Check**.
7. Under **FortiGuard Spam Filtering**, enable **URL Check**.
8. Under **FortiGuard Spam Filtering**, enable **E-mail Checksum Check**.
9. Select **OK** to save the email filter profile.

To create an email filter profile — CLI

```
config spamfilter profile
   edit basic_emailfilter
      set options spamfsip spamfsurl spamfschksum
   end
```

Selecting the email filter profile in a security policy

An email filter profile directs the FortiGate unit to scan network traffic only when it is selected in a security policy. When an email filter profile is selected in a security policy, its settings are applied to all the traffic the security policy handles.

To select the email filter profile in a security policy — web-based manager

1. Go to **Policy > Policy > IPv4.**
2. Create a new or edit a policy.
3. Turn on email filtering.
4. Select the `basic_emailfilter` profile from the list.
5. Select **OK** to save the security policy.

To select the email filter profile in a security policy — CLI

```
config firewall policy
   edit 1
      set utm-status enable
      set profile-protocol-options default
      set spamfilter-profile basic_emailfilter
   end
```

IMAP, POP3, and SMTP email traffic handled by the security policy you modified will be scanned for spam. Spam messages have the text “Spam” added to their subject lines. A small office may have only one security policy configured. If you have multiple policies, consider enabling spam scanning for all of them.

Blocking email from a user

Employees of the Example.com corporation have been receiving unwanted email messages from a former client at a company called example.net. The client’s email address is client@example.net. All ties between the company and the client have been severed, but the messages continue. The FortiGate unit can be configured to prevent these messages from being delivered.

To enable Email Filter

1. Go to **Security Profiles > Email Filter > Profile**.
2. Select the email filter profile that is used by the firewall policies handling email traffic from the email filter profile drop down list.
3. In the row **Tag Location**, select **Subject** for all three mail protocols.
4. In the row **Tag Format**, enter `SPAM:` in all three fields.
   This means that normal spam will be tagged in the subject line.
5. Select **Enable Spam Detection and Filtering**.
6. Under **Local Spam Filtering**, enable **Black White List** and select **Create New**.
7. In the Black White List widget, select **Create New**.

8. Select **Email Address Wildcard**.
9. Enter `client@example.net` in the **Pattern** field.
   - If you wanted to prevent everyone's email from the client's company from getting through you could have used *@example.net instead.
10. Set the **Action** as **Mark as Spam**.
11. Set the **Status** to **Enable**.
12. Confirm that the SMTP protocol action is set to **Discard**.
13. Select **OK**.

Now that the email address list is created, you must enable the email filter in the email filter profile.

When this email filter profile is selected in a security policy, the FortiGate unit will reject any email message from an address ending with @example.net for all email traffic handled by the security policy.

Data leak prevention

The FortiGate data leak prevention (DLP) system allows you to prevent sensitive data from leaving your network. When you define sensitive data patterns, data matching these patterns will be blocked, or logged and allowed, when passing through the FortiGate unit. You configure the DLP system by creating individual filters based on file type, file size, a regular expression, an advanced rule, or a compound rule, in a DLP sensor and assign the sensor to a security policy.

Although the primary use of the DLP feature is to stop sensitive data from leaving your network, it can also be used to prevent unwanted data from entering your network and to archive some or all of the content passing through the FortiGate unit.

This section describes how to configure the DLP settings.

The following topics are included:

- Data leak prevention concepts
- Enable data leak prevention
- Fingerprint
- File filter
- DLP archiving
- DLP examples

Log Only is enabled by default.

Data leak prevention concepts

Data leak prevention examines network traffic for data patterns you specify. You define whatever patterns you want the FortiGate unit to look for in network traffic. The DLP feature is broken down into a number of parts.

DLP sensor

A DLP sensor is a package of filters. To use DLP, you must enable it in a security policy and select the DLP sensor to use. The traffic controlled by the security policy will be searched for the patterns defined in the filters contained in the DLP sensor. Matching traffic will be passed or blocked according to how you configured the filters.

DLP filter

Each DLP sensor has one or more filters configured within it. Filters can examine traffic for known files using DLP fingerprints, for files of a particular type or name, for files larger than a specified size, for data matching a specified regular expression, or for traffic matching an advanced rule or compound rule.

You can configure the action taken when a match is detected. The actions include:

- None
- Log Only
- Block
- Quarantine IP address

Log Only is enabled by default.

DLP Filter Actions

None

No action is taken if filter even if filter is triggered

Log Only

The FortiGate unit will take no action on network traffic matching a rule with this action. The filter match is logged, however. Other matching filters in the same sensor may still operate on matching traffic.

Block

Traffic matching a filter with the block action will not be delivered. The matching message or download is replaced with the data leak prevention replacement message.

Quarantine IP Address/ Source IP ban

Starting in FortiOS 5.2, the quarantine, as a place where traffic content was held in storage where it couldn't interact with the network or system was removed, but the term quarantine was kept to describe keeping selected source IPs from interacting with the network and protected systems. This source IP ban is kept in the kernel rather than in any specific application engine and can be queried by APIs. The features that can use the APIs to access and use the banned source IP addresses are antivirus, DLP, DoS and IPS. Both IPv4 and IPv6 version are included in this feature.

If the **quarantine-ip** action is used, the additional variable of expiry time will become available. This variable determines for how long the source IP adddress will be blocked. In the GUI it is shown as a field before minutes. In the CLI the option is called `expiry` and the duration is in the format `<###d##h##m>`. The maximum days value is 364. The maximum hour value is 23 and the maximum minute value is 59. The default is 5 minutes.

Configure using the CLI

To configure the DLP sensor to add the source IP address of the sender of a protected file to the quarantine or list of banned source IP addresses edit the DLP Filter, in the CLI. as follows:

```
config dlp sensor
   edit <sensor name>
      config filter
         edit <id number of filter>
            set action quarantine-ip
            set expiry 5m
            end
         end
```

Preconfigured sensors

A number of preconfigured sensors are provided with your FortiGate unit. These can be edited or added to more closely match your needs.

Some of the preconfigured sensors with filters ready to go are:

- Credit-Card - This sensor logs the traffic, both files and messages, that contain credit card numbers in the formates used by American Express, MasterCard and Visa.

- SSN-Sensor - This sensor logs the traffic, both files and messages, that contain Social Security Numbers with the exception of those that are WebEx invitation emails.

These rules affect only unencrypted traffic types. If you are using a FortiGate unit that can decrypt and examine encrypted traffic, you can enable those traffic types in these rules to extend their functionality if required.

Before using the rules, examine them closely to ensure you understand how they will affect the traffic on your network.

DLP document fingerprinting

One of the DLP techniques to detect sensitive data is fingerprinting (also called document fingerprinting). Most DLP techniques rely on you providing a characteristic of the file you want to detect, whether it's the file type, the file name, or part of the file contents. Fingerprinting is different in that you provide the file itself. The FortiGate unit then generates a checksum fingerprint and stores it. The FortiGate unit generates a fingerprint for all files detected in network traffic, and it is compared to all of the fingerprints stored in its fingerprint database. If a match is found, the configured action is taken.

The document fingerprint feature requires a FortiGate unit with internal storage. The document fingerprinting menu item does not appear on models without internal storage.

Any type of file can be detected by DLP fingerprinting and fingerprints can be saved for each revision of your files as they are updated.

To use fingerprinting you select the documents to be fingerprinted and then add fingerprinting filters to DLP sensors and add the sensors to firewall policies that accept the traffic to which to apply fingerprinting.

Fingerprinting

Fingerprint scanning allows you to create a library of files for the FortiGate unit to examine. It will create checksum fingerprints so each file can be easily identified. Then, when files appear in network traffic, the FortiGate will generate a checksum fingerprint and compare it to those in the fingerprint database. A match triggers the configured action.

You must configure a document source or uploaded documents to the FortiGate unit for fingerprint scanning to work.

Fingerprinted Documents

The FortiGate unit must have access to the documents for which it generates fingerprints. One method is to manually upload documents to be fingerprinted directly to the FortiGate unit. The other is to allow the FortiGate unit to access a network share that contains the documents to be fingerprinted.

If only a few documents are to be fingerprinted, a manual upload may be the easiest solution. If many documents require fingerprinting, or if the fingerprinted documents are frequently revised, using a network share makes user access easier to manage.

Fingerprinting by document source

To configure a fingerprint document source

1. Go to **Security Profiles > Advanced > DLP Fingerprint**.
2. In the Document Sources section, select **Create New**.
3. Configure the settings:

Name	Enter a descriptive name for the document source.
Server Type	This refers to the type of server share that is being accessed. The default is Windows Share but this will also work on Samba shares.
Server Address	Enter the IP address of the server.
User Name	Enter the user name of the account the FortiGate unit uses to access the server network share.
Password	Enter the password for the account being used to access the network share.
Path	Enter the path to the document folder.
Filename Pattern	You may enter a filename pattern to restrict fingerprinting to only those files that match the pattern. To fingerprint all files, enter an asterisk (“*”).
Sensitivity Level	Select a sensitivity level. The sensitivity is a tag for your reference that is included in the log files. It does not change how fingerprinting works.
Scan Periodically	To have the files on the document source scanned on a regular basis, select this option. This is useful if files are added or changed regularly. Once selected, you can choose Daily, Weekly, or Monthly update options.The Hour and Min fields are for determining, in a 24 hour clock, the time that the source shares will be scanned.
Advanced	Expand the Advanced heading for additional options.
Fingerprint files in sub-directories	By default, only the files in the specified path are fingerprinted. Files in sub-directories are ignored. Select this option to fingerprint files in sub-directories of the specified path.
Remove fingerprints for deleted files	Select this option to retain the fingerprints of files deleted from the document source. If this option is disabled, fingerprints for deleted files will be removed when the document source is rescanned.
Keep previous fingerprints for modified files	Select this option to retain the fingerprints of previous revisions of updated files. If this option is disabled, fingerprints for previous version of files will be deleted when a new fingerprint is generated.

4. Select **OK**.

Fingerprinting manually by document

To configure manual document fingerprints

1. Go to **Security Profiles > Advanced > DLP Fingerprint**.
2. In the Manual Document Fingerprints section, select **Create New**.

3. Use the Browse feature for the File field to select the file to be fingerprinted. The selection will be limited to network resourses
4. Choose a Sensitivity level. The default choices are **Critical**, **Private** and **Warning**, but more can be added in the CLI.
5. If the file is an archive containing other files, select **Process files inside archive** if you also want the individual files inside the archive to have fingerprints generated in addition to the archive itself.
6. Select **OK**.
   The file is uploaded and a fingerprint generated.

File size

This filter-type checks for files exceeding a configured size. All files larger than the specified size are subject to the configured action. The value of the field is measured in Kilobytes.

DLP filtering by specific file types

File filters use file filter lists to examine network traffic for files that match either file names or file types. For example, you can create a file filter list that will find files called secret.* and also all JPEG graphic files. You can create multiple file filter lists and use them in filters in multiple DLP sensors as required.

Specify File Types is a DLP option that allows you to block files based on their file name or their type.

- **File types** are a means of filtering based on an examination of the file contents, regardless of the file name. If you block the file type **Archive (zip)**, all zip archives are blocked even if they are renamed with a different file extension. The FortiGate examines the file contents to determine what type of file it is and then acts accordingly.
- **File Name patterns** are a means of filtering based purely on the names of files. They may include wildcards (*). For example, blocking *.scr will stop all files with an scr file extension, which is commonly used for Windows screen saver files. Files trying to pass themselves off as Windows screen saver files by adopting the file-naming convention will also be stopped.
  - Files can specify the full or partial file name, the full or partial file extension, or any combination. File pattern entries are not case sensitive. For example, adding `*.exe` to the file pattern list also blocks any files ending with `.EXE`.
  - Files are compared to the enabled file patterns from top to bottom, in list order.

File filter detects files within archives for FortiOS 5.0.8, 5.2.0 and later. If you set the file type as `*.txt`, for example, text files inside of zip files will be detected.

Watermarking

Watermarking is essentially marking files with a digital pattern to mark the file as being proprietary to a specific company. Fortinet has a utility that will apply a digital watermark to files. The utility adds a small (approx. 100 byte) pattern to the file that is recognised by the DLP Watermark filter. the pattern is invisible to the end user.

When watermarking a file it should be verified that the pattern matches up to a category found on the FortiGate firewall. For example, if you are going to watermark a file with the sensitivity level of “Secret” you should verify that “Secret” is a sensitivity level that has been assigned in the FortiGate unit.

Watermark Sensitivity

If you are using watermarking on your files you can use this filter to check for watermarks that correspond to sensitivity categories that you have set up.

The Corporate Identifier is to make sure that you are only blocking watermarks that your company has place on the files, not watermarks with the same name by other companies.

Software Versions

Before planning on using watermarking software it is always best to verify that the software will work with your OS. Currently, the only utility available to watermark files is within the FortiExplorer software and that is only only available for the Windows operating system. There was an older version of software that is for Linux and is Commandline only, but is has been discontinued.

File types

The Watermark tool does not work with every file type. The following file types are supported by the watermark tool:

- .txt
- .pdf
- .doc
- .xls
- .ppt
- .docx
- .pptx
- .xlsx

Currently the DLP only works with Fortinet's watermarking software.

Using the FortiExplorer Watermark tool

The FortiExplorer software can be downloaded from the Fortinet Support Site.

1. Choose whether to "Apply Watermark To:"
   - Select File
   - Entire Directory
2. Fill in the fields:
   a. **Select File**
   This Field has a browse icon next to it which will allow the user to browse to and select a single file or directory to apply the water mark to.
   b. **Sensitivity Level**
   This field is a drop down menu that lists the available sensitivity levels that the FortiGate can scan for
   c. **Identifier**
   This is a unique identifier string of characters to identify the company that the document belongs to.
   d. **Output Directory**
   This Field has a browse icon next to it which will allow the user to browse to a directory where the altered file

will be placed. If the output directory is the same as the source directory the original file will be overwritten. If the output directory is different than the source directory then the watermarked version of the file will be place there and the unaltered original will be left in the source directory.

3. Select **Apply Watermark** to start the process.

Regular expression

The FortiGate unit checks network traffic for the regular expression specified in a regular expression filter. The regular expression library used by Fortinet is a variation of a library called PCRE (Perl Compatible Regular Expressions). A number of these filters can be added to a sensor making a sort of 'dictionary' subset within the sensor.

Some other, more limited DLP implementations, use a list of words in a text file to define what words are searched for. While the format used here is slightly different than what some people are used to, the resulting effect is similar. Each Regular Expression filter can be thought of as a more versatile word to be searched against. In this dictionary (or sensor), the list of words is not limited to just predefined words. It can include expressions that can accommodate complex variations on those words and even target phrases. Another advantage of the individual filter model of this dictionary over the list is that each word can be assigned its own action, making this implementation much more granular.

Encrypted

This filter is a binary one. If the file going through the policy is encrypted the action is triggered.

Examining specific services

To assist in optimizing the performance of the firewall, the option exists to select which services/protocol traffic will be checked for the targeted content.This setting gives you a tool to save the resources of the FortiGate unit by only using processing cycles on the relevant traffic. Just check the boxes associated with the service / protocol that you want to have checked for filter triggers.

DLP archiving

DLP is typically used to prevent sensitive information from getting out of your company network, but it can also be used to record network use. This is called DLP archiving. The DLP engine examines email, FTP, NNTP, and web traffic. Enabling archiving for rules when you add them to sensors directs the FortiGate unit to record all occurrences of these traffic types when they are detected by the sensor.

Since the archive setting is configured for each rule in a sensor, you can have a single sensor that archives only the things you want.

You can archive Email, FTP, HTTP, and session control content:

- Email content includes IMAP, POP3, and SMTP sessions. Email content can also include email messages tagged as spam by Email filtering. If your unit supports SSL content scanning and inspection, Email content can also include IMAPS, POP3S, and SMTPS sessions.
- HTTP content includes HTTP sessions. If your unit supports SSL content scanning and inspection HTTP content can also include HTTPS sessions.

DLP archiving comes in two forms: **Summary Only**, and **Full**.

Summary archiving records information about the supported traffic types. For example, when an email message is detected, the sender, recipient, message subject, and total size are recorded. When a user accesses the Web, every URL the user visits recorded. The result is a summary of all activity the sensor detected.

For more detailed records, full archiving is necessary. When an email message is detected, the message itself, including any attachments, is archived. When a user accesses the Web, every page the user visits is archived. Far more detailed than a summary, full DLP archives require more storage space and processing.

Because both types of DLP archiving require additional resources, DLP archives are saved to a FortiAnalyzer unit or the FortiGuard Analysis and Management Service (subscription required).

You can use DLP archiving to collect and view historical logs that have been archived to a FortiAnalyzer unit or the FortiGuard Analysis and Management Service. DLP archiving is available for FortiAnalyzer when you add a FortiAnalyzer unit to the Fortinet configuration. The FortiGuard Analysis server becomes available when you subscribe to the FortiGuard Analysis and Management Service.

Two sample DLP sensors are provided with DLP archiving capabilities enabled. If you select the `Content_Summary` sensor in a security policy, it will save a summary DLP archive of all traffic the security policy handles. Similarly, the `Content_Archive` sensor will save a full DLP archive of all traffic handled the security policy you apply it to. These two sensors are configured to detect all traffic of the supported types and archive them.

DLP archiving is set in the CLI only.

To set the archive to Full

```
config dlp sensor
   edit <name of sensor>
      set full-archive-proto smtp pop3 imap http ftp nntp msn yahoo mapi
   end
```

To set the archive to Summary Only

```
config dlp sensor
   edit <name of sensor>
      set summary-proto smtp pop3 imap http ftp nntp msn yahoo mapi
   end
```

Enable data leak prevention

DLP examines your network traffic for data patterns you specify. The FortiGate unit then performs an action based on the which pattern is found and a configuration set for each filter trigger.

General configuration steps

Follow the configuration procedures in the order given. Also, note that if you perform any additional actions between procedures, your configuration may have different results.

1. Create a DLP sensor.
   New DLP sensors are empty. You must create one or more filters in a sensor before it can examine network traffic.
2. Add one or more filters to the DLP sensor.
   Each filter searches for a specific data pattern. When a pattern in the active DLP sensor appears in the traffic, the FortiGate unit takes the action configured in the matching filter. Because the order of filters within a sensor cannot be changed, you must configure DLP in sequence.
3. Add the DLP sensor to one or more firewall policies that control the traffic to be examined.

Creating/editing a DLP sensor

DLP sensors are collections of filters. You must also specify an action for the filter when you create it in a sensor. Once a DLP sensor is configured, you can select it a security policy profile. Any traffic handled by the security policy will be examined according to the DLP sensor configuration.

To create/edit a DLP sensor

1. Go to **Security Profiles > Data Leak Prevention**.
2. Choose whether you want to edit an exiting sensor or create a new one.
   - The default sensor will be the one displayed by default.
   - If you are going to edit an existing sensor, selecting it can be done by either using the drop down menu in the upper right hand corner of the window or by selecting the List icon (the furthest right of the 3 icons in the upper right of the window, if resembles a page with some lines on it), and then selecting the profile you want to edit from the list.
   - If you need to create a new sensor you can either select the Create New icon (a plus sign within a circle) or select the List icon and then select the Create New link in the upper left of the window that appears.
3. Enter a name in the **Name** field for any new DLP sensors.
4. Optionally, you may also enter a comment. The comment appears in the DLP sensor list and can remind you of the details of the sensor.
5. At this point you can add filters to the sensor (see adding filters to a DLP sensor) or select **OK** to save the sensor.

Without filters, the DLP sensor will do nothing.

Adding filters to a DLP sensor

Once you have created a DLP sensor, you need to add filters.

1. To add filters to a DLP sensor
2. Go to **Security Profiles > Data Leak Prevention**.
3. Select the Sensor you wish to edit using the drop down menu or the sensor list window.
4. Within the Edit DLP Sensor window select **Create New**. A New Filter window should pop up.
5. Select the type of filter. You can choose either Messages or Files. Depending on which of these two are chosen different options will be available.

   Message filter will have these configuration options:
   - [radio button] Containing: [drop down menu including: Credit Card # or SSN]
   - [radio button] Regular Expression [input field]

   Examine the following Services:

   Web Access

   - HTTP-POST

   Email

   - [check box] SMTP
   - [check box] POP3
   - [check box] IMAP
   - [check box] MAPI

Others

- [check box] NNTP

Action [from drop down menu]

- None
- Log Only,
- Block
- Quarantine IP address

Files filter will have these options:

- [radio button] Containing: drop down menu including: Credit Card # or SSN
- [radio button] File Size >= [ ]KB
- [radio button] Specify File Types
  File Types: ["Click to add…"drop down menu of File extensions]
  File Name Patterns:["Click to add…"drop down menu]
- [radio button] File Finger Print : [drop down menu]
- [radio button] Watermark Sensitivity: [drop down menu] and Corporate Identifier [id field]
- [radio button] Regular Expression [input field]
- [radio button] Encrypted

Examine the following Services:

Web Access

- [check box] HTTP-POST
- [check box] HTTP-GET

Email

- [check box] SMTP
- [check box] POP3
- [check box] IMAP
- [check box] MAPI

Others

- [check box] FTP
- [check box] NNTP

Action [from drop down menu]

- None
- Log Only,
- Block
- Quarantine IP address

6. Select **OK**.
7. Repeat Steps 6 and 7 for each filter.
8. Select **Apply** to confirm the settings of the sensor.

If you have configured DLP to block IP addresses and if the FortiGate unit receives sessions that have passed through a NAT device, all traffic from that NAT device — not just traffic from individual users — could be blocked. You can avoid this problem by implementing authentication.

To view or modify the replacement message text, go to **System > Config > Replacement Message**.

DLP examples

Blocking content with credit card numbers

When the objective is to block credit card numbers one of the important things to remember is that 2 filters will need to be used in the sensor.

In the default Credit-Card sensor, you will notice a few things.

- The Action is set to Log Only
- In the Files filter not all of the services are being examined.

If you wish to block as much content as possible with credit card numbers in it instead of just logging most the traffic that has it, the existing sensor will have to be edited.

1. **Go to Security Profile** > **Data Leak Prevention**

Some configurations will have a preconfigured Credit Card sensor where you can use the drop down menu to select **Credit-Card**. If your configuration doesn't already have one create a new sensor.

2. Use the **Create New** icon to add a new sensor.
3. Create/edit the first filter. Use the following settings:
   Filter

Filter	Messages
Filter option	Credit Card #

   Examine the Following Services

   Make sure all of the services are being examined.

   Action

   Set action to **Block**.

   Select **OK** or **Apply**.

4. Create/edit the first filter. Use the following settings:
   Filter

Filter	Files
Filter option	Credit Card #

Examine the Following Services

Make sure all of the services are being examined.

Action

Set action to **Block**.

Select OK or Apply

5. Edit the appropriate policies so that under **Security Profiles**, **DLP** is turned on and the **Credit-Card** sensor is selected.

Blocking emails larger than 15 MB and logging emails from 5 MB to 15 MB

Multiple filters will have to be used in this case and the order that they are used is important. Because there is no mechanism to move the filters within the sensor the order that they are added to the sensor is important.

1. **Go to Security Profile** > **Data Leak Prevention.**
2. Use the **Create New** icon to add a new sensor.
   Use the following values:

Name	large_emails
Comment	<optional>

Once the Sensor has been created, a new filter will need to be added.

3. Create the filter to block the emails over 15 MB. In the filters table select **Create New**.
   Use the following values:
   Filter

Filter	Messages
Filter option	File Size >=
KB	15360 (1MB = 1024KB, 15 MB = 15 x 1024KB = 15360KB)

Examine the Following Services

Make sure all of the Email services are being examined.

Action

Set action to **Block**.

Select **OK**.

4. Create the filter to log emails between 5 MB and 10 MB. In the filters table select **Create New**.
   Use the following values
   Filter

Filter	Messages
Filter option	File Size >=
KB	5120 (1MB = 1024KB, 5 MB = 5 x 1024KB = 5124 KB)

Examine the Following Services

Make sure all of the Email services are being examined.

Action

Set action to **Block**.

Select **OK**.

The reason that the block filter is placed first is because the filters are applied in sequence and once the traffic triggers a filter the action is applied and then the traffic is passed on to the next test. If the Log Only filter which checks for anything over 1MB is triggered this would include traffic over 15MB, so a 16 MB file would only be logged. In the described order, the 16 MB file will be blocked and the 3 MB file will be logged.

Selective blocking based on a finger print

The following is a fairly complex example but shows what can be done by combining various components in the correct configuration.

The company has a number of copyrighted documents that it does not want “escaping” to the Internet but it does want to be able to send those documents to the printers for turning into hardcopy.

The policies and procedures regarding this issue state that:

- Only members of the group **Senior_Editors** can send copyrighted material to the printers.
- Every member of the company by default is included in the group **employees**.
- Even permitted transmission of copyrighted material should be recorded.
- All of the printers IP addresses are in a group called **approved_printers**.
- There is a file share called copyrighted where any file that is copyrighted is required to have a copy stored.
- It doesn’t happen often but for legal reasons sometimes these files can be changed, but all versions of a file in this directory need to be secured.
- All network connections to the Internet must have Antivirus enabled using at least the default profile.
- The SSL/SSH Inspection profile used will be **default**.

It is assumed for the purposes of this example that:

- Any addresses or address groups have been created.
- User accounts and groups have been created.
- The account used by the FortiGate is fgtaccess.
- The copyrighted sensitivity level needs to be created.
- The copyrighted material is stored at \\192.168.27.50\books\copyrighted\

1. Add a new Sensitivity Level by running the following commands in the CLI

```
config dlp fp-sensitivity
   edit copyrighted
end
```

2. Apply files to the fingerprint database

a. Go to **Security Profiles** > **Advanced** > **DLP Fingerprint**.

b. In the **Document Sources** section **select Create New**.
Use the following field values:

Name	copyrighted_material
Server Type	Windows Share
Server Address	192.168.27.50
User Name	fgtaccess
Password	******
Path	books/copyrighted/
Filename Pattern	*.pdf
Sensitivity	copyrighted
Scan Periodically	enabled
<Frequency>	Daily, Hour: 2, Min: 0
Advanced	
Fingerprint files in sub-directories	enabled
Remove fingerprints for deleted files	not enabled
Keep previous fingerprints for modified files	enabled

Two Sensors need to be created. One for blocking the transmission of copyrighted material and a second for allowing the passing of copyrighted material under specific circumstances.

3. Create the first DLP Sensor
   - Go to **Security Profile** > **Data Leak Prevention**.
   - Create a new sensor.
     Use the following field values:

Name	block_copyrighted
Comment	<optional>

   - In the Filter table, select **Create New**.
     Use the following values

     Filter

Filter	Files
Filter option	File Finger Print
Finger print value from dropdown	“copyrighted”

Examine the Following Services

Make sure all of the services are being examined.

Action

From the drop down menu choose **Block**

4. Create the second DLP Sensor
   - Go to **Security Profile** > **Data Leak Prevention**.
   - Create a new sensor.
     Use the following field values:

Name	allow_copyrighted
Comment	<optional>

   - In the Filter table, select **Create New**.
     Use the following values

     Filter

Filter	Files
Filter option	File Finger Print
Finger print value from dropdown	“copyrighted”

Examine the Following Services

Make sure all of the services are being examined.

Action

From the drop down menu choose **Log Only**

5. Create a policy to allow transmission of copyrighted material.
   a. Go to **Policy & Objects > Policy > IPv4**.
   b. Select **Create New**.
   c. Use the following values in the Policy:

Incoming Interface	LAN

Source Address	all
Outgoing Interface	wan1
Destination Address	all
Schedule	always
Service	all
Action	ACCEPT
Enable NAT	enabled -- Use Destination Interface Address
Antivirus	<ON> default
DLP	<ON> Copyrighted
SSL/SSH Inspection	<ON> default
Enable this policy	<ON>

This policy should be place as close to the beginning of the list of policies so the it is among the first tested against.

6. Create a policy to block transmission of copyrighted material.
This will in effect be the default template for all following policies in that they will have to use the DLP profile that blocks the transmission of the copyrighted material.
   a. Go to **Policy & Objects > Policy > IPv4**
   b. Select **Create New** or Edit an existing policy.
   c. Use the following values in the Policy:

   The fields should include what ever values you need to accomplish your requirements are but each policy should include the DLP sensor block_copyrighted or if a different DLP configuration is required it should include a filter that blocks **copyrighted** fingerprinted file.

   If you need to create a policy that is identity based make sure that there is an Authentication rule for the group **employees** that uses the DLP sensor that blocks copyrighted material.

ICAP

ICAP is the acronym for Internet Content Adaptation Protocol The purpose of the feature is to off load work that would normally take place on the firewall to a separate server specifically set up for the specialized processing of the incoming traffic. This takes some of the resource strain off of the FortiGate firewall leaving it to concentrate its resources on things that only it can do.

Off-loading value-added services from Web servers to ICAP servers allows those same web servers to be scaled according to raw HTTP throughput versus having to handle these extra tasks.

ICAP servers are focused on a specific function, for example:

- Ad insertion
- Virus scanning
- Content translation
- HTTP header or URL manipulation
- Language translation
- Content filtering

ICAP does not appear by default in the web-based manager. You must enable it in **System > Admin > Settings** to display ICAP in the web-based manager.

The following topics are included in this section:

- The Protocol
- Offloading using ICAP
- Configuration Settings
- Example ICAP sequence
- Example Scenerio

The Protocol

The protocol is a lightweight member of the TCP/IP suite of protocols. It is an Application layer protocol and its specifications are set out in RFC 3507. The default TCP that is assigned to it is 1344. Its purpose is to support HTTP content adaptation by providing simple object-based content vectoring for HTTP services. ICAP is usually used to implement virus scanning and content filters in transparent HTTP proxy caches. Content Adaptation refers to performing the particular value added service, or content manipulation, for an associated client request/response.

Essentially it allows an ICAP client, in this case the FortiGate firewall, to pass HTTP messages to an ICAP server like a remote procedure call for the purposes of some sort of transformation or other processing adaptation. Once the ICAP server has finished processing the the content, the modified content is sent back to the client.

The messages going back and forth between the client and server are typically HTTP requests or HTTP responses. While ICAP is a request/response protocol similar in semantics and usage to HTTP/1.1 it is not HTTP nor does it run over HTTP, as such it cannot be treated as if it were HTTP. For instance ICAP messages can not be forwarded by HTTP surrogates.

Offloading using ICAP

If you enable ICAP in a security policy, HTTP traffic intercepted by the policy is transferred to an ICAP server in the ICAP profile added to the policy. Responses from the ICAP server are returned to the FortiGate unit which forwards them to an HTTP client or server.

You can offload HTTP responses or HTTP requests (or both) to the same or different ICAP servers.

If the FortiGate unit supports HTTPS inspection, HTTPS traffic intercepted by a policy that includes an ICAP profile is also offloaded to the ICAP server in the same way as HTTP traffic.

When configuring ICAP on the FortiGate unit, you must configure an ICAP profile that contains the ICAP server information; this profile is then applied to a security policy.

Configuration Settings

There are 2 sections where ICAP is configured:

Servers

Go to **Security Profiles > Advanced > ICAP Servers**

The available settings to be configured regarding the server are

- **Name**
- **IP Type** (in the GUI) or IP address version (in the CLI)
  The options for this field in the GUI are 2 radio buttons labelled “IPv4” and “IPv4”. In the CLI the approach is slightly different. There is a field “ip-version” that can be set to “4” or “6”.
- **IP Address**
  Depending on whether you’ve set the IP version to 4 or 6 will determine the format that the content of this field will be set into. In the GUI it looks like the same field with a different format but in the CLI it is actually 2 different fields named “ip-address” and ip6-address.
- **Port**
  1344 is default TCP port used for the ICAP traffic. The range can be from 1 to 65535.

Maximum Connections

This value refers to the maximum number of concurrent connections that can be made to the ICAP server. The default setting is 100. This setting can only be configured in the CLI.

The syntax is:

```
config icap server
   edit <icap_server_name>
      set max-connections <integer>
      end
```

Profiles

Name

Just like any other profile each of the ICAP profiles needs to be assigned a name.

Enable Request Processing

Enabling this setting allows the ICAP server to process request messages.

If enabled this setting will also require:

- **Server** - This is the name of the ICAP server. It is chosen from the drop down menu in the field. The servers are configure in the Security Profiles > ICAP > Server section.
- **Path** - This is the path on the server to the processing compent. For instance if the Windows share name was “Processes” and the directory within the share was “Content-Filter” the path would be “/Processes/Content-Filter/”
- **On Failure** - There are 2 options. You can choose by the use of radio buttons either **Error** or **Bypass**.

Enable Response Processing

Enabling this setting allows the ICAP server to process response messages.

If enabled this setting will also require:

- **Server** - This is the name of the ICAP server. It is chosen from the drop down menu in the field. The servers are configure in the Security Profiles > ICAP > Server section.
- **Path** - This is the path on the server to the processing compent. For instance if the Windows share name was “Processes” and the directory within the share was “Content-Filter” the path would be “/Processes/Content-Filter/”
- **On Failure** - There are 2 options. You can choose by the use of radio buttons either **Error** or **Bypass**.

Enable Streaming Media Bypass

Enabling this setting allows streaming media to ignore offloading to the ICAP server.

Example ICAP sequence

This example is for an ICAP server performing web URL filtering on HTTP requests

1. A user opens a web browser and sends an HTTP request to connect to a web server.
2. The FortiGate unit intercepts the HTTP request and forwards it to an ICAP server.
3. The ICAP server receives the request and determines if the request is for URL that should be blocked or allowed.
   - If the URL should be blocked the ICAP server sends a response to the FortiGate unit. The FortiGate unit returns this response to the user’s web browser. This response could be a message informing the user that their request was blocked.
   - If the URL should be allowed the ICAP server sends a request to the FortiGate unit. The FortiGate unit forwards the request to the web server that the user originally attempted to connect to.
   - When configuring ICAP on the FortiGate unit, you must configure an ICAP profile that contains the ICAP server information; this profile is then applied to a security policy.

Example Scenario

Information relavent to the following example:

- The ICAP server is designed to do proprietary content filtering specific to the organization so it will have to receive the messages and sent back appropriate responses.
- The content filter is a required security precaution so it if the message cannot be processed it is not allowed through.

- Resources on both the Fortigate and the ICAP server are considerable so the maximum connections setting will set at a double the default value to analyse the impact on performance.
- The ICAP server's IP address is 172.16.100. 55.
- The path to the processing component is "/proprietary_code/content-filter/".
- Streaming media is not something that the filter considers, but is allowed through the policy so processing it would be a waste of resources.
- The ICAP profile is to be added to an existing firewall policy.
- It is assumed that the display of the policies has already been configured to show the column "ID".

1. Enter the following to configure the ICAP server:

   Go to **Security Profiles** > **Advanced** > **ICAP Server**.
   Use the following values:

Name	content-filtration-server4
IP Type	IPv4
IP Address	172.16.100.55
Port	1344

   Use the CLI to set the max-connections value.

```
config icap server
   edit content-filtration-server4
      set max-connections 200
      end
```

2. Enter the following to configure the ICAP profile to then apply to a security policy:

   Use the following values:

Name	Prop-Content-Filtration
Enable Request Processing	enable
Server	content-filtration-server4
Path	/proprietary_code/content-filter/
On Failure	Error
Enable Response Processing	enable
Server	content-filtration-server4
Path	/proprietary_code/content-filter/
On Failure	Error
Enable Streaming Media Bypass	enable

3. Apply the ICAP profile to policy:

The purposes of this particular ICAP profile is to filter the content of the traffic coming through the firewall via policy ID#17.

a. Go to **Policy & Objects** > **Policy** > **IPv4.**
b. Open the existing policy ID# 17 for editing.
c. Go to the section **Security Profiles.**
d. Select the button next to **ICAP** so that it indicates that it's status is **ON**.
e. Select the field with the profile name and use the drop down menu to select **Prop-Content-Filtration.**
f. Select **OK**.

Other Security Profiles considerations

The following topics are included in this section:

- Security Profiles and Virtual domains (VDOMs)
- Conserve mode
- SSL content scanning and inspection
- Using wildcards and Perl regular expressions

Security Profiles and Virtual domains (VDOMs)

If you enable virtual domains (VDOMs) on your FortiGate unit, all Security Profiles configuration is limited to the VDOM in which you configure it.

While configuration is not shared, the various databases used by Security Profiles features are shared. The FortiGuard antivirus and IPS databases and database updates are shared. The FortiGuard web filter and spam filter features contact the FortiGuard distribution network and access the same information when checking email for spam and web site categories and classification.

Conserve mode

FortiGate units perform all Security Profiles processing in physical RAM. Since each model has a limited amount of memory, the Conserve mode is activated to avoid a situation where the device is using so much memory to scan files that it becomes unresponsive. When the Conserve mode is activated the Antivirus engine proxy will not accept anymore sessions until the FortiGate leaves Conserve mode. This not only effects the Antivirus function but the DLP function as well.

The AV proxy

Most content inspection the FortiGate unit performs requires that the files, email messages, URLs, and web pages be buffered and examined as a whole. The AV proxy performs this function, and because it may be buffering many files at the same time, it uses a significant amount of memory. Conserve mode is designed to prevent all the component features of the FortiGate unit from trying to use more memory than it has. Because the AV proxy uses so much memory, conserve mode effectively disables it in most circumstances. As a result, the content inspection features that use the AV proxy are also disabled in conserve mode.

All of the Security Profiles features use the AV proxy with the exception of IPS, application control, DoS as well as flow-based antivirus, DLP, and web filter scanning. These features continue to operate normally when the FortiGate unit enters conserve mode.

Conserve mode trigger mechanisms

There are two separate triggers for activating the Conserve mode in FortiOS:

The first mechanism is that the proxies used for scanning content track the amount of shared memory that is in use and when it passes a given threshold the proxy triggers conserve mode. This mechanism is only operational if the applicable proxies are running. In past versions AV proxies were always running regardless of whether or not an AV profile was part of the configuration. In FortiOS version 5.x this was changed so that AV proxies were only running if required by the presence of an AV profile in the configuration. Because SIP is handled in the same

proxy as the IM protocols and IM protocols require an AV proxy meant that, because starting in 5.2 the SIP ALG was enabled by default, the AV proxies were again always running.

FortiOS 5.2.3 changed this so that AV proxies were not needed unless there was an AV profile because the proxies used to scan SIP could also do Conserve mode checking. This does mean that if you want to avoid the proxy Conserve mode checking mechanism you will also have to disable the SIP ALG.

The second mechanism is that the kernel checks the amount of free memory on the system and if the amount of memory available for use drops below the given threshold the kernel will trigger the Conserve mode. Although the second mechanism was added to augment the first mechanism, the two triggers actually measure different things. So the second trigger actually runs regardless of whether there is AV scanning enabled.

Entering and exiting conserve mode

A FortiGate unit will enter conserve mode because it is nearly out of physical memory, or because the AV proxy has reached the maximum number of sessions it can service. The memory threshold that triggers conserve mode varies by model, but it is about 20% free memory. When memory usage rises to the point where less than 20% of the physical memory is free, the FortiGate unit enters conserve mode. A noticeable change to what is happening to traffic only occurs if the AV proxy is being used and what change happens will depend on the `av-failopen` setting.

For example, if the default `av-failopen` setting, 'pass' is being used then any files that are not in the process of being scanned will go into AV bypass mode and all new connections will automatically go into AV bypass until member availability increases to the proper threshold. Conserve mode does not normally result in sessions being flushed from the session table unless the `av-failopen` setting is 'idledrop', in which case the AV proxy will delete what it considers to be the idle connections which in turn will result in sessions being deleted in the kernel.

The FortiGate unit will leave conserve mode only when the available physical memory exceeds about 30%. When exiting conserve mode, all new sessions configured to be scanned with features requiring the AV proxy will be scanned as normal, with the exception of a unit configured with the one-shot option.

The kernel conserve mode detection runs even when no policy in any VDOM has any form of AV/DLP scanning enabled. This means that even if there is no AV scanning occurring and the memory gets low conserve mode may be triggered and informational log messages are generated to this effect, but because no AV scanning is occurring, the actions associated with Conserve mode will not actually take place.

Conserve mode effects

What happens when the FortiGate unit enters conserve mode depends on how you have `av-failopen` configured. There are four options:

off

The off setting forces the FortiGate unit to stop all traffic that is configured for content inspection by Security Profiles features that use the AV proxy. New sessions are not allowed but current sessions continue to be processed normally unless they request more memory. Sessions requesting more memory are terminated.

For example, if a security policy is configured to use antivirus scanning, the traffic it permits is blocked while in conserve mode. A policy with IPS scanning enabled continues as normal. A policy with both IPS and antivirus scanning is blocked because antivirus scanning requires the AV proxy.

Use the off setting when security is more important than a loss of access while the problem is rectified.

pass

The pass setting allows traffic to bypass the AV proxy and continue to its destination. Since the traffic is bypassing the proxy, no Security Profiles scanning that requires the AV proxy is performed. Security Profiles scanning that does not require the AV proxy continues normally.

Use the pass setting when access is more important than security while the problem is rectified.

Pass is the default setting.

one-shot

The one-shot setting is similar to pass in that traffic is allowed when conserve mode is active. The difference is that a system configured for one-shot will force new sessions to bypass the AV proxy even after it leaves conserve mode. The FortiGate unit resumes use of the AV proxy only when the `av-failopen` setting is changed or the unit is restarted.

idledrop

The idledrop setting will recover memory and session space by terminating all the sessions associated with the host that has the most sessions open. The FortiGate may force this session termination a number of times, until enough memory is available to allow it to leave conserve mode.

The idledrop setting is primarily designed for situations in which malware may continue to open sessions until the AV proxy cannot accept more new sessions, triggering conserve mode. If your FortiGate unit is operating near capacity, this setting could cause the termination of valid sessions. Use this option with caution.

Configuring the av-failopen command

You can configure the av-failopen command using the CLI.

```
config system global
set av-failopen {off | pass | one-shot | idledrop}
end
```

The default setting is pass.

Conserve mode and session removal

It is a common misconception that one of the things that Conserve mode does is remove sessions to assist with memory, but there is no direct relationship between Conserve mode and session removal.

- The function of Conserve mode memory tracking is avoid using any more memory for scanning files in case the becomes unresponsive.
- The Session removal function is used as a last resort when the kernel becomes incapable of allocating a page of memory.

There is a mechanism to delete kernel sessions based on lack of memory. If the kernel attempts to allocate a page for any reason and a page cannot be allocated, then the session table is scanned and the oldest session in every bucket is deleted. The count of how many sessions have been deleted due to this process is visible in the 'memory_tension' count.

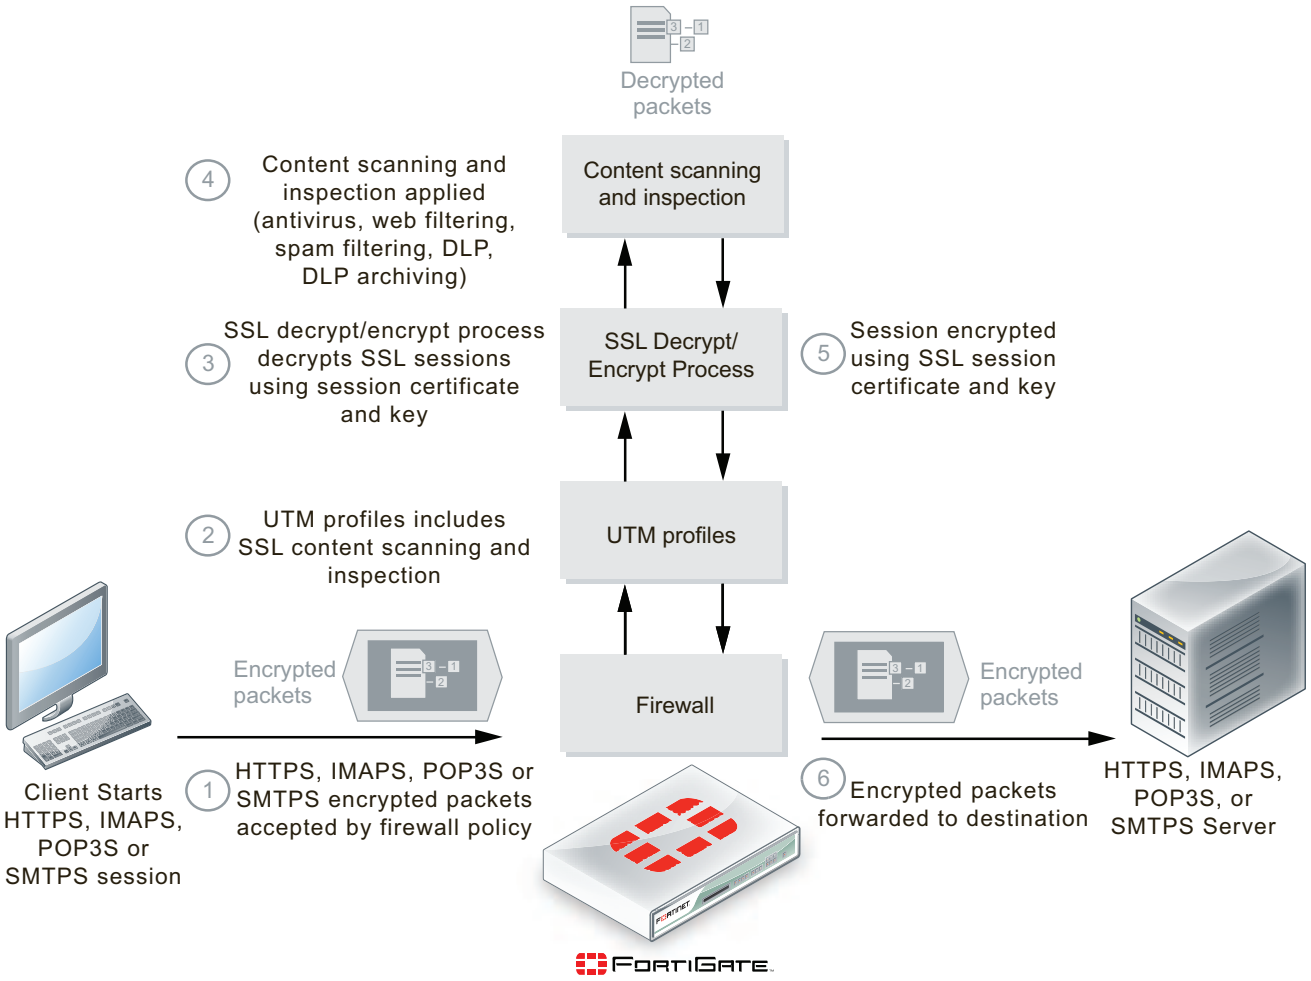
The connection between Conserve mode and session removal is that by definition page allocation cannot fail unless the device has already hit conserve mode.

SSL content scanning and inspection

If your FortiGate model supports SSL content scanning and inspection, you can apply antivirus scanning, web filtering, FortiGuard Web Filtering, and email filtering to encrypted traffic. You can also apply DLP and DLP archiving to HTTPS, IMAPS, POP3S, and SMTPS traffic. To perform SSL content scanning and inspection, the FortiGate unit does the following:

- intercepts and decrypts HTTPS, IMAPS, POP3S, SMTPS, and FTPS sessions between clients and servers (FortiGate SSL acceleration speeds up decryption)
- applies content inspection to decrypted content, including:
- HTTPS, IMAPS, POP3S, and SMTPS Antivirus, DLP, and DLP archiving
- HTTPS web filtering and FortiGuard web filtering
- IMAPS, POP3S, and SMTPS email filtering
- encrypts the sessions and forwards them to their destinations.

FortiGate SSL content scanning and inspection packet flow



HTTP Strict Transport Security (HSTS) Protocol

HSTS is a protocol used by Google and other web browsers to prevent man-in-the-middle attacks.

When performing deep inspection, the FortiGate intercepts the https traffic and would send its own self-signed CA certificate to the browser. If the browser is configured to use HSTS connections, it would refuse the FortiGate CA certificate since it is not on the trusted list for Google servers.

To keep the CA certificate from being refused, the HSTS settings should be cleared from the browser. Instructions for this vary between browsers.

Setting up certificates to avoid client warnings

To use SSL content scanning and inspection, you need to set up and use a certificate that supports it. FortiGate SSL content scanning and inspection intercepts the SSL keys that are passed between clients and servers during SSL session handshakes and then substitutes spoofed keys. Two encrypted SSL sessions are set up, one between the client and the FortiGate unit, and a second one between the FortiGate unit and the server. Inside the FortiGate unit the packets are decrypted.

While the SSL sessions are being set up, the client and server communicate in clear text to exchange SSL session keys. The session keys are based on the client and server certificates. The FortiGate SSL decrypt/encrypt process intercepts these keys and uses a built-in signing CA certificate named Fortinet_CA_SSLProxy to create keys to send to the client and the server. This signing CA certificate is used only by the SSL decrypt/encrypt process. The SSL decrypt/encrypt process then sets up encrypted SSL sessions with the client and server and uses these keys to decrypt the SSL traffic to apply content scanning and inspection.

Some client programs (for example, web browsers) can detect this key replacement and will display a security warning message. The traffic is still encrypted and secure, but the security warning indicates that a key substitution has occurred.

You can stop these security warnings by importing the signing CA certificate used by the server into the FortiGate unit SSL content scanning and inspection configuration. Then the FortiGate unit creates keys that appear to come from the server and not the FortiGate unit.

You can add one signing CA certificate for SSL content scanning and inspection. The CA certificate key size must be 1024 or 2048 bits. 4096-bit keys are not supported for SSL content scanning and encryption.

You can replace the default signing CA certificate, Fortinet_CA_SSLProxy, with another signing CA certificate. To do this, you need the signing CA certificate file, the CA certificate key file, and the CA certificate password.

To add a signing CA certificate for SSL content scanning and inspection

1. Obtain a copy of the signing CA certificate file, the CA certificate key file, and the password for the CA certificate.
2. Go to **System > Certificates > Local Certificates** and select **Import**.
3. Set **Type** to **Certificate**.
4. For **Certificate file,** use the **Browse** button to select the signing CA certificate file.
5. For **Key file,** use the **Browse** button to select the CA certificate key file.
6. Enter the CA certificate **Password**.
7. Select **OK**.
   The CA certificate is added to the **Local Certificates** list. In this example the signing CA certificate name is Example_CA. This name comes from the certificate file and key file name. If you want the certificate to have a different name, change these file names.
8. Add the imported signing CA certificate to the SSL content scanning and inspection configuration. Use the following CLI command if the certificate name is Example_CA.

```
config firewall ssl setting
   set caname Example_CA
end
```

The Example_CA signing CA certificate will now be used by SSL content scanning and inspection for establishing encrypted SSL sessions.

Exceptions

Periodically, you will come across situations were SSL and certificates will interfer with the smooth operation of an application or website. For instance, there is a popular application called Dropbox that does not work when deep SSL inspection is enabled. The reason for this is that the trusted certificate authority that is recognised by Dropbox is imbedded in the software and Dropbox cannot be reconfigured to recognise the FortiGate certificates that are used when deep SSL inspection is implimented.

One way to by-pass the deep inspection for Dropbox is to add dropbox.com to a local category in webfiltering and add that local category to the `ftgd-wf-ssl-exempt` list in the webfilter profile. This way any connections with dropbox.com will be exempt from deep SSL inspection.

Whenever an exception is found, the reason that it causes an issue will have to be determined in order to figure out a way to accommodate that application or website.

Configuring packet logging options

You can use a number of CLI commands to further configure packet logging.

Limiting memory use

When logging to memory, you can define the maximum amount of memory used to store logged packets.

```
config ips settings
   set packet-log-memory 256
end
```

The acceptable range is from 64 to 8192 kilobytes. This command affects only logging to memory.

Limiting disk use

When logging to the FortiGate unit internal hard disk, you can define the maximum amount of space used to store logged packets.

```
config ips settings
   set ips-packet-quota 256
end
```

The acceptable range is from 0 to 4294967295 megabytes. This command affects only logging to disk.

Configuring how many packets are captured

Since the packet containing the signature is sometimes not sufficient to troubleshoot a problem, you can specify how many packets are captured before and after the packet containing the IPS signature match.

```
config ips settings
   packet-log-history
   packet-log-post-attack
end
```

The `packet-log-history` command specifies how many packets are captured before and including the one in which the IPS signature is detected. If the value is more than `1`, the packet containing the signature is saved in

the packet log, as well as those preceding it, with the total number of logged packets equalling the `packet-log-history` setting. For example, if `packet-log-history` is set to `7`, the FortiGate unit will save the packet containing the IPS signature match and the six before it.

The acceptable range for `packet-log-history` is from 1 to 255. The default is 1.

Setting `packet-log-history` to a value larger than `1` can affect the performance of the FortiGate unit because network traffic must be buffered. The performance penalty depends on the model, the setting, and the traffic load.

The `packet-log-post-attack` command specifies how many packets are logged after the one in which the IPS signature is detected. For example, if `packet-log-post-attack` is set to `10`, the FortiGate unit will save the ten packets following the one containing the IPS signature match.

The acceptable range for `packet-log-post-attack` is from 0 to 255. The default is 0.

Using wildcards and Perl regular expressions

Many Security Profiles feature list entries can include wildcards or Perl regular expressions.

For more information about using Perl regular expressions, see http://perldoc.perl.org/perlretut.html.

Regular expression vs. wildcard match pattern

A wildcard character is a special character that represents one or more other characters. The most commonly used wildcard characters are the asterisk (*), which typically represents zero or more characters in a string of characters, and the question mark (?), which typically represents any one character.

In Perl regular expressions, the '.' character refers to any single character. It is similar to the '?' character in wildcard match pattern. As a result:

- example.com not only matches example.com but also examplea.com, exampleb.com, examplec.com, and so on.

To add a question mark (`?`) character to a regular expression from the FortiGate CLI, enter Ctrl+V followed by ?. To add a single backslash character (`\`) to a regular expression from the CLI you must add precede it with another backslash character. For example, `example\\.com`.

To match a special character such as '.' and '*' use the escape character '\'. For example:

- To match example.com, the regular expression should be: example\.com

In Perl regular expressions, '*' means match 0 or more times of the character before it, not 0 or more times of any character. For example:

- exam*.com matches exammmm.com but does not match example.com

To match any character 0 or more times, use '.*' where '.' means any character and the '*' means 0 or more times. For example, the wildcard match pattern exam*.com should therefore be exam.*\.com.

Word boundary

In Perl regular expressions, the pattern does not have an implicit word boundary. For example, the regular expression "test" not only matches the word "test" but also any word that contains "test" such as "atest", "mytest",

“testimony”, “atestb”. The notation “\b” specifies the word boundary. To match exactly the word “test”, the expression should be \btest\b.

Case sensitivity

Regular expression pattern matching is case sensitive in the web and Email Filter filters. To make a word or phrase case insensitive, use the regular expression `/i`. For example, `/bad language/i` will block all instances of “bad language”, regardless of case.

Perl regular expression formats

The following table lists and describes some example Perl regular expressions.

Perl regular expression formats

Expression	Matches
abc	“abc” (the exact character sequence, but anywhere in the string)
^abc	“abc” at the beginning of the string
abc$	“abc” at the end of the string
a|b	Either “a” or “b”
^abc|abc$	The string “abc” at the beginning or at the end of the string
ab{2,4}c	“a” followed by two, three or four “b”s followed by a “c”
ab{2,}c	“a” followed by at least two “b”s followed by a “c”
ab*c	“a” followed by any number (zero or more) of “b”s followed by a “c”
ab+c	“a” followed by one or more b's followed by a c
ab?c	“a” followed by an optional “b” followed by a” c”; that is, either “abc” or ”ac”
a.c	“a” followed by any single character (not newline) followed by a” c “
a\.c	“a.c” exactly
[abc]	Any one of “a”, “b” and “c”
[Aa]bc	Either of “Abc” and “abc”
[abc]+	Any (nonempty) string of “a”s, “b”s and “c”s (such as “a”, “abba”, ”acbabcacaa”)
[^abc]+	Any (nonempty) string which does not contain any of “a”, “b”, and “c” (such as “defg”)
\d\d	Any two decimal digits, such as 42; same as \d{2}
/i	Makes the pattern case insensitive. For example, `/bad language/i` blocks any instance of `bad language` regardless of case.
\w+	A “word”: A nonempty sequence of alphanumeric characters and low lines (under-scores), such as foo and 12bar8 and foo_1
100\s*mk	The strings “100” and “mk” optionally separated by any amount of white space (spaces, tabs, newlines)
abc\b	“abc” when followed by a word boundary (for example, in “abc!” but not in “abcd”)
perl\B	“perl” when not followed by a word boundary (for example, in “perlert” but not in “perl stuff”)

Expression	Matches
\x	Tells the regular expression parser to ignore white space that is neither preceded by a backslash character nor within a character class. Use this to break up a regular expression into (slightly) more readable parts.
/x	Used to add regular expressions within other text. If the first character in a pattern is forward slash '/', the '/' is treated as the delimiter. The pattern must contain a second '/'. The pattern between '/' will be taken as a regular expressions, and anything after the second '/' will be parsed as a list of regular expression options ('i', 'x', etc). An error occurs if the second '/' is missing. In regular expressions, the leading and trailing space is treated as part of the regular expression.

Examples of regular expressions

Block any word in a phrase

```
/block|any|word/
```

Block purposely misspelled words

Spammers often insert other characters between the letters of a word to fool spam blocking software.

```
/^.*v.*i.*a.*g.*r.*o.*$/i
/cr[eéèêë][\+\-\*=<>\.\,;!\?%&$@\^°\$£€\{\}()\[\]\|\\_01]dit/i
```

Block common spam phrases

The following phrases are some examples of common phrases found in spam messages.

```
/try it for free/i
/student loans/i
/you're already approved/i
/special[\+\-\*=<>\.\,;!\?%&~#$@\^°\$£€\{\}()\[\]\|\\_1]offer/i
```

Chapter 22 - SSL VPN

The following chapters are included in this document:

Introduction to SSL VPN provides useful general information about VPN and SSL, how the FortiGate unit implements them, and gives guidance on how to choose between SSL and IPsec.

Basic configuration explains how to configure the FortiGate unit and the web portal. Along with these configuration details, this chapter also explains how to grant unique access permissions, how to configure the SSL encryption key algorithm, and describes the SSL VPN OS Patch Check feature that allows a client with a specific OS patch to access SSL VPN services.

The SSL VPN client provides an overview of the FortiClient software required for tunnel mode, where to obtain the software, how to install it, and the configuration information required for remote users to connect to the internal network.

The SSL VPN web portal provides an overview of the SSL VPN web portal, with explanations of how to use and configure the web portal features.

Setup examples explores several configuration scenarios with step-by-step instructions. While the information provided is enough to set up the described SSL VPN configurations, these scenarios are not the only possible SSL VPN setups.

Introduction to SSL VPN

As organizations have grown and become more complex, secure remote access to network resources has become critical for day-to-day operations. In addition, businesses are expected to provide clients with efficient, convenient services including knowledge bases and customer portals. Employees traveling across the country or around the world require timely and comprehensive access to network resources. As a result of the growing need for providing remote/mobile clients with easy, cost-effective and secure access to a multitude of resources, the concept of a Virtual Private Network (VPN) was developed.

SSL VPNs establish connectivity using SSL, which functions at Levels 4 - 5 (Transport and Session layers). Information is encapsulated at Levels 6 - 7 (Presentation and Application layers), and SSL VPNs communicate at the highest levels in the OSI model. SSL is not strictly a Virtual Private Network (VPN) technology that allows clients to connect to remote networks in a secure way. A VPN is a secure logical network created from physically separate networks. VPNs use encryption and other security methods to ensure that only authorized users can access the network. VPNs also ensure that the data transmitted between computers cannot be intercepted by unauthorized users. When data is encoded and transmitted over the Internet, the data is said to be sent through a “VPN tunnel”. A VPN tunnel is a non-application oriented tunnel that allows the users and networks to exchange a wide range of traffic regardless of application or protocol.

The advantages of a VPN over an actual physical private network are two-fold. Rather than utilizing expensive leased lines or other infrastructure, you use the relatively inexpensive, high-bandwidth Internet. Perhaps more important though is the universal availability of the Internet. In most areas, access to the Internet is readily obtainable without any special arrangements or long wait times.

SSL (Secure Sockets Layer) as HTTPS is supported by most web browsers for exchanging sensitive information securely between a web server and a client. SSL establishes an encrypted link, ensuring that all data passed between the web server and the browser remains private and secure. SSL protection is initiated automatically when a user (client) connects to a web server that is SSL-enabled. Once the successful connection is established, the browser encrypts all the information before it leaves the computer. When the information reaches its destination, it is decrypted using a secret (private) key. Any data sent back is first encrypted, and is decrypted when it reaches the client.

FortiOS supports the SSL and TLS versions defined below:

SSL and TLS version support table

Version	RFC
SSL 2.0	RFC 6176
SSL 3.0	RFC 6101
TLS 1.0	RFC 2246
TLS 1.1	RFC 4346
TLS 1.2	RFC 5246

SSL VPN modes of operation

When a remote client connects to the FortiGate unit, the FortiGate unit authenticates the user based on username, password, and authentication domain. A successful login determines the access rights of remote users according to user group. The user group settings specify whether the connection will operate in web-only mode or tunnel mode.

Web-only mode

Web-only mode provides remote users with a fast and efficient way to access server applications from any thin client computer equipped with a web browser. Web-only mode offers true clientless network access using any web browser that has built-in SSL encryption and the Sun Java runtime environment.

Support for SSL VPN web-only mode is built into FortiOS. The feature comprises of an SSL daemon running on the FortiGate unit, and a web portal, which provides users with access to network services and resources including HTTP/HTTPS, Telnet, FTP, SMB/CIFS, VNC, RDP, and SSH.

In web-only mode, the FortiGate unit acts as a secure HTTP/HTTPS gateway and authenticates remote users as members of a user group. After successful authentication, the FortiGate unit redirects the web browser to the web portal home page and the user can access the server applications behind the FortiGate unit.

When the FortiGate unit provides services in web-only mode, a secure connection between the remote client and the FortiGate unit is established through the SSL VPN security in the FortiGate unit and the SSL security in the web browser. After the connection has been established, the FortiGate unit provides access to selected services and network resources through a web portal.

FortiGate SSL VPN web portals have a 1- or 2-column page layout and portal functionality is provided through small applets called widgets. Widget windows can be moved or minimized. The controls within each widget depend on its function. There are predefined web portals and the administrator can create additional portals.

Configuring the FortiGate unit involves selecting the appropriate web portal configuration in the user group settings. These configuration settings determine which server applications can be accessed. SSL encryption is used to ensure traffic confidentiality.

The following table lists the operating systems and web browsers supported by SSL VPN web-only mode.

VPN Web-only Mode, supported operating systems and web browsers

Operating System	Web Browser
Microsoft Windows 7 32-bit SP1	• Microsoft Internet Explorer versions 9, 10 and 11 • Mozilla Firefox version 33
Microsoft Windows 7 64-bit SP1	• Microsoft Internet Explorer versions 9, 10 and 11 • Mozilla Firefox version 33
Linux CentOS version 5.6 and Ubuntu version 12.0.4	• Mozilla Firefox version 5.6

Other operating systems and web browsers may function correctly, but are not supported by Fortinet.

Tunnel mode

Tunnel mode offers remote users the freedom to connect to the internal network using the traditional means of web-based access from laptop computers, as well as from airport kiosks, hotel business centers, and Internet cafés. If the applications on the client computers used by your user community vary greatly, you can deploy a dedicated SSL VPN client to any remote client through its web browser. The SSL VPN client encrypts all traffic from the remote client computer and sends it to the FortiGate unit through an SSL VPN tunnel over the HTTPS link between the web browser and the FortiGate unit. Another option is split tunneling, which ensures that only the traffic for the private network is sent to the SSL VPN gateway. Internet traffic is sent through the usual unencrypted route. This conserves bandwidth and alleviates bottlenecks.

In tunnel mode, remote clients connect to the FortiGate unit and the web portal login page using Microsoft Internet Explorer, Firefox, Mac OS, or Linux. The FortiGate unit acts as a secure HTTP/HTTPS gateway and authenticates remote users as members of a user group. After successful authentication, the FortiGate unit redirects the web browser to the web portal home page dictated by the user group authentication settings. If the user does not have the SSL VPN client installed, they will be prompted to download the SSL VPN client (an ActiveX or Java plugin) and install it using controls provided through the web portal. SSL VPN tunnel mode can also be initiated from a standalone application on Windows, Mac OS X, and Linux (see below).

Remote clients in tunnel mode cannot connect to the web portal using Chrome as it is not supported. Refer to the Release Notes for more information.

SSL VPN Tunnel client standalone installer (build 2300) supported operating systems

Operating System	Release
Microsoft Windows	• 8.1 (32-bit & 64-bit), 8 (32-bit & 64-bit), 7 (32-bit & 64-bit), and XP SP3 in .exe and .msi formats
Linux	• CentOS and Ubuntu in .tar.gz format
Virtual Desktop	• In .jar format for Microsoft Windows 7 SP1 (32-bit)

When the user initiates a VPN connection with the FortiGate unit through the SSL VPN client, the FortiGate unit establishes a tunnel with the client and assigns the client a virtual IP address from a range of reserved addresses. The client uses the assigned IP address as its source address for the duration of the connection. After the tunnel has been established, the user can access the network behind the FortiGate unit.

Configuring the FortiGate unit to establish a tunnel with remote clients involves enabling the feature through SSL VPN configuration settings and selecting the appropriate web portal configuration for tunnel-mode access in the user group settings. The security policy and protection profiles on the FortiGate unit ensure that inbound traffic is screened and processed securely.

The user account used to install the SSL VPN client on the remote computer must have administrator privileges.

If you are using Windows Vista, you must disable UAC (User Account Control) before installing the SSL VPN tunnel client. IE7 in Windows Vista runs in Protected Mode by default. To install SSL VPN client ActiveX, you need to launch IE7 by using 'Run as administrator' (right-click the IE7 icon and select 'Run as administrator').

For information about client operating system requirements, see the Release Notes for your FortiGate firmware. For information on configuring tunnel mode, see Basic configuration on page 2155.

Port forwarding mode

While tunnel mode provides a Layer 3 tunnel that users can run any application over, the user needs to install the tunnel client, and have the required administrative rights to do so. In some situations, this may not be desirable, yet the simple web mode does not provide enough flexibility for application support (for example, if you wish to use an email client that communicates with a POP3 server). The port forward mode, or proxy mode, provides this middle ground between web mode and tunnel mode.

SSL VPN port forwarding listens on local ports on the user's computer. When it receives data from a client application, the port forward module encrypts and sends the data to the FortiGate unit, which then forwards the traffic to the application server.

The port forward module is implemented with a Java applet, which is downloaded and runs on the user's computer. The applet provides the up-to-date status information such as addressing and bytes sent and received.

On the user end, the user logs into the FortiGate SSL VPN portal, and selects a port forward bookmark configured for a specific application. The bookmark defines the server address and port as well as which port to listen to on the user's computer.

The user must configure the application on the PC to point to the local proxy instead of the application server. For information on this configuration change, see the application documentation.

This mode only supports client/server applications that are using a static TCP port. It will not support client/server applications using dynamic ports or traffic over UDP.

For information on configuring a port forward tunnel, see Basic configuration on page 2155.

Application support

With Citrix application servers, the server downloads an ICA configuration file to the user's PC. The client application uses this information to connect to the Citrix server. The FortiGate unit will read this file and append a SOCKS entry to set the SOCKS proxy to 'localhost'. The Citrix client will then be able to connect to the SSL VPN port forward module to provide the connection. When configuring the port forwarding module, a selection is available for Citrix servers.

For Windows Remote Desktop Connections, when selecting the RDP option, the tunnel will launch the RDP client and connect to the local loopback address after the port forward module has been initiated.

RDP Native, in some instances, may not be supported. If this is the case, use Internet Explorer and disable ActiveX Filtering.

Antivirus and firewall host compatibility

The following tables list the antivirus and firewall client software packages that are supported in FortiOS.

Supported Windows XP antivirus and firewall software

Product supported	Antivirus	Firewall
Symantec Endpoint Protection V11	•	•
Kaspersky Antivirus 2009	•	
McAfee Security Center v8.1	•	•
Trend Micro Internet Security Pro	•	•
F-Secure Internet Security 2009	•	•

Supported Windows 7 32-bit and 64-bit antivirus and firewall software

Product supported	Antivirus	Firewall
CA Internet Security 2011	•	•
AVG Internet Security 2011

Traveling and security

Because SSL VPN provides a means for “on-the-go” users to dial in to the network while away from the office, you need to ensure that wherever and however they choose to dial in is secure, and not potentially compromising the

corporate network.

When setting up the portal, you can include two options to ensure corporate data is safe; a host check for antivirus software, and a cache cleaner.

Host check

You can enable a host integrity checker to scan the remote client. The integrity checker probes the remote client computer to verify that it is safe before access is granted. Security attributes recorded on the client computer (for example, in the Windows registry, in specific files, or held in memory due to running processes) are examined and uploaded to the FortiGate unit. For more information, see Basic configuration on page 2155.

Host Check is applicable for both SSLVPN Web Mode and SSLVPN Tunnel mode.

Cache cleaning

You can enable a cache cleaner to remove any sensitive data that would otherwise remain on the remote computer after the session ends. For example, all cache entries, browser history, cookies, encrypted information related to user authentication, and any temporary data generated during the session are removed from the remote computer. If the client's browser cannot install and run the cache cleaner, the user is not allowed to access the SSL-VPN portal. For more information, see Basic configuration on page 2155.

SSL VPN and IPv6

FortiOS supports SSL VPN with IPv6 addressing, and is available for all the java applets (Telnet, VNC, RDP, and so on). IPv6 configurations for security policies and addressing include:

- Policy matching for IPv6 addresses
- Support for DNS resolving in SSL VPN
- Support IPv6 for ping
- FTP applications
- SMB

In essentially any of the following instructions, replace **IPv4** with **IPv6** to achieve the same desired results, but for IPv6 addresses and configurations.

Basic configuration

Configuring SSL VPN involves a number of configurations within FortiOS that you need to complete to make it all come together. This chapter describes the components required, and how and where to configure them to set up the FortiGate unit as an SSL VPN server. The configurations and steps are high level, to show you the procedures needed, and where to locate the options in FortiOS. For real-world examples, see Setup examples on page 2200.

There are three or four key steps to configuring an SSL VPN tunnel. The first three in the points below are mandatory, while the others are optional. This chapter outlines these key steps as well as additional configurations for tighter security and monitoring.

The key steps are:

- Create user accounts and user groups for the remote clients.
  (User accounts and groups on page 2155)
- Create a web portal to define user access to network resources.
  (Configuring SSL VPN web portals on page 2160)
- Configure the security policies.
  (Configuring security policies on page 2167)
- For tunnel-mode operation, add routing to ensure that client tunnel-mode packets reach the SSL VPN interface.
  (Routing in tunnel mode on page 2173)
- Setup logging of SSL VPN activities.
  (SSL VPN logs on page 2180)

This section contains the following information:

User accounts and groups
Configuring SSL VPN web portals
Configuring security policies
Configuring encryption key algorithms
Additional configuration options

User accounts and groups

The first step for an SSL VPN tunnel is to add the users and user groups that will access the tunnel. You may already have users defined for other authentication-based security policies.

The user group is associated with the web portal that the user sees after logging in. You can use one policy for multiple groups, or multiple policies to handle differences between the groups such as access to different services, or different schedules.

To create a user account:

- In the web-based manager, go to **User & Device > User > User Definition**, and select **Create New.**
- In the CLI, use the commands in `config user local`.

All users accessing the SSL tunnel must be in a firewall user group. User names can be up to 64 characters long.

To create user groups:

- In the web-based manager, go to **User & Device > User > User Groups** and select **Create New**.
- In the CLI, use the commands in `config user group`.

Authentication

Remote users must be authenticated before they can request services and/or access network resources through the web portal. The authentication process can use a password defined on the FortiGate unit or optionally use established external authentication mechanisms such as RADIUS or LDAP.

To authenticate users, you can use a plain text password on the local FortiGate unit, forward authentication requests to an external RADIUS, LDAP or TACACS+ server, or utilize PKI certificates.

For information about how to create RADIUS, LDAP, TACACS+ or PKI user accounts and certificates, see the Authentication Guide.

FortiOS supports LDAP password renewal notification and updates through SSL VPN. Configuration is enabled using the CLI commands:

```
config user ldap
   edit <username>
       set server <domain>
       set password-expiry-warning enable
       set password-renewal enable
end
```

For more information, see the Authentication Guide.

MAC host check

When a remote client attempts to log in to the portal, you can have the FortiGate unit check against the client's MAC address to ensure that only a specific computer or device is connecting to the tunnel. This can ensure better security should a password be compromised.

MAC addresses can be tied to specific portals and can be either the entire MAC address or a subset of the address. MAC host checking is configured in the CLI using the folowing commands:

```
conf vpn ssl web portal
   edit portal
      set mac-addr-check enable
      set mac-addr-action allow
         config mac-addr-check-rule
            edit "rule1"
               set mac-addr-list 01:01:01:01:01:01 08:00:27:d4:06:5d
               set mac-addr-mask 48
         end
   end
```

IP addresses for users

After the FortiGate unit authenticates a request for a tunnel-mode connection, the FortiGate unit assigns the SSL VPN client an IP address for the session. The address is assigned from an IP Pool, which is a firewall address

defining an IP address range.

Take care to prevent overlapping IP addresses. Do not assign to clients any IP addresses that are already in use on the private network. As a precaution, consider assigning IP addresses from a network that is not commonly used (for example, 10.254.254.0/24).

To set tunnel-mode client IP address range - web-based manager:

1. Go to **Policy & Objects > Objects > Addresses** and select **Create New**.
2. Enter a **Name**, for example, `SSL_VPN_tunnel_range`.
3. Select a **Type** of **IP Range**.
4. In the **Subnet/IP Range** field, enter the starting and ending IP addresses that you want to assign to SSL VPN clients, for example `10.254.254.[80-100]`.
5. In **Interface**, select **Any**.
6. Select **OK**.

To set tunnel-mode client IP address range - CLI:

If your SSL VPN tunnel range is for example 10.254.254.80 - 10.254.254.100, you could enter

```
config firewall address
   edit SSL_tunnel_users
      set type iprange
      set end-ip 10.254.254.100
      set start-ip 10.254.254.80
   end
```

DHCP relay of IP address

The FortiGate can get an IP address via DHCP server for SSL VPN services, however it is only configurable in the CLI Console by editing the ssl.root interface.

To enable DHCP relay service and relay IP address - CLI:

```
config system interface
   edit ssl.root
      set dhcp-relay-service [enable|disable]
      set dhcp-relay-ip
   next
end
```

Authentication of remote users

When remote users connect to the SSL VPN tunnel, they must perform authentication before being able to use the internal network resources. This can be as simple as assigning users with their own passwords, connecting to an LDAP server or using more secure options. FortiOS provides a number of options for authentication as well as security option for those connected users.

The web portal can include bookmarks to connect to internal network resources. A web (HTTP/HTTPS) bookmark can include login credentials so that the FortiGate unit automatically logs the user into the website. This means that the user logs into the SSL VPN and then does not have to enter any more credentials to visit preconfigured web sites.

Both the administrator and the end user can configure bookmarks, including SSO bookmarks. To add bookmarks as a web portal user, see The SSL VPN web portal on page 2184.

Setting the client authentication timeout

The client authentication timeout controls how long an authenticated user will remain connected. When this time expires, the system forces the remote client to authenticate again. As with the idle timeout, a shorter period of time is more secure. The default value is 28800 seconds (8 hours). You can only modify this timeout value in the CLI.

For example, to change the authentication timeout to 18 000 seconds, enter the following commands in the CLI:

```
config vpn ssl settings
   set auth-timeout 18000
end
```

You can also set the idle timeout for the client, to define how long the user does not access the remote resources before they are logged out. For information see User accounts and groups on page 2155.

Allow one-time login per user

You can set the SSL VPN tunnel such that each user can only log into the tunnel one time concurrently per user per login. That is, once logged into the portal, they cannot go to another system and log in with the same credentials again.

To allow one-time login per user - web-based manager:

Go to **VPN > SSL > Portals**, select a portal, and enable **Limit Users to One SSL-VPN Connection at a Time.** It is disabled by default.

To allow one-time login per user - CLI:

```
config vpn ssl web portal
   edit <portal_name>
      set limit-user-logins enable
end
```

Strong authentication with security certificates

The FortiGate unit supports strong (two-factor) authentication through X.509 security certificates (version 1 or 3). The FortiGate unit can require clients to authenticate using a certificate, and the client can require the FortiGate unit to authenticate using a certificate.

For information about obtaining and installing certificates, see the Authentication Guide.

You can select the **Require Client Certificate** option so that clients must authenticate using certificates. The client browser must have a local certificate installed, and the FortiGate unit must have the corresponding CA certificate installed.

When the remote client initiates a connection, the FortiGate unit prompts the client browser for its client-side certificate as part of the authentication process.

To require client authentication by security certificates - web-based manager:

1. Go to **VPN > SSL > Settings**.
2. Select **Require Client Certificate**.
3. Select **Apply**.

To require client authentication by security certificates - CLI:

```
config vpn ssl settings
   set reqclientcert enable
end
```

If your SSL VPN clients require strong authentication, the FortiGate unit must offer a CA certificate that the client browser has installed.

In the FortiGate unit SSL VPN settings, you can select which certificate the FortiGate offers to authenticate itself. By default, the FortiGate unit offers its factory installed (Fortinet_CA_SSLProxy) certificate from Fortinet to remote clients when they connect. If you leave the default setting, a warning appears that recommends you purchase a certificate for your domain and upload it for use.

To enable FortiGate unit authentication by certificate - web-based manager:

1. Go to **VPN > SSL > Settings**.
2. From the **Server Certificate** list, select the certificate that the FortiGate unit uses to identify itself to SSL VPN clients.
3. Select **Apply**.

To enable FortiGate unit authentication by certificate - CLI:

For example, to use the `example_cert` certificate

```
config vpn ssl settings
   set servercert example_cert
end
```

FortiOS will check the server certificate to verify that the certificate is valid. Only valid server certificates should be used.

NSA Suite B cryptography support

FortiOS supports the use of ECDSA Local Certificates for SSL VPN Suite B. The National Security Agency (NSA) developed Suite B algorithms in 2005 to serve as a cryptographic base for both classified and unclassified information at an interoperable level.

FortiOS allows you to import, generate, and use ECDSA certificates defined by the Suite B cryptography set. To generate ECDSA certificates, use the following command in the CLI:

```
exec vpn certificate local generate ec <certificate-name_str> <elliptic-curve-name>
    <subject_str> [<optional_information>]
```

Configuring SSL VPN web portals

The SSL VPN portal enables remote users to access internal network resources through a secure channel using a web browser. FortiGate administrators can configure login privileges for system users as well as the network resources that are available to the users.

FortiOS supports LDAP password renewal notification and updates through SSL VPN. Configuration is enabled using the CLI commands:

```
config user ldap
   edit <username>
       set server <domain>
       set password-expiry-warning enable
       set password-renewal enable
end
```

For more information, see the Authentication Guide.

This step in the configuration of the SSL VPN tunnel sets up the infrastructure; the addressing, encryption, and certificates needed to make the initial connection to the FortiGate unit. This step is also where you configure what the remote user sees with a successful connection. The portal view defines the resources available to the remote users and the functionality they have on the network.

SSL connection configuration

To configure the basic SSL VPN settings for encryption and login options, go to **VPN > SSL > Settings.**

Listen on Interface(s)	Define the interface which the FortiGate will use to listen for SSL VPN tunnel requests. This is generally your external interface.
Listen on Port	Enter the port number for HTTPS access.
Restrict Access	Restrict accessibility to either **Allow access from any host** or to **Limit access to specific hosts** as desired. If selecting the latter, you must specify the hosts.
Server Certificate	Select the signed server certificate to use for authentication. If you leave the default setting (Fortinet_CA_SSLProxy), the FortiGate unit offers its built-in certificate from Fortinet to remote clients when they connect. A warning appears that recommends you purchase a certificate for your domain and upload it for use.
Require Client Certificate	Select to use group certificates for authenticating remote clients. When the remote client initiates a connection, the FortiGate unit prompts the client for its client-side certificate as part of the authentication process. For information on using PKI to provide client certificate authentication, see the Authentication Guide.
Idle Logout	Type the period of time (in seconds) that the connection can remain inactive before the user must log in again. The range is from 10 to 28800 seconds. Setting the value to 0 will disable the idle connection timeout. This setting applies to the SSL VPN session. The interface does not time out when web application sessions or tunnels are up.
Address Range	Select **Specify custom IP ranges** to select the range or subnet firewall addresses that represent IP address ranges reserved for tunnel-mode SSL VPN clients.
DNS Server	Enter up to two DNS servers (IPv4 or IPv6) to be provided for the use of clients.
Specify WINS Servers	Enable to access options for entering up to two WINS servers (IPv4 or IPv6) to be provided for the use of clients.
Allow Endpoint Registration	Select so that FortiClient registers with the FortiGate unit when connecting. If you configured a registration key by going to **System > Config > Advanced**, the remote user is prompted to enter the key. This only occurs on the first connection to the FortiGate unit.

Portal configuration

The portal configuration determines what the remote user sees when they log in to the portal. Both the system administrator and the user have the ability to customize the SSL VPN portal.

To view the portals settings page, go to **VPN > SSL > Portals**.

There are three pre-defined default portal configurations available:

- *full-access*
- *tunnel-access*
- *web-access*

Each portal type includes similar configuration options. Select between the different portals by double-clicking one of the default portals in the list. You can also create a custom portal by selecting the **Create New** option at the top.

Name	The name for the portal.
Enable Tunnel Mode	If your web portal provides tunnel mode access, you need to configure the **Tunnel Mode** widget. These settings determine how tunnel mode clients are assigned IPv4 addresses.
Enable Split Tunneling	Select so that the VPN carries only the traffic for the networks behind the FortiGate unit. The user's other traffic follows its normal route. If you enable split tunneling, you are required to set the **Routing Address**, which is the address that your corporate network is using. Traffic intended for the Routing Address will not be split from the tunnel.
Source IP Pools	Select an IPv4 Pool for users to acquire an IP address when connecting to the portal. There is always a default pool available if you do not create your own.
Enable IPv6 Tunnel Mode	If your web portal provides tunnel mode access, you need to configure the **Tunnel Mode** widget. These settings determine how tunnel mode clients are assigned IPv6 addresses.
Enable IPv6 Split Tunneling	Select so that the VPN carries only the traffic for the networks behind the FortiGate unit. The user's other traffic follows its normal route. This applies only to IPv6 tunnels. If you enable split tunneling, you are required to set the **Routing Address**, which is the address that your corporate network is using. Traffic intended for the Routing Address will not be split from the tunnel.
Source IPv6 Pools	Select an IPv6 Pool for users to acquire an IP address when connecting to the portal. There is always a default pool available if you do not create your own.
Client Options	These options affect how the FortiClient application behaves when connected to the FortiGate VPN tunnel. When enabled, a check box for the corresponding option appears on the VPN login screen in FortiClient, and is not enabled by default. **Save Password** - When enabled, if the user selects this option, their password is stored on the user's computer and will automatically populate each time they connect to the VPN. **Auto Connect** - When enabled, if the user selects this option, when the FortiClient application is launched, for example after a reboot or system startup, FortiClient will automatically attempt to connect to the VPN tunnel. **Always Up (Keep Alive)** - When enabled, if the user selects this option, the FortiClient should try to reconnect once it detects the VPN connection is down unexpectedly (not manually disconnected by user).

Enable Web Mode	Select to enable web mode access.
Portal Message	This is a text header that appears on the top of the web portal.
Theme	A color styling specifically for the web portal.
Page Layout	Select one column or two column layouts for the widgets that appear on the web portal page.
Include Status Information	Select to display the **Status Information** widget on the portal page. The **Status Information** widget displays the login name of the user, the amount of time the user has been logged in, and the inbound and out-bound traffic statistics.
Include Connection Tool	Select to display the Connection Tool widget on the portal page. Use the **Connection Tool** widget to connect to a internal network resource without adding a bookmark to the bookmark list. You select the type of resource and specify the URL or IP address of the host computer.
Include FortiClient Down-load	Select to include the **FortiClient Download** option in the web portal. This is enabled by default.
Prompt Mobile Users to Download FortiClient Application	If a remote user is using a web browser to connects to the SSL VPN in web mode, they are prompted to download the FortiClient application. The remote user can accept or reject the notification. If the user accepts, they are redirected to the FortiClient web site.
Include Login History	Select to include user login history on the web portal.
Enable User Bookmarks	Select to include bookmarks on the web portal. Bookmarks are used as links to internal network resources. When a bookmark is selected from a bookmark list, a pop-up window appears with the web page. Telnet, VNC, and RDP require a browser plugin. FTP and Samba replace the bookmarks page with an HTML file-browser.
Limite Users to One SSL-VPN Connection at a Time	You can set the SSL VPN tunnel such that each user can only log into the tunnel one time concurrently per user per login. That is, once logged into the portal, they cannot go to another system and log in with the same cre-dentials again. This option is disabled by default.

If your network configuration does not contain a default SSL VPN portal, you might receive the error message “Input value is invalid” when you attempt to access **VPN > SSL > Portals**.

To enable a default portal - CLI:

```
config vpn ssl settings
   set default-portal <full-access | tunnel-access |
    web-access>
end
```

Adding bookmarks

A web bookmark can include login credentials to automatically log the SSL VPN user into the website. When the administrator configures bookmarks, the website credentials must be the same as the user's SSL VPN credentials. Users configuring their own bookmarks can specify alternative credentials for the website.

To add a bookmark - web-based manager:

1. On the **VPN > SSL > Portals** page, ensure **Enable User Bookmarks** is enabled.
2. Select **Create New** and enter the following information:

Category	Select a category, or group, to include the bookmark. If this is the first bookmark added, you will be prompted to add a category. Otherwise, select **Create** from the drop-down list.
Name	Enter a name for the bookmark.
Type	Select the type of link from the drop-down list. Telnet, VNC, and RDP require a browser plugin. FTP and Samba replace the bookmarks page with an HTML file-browser.
URL	Enter the IP address source.
Description	Enter a brief description of the link.
Single Sign-On	Enable if you wish to use Single Sign-On (SSO) for any links that require authentication. When including a link using SSO, be sure to use the entire URL. For example, http://10.10.1.0/login, rather than just the IP address.

3. Select **OK**.

For more configuration options, see Configuring SSL VPN web portals on page 2160.

Personal bookmarks

The administrator has be ability to view bookmarks the remote client has added to their SSL VPN login in the bookmarks widget. This enables the administrator to monitor and, if needed, remove unwanted bookmarks that do not meet with corporate policy.

To view and maintain remote client bookmarks, go to **VPN > SSL > Personal Bookmarks**.

For more information about available bookmark applications, see Applications available in the web portal on page 2192

SSL VPN Realms

You can go to **VPN > SSL > Realms** and create custom login pages for your SSL VPN users. You can use this feature to customize the SSL VPN login page for your users and also to create multiple SSL VPN logins for different user groups.

In order to create a custom login page using the web-based manager, this feature must be enabled using **Feature Select**.

Before you begin, copy the default login page text to a separate text file for safe-keeping. Afterward, if needed, you can restore the text to the original version.

To configure SSL VPN Realms - web-based manager:

1. Configure a custom SSL VPN login by going to **VPN > SSL > Realms** and selecting **Create New**. Users access different portals depending on the URL they enter.
2. The first option in the custom login page is to enter the path of the custom URL.
   This path is appended to the address of the FortiGate unit interface to which SSL VPN users connect. The actual path for the custom login page appears beside the URL path field.
3. You can also limit the number of users that can access the custom login at any given time.
4. You can use HTML code to customize the appearance of the login page.
5. After adding the custom login, you must associate it with the users that will access the custom login. Do this by going to **VPN > SSL > Settings** and adding a rule to the **Authentication/Portal Mapping** section.
6. Under **Authentication/Portal Mapping**, click **Create New** and select the user group(s) and the associated Realm.

To configure SSL VPN Realms - CLI:

```
config vpn ssl web realm
   edit <url-path>
      set login-page <content_str>
      set max-concurrent-user <int>
      set virtual-host <hostname_str>
   end
```

Where the following variables are set:

Variable	Description	Default
`edit <url-path>`	Enter the URL path to access the SSL-VPN login page. Do not include “http://”.	No default.
`login-page <content_str>`	Enter replacement HTML for SSL-VPN login page.	No default.
`max-concurrent-user <int>`	Enter the maximum number of concurrent users allowed. Range 0-65 535. 0 means unlimited.	0
`virtual-host <hostname_str>`	Enter the virtual host name for this realm. Optional. Maximum length 255 characters.	No default.

Tunnel mode and split tunneling

If you want your web portal to have tunnel mode access, select **Tunnel Mode** when creating a new portal. Enable **Split Tunneling** so that the VPN carries only the traffic for the networks behind the FortiGate unit. The user’s other traffic follows its normal route.

When you enable split tunneling, you are required to set the **Routing Address**, which is the address that your corporate network is using. Traffic intended for the Routing Address will not be split from the tunnel.

CLI Syntax:

```
config vpn ssl web portal
   edit "full-access"
      set tunnel-mode enable
      set web-mode enable
      set mac-addr-check enable
      set ip-pools "SSLVPN_TUNNEL_ADDR1"
      set split-tunneling-routing-address "Internal_subnet"
```

Port forwarding

Port forwarding provides a method of connecting to application servers without configuring a tunnel mode connection, and requiring the installation of a tunnel mode client. Set up the portal as described at Configuring SSL VPN web portals on page 2160. To configure the application, create a bookmark with the **Type** field set to **Port Forward**.

Ensure that **Port Forward** is enabled in the **Applications** list.

Configuring security policies

You will need at least one SSL VPN security policy. This is an identity-based policy that authenticates users and enables them to access the SSL VPN web portal. The SSL VPN user groups named in the policy determine who can authenticate and which web portal they will use. From the web portal, users can access protected resources or download the SSL VPN tunnel client application.

This section contains the procedures needed to configure security policies for web-only mode operation and tunnel-mode operation. These procedures assume that you have already completed the procedures outlined in Configuring security policies on page 2167.

If you will provide tunnel mode access, you will need a second security policy—an ACCEPT tunnel mode policy to permit traffic to flow between the SSL VPN tunnel and the protected networks.

Firewall addresses

Before you can create security policies, you need to define the firewall addresses you will use in those policies. For both web-only and tunnel mode operation, you need to create firewall addresses for all of the destination networks and servers to which the SSL VPN client will be able to connect.

For tunnel mode, you will already have defined firewall addresses for the IP address ranges that the FortiGate unit will assign to SSL VPN clients.

The source address for your SSL VPN security policies will be the predefined “all” address. Both the address and the netmask are `0.0.0.0`. The “all” address is used because VPN clients will be connecting from various addresses, not just one or two known networks. For improved security, if clients will be connecting from one or two known locations you should configure firewall addresses for those locations, instead of using the “all” address.

To create a firewall address, in the web-based manager, go to **Policy & Objects > Objects > Addresses**, and select **Create New.**

Create an SSL VPN security policy

At minimum, you need one SSL VPN security policy to authenticate users and provide access to the protected networks. You will need additional security policies only if you have multiple web portals that provide access to different resources. You can use one policy for multiple groups, or multiple policies to handle differences between the groups such as access to different services, or different schedules.

The SSL VPN security policy specifies:

- The incoming interface that corresponds to the ssl.root interface.
- The SSL VPN user groups that can use the security policy.
- The times (schedule) and types of services that users can access.
- The UTM features and logging that are applied to the connection.

Do not use ALL as the destination address. If you do, you will see the “Destination address of Split Tunneling policy is invalid” error when you enable Split Tunneling.

To create an SSL-VPN security policy - web-based manager:

1. Go to **Policy & Objects > Policy > IPv4** and select **Create New.**
2. Enter the following information:

Incoming Interface	Select the virtual SSL VPN interface, such as **ssl.root.**
Source Address	Select **all**.
Source User(s)	Select to allow access only to holders of a (shared) group certificate. The holders of the group certificate must be members of an SSL VPN user group, and the name of that user group must be present in the Allowed field. See Configuring security policies on page 2167.
Outgoing Interface	Select the FortiGate network interface that connects to the protected network.
Destination Address	Select the firewall address you created that represents the networks and servers to which the SSL VPN clients will connect. If you want to associate multiple firewall addresses or address groups with the **Destination Interface/Zone**, from **Destination Address**, select the plus symbol. In the dialog box, move the firewall addresses or address groups from the **Available Addresses** section to the **Members** section, then select **OK**.
Service	Select services in the left list and use the right arrow button to move them to the right list. Select the ALL service to allow the user group access to all services.
Action	Select **Accept**.

Your identity-based policies are listed in the security policy table. The FortiGate unit searches the table from the top down to find a policy to match the client’s user group. Using the move icon in each row, you can change the

order of the policies in the table to ensure the best policy will be matched first. You can also use the icons to edit or delete policies. Furthermore, you can drag and drop policies in the policy list to rearrange their order.

To create an SSL VPN security policy - CLI:

Create the SSL VPN security policy by entering the following CLI commands.

```
config firewall policy
   edit <id>
      set srcintf ssl.root(sslvpn tunnel interface)
      set dstintf port2
      set srcaddr all
      set dstaddr OfficeLAN
      set nat enable
   end
```

Create a tunnel mode security policy

If your SSL VPN will provide tunnel mode operation, you need to create a security policy to enable traffic to pass between the SSL VPN virtual interface and the protected networks. This is in addition to the SSL VPN security policy that you created in the preceding section.

The SSL VPN virtual interface is the FortiGate unit end of the SSL tunnel that connects to the remote client. It is named `ssl.<vdom_name>`. In the root VDOM, for example, it is named `ssl.root`. If VDOMs are not enabled on your FortiGate unit, the SSL VPN virtual interface is also named ssl.root.

To configure the tunnel mode security policy - web-based manager:

1. Go to **Policy & Objects > Policy > IPv4** and select **Create New**.
2. Enter the following information and select **OK**.

Incoming Interface	Select the virtual SSL VPN interface, such as **ssl.root.**
Source Address	Select the firewall address you created that represents the IP address range assigned to SSL VPN clients, such as SSL_VPN_tunnel_users.
Source User(s)	Select to allow access only to holders of a (shared) group certificate. The holders of the group certificate must be members of an SSL VPN user group, and the name of that user group must be present in the Allowed field. See Configuring security policies on page 2167.
Outgoing Interface	Select the FortiGate network interface that connects to the protected network.
Destination Address	Select the firewall address that represents the networks and servers to which the SSL VPN clients will connect. To select multiple firewall addresses or address groups, select the plus sign next to the drop-down list.
Service	Select services in the left list and use the right arrow button to move them to the right list. Select the ALL service to allow the user group access to all services.

Action	Select **Accept**.
Enable NAT	Select **Enable NAT. (Optional)**

To configure the tunnel mode security policy - CLI:

```
config firewall policy
   edit <id>
      set srcintf ssl.root(sslvpn tunnel interface)
      set dstintf <dst_interface_name>
      set srcaddr <tunnel_ip_address>
      set dstaddr <protected_network_address_name>
      set schedule always
      set service ALL
      set nat enable
   end
```

This policy enables the SSL VPN client to initiate communication with hosts on the protected network. If you want to enable hosts on the protected network to initiate communication with the SSL VPN client, you should create another Accept policy like the preceding one but with the source and destination settings reversed.

You must also add a static route for tunnel mode operation.

Routing for tunnel mode

If your SSL VPN operates in tunnel mode, you must add a static route so that replies from the protected network can reach the remote SSL VPN client.

To add the tunnel mode route - web-based manager:

1. Go to **Router > Static > Static Routes** and select **Create New**.

   For low-end FortiGate units, go to **System > Network > Routing** and select **Create New**.
2. Enter the **Destination IP/Mask** of the tunnel IP address that you assigned to the users of the web portal.
3. Select the SSL VPN virtual interface for the **Device**.
4. Select **OK**.

To add the tunnel mode route - CLI:

If you assigned 10.11.254.0/24 as the tunnel IP range, you would enter:

```
config router static
   edit <id>
      set device ssl.root
      set dst 10.11.254.0/24
end
```

Split tunnel Internet browsing policy

With split tunneling disabled, all of the SSL VPN client's requests are sent through the SSL VPN tunnel. But the tunnel mode security policy provides access only to the protected networks behind the FortiGate unit. Clients will receive no response if they attempt to access Internet resources. You can enable clients to connect to the Internet through the FortiGate unit using a split tunnel Internet browsing policy.

To add an Internet browsing policy:

1. Go to **Policy & Objects > Policy > IPv4** and select **Create New**.
2. Enter the following information and select **OK**.

Incoming Interface	Select the virtual SSL VPN interface (**ssl.root**, for example).
Source Address	Select the firewall address you created that represents the IP address range assigned to SSL VPN clients.
Outgoing Interface	Select the FortiGate network interface that connects to the Internet.
Destination Address	Select **All**.
Action	Select **Accept**.
Enable NAT	Select **Enable**.

To configure the Internet browsing security policy - CLI:

To enable browsing the Internet through port1, you would enter:

```
config firewall policy
   edit 0
      set srcintf ssl.root
      set dstintf port1
      set srcaddr SSL_tunne_users
      set dstaddr all
      set schedule always
      set service ALL
      set nat enable
end
```

Enabling a connection to an IPsec VPN

You might want to provide your SSL VPN clients access to another network, such as a branch office, that is connected by an IPsec VPN. To do this, you need only to add the appropriate security policy. For information about route-based and policy-based IPsec VPNs, see the IPsec VPN Guide.

Route-based connection

To configure interconnection with a route-based IPsec VPN - web-based manager:

1. Go to **Policy & Objects > Policy > IPv4** and select **Create New**.
2. Enter the following information and select **OK**.

Incoming Interface	Select the virtual SSL VPN interface (**ssl.root**, for example).
Source Address	Select the firewall address that represents the IP address range assigned to SSL VPN clients.
Outgoing Interface	Select the virtual IPsec interface for your IPsec VPN.

Destination Address	Select the address of the IPsec VPN remote protected subnet.
Action	Select **ACCEPT**.
Enable NAT	Enable.

To configure interconnection with a route-based IPsec VPN - CLI:

If, for example, you want to enable SSL VPN users to connect to the private network (address name OfficeAnet) through the toOfficeA IPsec VPN, you would enter:

```
config firewall policy
   edit 0
      set srcintf ssl.root
      set dstintf toOfficeA
      set srcaddr SSL_tunnel_users
      set dstaddr OfficeAnet
      set action accept
      set nat enable
      set schedule always
      set service ALL
end
```

Policy-based connection

To configure interconnection with a policy-based IPsec VPN - web-based manager:

1. Go to **Policy & Objects > Policy > IPv4** and select **Create New**.
2. Enter the following information and select **OK**.

Incoming Interface	Select the virtual SSL VPN interface (**ssl.root**, for example).
Source Address	Select the firewall address that represents the IP address range assigned to SSL VPN clients.
Outgoing Interface	Select the FortiGate network interface that connects to the Internet.
Destination Address	Select the address of the IPsec VPN remote protected subnet.

3. Configure inbound NAT from the CLI:

```
config firewall policy
   edit 0
      set natinbound enable
   end
```

To configure interconnection with a policy-based IPsec VPN - CLI:

If, for example, you want to enable SSL VPN users to connect to the private network (address name OfficeAnet) through the OfficeA IPsec VPN, you would enter:

```
config firewall policy
   edit 0
      set srcintf ssl.root
      set dstintf port1
      set srcaddr SSL_tunnel_users
```

```
            set dstaddr OfficeAnet
            set action ipsec
            set schedule always
            set service ALL
            set inbound enable
            set outbound enable
            set natinbound enable
            set vpntunnel OfficeA
      end
```

In this example, port1 is connected to the Internet.

Configuring encryption key algorithms

The FortiGate unit supports a range of cryptographic cipher suites to match the capabilities of various web browsers. The web browser and the FortiGate unit negotiate a cipher suite before any information (for example, a user name and password) is transmitted over the SSL link. You can only configure encryption key algorithms for SSL VPN in the CLI.

To configure encryption key algorithms - CLI:

Use the following CLI command,

```
config vpn ssl settings
   set algorithm <cipher_suite>
end
```

where one of the following variables replaces <*cipher_suite*>:

Variable	Description
`low`	Use any cipher suite; AES, 3DES, RC4, or DES.
`medium`	Use a 128-bit or greater cipher suite; AES, 3DES, or RC4.
`high`	Use a ciper suite grather than 128 bits; AES or 3DES.

Note that the `algorithm <cipher_suite>` syntax is only available when the `sslvpn-enable` attribute is set to **enable**.

Additional configuration options

Beyond the basics of setting up the SSL VPN, you can configure a number of other options that can help to ensure your internal network is secure and can limit the possibility of attacks and viruses entering the network from an outside source.

Routing in tunnel mode

If you are creating a SSL VPN connection in tunnel mode, you need to add a static route so that replies from the protected network can reach the remote SSL VPN client.

To add the tunnel mode route - web-based manager:

1. Go to **Router > Static > Static Routes** and select **Create New**.
   For low-end FortiGate units, go to **System > Network > Routing** and select **Create New**.

2. Enter the **Destination IP/Mask** of the tunnel IP address that you assigned to the users of the web portal.
3. Select the SSL VPN virtual interface for the **Device**.
4. Select **OK**.

To add the tunnel mode route - CLI:

If you assigned 10.11.254.0/24 as the tunnel IP range, you would enter:

```
config router static
   edit <id>
      set device ssl.root
      set dst 10.11.254.0/24
end
```

Changing the port number for web portal connections

You can specify a different TCP port number for users to access the web portal login page through the HTTPS link. By default, the port number is 443 and users can access the web portal login page using the following default URL:

`https://<FortiGate_IP_address>:443/remote/login`

where `<FortiGate_IP_address>` is the IP address of the FortiGate interface that accepts connections from remote users.

To change the SSL VPN port - web-based manager:

1. If **Current VDOM** appears at the bottom left of the screen, select **Global** from the list of VDOMs.
2. Go to **VPN > SSL > Settings**.
3. Type an unused port number in the **Listen on Port** field and select **Apply**.

To change the SSL VPN port - CLI:

This is a global setting. For example, to set the SSL VPN port to 10443, enter:

```
config vpn ssl settings
   set port 10443
end
```

SSL offloading

To configure SSL offloading, which allows or denies client renegotiation, you must use the CLI. This helps to resolve the issues that affect all SSL and TLS servers that support renegotiation, identified by the Common Vulnerabilities and Exposures system in CVE-2009-3555. The SSL offloading renegotiation feature is considered a workaround until the IETF permanently resolves the issue.

The CLI command is `ssl-client-renegotiation` and is found under the `config firewall vip` syntax.

Host check

When you enable AV, FW, or AV-FW host checking in the web portal Security Control settings, each client is checked for security software that is recognized by the Windows Security Center. As an alternative, you can

create a custom host check that looks for security software selected from the Host Check list. For more information, see Additional configuration options on page 2173.

The Host Check list includes default entries for many security software products.

Host integrity checking is only possible with client computers running Microsoft Windows platforms.

To configure host checking - CLI:

To configure the full-access portal to check for AV and firewall software on client Windows computers, you would enter the following:

```
config vpn ssl web portal
   edit full-access
      set host-check av-fw
end
```

To configure the full-access portal to perform a custom host check for FortiClient Host Security AV and firewall software, you would enter the following:

```
config vpn ssl web portal
   edit full-access
      set host-check custom
      set host-check-policy FortiClient-AV FortiClient-FW
end
```

Replacing the host check error message

You can add your own host security check error message using either the web-based manager or the CLI. The default message reads: “Your PC does not meet the host checking requirements set by the firewall. Please check that your OS version or antivirus and firewall applications are installed and running properly or you have the right network interface.”

To replace the host check error message - web-based manager:

1. Navigate to **System > Config > Replacement Messages** and select **Extended View** in the upper right corner.
2. Scroll down to **SSL VPN** and select **Hostcheck Error Message**.
3. Edit the text in the right-hand column below and select **Save**.
   If you are unhappy with the new message, you can restore the message to its default by selecting **Restore Default** instead of **Save**.

To replace the host check error message - CLI:

Configure the host check error message using the following command.

```
config system replacemsg sslvpn hostcheck-error
```

Creating a custom host check list

You can add your own software requirements to the host check list using the CLI. Host integrity checking is only possible with client computers running Microsoft Windows platforms. Enter the following commands:

```
config vpn ssl web host-check-software
   edit <software_name>
```

```
        set guid <guid_value>
        set type <av | fw>
        set version <version_number>
    end
```

If known, enter the Globally Unique Identifier (GUID) for the host check application. Windows uses GUIDs to identify applications in the Windows Registry. The GUID can be found in the Windows registry in the HKEY_ CLASSES_ROOT section.

To obtain the exact versioning, in Windows, right-click on the .EXE file of the application and select **Properties**, then select the **Version** tab.

Host Check is applicable for both SSLVPN Web Mode and SSLVPN Tunnel mode.

Windows OS check

The Windows patch check enables you to define the minimum Windows version and patch level allowed when connecting to the SSL VPN portal. When the user attempts to connect to the web portal, FortiOS performs a query on the version of Windows the user has installed. If it does not match the minimum requirement, the connection is denied. The Windows patch check is configured in the CLI.

The following example shows you how to add an OS check to the 'g1portal' web portal. This OS check accepts all Windows XP users and Windows 2000 users running patch level 3.

To specify the acceptable patch level, you set the `latest-patch-level` and the `tolerance`. The lowest acceptable patch level is `latest-patch-level` minus `tolerance`. In this case, `latest-patch-level` is 3 and `tolerance` is 1, so 2 is the lowest acceptable patch level.

```
config vpn ssl web portal
   edit g1portal
      set os-check enable
      config os-check-list windows-2000
         set action check-up-to-date
         set latest-patch-level 3
         set tolerance 1
      end
      config os-check-list windows-xp
         set action allow
      end
   end
```

Host check for Windows firewall

The Windows built-in firewall does not have a GUID in root\securitycenter or root\securitycenter2, but you can use a registry value to detect the firewall status.

If Windows firewall is on, the following registry value will be set to 1:

- **KeyName:** HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\SharedAccess\Parameters\ FirewallPolicy\StandardProfile
- **ValueName:** EnableFirewall

In FortiOS, use the registry-value-check feature to define the Windows Firewall software by entering the following in the CLI:

```
config vpn ssl web host-check-software
   edit "Microsoft-Windows-Firewall"
      config check-item-list
         edit 1
```

```
            set target
                "HKLM\\SYSTEM\\CurrentControlSet\\Services\\SharedAccess\\Parameters\\Firew
                allPolicy\\StandardProfile:EnableFirewall==1"
            set type registry
         next
         edit 2
            set target
                "HKLM\\SYSTEM\\CurrentControlSet\\Services\\SharedAccess\\Parameters\\Firew
                allPolicy\\PublicProfile:EnableFirewall==1"
            set type registry
         next
         edit 3
            set target
                "HKLM\\SYSTEM\\CurrentControlSet\\Services\\SharedAccess\\Parameters\\Firew
                allPolicy\\DomainProfile:EnableFirewall==1"
            set type registry
         next
      end
   set type fw
next
set host-check custom
set host-check-policy Microsoft-Windows-Firewall
```

Configuring cache cleaning

When the SSL VPN session ends, the client browser cache may retain some information. To enhance security, cache cleaning clears this information just before the SSL VPN session ends.

The cache cleaner is effective only if the session terminates normally. The cache is not cleaned if the session ends due to a malfunction, such as a power failure.

To enable cache cleaning

To enable cache cleaning on the full-access portal, you would enter:

```
config vpn ssl web portal
   edit full-access
      set cache-cleaner enable
   end
```

Cache cleaning requires a browser plugin. If the user does not have the plugin, it is automatically downloaded to the client computer.

Configuring virtual desktop

Available for 32-bit Windows XP, Windows Vista, and Windows 7 client PCs, the virtual desktop feature completely isolates the SSL VPN session from the client computer's desktop environment. All data is encrypted, including cached user credentials, browser history, cookies, temporary files, and user files created during the session. When the SSL VPN session ends normally, the files are deleted. If the session ends due to a malfunction, files might remain, but they are encrypted so that the information is protected.

When the user starts an SSL VPN session that has virtual desktop enabled, the virtual desktop replaces the user's normal desktop. When the virtual desktop exits, the user's normal desktop is restored.

Virtual desktop requires the Fortinet cache cleaner plugin. If the plugin is not present, it automatically downloads to the client computer.

To enable virtual desktop :

To enable virtual desktop on the full-access portal and apply the application control list 'List1', for example, you would enter:

```
config vpn ssl web portal
   edit full-access
      set virtual-desktop enable
      set virtual-desktop-app-list List1
   end
```

Configuring virtual desktop application control

You can control which applications users can run on their virtual desktop. To do this, you create an Application Control List of either allowed or blocked applications. When you configure the web portal, you select the list to use.

Configure the application control list in the CLI.

To create an Application Control List - CLI:

If you want to add 'BannedApp' to 'List1', a list of blocked applications, you would enter:

```
config vpn ssl web virtual-desktop-app-list
   edit "List1"
      set action block
      config apps
         edit "BannedApp"
            set md5s "06321103A343B04DF9283B80D1E00F6B"
         end
   end
```

Configuring client OS Check

The SSLVPN client OS Check feature can determine if clients are running the Windows 2000, Windows XP, Windows Vista or Windows 7 operating system. You can configure the OS Check to do any of the following:

- Allow the client access.
- Allow the client access only if the operating system has been updated to a specified patch (service pack) version.
- Deny the client access.

The OS Check has no effect on clients running other operating systems.

To configure OS Check:

OS Check is configurable only in the CLI.

```
config vpn ssl web portal
   edit <portal_name>
      set os-check enable
      config os-check-list {windows-2000 | windows-xp | windows-vista | windows-7}
         set action {allow | check-up-to-date | deny}
         set latest-patch-level {disable | 0 - 255}
         set tolerance {tolerance_num}
```

```
    end
  end
```

Adding WINS and DNS services for clients

You can specify the WINS or DNS servers that are made available to SSL-VPN clients.

DNS servers provide the IP addresses that browsers need to access web sites. For Internet sites, you can specify the DNS server that your FortiGate unit uses. If SSL VPN users will access intranet sites using URLs, you need to provide them access to the intranet's DNS server. You specify a primary and a secondary DNS server.

A WINS server provides IP addresses for named servers in a Windows domain. If SSL VPN users will access a Windows network, you need to provide them access to the domain WINS server. You specify a primary and a secondary WINS server.

To specify WINS and DNS services for clients - web-based manager:

1. Go to **VPN > SSL > Settings**.
2. Next to **DNS Server** select **Specify**.
3. Enter the IP addresses of DNS servers in the **DNS Server** fields as needed. Fields are available for both IPv4 and IPv6 addresses.
4. Select **Specify WINS Servers**, and enter the IP addresses of WINS servers in the **WINS Server** fields as needed. Fields are available for both IPv4 and IPv6 addresses.
5. Select **Apply**.

To specify WINS and DNS services for clients - CLI:

```
config vpn ssl settings
   set dns-server1 <address_ipv4>
   set dns-server2 <address_ipv4>
   set wins-server1 <address_ipv4>
   set wins-server2 <address_ipv4>
end
```

Setting the idle timeout setting

The idle timeout setting controls how long the connection can remain idle before the system forces the remote user to log in again. For security, keep the default value of 5000 seconds or less. Set the timeout value to 0 to disable idle timeouts.

To set the idle timeout - web-based manager:

1. Go to **VPN > SSL > Settings** and enable **Idle Logout**.
2. In the **Inactive For** field, enter the timeout value.
   The valid range is from 10 to 28800 seconds.
3. Select **Apply**.

To set the idle timeout - CLI:

```
config vpn ssl settings
   set idle-timeout <seconds_int>
end
```

SSL VPN logs

Logging is available for SSL VPN traffic so you can monitor users connected to the FortiGate unit and their activity. For more information on configuring logs on the FortiGate unit, see the Logging and Reporting Guide.

To enable logging of SSL VPN events - web-based manager:

1. Go to **Log & Report > Log Config > Log Settings**.
2. Enable **Event Logging**, and select **VPN activity event**.
3. Select **Apply**.

To view the SSL VPN log data, in the web-based manager, go to **Log & Report** and select either the **Event Log** or **Traffic Log**.

In event log entries, look for the sub-types “sslvpn-session” and “sslvpn-user”.

For information about how to interpret log messages, see the FortiGate Log Message Reference.

Monitoring active SSL VPN sessions

You can go to **User & Device > Monitor** to view a list of active SSL VPN sessions. The list displays the user name of the remote user, the IP address of the remote client, and the time the connection was made. You can also see which services are being provided, and delete an active web session from the FortiGate unit.

To monitor SSL VPNs - web-based manager:

To view the list of active SSL VPN sessions, go to **VPN > Monitor > SSL-VPN Monitor**.

When a tunnel-mode user is connected, the **Description** field displays the IP address that the FortiGate unit assigned to the remote host.

If required, you can end a session/connection by selecting its checkbox and then clicking the **Delete** icon.

Importing and using a CA-signed SSL certificate

Use the following set of instructions to import a CA-signed SSL certificate and configure an SSL VPN using that certificate.

Import the signed certificate into your FortiGate device

1. Unzip the file downloaded from the CA.
   There should be two .CRT files: a CA certificate with bundle in the file name, and a local certificate.
2. Log in to your FortiGate unit and browse to **System > Certificates**.
3. Select **Import > Local Certificate** to import the local certificate.
   The status of the certificate will change from PENDING to OK.
4. Import the CA certificate by selecting **Import > CA Certificate**.
   It will be listed in the CA Certificates section of the certificates list. You can now configure SSL VPN using the signed certificate.

Configure your FortiGate device to use the signed certificate

1. Log in to your FortiGate unit and browse to **VPN > SSL > Settings**.
2. In the **Connection Settings** section, locate the **Server Certificate** field.

3. Select the new certificate from the drop-down menu.
4. Select **Apply** to configure SSL VPN to use the new certificate.

The SSL VPN client

The remote client connects to the SSL VPN tunnel in various ways, depending on the VPN configuration.

- Web mode requires nothing more than a web browser. Microsoft Internet Explorer, Firefox, and Apple Safari browsers are supported. For detailed information about supported browsers, see Web-only mode on page 2150.
- Tunnel mode establishes a connection to the remote protected network that any application can use. If the client computer runs Microsoft Windows, they can download the tunnel mode client from the web portal Tunnel Mode widget. After installing the client, they can start and stop tunnel operation from the Tunnel Mode widget, or open the tunnel mode client as a standalone application. The tunnel mode client is available on the Start menu at **All Programs > FortiClient > FortiClient SSL VPN**.
  If the client computer runs Linux or Mac OS X, the user needs to download the tunnel mode client application from the Fortinet Support web site. See the Release Notes for your FortiOS firmware for the specific operating system versions that are supported. On Linux and Mac OS X platforms, tunnel mode operation cannot be initiated from the web portal Tunnel Mode widget. The remote user must use the standalone tunnel client application.
- The virtual desktop application creates a virtual desktop on a user's PC and monitors the data read/write activity of the web browser running inside the virtual desktop. When the application starts, it presents a 'virtual desktop' to the user. The user starts the web browser from within the virtual desktop and connects to the SSL VPN web portal. The browser file/directory operation is redirected to a new location, and the data is encrypted before it is written to the local disk. When the virtual desktop application exits normally, all the data written to the disk is removed. If the session terminates abnormally (power loss, system failure, etc.), the data left behind is encrypted and unusable to the user. The next time you start the virtual desktop, the encrypted data is removed.

FortiClient

Remote users can use the FortiClient software to initiate an SSL VPN tunnel to connect to the internal network. FortiClient uses local port TCP 1024 to initiate an SSL encrypted connection to the FortiGate unit, on port TCP 443. When connecting using FortiClient, the FortiGate unit authenticates the FortiClient SSL VPN request based on the user group options. The FortiGate unit establishes a tunnel with the client and assigns a virtual IP address to the client PC. Once the tunnel has been established, the user can access the network behind the FortiGate unit.

FortiClient software is available for download at www.forticlient.com and is available for Windows, Mac OS X, Apple iOS, and Android.

Tunnel mode client configuration

The FortiClient SSL VPN tunnel client requires basic configuration by the remote user to connect to the SSL VPN tunnel. When distributing the FortiClient software, provide the following information for the remote user to enter once the client software has been started. Once entered, they can select **Connect** to begin an SSL VPN session.

Connection Name	If you have pre-configured the connection settings, select the connection from the list and then select **Connect**. Otherwise, enter the settings in the fields below.
Remote Gateway	Enter the IP address or FQDN of the FortiGate unit that hosts the SSL VPN.
Username	Enter your username.
Client Certificate	Use this field if the SSL VPN requires a certificate for authentication. Select the required certificate from the drop-down list. The certificate must be installed in the Internet Explorer certificate store.

The SSL VPN web portal

This chapter explains how to use and configure the web portal features. This chapter is written for end users as well as administrators.

The following topics are included:

Connecting to the FortiGate unit
Web portal overview
Portal configuration
Using the My Bookmarks widget
Using the Connection Tool
Tunnel-mode features
Using the SSL VPN virtual desktop
Using FortiClient

Connecting to the FortiGate unit

You can connect to the FortiGate unit using a web browser. The URL of the FortiGate interface may vary from one installation to the next. If required, ask your FortiGate administrator for the URL of the FortiGate unit, and obtain a user name and password. You can connect to the web portal using an Android phone, iPhone, or iPad. The FortiGate unit will display the content of the portal to fit the device's screen.

In addition, if you will be using a personal or group security (X.509) certificate to connect to the FortiGate unit, your web browser may prompt you for the name of the certificate. Your FortiGate administrator can tell you which certificate to select.

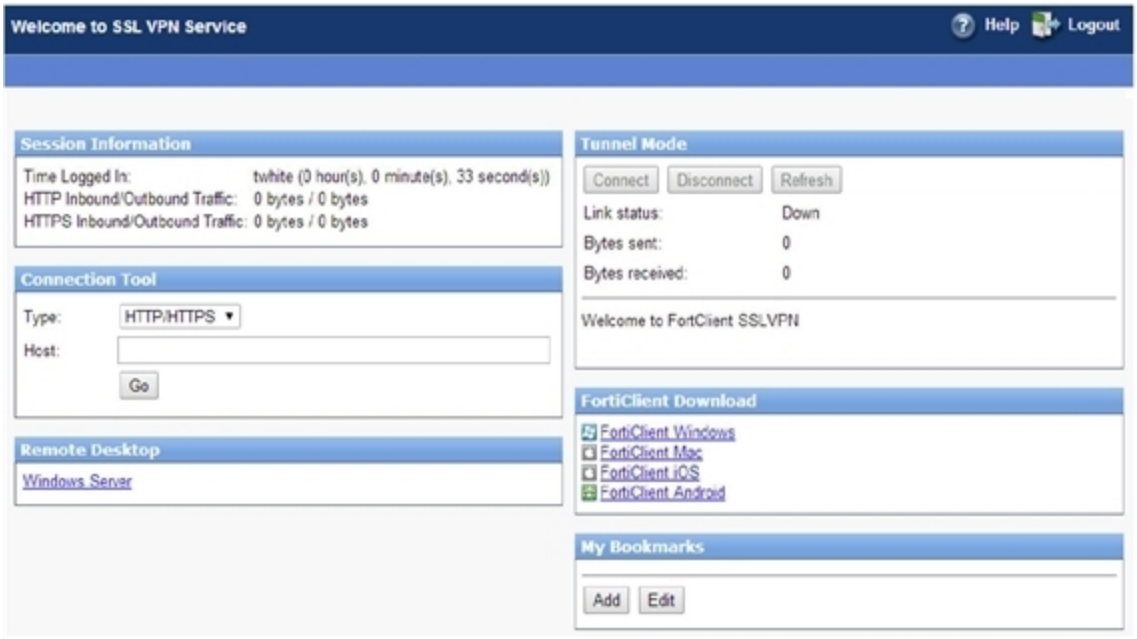
To log into the secure FortiGate HTTP gateway

1. Using the web browser on your computer, browse to the URL of the FortiGate unit (for example, `https://`<FortiGate_IP_address>`:443/remote/login`). The FortiGate unit may offer you a self-signed security certificate. If you are prompted to proceed, select **Yes**.
   A second message may be displayed to inform you that the FortiGate certificate distinguished name differs from the original request. This message is displayed because the FortiGate unit is attempting to redirect your web browser connection. You can ignore the message.
2. When you are prompted for your user name and password:
   - In the **Name** field, type your user name.
   - In the **Password** field, type your password.
3. Select **Login**.
   The FortiGate unit will redirect your web browser to the FortiGate SSL VPN web portal home page automatically.

Web portal overview

After you log in, you see a web portal page like the following:

FortiGate SSL VPN web portal page



Six"widgets" provide the web portal's features:

- **Session Information** displays the elapsed time since login and the volume of HTTP and HTTPS traffic, both inbound and outbound.
- **Tunnel Mode** connects and disconnects the tunnel mode SSL connection to the FortiGate unit. While the tunnel is active, the widget displays the amount of data that is sent and received. For more information, see Web portal overview on page 2184.

  Tunnel mode requires a downloadable client application. If your computer is running Microsoft Windows, the Tunnel Mode widget provides a download link if you need to install the client on your computer. If you are using Macintosh or Linux, you can obtain and install an appropriate client application from the Fortinet Support site.
- **Connection Tool** enables you to connect to network resources without using or creating a bookmark.
- **Remote Desktop** provides access to preconfigured remote desktop environments.
- **FortiClient Download** provides access to the FortiClient tunnel application for various operating systems.
- **My Bookmarks** provides links to network resources. You can use the administrator-defined bookmarks and you can add your own bookmarks. See Web portal overview on page 2184.

Depending on the web portal configuration and user group settings, some widgets might not be present. For example, the predefined web-access portal contains only the Session Information and Bookmarks widgets.

While using the web portal, you can select the **Help** button to get information to assist you in using the portal features. This information displays in a separate browser window.

When you have finished using the web portal, select the **Logout** button in the top right corner of the portal window.

After making any changes to the web portal configuration, be sure to select **Apply**.

Portal configuration

The SSL VPN Service portal enables users to access network resources through a secure channel using a web browser. Fortinet administrators can configure log in privileges for system users and which network resources are available to the users.

The portal configuration determines what the user sees when they log in to the portal. Both the system administrator and the user have the ability to customize the SSL VPN portal.

There are three pre-defined default web portal configurations available:

- **full-access**: Includes all widgets available to the user - **Session Information**, **Tunnel Mode**, **Connection Tool**, **FortiClient Download**, **Remote Desktop**, and **My Bookmarks**.
- **tunnel-access**: Includes **Session Information** and **Tunnel Mode** widgets.
- **web-access**: Includes **Session Information** and **My Bookmarks** widgets.

You can also create your own web portal to meet your corporate requirements.

This topic includes the following:

- Portal settings
- Portal widgets

Portal page	
Create New	Creates a new web portal.
Edit	Select a portal from the list to enable the Edit option, and modify the portal configuration.
Delete	Removes a portal configuration. To remove multiple portals from the list, select the check box beside the portal names, then select **Delete**.
Name	The name of the web portal.
Ref.	Displays the number of times the object is referenced in other configurations on the FortiGate unit, such as security policies. To view the location of the referenced object, select the number in **Ref.** column. To view more information about how the object is used, select one of: **View the list page for these objects** – automatically redirects you to the list page where the object is referenced at. **Edit this object** – modifies settings within that particular setting that the object is referenced with. **View the details for this object** – similar to the log viewer table, contains information about what settings are configured within that particular setting that the object is referenced with.
Portal Settings page	
Edit Settings window	Provides general, virtual desktop and security control settings for the SSL VPN Service portal page. This window appears when you select **Settings**. This window also appears whenever you select **Create New** and are automatically redirected to the Portal Settings page. For more information, see Portal settings on page 2188.
Settings	Select to edit the settings for the SSL VPN web portal. See Portal configuration on page 2186.
Widgets	The widgets that will appear on the SSL VPN Service page. You can add widgets from the Add Widgets drop-down list. For more information, see Portal widgets on page 2191.
Add Widget	Select to add a new widget to the page.

Session Information	Displays basic information of the current session of the logged in user. For more information, see Session Information on page 2191.
Bookmarks	Displays configured bookmarks, allows for the addition of new bookmarks and editing of existing bookmarks. For more information, see Bookmarks on page 2191.
Connection Tool	Enter the URL or IP address for a connection tool application/server (selected when configuring the **Connection Tool**). You can also check connectivity to a host or server on the network behind the unit by selecting the **Type** Ping. For more information, see Connection Tool on page 2191.
Tunnel Mode	Displays tunnel information and actions in user mode. The administrator can configure a split-tunneling option. For more information, see Tunnel Mode on page 2191.

Portal settings

A web portal defines SSL VPN user access to network resources. The portal configuration determines what SSL VPN users see when they log in to the unit. Both the Fortinet administrator and the SSL VPN user have the ability to customize the web portal settings. Portal settings are configured in **VPN > SSL > Portals**.

The Settings Window provides settings for configuring general, virtual desktop and security console options for your web portal.

The virtual desktop options, available for Windows XP and Windows Vista client PCs, are configured to completely isolate the SSL VPN session from the client computer's desktop environment. All data is encrypted, including cached user credentials, browser history, cookies, temporary files, and user files created during the session. When the SSL VPN session ends normally, the files are deleted. If the session ends unexpectedly, any files that may remain will be encrypted.

Virtual desktop requires the Fortinet host check plugin. If the plugin is not present, it is automatically downloaded to the client computer.

Security control options provide cache cleaning and host checking to the clients of your web portal. Cache cleaning clears information from the client browser cache just before the SSL VPN session ends. The cache cleaner is effective only if the session terminates normally. The cache is not cleaned if the session ends unexpectedly.

Host checking enforces the client's use of antivirus or firewall software. Each client is checked for security software that is recognized by the Windows Security Center. As an alternative, you can create a custom host check that looks for specific security software selected from the Host Check list. For more information, see Basic configuration on page 2155.

Edit Settings Window

General tab	
Name	Enter a name for the web portal configuration.
Applications	Select the server applications or network services clients can use.
Portal Message	Enter the caption that appears at the top of the web portal home page when the user logs in.
Theme	Select the color scheme for the web portal home page.
Page Layout	Select the one or two page column format for the web portal home page.
Redirect URL	Enter the URL that the web portal displays when the web portal home page is displayed.
Virtual Desktop tab	
Enable Virtual Desktop	Select to enable the virtual desktop.
Allow switching between virtual desktop and regular desktop	Select to allow users to switch between the virtual desktop, and their regular desktop.
Allow clipboard contents to be shared with regular desktop	Select to allow users access to the clipboard contents when they are using the regular desktop.
Allow use of removable media	Select to allow users to access removable media.
Allow network share access	Select to allow users to have access to network resources.
Allow printing	Select to allow users to print from the virtual desktop.
Quit the virtual desktop and logout session when browser is closed	Select to have the virtual desktop close and log the user out of the current session whenever the browser is closed.
Application Control List	Select a virtual desktop application list from the drop-down list.
Security Control tab	
Clean Cache	Select to have the unit remove residual information from the remote client computer just before the SSL VPN session closes.

Host Check	Select any host checking that is required before the user can log into the portal. Host checks will verify if the user has the required antivirus software or applications. If the user does not, the log in will be denied. Host Check is applicable for both SSLVPN Web Mode and SSLVPN Tunnel mode. For more information, see Basic configuration on page 2155.
Interval	Enter how often to recheck the host for updates and changes in seconds.
Policy	This is available when the **Host Check selection is Custom**. Select the specific host check software to look for. Select **Edit** to modify the policy settings.

Portal widgets

Portal widgets are widgets hold the content the user logging into the portal will see.

Session Information

The **Session Information** widget displays the login name of the user, the amount of time the user has been logged in and the inbound and outbound traffic statistics.

Bookmarks

Bookmarks are used as links to specific resources on the network. When a bookmark is selected from a bookmark list, a pop-up window appears with the requested web page. Telnet, VNC, and RDP all pop up a window that requires a browser plug-in. FTP and Samba replace the bookmarks page with an HTML file-browser.

A web bookmark can include login credentials to automatically log the SSL VPN user into the web site. When the administrator configures bookmarks, the web site credentials must be the same as the user's SSL VPN credentials. Users configuring their own bookmarks can specify alternative credentials for the web site.

Connection Tool

Use the **Connection Tool** widget to connect to a network resource without adding a bookmark to the bookmark list. You select the type of resource and specify the URL or IP address of the host computer.

Tunnel Mode

If your web portal provides tunnel mode access, you need to configure the **Tunnel Mode** widget. These settings determine how tunnel mode clients are assigned IP addresses. You can also enable a split tunneling configuration so that the VPN carries only the traffic for the networks behind the unit. The user's other traffic follows its normal route.

Applications available in the web portal

Depending on the web portal configuration and user group settings, one or more of the following server applications are available to you through Bookmarks or the Connection Tool:

- Citrix makes use of SOCKS so that the Citrix client can connect to the SSL VPN port forward module to provide the connection.
- FTP (File Transfer Protocol) enables you to transfer files between your computer and a remote host.
- HTTP/HTTPS accesses web pages.
- Port Forward provides the middle ground between web mode and tunnel mode. When the SSL VPN receives data from a client application, the data is encrypted and sent to the FortiGate unit, which then forwards the traffic to the application server.
- RDP/RDP Native (Remote Desktop Protocol), similar to VNC, enables you to remotely control a computer running Microsoft Terminal Services.
- SMB/CIFS implements the Server Message Block (SMB) protocol to support file sharing between your computer and a remote server host.
- SSH (Secure Shell) enables you to exchange data between two computers using a secure channel.
- TELNET (Teletype Network emulation) enables you to use your computer as a virtual text-only terminal to log in to a remote host.
- VNC (Virtual Network Computing) enables you to remotely control another computer, for example, accessing your work computer from your home computer.

Some server applications may prompt you for a user name and password. You must have a user account created by the server administrator so that you can log in.

RDP Native, in some instances, may not be supported. If this is the case, use Internet Explorer and disable ActiveX Filtering.

Windows file sharing through SMB/CIFS is supported through shared directories.

Using the My Bookmarks widget

The My Bookmarks widget shows both administrator-configured and user-configured bookmarks. Administrator bookmarks cannot be altered but you can add, edit or delete user bookmarks.

My Bookmarks widget

The FortiGate unit forwards client requests to servers on the Internet or internal network. To use the web-portal applications, you add the URL, IP address, or name of the server application to the My Bookmarks list. For more information, see Adding bookmarks on page 2193.

If you want to access a web server or telnet server without first adding a bookmark to the My Bookmarks list, use the Connection Tool instead. For more information, see Using the My Bookmarks widget on page 2192.

Adding bookmarks

You can add frequently used connections as bookmarks. Afterward, select any hyperlink from the Bookmarks list to initiate a session.

To add a bookmark

1. In the **Bookmarks** widget, select **Add**.
2. Enter the following information:

Name	Enter the name to display in the Bookmarks list.
Type	Select the abbreviated name of the server application or network service from the drop-down list.
Location	Enter the IP address or FQDN of the server application or network service. For RDP connections, you can append some parameters to control screen size and keyboard layout. See Using the My Bookmarks widget on page 2192.
Description	Optionally enter a short description. The description displays when you pause the mouse pointer over the hyperlink.
SSO	Single Sign On (SSO) is available for HTTP/HTTPS bookmarks only. **Disabled** — This is not an SSO bookmark. **Automatic** — Use your SSL VPN credentials or an alternate set. See the **SSO Credentials** field. **Static** — Supply credentials and other required information (such as an account number) to a web site that uses an HTML form for authentication. You provide a list of the form field names and the values to enter into them. This method does not work for sites that use HTTP authentication, in which the browser opens a pop-up dialog box requesting credentials.
SSO fields	
SSO Credentials	**SSL VPN Login** — Use your SSL VPN login credentials. **Alternative** — Enter **Username** and **Password** below.
Username	Alternative username. Available if **SSO Credentials** is **Alternative**.

Password	Alternative password. Available if **SSO Credentials** is **Alternative**.
Static SSO fields	These fields are available if **SSO** is **Static**.
Field Name	Enter the field name, as it appears in the HTML form.
Value	Enter the field value. To use the values from **SSO Credentials**, enter `%passwd%` for password or `%username%` for username.
Add	Add another **Field Name** / **Value** pair.

3. Select **OK** and then select **Done**.

Using the Connection Tool

The **Connection Tool** widget enables a user to connect to a resource when it isn't a bookmark. In the FortiGate, ensure that the desired application or protocol (to which you want remote users to connect) is enabled in the **Applications** list of the **General** settings, by selecting the **Settings** button in the portal configuration window.

You can connect to any type of server without adding a bookmark to the My Bookmarks list. The fields in the Connection Tool enable you to specify the type of server and the URL or IP address of the host computer.

See the following procedures:

- To connect to a web server on page 2194
- To ping a host or server behind the FortiGate unit on page 2195
- To start a Telnet session on page 2195
- To start an FTP session on page 2195
- To start an SMB/CIFS session on page 2195
- To start an SSH session on page 2196
- To start an RDP session on page 2196
- To start a VNC session on page 2197

Except for ping, these services require that you have an account on the server to which you connect.

When you use the Connection Tool, the FortiGate unit may offer you its self-signed security certificate. Select **Yes** to proceed. A second message may be displayed to inform you of a host name mismatch. This message is displayed because the FortiGate unit is attempting to redirect your web browser connection. Select **Yes** to proceed.

To connect to a web server

1. In **Type**, select **HTTP/HTTPS**.
2. In the **Host** field, type the URL of the web server.
   For example: `http://www.mywebexample.com` or `https://172.20.120.101`
3. Select **Go**.
4. To end the session, close the browser window.

To ping a host or server behind the FortiGate unit

1. In **Type**, select **Ping**.
2. In the **Host** field, enter the IP address of the host or server that you want to reach.
   For example: `10.11.101.22`
3. Select **Go**.
   A message stating whether the IP address can be reached or not is displayed.

To start a Telnet session

1. In **Type**, select **Telnet**.
2. In the **Host** field, type the IP address of the telnet host.
   For example: `10.11.101.12`
3. Select **Go**.
   A Telnet window opens.
4. Select **Connect**.
5. A telnet session starts and you are prompted to log in to the remote host.
   After you log in, you may enter any series of valid telnet commands at the system prompt.
6. To end the session, select **Disconnect** (or type `exit`) and then close the TELNET connection window.

To start an FTP session

1. In **Type**, select **FTP**.
2. In the **Host** field, type the IP address of the FTP server.
   For example: `10.11.101.12`
3. Select **Go**.
   A login window opens.
4. Enter your user name and password and then select **Login**.
   You must have a user account on the remote host to log in.
5. Manipulate the files in any of the following ways:
   - To download a file, select the file link in the **Name** column.
   - To access a subdirectory (**Type** is **Folder**), select the link in the **Name** column.
   - To create a subdirectory in the current directory, select **New directory**.
   - To delete a file or subdirectory from the current directory, select its **Delete** icon.
   - To rename a file in the current directory, select its **Rename** icon.
   - To upload a file to the current directory from your client computer, select **Upload**.
   - When the current directory is a subdirectory, you can select **Up** to access the parent directory.
6. To end the FTP session, select **Logout**.

To start an SMB/CIFS session

1. In **Type**, select **SMB/CIFS**.
2. In the **Host** field, type the IP address of the SMB or CIFS server.
   For example: `10.11.101.12`
3. Select **Go**.
4. Enter your user name and password and then select **Login**.

You must have a user account on the remote host to log in.

5. Manipulate the files in any of the following ways:
   - To download a file, select the file link in the **Name** column.
   - To access a subdirectory (**Type** is **Folder**), select the file link in the **Name** column.
   - To create a subdirectory in the current directory, select **New Directory**.
   - To delete a file or subdirectory from the current directory, select its **Delete** icon.
   - To rename a file, select its **Rename** icon.
   - To upload a file from your client computer to the current directory, select **Upload**.
   - When the current directory is a subdirectory, you can select **Up** to access the parent directory.
6. To end the SMB/CIFS session, select **Logout** and then close the SMB/CIFS window.

To start an SSH session

1. In **Type**, select **SSH**.
2. In the **Host** field, type the IP address of the SSH host.
   For example: `10.11.101.12`
3. Select **Go**.
   A login window opens.
4. Select **Connect**.
   A SSH session starts and you are prompted to log in to the remote host. You must have a user account to log in. After you log in, you may enter any series of valid commands at the system prompt.
5. To end the session, select **Disconnect** (or type `exit`) and then close the SSH connection window.

To start an RDP session

1. In **Type**, select **RDP**.
2. In the **Host** field, type the IP address of the RDP host.
   For example: `10.11.101.12`
3. Optionally, you can specify additional options for RDP by adding them to the **Host** field following the host address. See RDP options on page 2196 for information about the available options.
   For example, to use a French language keyboard layout you would add the `-m` parameter:
   `10.11.101.12 -m fr`
4. Select **Go**.
   A login window opens.
5. When you see a screen configuration dialog, click **OK**.
   The screen configuration dialog does not appear if you specified the screen resolution with the host address.
6. When you are prompted to log in to the remote host, type your user name and password. You must have a user account on the remote host to log in.
7. Select **Login**.
   If you need to send Ctrl-Alt-Delete in your session, use Ctrl-Alt-End.
8. To end the RDP session, Log out of Windows or select **Cancel** from the Logon window.

RDP options

When you specify the RDP server address, you can also specify other options for your remote desktop session.

Screen resolution Use this command to make the RDP window full screen or a specific the window size.	`-f` Make RDP full-screen `-g <width>x<height>` `<width>` and `<height>` are in pixels Example: `-g 800x600`

Authentication
 	
Use these options to send your authentication credentials with the connection request, instead of entering them after the connection is established.
	`-u <user name>`
	`-p <password>`
	`-d <domain>`

Locale/Keyboard Use this option if the remote computer might not use the same keyboard layout as your computer. Select the locale code that matches your computer.	-m <locale> The supported values of `<locale>` are:

ar	Arabic	it	Italian
da	Danish	ja	Japanese
de	German	lt	Lithuanian
de-ch	Swiss German	lv	Latvian
en-gb	British English	mk	Macedonian
en-uk	UK English	no	Norwegian
en-us	US English	pl	Polish
es	Spanish	pt	Portuguese
fi	Finnish	pt-br	Brazilian Portuguese
fr	French	ru	Russian
fr-be	Belgian French	sl	Slovenian
fr-ca	Canadian French	sv	Sudanese
fr-ch	Swiss French	tk	Turkmen
hr	Croatian	tr	Turkish
hu	Hungarian		

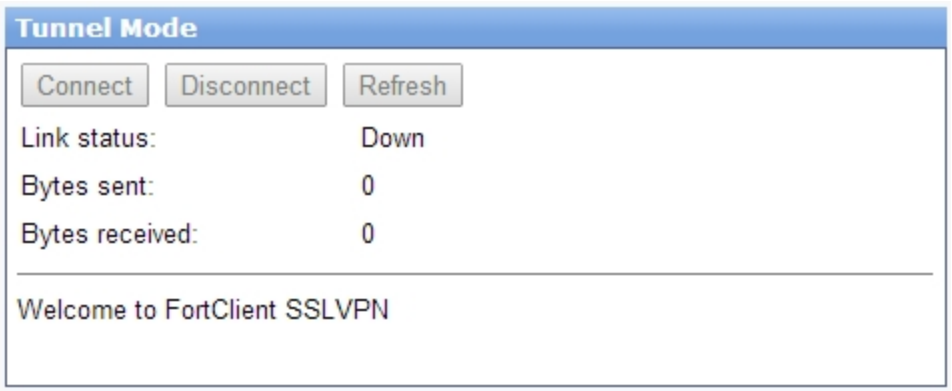
To start a VNC session

1. In **Type**, select **VNC**.
2. In the **Host** field, type the IP address of the VNC host.
   For example: `10.11.101.12`
3. Select **Go**.
   A login window opens.
4. Type your user name and password when prompted to log in to the remote host.
   You must have a user account on the remote host to log in.
5. Select **OK**.
   If you need to send Ctrl-Alt-Delete in your session, press F8, then select **Send Ctrl-Alt-Delete** from the pop-up menu.
6. To end the VNC session, close the VNC window.

Tunnel-mode features

For Windows users, the web portal Tunnel Mode widget provides controls for your tunnel mode connection and also provides status and statistics about its operation. You can also control and monitor tunnel mode operation from the standalone client application.

Fortinet SSL VPN Tunnel Mode widget



Connect	Initiate a session and establish an SSL VPN tunnel with the FortiGate unit.
Disconnect	End the session and close the tunnel to the FortiGate unit.
Refresh	Refresh the status and statistics immediately.
Link Status	The state of the SSL VPN tunnel: **Up** — an SSL VPN tunnel with the FortiGate unit has been established. **Down** — a tunnel connection has not been initiated.
Bytes Sent	The number of bytes of data transmitted from the client to the FortiGate unit since the tunnel was established.
Bytes Received	The number of bytes of data received by the client from the FortiGate unit since the tunnel was established.

Using the SSL VPN virtual desktop

The virtual desktop feature is available for Windows only. When you start an SSL VPN session, the virtual desktop replaces your normal desktop. When the virtual desktop exits, your regular desktop is restored. Virtual desktop information is encrypted so that no information from it remains available after your session ends.

To use the SSL VPN virtual desktop, simply log in to an SSL VPN that requires the use of the virtual desktop. Wait for the virtual desktop to initialize and replace your desktop with the SSL VPN desktop, which has a Fortinet SSL VPN logo as wallpaper. Your web browser will open to the web portal page.

You can use the virtual desktop just as you use your regular desktop, subject to the limitations that virtual desktop application control imposes. If it is enabled in the web portal virtual desktop settings, you can switch between the virtual desktop and your regular desktop. Right-click the **SSL VPN Virtual Desktop** icon in the taskbar and select **Switch Desktop**.

To see the web portal virtual desktop settings, right-click the **SSL VPN Virtual Desktop** icon in the taskbar and select **Virtual Desktop Option**.

When you have finished working with the virtual desktop, right-click the SSL VPN Virtual Desktop icon in the taskbar and select **Exit**. Select **Yes** to confirm. The virtual desktop closes and your regular desktop is restored.

Using FortiClient

Remote users can use FortiClient Endpoint Security to initiate an SSL VPN tunnel to connect to the internal network. FortiClient uses local port TCP 1024 to initiate an SSL encrypted connection to the FortiGate unit, on port TCP 10443. When connecting using FortiClient, the FortiGate unit authenticates the FortiClient SSL VPN request based on the user group options. the FortiGate unit establishes a tunnel with the client and assigns a virtual IP address to the client PC. Once the tunnel has been established, the user can access the network behind the FortiGate unit.

For information on configuring the FortiGate unit for SSL VPN connectivity, see Basic configuration on page 2155. For details on configuring FortiClient for SSL VPN connections, see the FortiClient documentation.

Setup examples

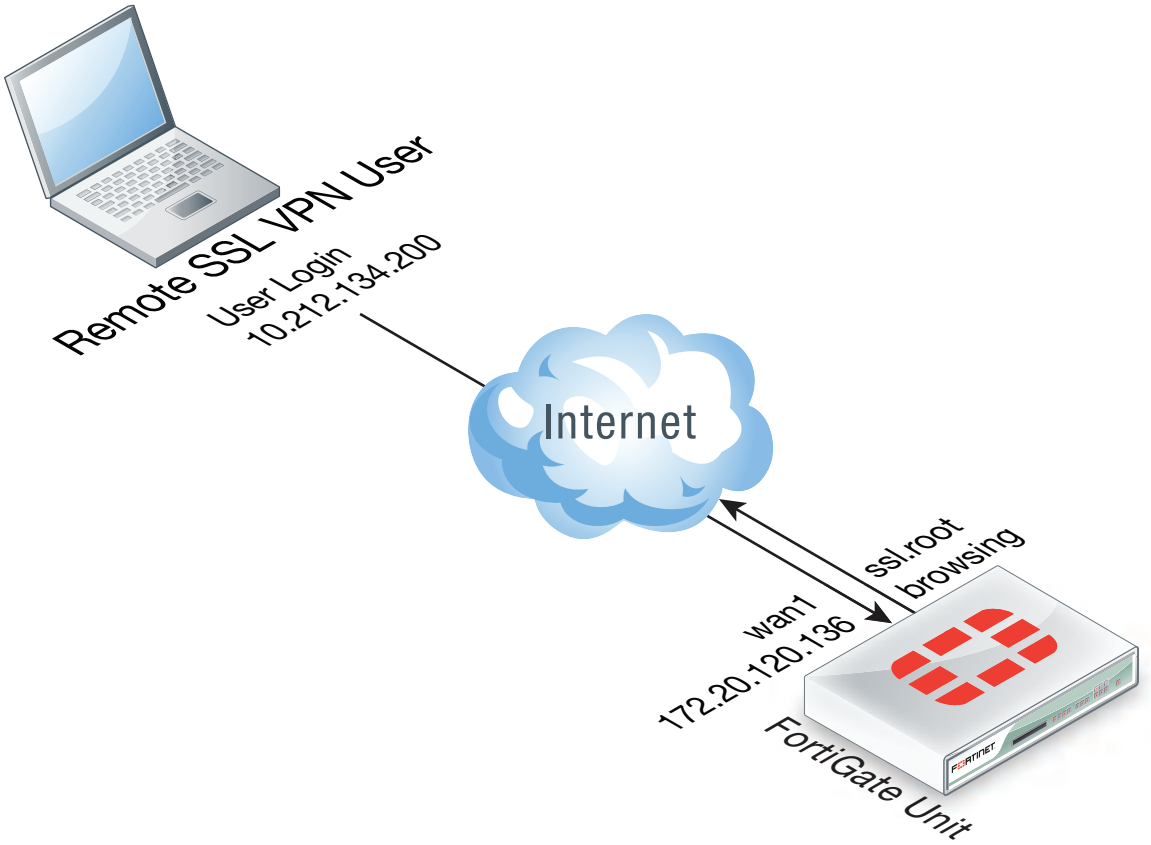
The examples in this chapter demonstrate the basic configurations needed for common connections to the SSL VPN tunnel and portals, applying the steps outlined in Basic configuration on page 2155.

The following examples are included:

Secure Internet browsing
Split Tunnel
Multiple user groups with different access permissions

Secure Internet browsing

This example sets up an SSL VPN tunnel that provides remote users the ability to access the Internet while traveling, and ensures that they are not subject to malware and other dangers, by using the corporate firewall to filter all of their Internet traffic. Essentially, the remote user will connect to the corporate FortiGate unit to surf the Internet.



Using SSL VPN and FortiClient SSL VPN software, you create a means to use the corporate FortiGate to browse the Internet safely.

Creating an SSL VPN IP pool and SSL VPN web portal

1. Go to **VPN > SSL > Portals** and select *tunnel-access*.
2. For **Source IP Pools** select **SSLVPN_TUNNEL_ADDR1**.
3. Select **OK**.

Creating the SSL VPN user and user group

1. Create the SSL VPN user and add the user to a user group configured for SSL VPN use.
2. Go to **User & Device > User > User Definition** and select **Create New** to add the user:

User Name	twhite
Password	password

3. Select **OK**.
4. Go to **User & Device > User > User Groups** and select **Create New** to add `twhite` to a group called `SSL VPN`:

Name	SSL VPN
Type	Firewall

5. Move **twhite** to the **Members** list.
6. Select **OK**.

Creating a static route for the remote SSL VPN user

Create a static route to direct traffic destined for tunnel users to the SSL VPN tunnel.

1. Go to **Router > Static > Static Routes** and select **Create New** to add the static route.

   For low-end FortiGate units, go to **System > Network > Routing** and select **Create New**.

Destination IP/Mask	10.212.134.0/255.255.255.0
Device	ssl.root

The **Destination IP/Mask** matches the network address of the remote SSL VPN user.

2. Select **OK**.

Creating security policies

Create an SSL VPN security policy with SSL VPN user authentication to allow SSL VPN traffic to enter the FortiGate unit. Create a normal security policy from ssl.root to wan1 to allow SSL VPN traffic to connect to the Internet.

Users and user groups are added to the SSL VPN under **VPN > SSL > Settings**, by adding a rule to the Authentication/Portal Mapping section. However, you must also add these users and user groups to the SSL VPN security policy.

1. Go to **Policy & Objects > Policy > IPv4** and select **Create New**.
2. Add an SSL VPN security policy as below, and click *OK*.

Incoming Interface	wan1
Source Address	all
Source User(s)	SSL VPN
Outgoing Interface	ssl.root

3. Select **Create New** to add a security policy that allows remote SSL VPN users to connect to the Internet:

Incoming Interface	ssl.root
Source Address	all
Source User(s)	SSL VPN
Outgoing Interface	wan1
Destination Address	all
Schedule	always
Service	ALL
Action	ACCEPT

4. Select **OK**.

Configuring authentication rules

1. Go to **VPN > SSL > Settings** and select **Create New** under **Authentication/Portal Mapping**.
2. Add an authentication rule for the remote user:

Users/Groups	Tunnel
Portal	tunnel-access

3. Select **OK** and **Apply**.

Results

Using the FortiClient SSLVPN application, access the VPN using the address `https://172.20.120.136:443/` and log in as `twhite`. Once connected, you can browse the Internet.

From the FortiGate web-based manager, go to **VPN > Monitor > SSL-VPN Monitor** to view the list of users connected using SSL VPN. The **Subsession** entry indicates the split tunnel which redirects to the Internet.

Split Tunnel

In this configuration, remote users are able to securely access the head office internal network through the head office firewall, yet browse the Internet without going through the head office FortiGate. Split tunneling is enabled by default for SSL VPN on FortiGate units.

The solution below describes how to configure FortiGate SSL VPN split tunneling using the FortiClient SSL VPN software, available from the Fortinet Support site.

Without split tunneling, all communication from remote SSL VPN users to the head office internal network and to the Internet uses an SSL VPN tunnel between the user's PC and the head office FortiGate unit. Connections to the Internet are routed back out the head office FortiGate unit to the Internet. Replies come back into the head office FortiGate unit before being routed back through the SSL VPN tunnel to the remote user.

In short, enabling split tunneling protects the head office from potentially harmful access and external threats that may occur as a result of the end user's indiscretion while browsing the Internet. By contrast, disabling split tunneling protects the end user by forcing all their Internet traffic to pass through the FortiGate firewall.

Creating a firewall address for the head office server

1. Go to **Policy & Objects > Objects > Addresses** and select **Create New** and add the head office server address:

Category	Address
Name	Head office server
Type	Subnet
Subnet / IP Range	192.168.1.12
Interface	Internal

2. Select **OK**.

Creating an SSL VPN IP pool and SSL VPN web portal

1. Go to **VPN > SSL > Portals** and select **tunnel-access**.
2. Enter the following:

Name	Connect to head office server
Enable Tunnel Mode	Enable
Enable Split Tunneling	Enable
Routing Address	Internal
Source IP Pools	SSLVPN_TUNNEL_ADDR1

3. Select **OK**.

Creating the SSL VPN user and user group

Create the SSL VPN user and add the user to a user group.

1. Go to **User & Device > User > User Definition**, select **Create New** and add the user:

User Name	twhite
Password	password

2. Select **OK**.
3. Go to **User & Device > User > User Groups** and select **Create New** to add the new user to the SSL VPN user group:

Name	Tunnel
Type	Firewall

4. Move **twhite** to the **Members** list.
5. Select **OK**.

Creating a static route for the remote SSL VPN user

Create a static route to direct traffic destined for tunnel users to the SSL VPN tunnel.

1. Go to **Router > Static > Static Routes** and select **Create New**
2. For low-end FortiGate units, go to **System > Network > Routing** and select **Create New**:

Destination IP/Mask	10.212.134.0/255.255.255.0
Device	ssl.root

3. Select **OK**.

Creating security policies

Create an SSL VPN security policy with SSL VPN user authentication to allow SSL VPN traffic to enter the FortiGate unit. Create a normal security policy from ssl.root to wan1 to allow SSL VPN traffic to connect to the Internet.

1. Go to **Policy & Objects > Policy > IPv4** and select **Create New**.
2. Complete the following:

Incoming Interface	ssl.root
Source Address	all
Source User(s)	Tunnel
Outgoing Interface	internal
Destination Address	Head office server

3. Select **OK**.
4. Add a security policy that allows remote SSL VPN users to connect to the Internet.
5. Select **Create New**.
6. Complete the following and select **OK**:

Incoming Interface	ssl.root
Source Address	all
Source User(s)	Tunnel
Outgoing Interface	wan1
Destination Address	all
Schedule	always
Service	ALL
Action	ACCEPT

Configuring authentication rules

1. Go to **VPN > SSL > Settings** and select **Create New** under **Authentication/Portal Mapping**.
2. Add an authentication rule for the remote user:

Users/Groups	Tunnel
Portal	tunnel-access

3. Select **OK** and **Apply**.

Results

Using the FortiClient SSL VPN application on the remote PC, connect to the VPN using the address `https://172.20.120.136:443/` and log in with the `twhite` user account. Once connected, you can connect to the head office server or browse to web sites on the Internet.

From the web-based manager, go to **VPN > Monitor > SSL-VPN Monitor** to view the list of users connected using SSL VPN. The **Subsession** entry indicates the split tunnel which redirects SSL VPN sessions to the Internet.

Multiple user groups with different access permissions

You might need to provide access to several user groups with different access permissions. Consider the following example topology in which users on the Internet have controlled access to servers and workstations on private networks behind a FortiGate unit.

In this example configuration, there are two users:

- User1 can access the servers on Subnet_1.
- User2 can access the workstation PCs on Subnet_2.

You could easily add more users to either user group to provide them access to the user group's assigned web portal.

General configuration steps

1. Create firewall addresses for:
   - The destination networks.
   - Two non-overlapping tunnel IP address ranges that the FortiGate unit will assign to tunnel clients in the two user groups.
2. Create two web portals.
3. Create two user accounts, User1 and User2.
4. Create two user groups. For each group, add a user as a member and select a web portal. In this example, User1 will belong to Group1, which will be assigned to Portal1 (similar configuration for User2).
5. Create security policies:
   - Two SSL VPN security policies, one to each destination.
   - Two tunnel-mode policies to allow each group of users to reach its permitted destination network.
6. Create the static route to direct packets for the users to the tunnel.

Creating the firewall addresses

Security policies do not accept direct entry of IP addresses and address ranges. You must define firewall addresses in advance.

Creating the destination addresses

SSL VPN users in this example can access either Subnet_1 or Subnet_2.

To define destination addresses - web-based manager:

1. Go to **Policy & Objects > Objects > Addresses.**
2. Select **Create New**, enter the following information, and select **OK**:

Name	Subnet_1
Type	Subnet
Subnet/IP Range	10.11.101.0/24
Interface	port2

3. Select **Create New**, enter the following information, and select **OK**:

Name	Subnet_2
Type	Subnet
Subnet/IP Range	10.11.201.0/24
Interface	port3

Creating the tunnel client range addresses

To accommodate the two groups of users, split an otherwise unused subnet into two ranges. The tunnel client addresses must not conflict with each other or with other addresses.

To define tunnel client addresses - web-based manager:

1. Go to **Policy & Objects > Objects > Addresses.**
2. Select **Create New**, enter the following information, and select **OK**:

Name	Tunnel_group1
Type	IP Range
Subnet/IP Range	10.11.254.1-10.11.254.50
Interface	Any

3. Select **Create New**, enter the following information, and select **OK**.

Name	Tunnel_group2
Type	IP Range
Subnet/IP Range	10.11.254.51-10.11.254.100
Interface	Any

Creating the web portals

To accommodate two different sets of access permissions, you need to create two web portals, portal1 and portal2, for example. Later, you will create two SSL VPN user groups, one to assign to portal1 and the other to assign to portal2.

To create the portal1 web portal:

1. Go to **VPN > SSL > Portals** and select **Create New**.
2. Enter `portal1` in the **Name** field.
3. In **Source IP Pools**, select **Tunnel_ group1**.
4. Select **OK**.

To create the portal2 web portal:

1. Go to **VPN > SSL > Portals** and select **Create New**.
2. Enter `portal2` in the **Name** field and select **OK**.
3. In **IP Pools**, select **Tunnel_ group2**
4. Select **OK**.

Later, you can configure these portals with bookmarks and enable connection tool capabilities for the convenience of your users.

Creating the user accounts and user groups

After enabling SSL VPN and creating the web portals that you need, you need to create the user accounts and then the user groups that require SSL VPN access.

Go to **User & Device > User > User Definition** and create user1 and user2 with password authentication. After you create the users, create the SSL VPN user groups.

To create the user groups - web-based manager:

1. Go to **User & Device > User > User Groups**.
2. Select **Create New** and enter the following information:

Name	Group1
Type	Firewall

3. From the **Available** list, select **User1** and move it to the **Members** list by selecting the right arrow button.
4. Select **OK**.
5. Repeat steps 2 through 4 to create Group2, assigned to Portal2, with User2 as its only member.

Creating the security policies

You need to define security policies to permit your SSL VPN clients, web-mode or tunnel-mode, to connect to the protected networks behind the FortiGate unit. Before you create the security policies, you must define the source and destination addresses to include in the policy. See Creating the firewall addresses on page 2206.

Two types of security policy are required:

- An SSL VPN policy enables clients to authenticate and permits a web-mode connection to the destination network. In this example, there are two destination networks, so there will be two SSL VPN policies. The authentication ensures that only authorized users can access the destination network.
- A tunnel-mode policy is a regular ACCEPT security policy that enables traffic to flow between the SSL VPN tunnel interface and the protected network. Tunnel-mode policies are required if you want to provide tunnel-mode connections for your clients. In this example, there are two destination networks, so there will be two tunnel-mode policies.

To create the SSL VPN security policies - web-based manager:

1. Go to **Policy & Objects > Policy > IPv4** and select **Create New.**
2. Enter the following information and click **OK**:

Incoming Interface	ssl.root (sslvpn tunnel interface)
Source Address	All
Source User(s)	Group1
Outgoing Interface	port2
Destination Address	Subnet_1
Service	All

3. Select **Create New.**
4. Enter the following information:

Incoming Interface	ssl.root (sslvpn tunnel interface)
Source Address	All
Source User(s)	Group2
Outgoing Interface	port3
Destination Address	Subnet_2
Service	All

5. Click **OK**.

Configuring authentication rules

1. Go to **VPN > SSL > Settings** and select **Create New** under **Authentication/Portal Mapping**.
2. Add an authentication rule for the first remote group:

Users/Groups	Group1
Portal	Portal1

3. Select **OK** and **Apply**.
4. Select **Create New** and add an authentication rule for the second remote group:

Users/Groups	Group2
Portal	Portal2

5. Select **OK** and **Apply**.

To create the tunnel-mode security policies - web-based manager:

1. Go to **Policy & Objects > Policy > IPv4** and select **Create New**.
2. Enter the following information, and select **OK**:

Incoming Interface	ssl.root (sslvpn tunnel interface)
Source Address	Tunnel_group1
Source User(s)	Group1
Outgoing Interface	port2
Destination Address	Subnet_1
Service	All

Action	ACCEPT
Enable NAT	Enable

3. Select **Create New.**
4. Enter the following information, and select **OK**:

Incoming Interface	ssl.root (sslvpn tunnel interface)
Source Address	Tunnel_group2
Source User(s)	Group2
Outgoing Interface	port3
Destination Address	Subnet_2
Service	All
Action	ACCEPT
Enable NAT	Enable

Create the static route to tunnel mode clients

Reply packets destined for tunnel mode clients must pass through the SSL VPN tunnel. You need to define a static route to allow this.

To add a route to SSL VPN tunnel mode clients - web-based manager:

1. Go to **Router > Static > Static Routes** and select **Create New**.

   For low-end FortiGate units, go to **System > Network > Routing** and select **Create New**.
2. Enter the following information and select **OK**.

Destination IP/Mask	`10.11.254.0/24` This IP address range covers both ranges that you assigned to SSL VPN tunnel-mode users. See Creating the tunnel client range addresses on page 2207.
Device	Select the SSL VPN virtual interface, **ssl.root** for example.

In this example, the **IP Pools** field on the **VPN > SSL > Settings** page is not used because each web portal specifies its own tunnel IP address range.

Troubleshooting

This section contains tips to help you with some common challenges of SSL VPNs.

- Enter the following to display debug messages for SSL VPN:

  ```
  diagnose debug application sslvpn -1
  ```

  This command enables debugging of SSL VPN with a debug level of -1. The -1 debug level produces detailed results.

- Enter the following command to verify the debug configuration:

  ```
  diagnose debug info
  debug output: disable
  console timestamp: disable
  console no user log message: disable
  sslvpn debug level: -1 (0xffffffff)
  CLI debug level: 3
  ```

  This output verifies that SSL VPN debugging is enabled with a debug level of -1, and shows what filters are in place. The output above indicates that debug output is disabled, so debug messages are not displayed. The output also indicates that debugging has not been enabled for any software systems.

- Enter the following to enable displaying debug messages:

  ```
  diagnose debug enable
  ```

  To view the debug messages, log into the SSL VPN portal. The CLI displays debug output similar to the following:

  ```
  FGT60C3G10002814 # [282:root]SSL state:before/accept initialization (172.20.120.12)
  [282:root]SSL state:SSLv3 read client hello A (172.20.120.12)
  [282:root]SSL state:SSLv3 write server hello A (172.20.120.12)
  [282:root]SSL state:SSLv3 write change cipher spec A (172.20.120.12)
  [282:root]SSL state:SSLv3 write finished B (172.20.120.12)
  [282:root]SSL state:SSLv3 flush data (172.20.120.12)
  [282:root]SSL state:SSLv3 read finished A:system lib(172.20.120.12)
  [282:root]SSL state:SSLv3 read finished A (172.20.120.12)
  [282:root]SSL state:SSL negotiation finished successfully (172.20.120.12)
  [282:root]SSL established: DHE-RSA-AES256-SHA SSLv3 Kx=DH Au=RSA Enc=AES(256) Mac=SHA1
  ```

- Enter the following to stop displaying debug messages:

  ```
  diagnose debug disable
  ```

The following is a list of potential issues. The suggestions below are not exhaustive, and may not reflect your network topology.

There is no response from the SSL VPN URL.

- Go to **VPN > SSL > Settings** and check the SSL VPN port assignment. Also, verify that the SSL VPN policy is configured correctly.
- Check the URL you are attempting to connect to. It should follow this pattern:

```
https://<FortiGate IP>:<Port>/remote/login
```

- Ensure that you are using the correct port number in the URL.

FortiClient cannot connect.

Read the Release Notes to ensure that the version of FortiClient you are using is compatible with your version of FortiOS.

Tunnel-mode connection shuts down after a few seconds.

This issue can occur when there are multiple interfaces connected to the Internet (for example, a dual WAN). Upgrade to the latest firmware then use the following CLI command:

```
config vpn ssl settings
   set route-source-interface enable
end
```

When you attempt to connect using FortiClient or in Web mode, you are returned to the login page, or you receive the following error message: "*Unable to logon to the server. Your user name or password may not be configured properly for this connection. (-12).*"

- Ensure that cookies are enabled in your browser.
- If you are using a remote authentication server, ensure that the FortiGate is able to communicate with it.
- Access to the web portal or tunnel will fail if Internet Explorer has the privacy Internet Options set to High. If set to High, Internet Explorer will block cookies that do not have a compact privacy policy, and that use personally identifiable information without your explicit consent.

You receive an error message stating: "*Destination address of Split Tunneling policy is invalid.*"

The SSL VPN security policy uses the **ALL** address as its destination. Change the address to that of the protected network instead.

The tunnel connects but there is no communication.

Go to **Router > Static > Static Routes** and ensure that there is a static route to direct packets destined for the tunnel users to the SSL VPN interface.

You can connect remotely to the VPN tunnel but are unable to access the network resources.

Go to **Policy & Objects > Policy > IPv4** and examine the policy allowing VPN access to the local network. If the destination address is set to all, create a firewall address for the internal network. Change the destination address and attempt to connect remotely again.

Users are unable to download the SSL VPN plugin.

Go to **VPN > SSL > Portals** to make sure that the option to **Limit Users to One SSL-VPN Connection at a Time** is disabled. This allows users to connect to the resources on the portal page while also connecting to the VPN through FortiClient.

Users are being assigned to the wrong IP range.

Ensure that the same IP Pool is used in VPN Portal and VPN Settings to avoid conflicts. If there is a conflict, the portal settings will be used.

Sending tunnel statistics to FortiAnalyzer

By default, logged events include tunnel-up and tunnel-down status events. Other events, by default, will appear in the FortiAnalyzer report as "No Data Available". More accurate results require logs with `action=tunnel-stats`, which is used in generating reports on the FortiAnalyzer (rather than the tunnel-up and tunnel-down event logs). The FortiGate does not, by default, send `tunnel-stats` information.

To allow VPN `tunnel-stats` to be sent to FortiAnalyzer, configure the FortiGate unit as follows using the CLI:

```
config system settings
   set vpn-stats-log ipsec ssl
   set vpn-stats-period 300
end
```

Chapter 23 - System Administration

This guide contains the following sections:

Using the CLI provides an overview of the command line interface (CLI) for FortiOS. If you are new to the FortiOS CLI, this chapter provides a high level overview of how to use this method of administration.

Interfaces describes the FortiGate interface options and configuration choices.

Central management describes how to configure the FortiGate unit to use FortiManager as a method of maintaining the device and other features that FortiManager has to facilitate the administration of multiple devices.

Monitoring describes various methods of collecting log data and tracking traffic flows and tends.

VLANs discusses the implementation of virtual local area networks (VLANs) in FortiOS and how to configure and use them.

PPTP and L2TP describes these virtual private network (VPN) types and how to configure them.

Session helpers describes what session helpers are and how to view and configure them.

Advanced concepts describes more involved administrative topics to enhance network security and traffic efficiency.

Using the CLI

The command line interface (CLI) is an alternative configuration tool to the web-based manager. While the configuration of the web-based manager uses a point-and-click method, the CLI requires typing commands or uploading batches of commands from a text file, like a configuration script.

This section also explains common CLI tasks that an administrator does on a regular basis and includes the topics:

- Connecting to the CLI
- Command syntax
- Sub-commands
- Permissions
- Tips

Connecting to the CLI

You can access the CLI in three ways:

- Locally with a console cable — Connect your computer directly to the FortiGate unit's console port. Local access is required in some cases:
  - If you are installing your FortiGate unit for the first time and it is not yet configured to connect to your network, unless you reconfigure your computer's network settings for a peer connection, you may only be able to connect to the CLI using a local serial console connection.
  - Restoring the firmware utilizes a boot interrupt. Network access to the CLI is not available until after the boot process has completed, making local CLI access the only viable option.
- Through the network — Connect your computer through any network attached to one of the FortiGate unit's network ports. The network interface must have enabled Telnet or SSH administrative access if you will connect using an SSH/Telnet client, or HTTP/HTTPS administrative access if you will connect using the ***CLI Console*** widget in the web-based manager.
- Locally with FortiExplorer — Connect your computer directly to the FortiGate unit's USB management port. FortiExplorer provides direct access to the FortiOS setup wizard, Web-based Manager, and CLI console.

Connecting to the CLI using a local console

Local console connections to the CLI are formed by directly connecting your management computer or console to the FortiGate unit, using its DB-9 or RJ-45 console port. To connect to the local console you need:

- A computer with an available serial communications (COM) port.
- The RJ-45-to-DB-9 or null modem cable included in your FortiGate package.
- Terminal emulation software such as HyperTerminal for Microsoft Windows.

The following procedure describes connection using Microsoft HyperTerminal software; steps may vary with other terminal emulators.

To connect to the CLI using a local serial console connection

1. Using the null modem or RJ-45-to-DB-9 cable, connect the FortiGate unit's console port to the serial communications (COM) port on your management computer.

2. On your management computer, start HyperTerminal.
3. For the **Connection Description**, enter a **Name** for the connection, and select **OK**.
4. On the **Connect using** drop-down list box, select the communications (COM) port on your management computer you are using to connect to the FortiGate unit.
5. Select **OK**.
6. Select the following **Port** settings and select **OK**.

Bits per second	9600
Data bits	8
Parity	None
Stop bits	1
Flow control	None

7. Press **Enter** or **Return** on your keyboard to connect to the CLI.
8. Type a valid administrator account name (such as `admin`) and press Enter.
9. Type the password for that administrator account and press Enter. (In its default state, there is no password for the `admin` account.)

   The CLI displays the following text:

   ```
   Welcome!
   Type ? to list available commands.
   ```

   You can now enter CLI commands, including configuring access to the CLI through SSH or Telnet.

Enabling access to the CLI through the network (SSH or Telnet)

SSH or Telnet access to the CLI is accomplished by connecting your computer to the FortiGate unit using one of its RJ-45 network ports. You can either connect directly, using a peer connection between the two, or through any intermediary network.

If you do not want to use an SSH/Telnet client and you have access to the web-based manager, you can alternatively access the CLI through the network using the **CLI Console** widget in the web-based manager.

You must enable SSH and/or Telnet on the network interface associated with that physical network port. If your computer is not connected directly or through a switch, you must also configure the FortiGate unit with a static route to a router that can forward packets from the FortiGate unit to your computer. You can do this using either a local console connection or the web-based manager.

Requirements

- A computer with an available serial communications (COM) port and RJ-45 port
- Terminal emulation software such as HyperTerminal for Microsoft Windows
- The RJ-45-to-DB-9 or null modem cable included in your FortiGate package
- A network cable
- Prior configuration of the operating mode, network interface, and static route.

To enable SSH or Telnet access to the CLI using a local console connection

1. Using the network cable, connect the FortiGate unit's network port either directly to your computer's network port, or to a network through which your computer can reach the FortiGate unit.
2. Note the number of the physical network port.
3. Using a local console connection, connect and log into the CLI.
4. Enter the following command:

```
config system interface
  edit <interface_str>
    set allowaccess <protocols_list>
    end
```

   where:

   - `<interface_str>` is the name of the network interface associated with the physical network port and containing its number, such as `port1`
   - `<protocols_list>` is the complete, space-delimited list of permitted administrative access protocols, such as `https ssh telnet`

   For example, to exclude HTTP, HTTPS, SNMP, and PING, and allow only SSH and Telnet administrative access on `port1`:

```
config system interface
  edit port1
    set allowaccess ssh telnet
    end
```

5. To confirm the configuration, enter the command to display the network interface's settings.

```
show system interface <interface_str>
```

   The CLI displays the settings, including the allowed administrative access protocols, for the network interfaces.

Connecting to the CLI using SSH

Once the FortiGate unit is configured to accept SSH connections, you can use an SSH client on your management computer to connect to the CLI.

Secure Shell (SSH) provides both secure authentication and secure communications to the CLI. FortiGate units support 3DES and Blowfish encryption algorithms for SSH.

Before you can connect to the CLI using SSH, you must first configure a network interface to accept SSH connections. The following procedure uses PuTTY. Steps may vary with other SSH clients.

To connect to the CLI using SSH

1. On your management computer, start an SSH client.
2. In **Host Name (or IP Address)**, enter the IP address of a network interface on which you have enabled SSH administrative access.
3. In **Port**, enter `22`.
4. For the **Connection type**, select **SSH**.
5. Select **Open**.

   The SSH client connects to the FortiGate unit.

The SSH client may display a warning if this is the first time you are connecting to the FortiGate unit and its SSH key is not yet recognized by your SSH client, or if you have previously connected to the FortiGate unit but used a different IP address or SSH key. This is normal If your management computer is directly connected to the FortiGate unit with no network hosts between them.

6. Click **Yes** to verify the fingerprint and accept the FortiGate unit's SSH key. You will not be able to log in until you have accepted the key.
7. The CLI displays a login prompt.
8. Type a valid administrator account name (such as `admin`) and press Enter.
9. Type the password for this administrator account and press Enter.

   The FortiGate unit displays a command prompt (its host name followed by a `#`. You can now enter CLI commands.

If three incorrect login or password attempts occur in a row, you will be disconnected. If this occurs, wait one minute, then reconnect to attempt the login again.

Connecting to the CLI using Telnet

Once the FortiGate unit is configured to accept Telnet connections, you can use a Telnet client on your management computer to connect to the CLI.

Telnet is not a secure access method. SSH should be used to access the CLI from the Internet or any other untrusted network.

Before you can connect to the CLI using Telnet, you must first configure a network interface to accept Telnet connections.

To connect to the CLI using Telnet

1. On your management computer, start a Telnet client.
2. Connect to a FortiGate network interface on which you have enabled Telnet.
3. Type a valid administrator account name (such as `admin`) and press Enter.
4. Type the password for this administrator account and press Enter.

   The FortiGate unit displays a command prompt (its host name followed by a `#`. You can now enter CLI commands.

If three incorrect login or password attempts occur in a row, you will be disconnected. If this occurs, wait one minute, then reconnect to attempt the login again.

Connecting to the CLI locally with FortiExplorer

FortiExplorer is a standalone software solution that allows you to connect to your FortiGate device using the USB interface of your management computer. FortiExplorer provides direct access to the FortiOS setup wizard, Web-based Manager, and CLI console.

FortiExplorer is available for download from the Customer Service & Support website https://support.fortinet.com in firmware images. FortiExplorer is available for both Microsoft Windows and Mac OS X computers.

FortiExplorer provides a user-friendly tool that you can use to configure a FortiGate unit over a standard USB connection, rather than using a console cable or Ethernet connection.

Do not connect the USB cable until after FortiExplorer has been installed.

Installing FortiExplorer on Microsoft Windows

To install FortiExplorer on a Microsoft Windows workstation:

1. Double-click the .msi or .exe file and follow the instructions on-screen.
2. Connect the USB cable to the FortiGate unit and then to the management computer.
3. The FortiExplorer Fortinet Device Easy Configuration Utility opens when the USB cable is connected. Select ***Install the hardware automatically*** and select ***Next***.
4. After a moment, FortiExplorer will launch.

Installing FortiExplorer on Mac OS X

To install FortiExplorer on a Mac OS X workstation:

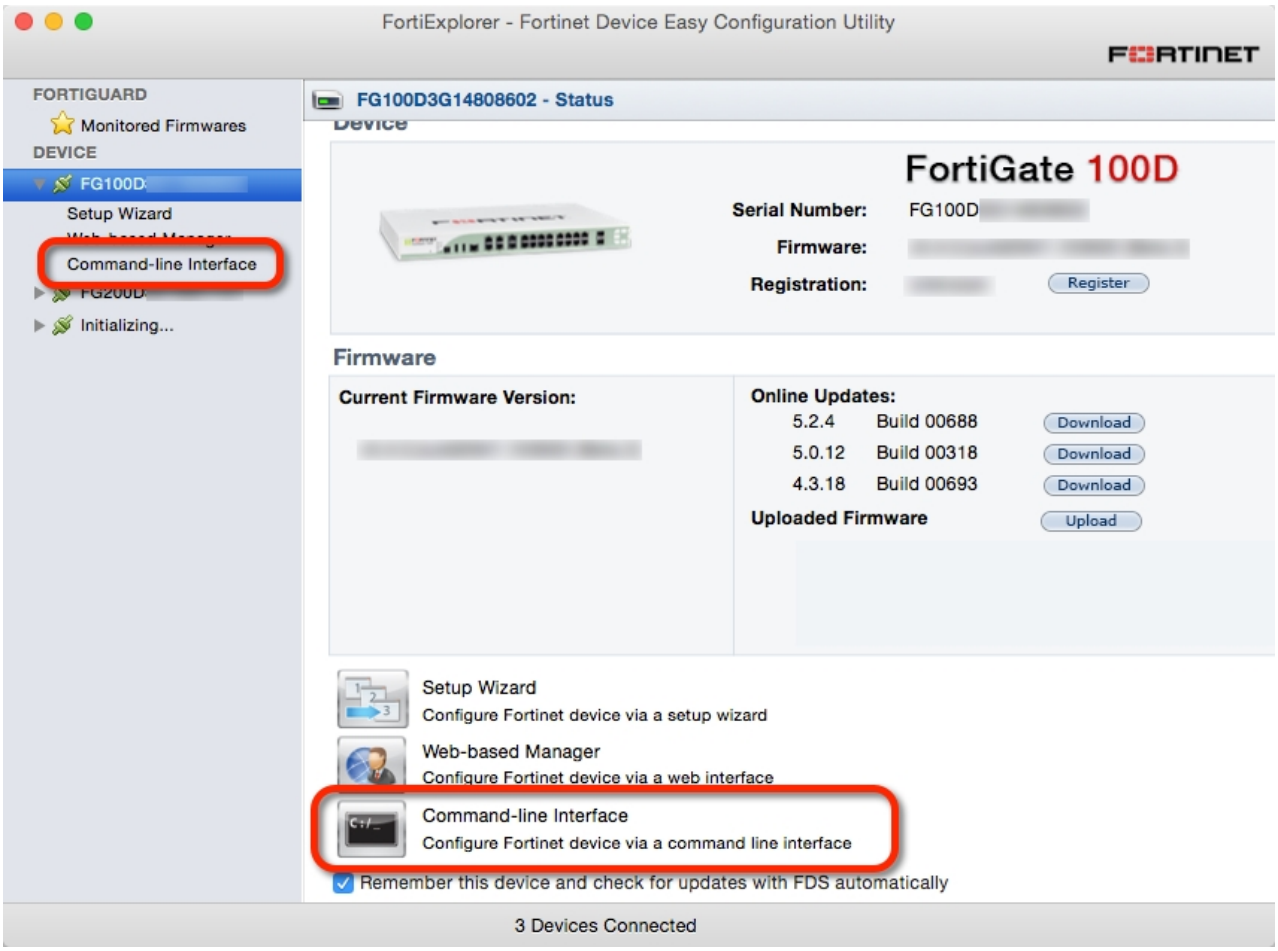
1. Double-click the .dmg file and drag the FortiExplorer program file into the Applications folder.
2. Connect the USB cable to the FortiGate unit and then to the management computer.
3. Double-click the FortiExplorer icon to launch the application.

Starting the CLI from FortiExplorer

The below image shows the FortiExplorer tool connected to a FortiGate 100D device. You have two options for connecting to the CLI.

1. The left window pan, in the ***Devices*** section, under the specific FortiGate's name, select on ***Command-line Interface.*** Select the text
2. In the main window pane, at the bottom, there is an icon of a terminal window beside the text ***Command-line Interface***. Select the icon.

Selecting either of these links will open a terminal emulation or command line interface in the main window pane of the FortiExplorer window.



Command syntax

When entering a command, the command line interface (CLI) requires that you use valid syntax and conform to expected input constraints. It will reject invalid commands.

Fortinet documentation uses the following conventions to describe valid command syntax

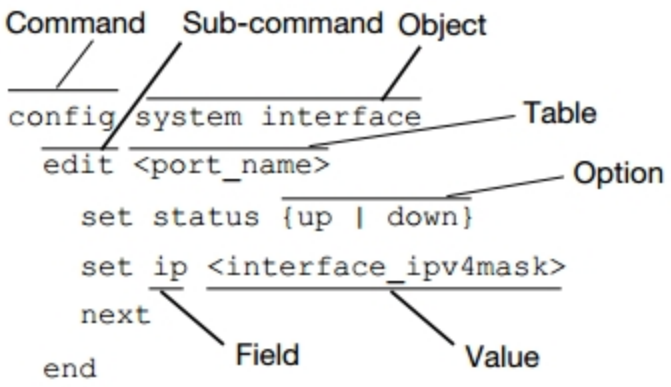
Terminology

Each command line consists of a command word that is usually followed by words for the configuration data or other specific item that the command uses or affects:

```
get system admin
```

To describe the function of each word in the command line, especially if that nature has changed between firmware versions, Fortinet uses terms with the following definitions.

Command syntax terminology



- **command** — A word that begins the command line and indicates an action that the FortiGate unit should perform on a part of the configuration or host on the network, such as `config` or `execute`. Together with other words, such as fields or values, that end when you press the Enter key, it forms a command line. Exceptions include multiline command lines, which can be entered using an escape sequence.
  Valid command lines must be unambiguous if abbreviated. Optional words or other command line permutations are indicated by syntax notation.
- **sub-command** — A kind of command that is available only when nested within the scope of another command. After entering a command, its applicable sub-commands are available to you until you exit the scope of the command, or until you descend an additional level into another sub-command. Indentation is used to indicate levels of nested commands.
  Not all top-level commands have sub-commands. Available sub-commands vary by their containing scope.
- **object** — A part of the configuration that contains tables and/or fields. Valid command lines must be specific enough to indicate an individual object.
- **table** — A set of fields that is one of possibly multiple similar sets which each have a name or number, such as an administrator account, policy, or network interface. These named or numbered sets are sometimes referenced by other parts of the configuration that use them.
- **field** — The name of a setting, such as `ip` or `hostname`. Fields in some tables must be configured with values. Failure to configure a required field will result in an invalid object configuration error message, and the FortiGate unit will discard the invalid table.
- **value** — A number, letter, IP address, or other type of input that is usually your configuration setting held by a field. Some commands, however, require multiple input values which may not be named but are simply entered in sequential order in the same command line. Valid input types are indicated by constraint notation.
- **option** — A kind of value that must be one or more words from of a fixed set of options.

Indentation

Indentation indicates levels of nested commands, which indicate what other subcommittees are available from within the scope. For example, the `edit` sub-command is available only within a command that affects tables, and the `next` sub-command is available only from within the `edit` sub-command:

```
config system interface
   edit port1
      set status up
      end
```

Notation

Brackets, braces, and pipes are used to denote valid permutations of the syntax. Constraint notations, such as `<address_ipv4>`, indicate which data types or string patterns are acceptable value input.

Command syntax notation

Convention	Description
Square brackets `[ ]`	A non-required word or series of words. For example: `[verbose {1 | 2 | 3}]` indicates that you may either omit or type both the `verbose` word and its accompanying option, such as `verbose 3`.
Angle brackets `< >`	A word constrained by data type. The angled brackets contain a descriptive name followed by an underscore (_) and suffix that indicates the valid data type. For example, `<retries_int>`, indicates that you should enter a number of retries, such as `5`. Data types include: • `<xxx_name>`: A name referring to another part of the configuration, such as `policy_A`. • `<xxx_index>`: An index number referring to another part of the configuration, such as `0` for the first static route. • `<xxx_pattern>`: A regular expression or word with wild cards that matches possible variations, such as `*@example.com` to match all email addresses ending in `@example.com`. • `<xxx_fqdn>`: A fully qualified domain name (FQDN), such as `mail.example.com`. • `<xxx_email>`: An email address, such as `admin@example.com`. • `<xxx_ipv4>`: An IPv4 address, such as `192.168.1.99`. • `<xxx_v4mask>`: A dotted decimal IPv4 netmask, such as `255.255.255.0`. • `<xxx_ipv4mask>`: A dotted decimal IPv4 address and netmask separated by a space, such as `192.168.1.99 255.255.255.0`. • `<xxx_ipv4/mask>`: A dotted decimal IPv4 address and CIDR-notation netmask separated by a slash, such as `192.168.1.1/24` • `<xxx_ipv4range>` : A hyphen (`-`)-delimited inclusive range of IPv4 addresses, such as `192.168.1.1-192.168.1.255`. • `<xxx_ipv6>`: A colon(`:`)-delimited hexadecimal IPv6 address, such as `3f2e:6a8b:78a3:0d82:1725:6a2f:0370:6234`. • `<xxx_v6mask>`: An IPv6 netmask, such as `/96`. • `<xxx_ipv6mask>`: A dotted decimal IPv6 address and netmask separated by a space. • `<xxx_str>`: A string of characters that is not another data type, such as `P@ssw0rd`. Strings containing spaces or special characters must be surrounded in quotes or use escape sequences. • `<xxx_int>`: An integer number that is **not** another data type, such as `15` for the number of minutes.

Convention	Description
Curly braces `{ }`	A word or series of words that is constrained to a set of options delimited by either vertical bars or spaces. You must enter at least one of the options, unless the set of options is surrounded by square brackets `[ ]`.
Options delimited by vertical bars `|`	Mutually exclusive options. For example: `{enable | disable}` indicates that you must enter either `enable` or `disable`, but must not enter both.

Options delimited by spaces	Non-mutually exclusive options. For example:
	`{http https ping snmp ssh telnet}`
	indicates that you may enter all or a subset of those options, in any order, in a space-delimited list, such as:
	`ping https ssh`

Sub-commands

Each command line consists of a command word that is usually followed by words for the configuration data or other specific item that the command uses or affects:

```
get system admin
```

Sub-commands are available from within the scope of some commands.When you enter a sub-command level, the command prompt changes to indicate the name of the current command scope. For example, after entering:

```
config system admin
```

the command prompt becomes:

```
(admin)#
```

Applicable sub-commands are available to you until you exit the scope of the command, or until you descend an additional level into another sub-command.

For example, the `edit` sub-command is available only within a command that affects tables; the `next` sub-command is available only from within the `edit` sub-command:

```
config system interface
   edit port1
      set status up
      next
   end
```

Sub-command scope is indicated by indentation.

Available sub-commands vary by command. From a command prompt within `config`, two types of sub-commands might become available:

- commands affecting fields
- commands affecting tables

Commands for tables

clone <table>	Clone (or make a copy of) a table from the current object.
	
	For example, in `config firewall policy`, you could enter the following command to clone security policy 27 to create security policy 30:
	
	`clone 27 to 30`
	
	In `config antivirus profile`, you could enter the following command to clone an antivirus profile named `av_pro_1` to create a new antivirus profile named `av_pro_2`:
	
	`clone av_pro_1 to av_pro_2`
	
	`clone` may not be available for all tables.

delete <table>	Remove a table from the current object. For example, in `config system admin`, you could delete an administrator account named `newadmin` by typing `delete newadmin` and pressing Enter. This deletes `newadmin` and all its fields, such as `newadmin`'s `first-name` and `email-address`. `delete` is only available within objects containing tables.
edit <table>	Create or edit a table in the current object. For example, in `config system admin`: • edit the settings for the default `admin` administrator account by typing `edit admin`. • add a new administrator account with the name `newadmin` and edit `newadmin`'s settings by typing `edit newadmin`. `edit` is an interactive sub-command: further sub-commands are available from within `edit`. `edit` changes the prompt to reflect the table you are currently editing. `edit` is only available within objects containing tables. In objects such as security policies, `<table>` is a sequence number. To create a new entry without the risk of overwriting an existing one, enter `edit 0`. The CLI initially confirms the creation of entry 0, but assigns the next unused number after you finish editing and enter `end`.
end	Save the changes to the current object and exit the `config` command. This returns you to the top-level command prompt.

get	List the configuration of the current object or table. • In objects, `get` lists the table names (if present), or fields and their values. • In a table, `get` lists the fields and their values. For more information on `get` commands, see the CLI Reference.
purge	Remove all tables in the current object. For example, in `config user local`, you could type `get` to see the list of user names, then type `purge` and then `y` to confirm that you want to delete all users. `purge` is only available for objects containing tables. **Caution:** Back up the FortiGate unit before performing a `purge`. `purge` cannot be undone. To restore purged tables, the configuration must be restored from a backup. **Caution:** Do not purge `system interface` or `system admin` tables. `purge` does not provide default tables. This can result in being unable to connect or log in, requiring the FortiGate unit to be formatted and restored.
rename <table> to <table>	Rename a table. For example, in `config system admin`, you could rename `admin3` to `fwadmin` by typing `rename admin3 to fwadmin`. `rename` is only available within objects containing tables.
show	Display changes to the default configuration. Changes are listed in the form of configuration commands.

Example of table commands

From within the `system admin` object, you might enter:

```
edit admin_1
```

The CLI acknowledges the new table, and changes the command prompt to show that you are now within the `admin_1` table:

```
new entry 'admin_1' added
(admin_1)#
```

Commands for fields

abort	Exit both the `edit` and/or `config` commands without saving the fields.
append	Add an option to an existing list.
end	Save the changes made to the current table or object fields, and exit the `config` command. (To exit without saving, use `abort` instead.)
get	List the configuration of the current object or table. • In objects, `get` lists the table names (if present), or fields and their values. • In a table, `get` lists the fields and their values.
move	Move an object within a list, when list order is important. For example, rearranging security policies within the policy list.
next	Save the changes you have made in the current table's fields, and exit the `edit` command to the object prompt. (To save and exit completely to the root prompt, use `end` instead.) `next` is useful when you want to create or edit several tables in the same object, without leaving and re-entering the `config` command each time. `next` is only available from a table prompt; it is not available from an object prompt.
select	Clear all options except for those specified. For example, if a group contains members A, B, C, and D and you remove all users except for B, use the command `select member B`.
set <field> <value>	Set a field's value. For example, in `config system admin`, after typing `edit admin`, you could type `set password newpass` to change the password of the `admin` administrator to `newpass`. **Note:** When using `set` to change a field containing a space-delimited list, type the whole new list. For example, `set <field> <new-value>` will replace the list with the `<new-value>` rather than appending `<new-value>` to the list.
show	Display changes to the default configuration. Changes are listed in the form of configuration commands.
unselect	Remove an option from an existing list.
unset <field>	Reset the table or object's fields to default values. For example, in `config system admin`, after typing `edit admin`, typing `unset password` resets the password of the `admin` administrator account to the default (in this case, no password).

Example of field commands

From within the `admin_1` table, you might enter:

```
set password my1stExamplePassword
```

to assign the value `my1stExamplePassword` to the `password` field. You might then enter the `next` command to save the changes and edit the next administrator's table.

Permissions

Depending on the account that you use to log in to the FortiGate unit, you may not have complete access to all CLI commands. Access profiles control which CLI commands an administrator account can access. Access profiles assign either read, write, or no access to each area of the FortiGate software. To view configurations, you must have read access. To make changes, you must have write access.

Unlike other administrator accounts, the administrator account named `admin` exists by default and cannot be deleted. The `admin` administrator account is similar to a root administrator account. This administrator account always has full permission to view and change all FortiGate configuration options, including viewing and changing **all** other administrator accounts. Its name and permissions cannot be changed. It is the only administrator account that can reset another administrator's password without being required to enter that administrator's existing password.

Set a strong password for the admin administrator account, and change the password regularly. By default, this administrator account has no password. Failure to maintain the password of the admin administrator account could compromise the security of your FortiGate unit.

For complete access to all commands, you must log in with the administrator account named `admin`.

Tips

Basic features and characteristics of the CLI environment provide support and ease of use for many CLI tasks.

Help

To display brief help during command entry, press the question mark (?) key.

- Press the question mark (?) key at the command prompt to display a list of the commands available and a description of each command.
- Type a word or part of a word, then press the question mark (?) key to display a list of valid word completions or subsequent words, and to display a description of each.

Shortcuts and key commands

Shortcuts and key commands

Action	Keys
List valid word completions or subsequent words. If multiple words could complete your entry, display all possible completions with helpful descriptions of each.	?
Complete the word with the next available match. Press the key multiple times to cycle through available matches.	Tab
Recall the previous command. Command memory is limited to the current session.	Up arrow, or Ctrl + P
Recall the next command.	Down arrow, or Ctrl + N
Move the cursor left or right within the command line.	Left or Right arrow
Move the cursor to the beginning of the command line.	Ctrl + A
Move the cursor to the end of the command line.	Ctrl + E
Move the cursor backwards one word.	Ctrl + B
Move the cursor forwards one word.	Ctrl + F
Delete the current character.	Ctrl + D
Abort current interactive commands, such as when entering multiple lines. If you are not currently within an interactive command such as `config` or `edit`, this closes the CLI connection.	Ctrl + C
Continue typing a command on the next line for a multi-line command. For each line that you want to continue, terminate it with a backslash (\ ). To complete the command line, terminate it by pressing the spacebar and then the Enter key, without an immediately preceding backslash.	\ then Enter

Command abbreviation

You can abbreviate words in the command line to their smallest number of non-ambiguous characters.

For example, the command `get system status` could be abbreviated to `g sy stat`.

Adding and removing options from lists

When adding options to a list, such as a user group, using the `set` command will remove the previous configuration. For example. if you wish to add user D to a user group that already contains members A, B, and C, the command would need to be `set member A B C D`. If only `set member D` was used, then all former members would be removed from the group.

However, there are additional commands which can be used instead of `set` for changing options in a list.

Additional commands for lists

append	Add an option to an existing list. For example, `append member` would add user D to a user group while all previous group members are retained
select	Clear all options except for those specified. For example, if a group contains members A, B, C, and D and you remove all users except for B, use the command `select member B`.
unselect	Remove an option from an existing list. For example, `unselect member A` would remove member A from a group will all previous group members are retained.

Environment variables

The CLI supports the following environment variables. Variable names are case-sensitive.

Environment variables

$USERFROM	The management access type (`ssh`, `telnet`, `jsconsole` for the **CLI Console** widget in the web-based manager, and so on) and the IP address of the administrator that configured the item.
$USERNAME	The account name of the administrator that configured the item.
$SerialNum	The serial number of the FortiGate unit.

For example, the FortiGate unit's host name can be set to its serial number.

```
config system global
   set hostname $SerialNum
end
```

Special characters

The characters <, >, (,), #, ', and " are not permitted in most CLI fields. These characters are special characters, also known as reserved characters.

You may be able to enter special character as part of a string's value by using a special command, enclosing it in quotes, or preceding it with an escape sequence — in this case, a backslash (\ ) character.

In other cases, different keystrokes are required to input a special character. If you need to enter ? as part of config, you first need to input CTRL-V. If you enter the question mark (?) without first using CTRL-V, the question mark has a different meaning in CLI: it will show available command options in that section.

For example, if you enter ? without CTRL-V:

```
edit "*.xe
token line: Unmatched double quote.
```

If you enter ? with CTRL-V:

```
edit "*.xe?"
new entry '*.xe?' added
```

Entering special characters

Character	Keys
?	Ctrl + V then ?
Tab	Ctrl + V then Tab
Space (to be interpreted as part of a string value, not to end the string)	Enclose the string in quotation marks: `"Security Administrator"`. Enclose the string in single quotes: `'Security Administrator'`. Precede the space with a backslash: `Security\ Administrator`.
' (to be interpreted as part of a string value, not to end the string)	\'
" (to be interpreted as part of a string value, not to end the string)	\"
\	\\

Using grep to filter get and show command output

In many cases, the `get` and `show` (and `diagnose`) commands may produce a large amount of output. If you are looking for specific information in a large get or show command output, you can use the grep command to filter the output to only display what you are looking for. The `grep` command is based on the standard UNIX grep, used for searching text output based on regular expressions.

Use the following command to display the MAC address of the FortiGate unit internal interface:

```
get hardware nic internal | grep Current_HWaddr
Current_HWaddr             00:09:0f:cb:c2:75
```

Use the following command to display all TCP sessions in the session list and include the session list line number in the output

```
get system session list | grep -n tcp
```

Use the following command to display all lines in HTTP replacement message commands that contain `URL` (upper or lower case):

```
show system replacemsg http | grep -i url
```

There are three additional options that can be applied to grep:

```
-A <num> After
-B <num> Before
-C <num> Context
```

The option `-f` is also available to support Fortinet contextual output, in order to show the complete configuration. The following example shows the difference in output when `-f` option is used versus when it is not.

Using -f:

```
show | grep -f ldap-group1
   config user group
      edit "ldap-group1"
         set member "pc40-LDAP"
      next
   end
   config firewall policy
      edit 2
         set srcintf "port31"
         set dstintf "port32"
         set srcaddr "all"
         set action accept
         set identity-based enable
         set nat enable
         config identity-based-policy
            edit 1
               set schedule "always"
               set groups "ldap-group1"
               set dstaddr "all"
               set service "ALL"
            next
         end
      next
   end
```

Without using -f:

```
show | grep ldap-group1
   edit "ldap-group1"
      set groups "ldap-group1"
```

Language support and regular expressions

Characters such as ñ, é, symbols, and ideographs are sometimes acceptable input. Support varies by the nature of the item being configured. CLI commands, objects, field names, and options must use their exact ASCII characters, but some items with arbitrary names or values may be input using your language of choice. To use other languages in those cases, you must use the correct encoding.

Input is stored using Unicode UTF-8 encoding but is not normalized from other encodings into UTF-8 before it is stored. If your input method encodes some characters differently than in UTF-8, your configured items may not display or operate as expected.

Regular expressions are especially impacted. Matching uses the UTF-8 character values. If you enter a regular expression using another encoding, or if an HTTP client sends a request in an encoding other than UTF-8, matches may not be what you expect.

For example, with Shift-JIS, backslashes (\ ) could be inadvertently interpreted as the symbol for the Japanese yen (¥) and vice versa. A regular expression intended to match HTTP requests containing money values with a yen symbol therefore may not work it if the symbol is entered using the wrong encoding.

For best results, you should:

- use UTF-8 encoding, or
- use only the characters whose numerically encoded values are the same in UTF-8, such as the US-ASCII characters that are also encoded using the same values in ISO 8859-1, Windows code page 1252, Shift-JIS and other encodings, or
- for regular expressions that must match HTTP requests, use the same encoding as your HTTP clients.

HTTP clients may send requests in encodings other than UTF-8. Encodings usually vary by the client's operating system or input language. If you cannot predict the client's encoding, you may only be able to match any parts of the request that are in English, because regardless of the encoding, the values for English characters tend to be encoded identically. For example, English words may be legible regardless of interpreting a web page as either ISO 8859-1 or as GB2312, whereas simplified Chinese characters might only be legible if the page is interpreted as GB2312.

If you configure your FortiGate unit using other encodings, you may need to switch language settings on your management computer, including for your web browser or Telnet/SSH client. For instructions on how to configure your management computer's operating system language, locale, or input method, see its documentation.

If you choose to configure parts of the FortiGate unit using non-ASCII characters, verify that all systems interacting with the FortiGate unit also support the same encodings. You should also use the same encoding throughout the configuration if possible in order to avoid needing to switch the language settings of the web-based manager and your web browser or Telnet/SSH client while you work.

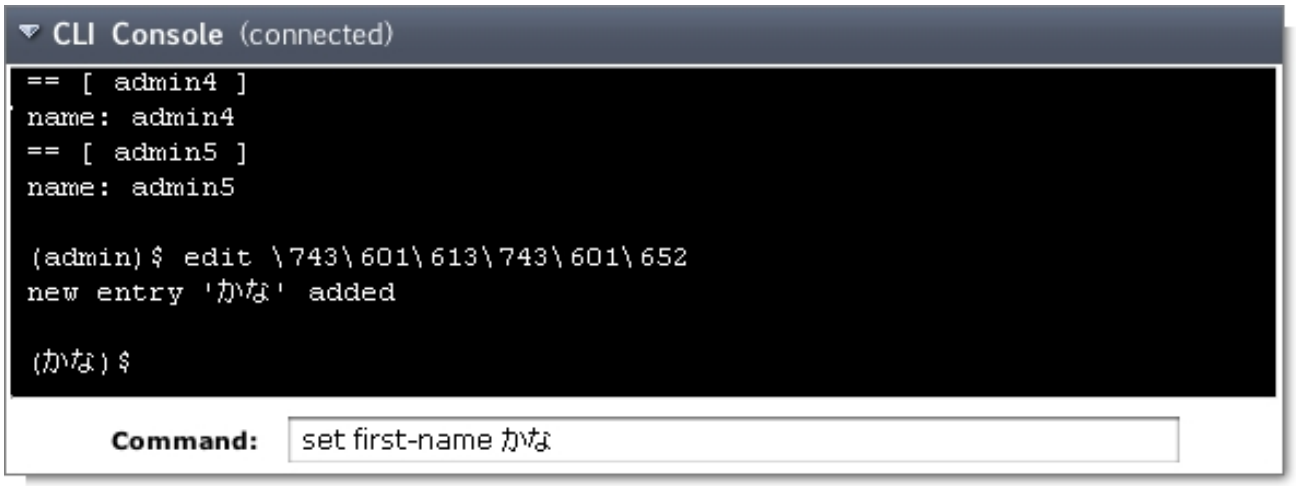
Similarly to input, your web browser or CLI client should usually interpret display output as encoded using UTF-8. If it does not, your configured items may not display correctly in the web-based manager or CLI. Exceptions include items such as regular expressions that you may have configured using other encodings in order to match the encoding of HTTP requests that the FortiGate unit receives.

To enter non-ASCII characters in the CLI Console widget

1. On your management computer, start your web browser and go to the URL for the FortiGate unit's web-based manager.

2. Configure your web browser to interpret the page as UTF-8 encoded.
3. Log in to the FortiGate unit.
4. Go to **System > Dashboard > Status**.
5. In title bar of the **CLI Console** widget, click **Edit** (the pencil icon).
6. Enable **Use external command input box**.
7. Select **OK**.
8. The **Command** field appears below the usual input and display area of the **CLI Console** widget.
9. In **Command**, type a command.

Entering encoded characters (CLI Console widget):



10. Press **Enter**.
    In the display area, the ***CLI Console*** widget displays your previous command interpreted into its character code equivalent, such as:

    ```
    edit \743\601\613\743\601\652
    ```

    and the command's output.

To enter non-ASCII characters in a Telnet/SSH client

1. On your management computer, start your Telnet or SSH client.
2. Configure your Telnet or SSH client to send and receive characters using UTF-8 encoding.
   Support for sending and receiving international characters varies by each Telnet/SSH client. Consult the documentation for your Telnet/SSH client.
3. Log in to the FortiGate unit.
4. At the command prompt, type your command and press Enter.

Entering encoded characters (PuTTY):

You may need to surround words that use encoded characters with single quotes (').

Depending on your Telnet/SSH client's support for your language's input methods and for sending international characters, you may need to interpret them into character codes before pressing Enter.

For example, you might need to enter:

```
edit '\743\601\613\743\601\652'
```

5. The CLI displays your previous command and its output.

Screen paging

You can configure the CLI to pause after displaying each page's worth of text when displaying multiple pages of output. When the display pauses, the last line displays `--More--`. You can then either:

- press the spacebar to display the next page.
- type `Q` to truncate the output and return to the command prompt.

This may be useful when displaying lengthy output, such as the list of possible matching commands for command completion, or a long list of settings. Rather than scrolling through or possibly exceeding the buffer of your terminal emulator, you can simply display one page at a time.

To configure the CLI display to pause when the screen is full:

```
config system console
   set output more
end
```

Baud rate

You can change the default baud rate of the local console connection.

To change the baud rate enter the following commands:

```
config system console
   set baudrate {115200 | 19200 | 38400 | 57600 | 9600}
end
```

Editing the configuration file on an external host

You can edit the FortiGate configuration on an external host by first backing up the configuration file to a TFTP server. Then edit the configuration file and restore it to the FortiGate unit.

Editing the configuration on an external host can be timesaving if you have many changes to make, especially if your plain text editor provides advanced features such as batch changes.

To edit the configuration on your computer

1. Use `execute backup` to download the configuration file to a TFTP server, such as your management computer.
2. Edit the configuration file using a plain text editor that supports Unix-style line endings.

Do not edit the first line. The first line(s) of the configuration file (preceded by a # character) contains information about the firmware version and FortiGate model. If you change the model number, the FortiGate unit will reject the configuration file when you attempt to restore it.

3. Use `execute restore` to upload the modified configuration file back to the FortiGate unit.
   The FortiGate unit downloads the configuration file and checks that the model information is correct. If it is, the FortiGate unit loads the configuration file and checks each command for errors. If a command is invalid, the FortiGate unit ignores the command. If the configuration file is valid, the FortiGate unit restarts and loads the new configuration.

Using Perl regular expressions

Some FortiGate features, such as spam filtering and web content filtering can use either wildcards or Perl regular expressions.

See http://perldoc.perl.org/perlretut.html for detailed information about using Perl regular expressions. For more information on using Perl expressions see the Security Profiles chapter of The Handbook.

Differences between regular expression and wildcard pattern matching

In Perl regular expressions, the period (‘.’) character refers to any single character. It is similar to the question mark (‘?’) character in wildcard pattern matching. As a result:

- `fortinet.com` not only matches `example.com` but also matches `exampleacom`, `examplebcom`, `exampleccom` and so on.

To match a special character such as the period ('.') and the asterisk (‘*’), regular expressions use the slash (‘\’) escape character. For example:

- To match `example.com`, the regular expression should be `example\.com`.

In Perl regular expressions, the asterisk (‘*’) means match 0 or more times of the character before it, not 0 or more times of any character. For example:

- `exam*\.com` matches `exammmm.com` but does not match `eample.com`.

To match any character 0 or more times, use ‘.*’ where ‘.’ means any character and the ‘*’ means 0 or more times. For example:

- the wildcard match pattern `exam*.com` is equivalent to the regular expression `exam.*\.com`.

Word boundary

In Perl regular expressions, the pattern does not have an implicit word boundary. For example, the regular expression “test” not only matches the word “test” but also matches any word that contains the word “test” such as

“atest”, “mytest”, “testimony”, “atestb”. The notation “\b” specifies the word boundary. To match exactly the word “test”, the expression should be `\btest\b`.

Case sensitivity

Regular expression pattern matching is case sensitive in the Web and Spam filters. To make a word or phrase case insensitive, use the regular expression `/i`. For example, `/bad language/i` will block all instances of “bad language” regardless of case.

Perl regular expression examples

Expression	Matches
abc	abc (that exact character sequence, but anywhere in the string)
^abc	abc at the beginning of the string
abc$	abc at the end of the string
a|b	either of a and b
^abc|abc$	the string abc at the beginning or at the end of the string
ab{2,4}c	an a followed by two, three or four b's followed by a c
ab{2,}c	an a followed by at least two b's followed by a c
ab*c	an a followed by any number (zero or more) of b's followed by a c
ab+c	an a followed by one or more b's followed by a c
ab?c	an a followed by an optional b followed by a c; that is, either abc or ac
a.c	an a followed by any single character (not newline) followed by a c
a\.c	a.c exactly
[abc]	any one of a, b and c
[Aa]bc	either of Abc and abc
[abc]+	any (nonempty) string of a's, b's and c's (such as a, abba, acbabcacaa)
[^abc]+	any (nonempty) string which does not contain any of a, b and c (such as defg)
\d\d	any two decimal digits, such as 42; same as \d{2}
/i	makes the pattern case insensitive. For example, `/bad language/i` blocks any instance of “bad language” regardless of case.
\w+	a "word": a nonempty sequence of alphanumeric characters and low lines (underscores), such as foo and 12bar8 and foo_1
100\s*mk	the strings 100 and mk optionally separated by any amount of white space (spaces, tabs, newlines)
abc\b	abc when followed by a word boundary (e.g. in abc! but not in abcd)
perl\B	perl when not followed by a word boundary (e.g. in perlert but not in perl stuff)

Expression	Matches
\x	tells the regular expression parser to ignore white space that is neither backslashed nor within a character class. You can use this to break up your regular expression into (slightly) more readable parts.

Firmware

Fortinet periodically updates the FortiGate firmware to include new features and resolve important issues. After you have registered your FortiGate unit, you can download firmware updates from the support web site, https://support.fortinet.com.

Before you install any new firmware, be sure to follow the steps below:

- Review the Release Notes for a new firmware release.
- Review the Supported Upgrade Paths document to make sure the upgrade from your current image to the desired new image is supported.
- Backup the current configuration, including local certificates. For more information, see Firmware on page 2243.
- Test the new firmware until you are satisfied that it applies to your configuration.

Installing new firmware without reviewing release notes or testing the firmware may result in changes to settings or unexpected issues.

Only FortiGate admin users and administrators whose access profiles contain system read and write privileges can change the FortiGate firmware.

Backing up the current configuration

In case you need to restore your FortiGate configuration, you should always back up the configuration before installing new firmware.

To create a local backup:

1. Go to **System > Dashboard > Status** and locate the **System Information** widget.
2. Select **Backup** beside **System Configuration**.
3. Choose either **Local PC** or **USB Disk** to save the configuration file.
4. If desired, select **Encrypt configuration file**.
5. Select **Backup**.

Restoring a configuration file

Rather than reconfigure the FortiGate manually, it is possible to upload a saved configuration file.

To restore your FortiGate configuration

1. Go to **System > Dashboard > Status** and locate the **System Information** widget.
2. Select **[Restore]** beside **System Configuration**.
3. Choose either **Local PC** or **USB Disk** depending the location of the file.
4. Select ***Choose File*** and browse to the correct file in the file manager window.

5. If a password was associated with the configuration file, enter it in the ***Password*** field.
6. Select **Restore**.

Troubleshooting

During the installation there are some possible errors that you may come across but the solutions are usually straightforward.

.

Error message	Reason and Solution
Configuration file error	This error occurs when attempting to upload a configuration file that is incompatible with the device. This may be due to the configuration file being for a different model or being saved from a different version of firmware. **Solution**: upload a configuration file that is for the correct model of FortiGate device and the correct version of the firmware.
Invalid password	When the configuration file is saved, it can be protected by a password. The password entered during the upload process is not matching the one associated with the configuration file. **Solution**: use the correct password if the file is password protected.

Downloading firmware

Firmware images for all FortiGate units is available on the Fortinet Customer Support website, https://support.fortinet.com.

To download firmware

1. Log into the site using your user name and password.
2. Go to **Download > Firmware Images**.
3. A list of Release Notes is shown. If you have not already done so, download and review the Release Notes for the firmware you wish to upgrade your FortiGate unit to.
4. Select **HTTPS Download**.

Firmware can also be downloaded using FTP; however, as FTP is not an encrypted file transferring protocol, HTTPS downloading is recommended.

5. Navigate to find the folder for the firmware version you wish to use.
6. Select your FortiGate model from the list. If your unit is a FortiWiFi, be sure to get the appropriate firmware, which will have a filename starting with FWF.
7. Save the firmware image to your computer.

Testing new firmware

The integrity of a firmware images downloaded from Fortinet's support portal can be verified using a file checksum. A file checksum that does not match the expected value indicates a corrupt file. The corruption could be caused by errors in transfer or by file modification. A list of expected checksum values for each build of released code is available on Fortinet's support portal.

Image integrity is also verified when the FortiGate is booting up. This integrity check is done through cyclic redundancy check (CRC). If the CRC fails, the Fortinet unit will error during the boot process, preventing suboptimal operation of the device.

Lastly, firmware images are signed and the signature is attached to the code as it is built. When upgrading an image, the running OS will generate a signature and compare it with the signature attached to the image. If the signatures do not match, the new OS will not load.

Testing before installation

FortiOS enables you to test a new firmware image by installing the firmware image from a system reboot and saving it to system memory. After completing this procedure, the FortiGate unit operates using the new firmware image with the current configuration. This new firmware image is not permanently installed. The next time the FortiGate unit restarts, it operates with the originally installed firmware image using the current configuration. If the new firmware image operates successfully, you can install it permanently using the procedure Testing new firmware on page 2245 .

To use this procedure, you must connect to the CLI using the FortiGate console port and a RJ-45 to DB-9 or null modem cable. This procedure temporarily installs a new firmware image using your current configuration.

For this procedure, you must install a TFTP server that you can connect to from the FortiGate internal interface. The TFTP server should be on the same subnet as the internal interface.

To test the new firmware image

1. Connect to the CLI using a RJ-45 to DB-9 or null modem cable.
2. Make sure the TFTP server is running.
3. Copy the new firmware image file to the root directory of the TFTP server.
4. Make sure the FortiGate unit can connect to the TFTP server using the `execute ping` command.
5. Enter the following command to restart the FortiGate unit:
   ```
   execute reboot
   ```
6. As the FortiGate unit reboots, press any key to interrupt the system startup. As the FortiGate unit starts, a series of system startup messages appears.
   When the following messages appears:
   ```
   Press any key to display configuration menu....
   ```
7. Immediately press any key to interrupt the system startup.

You have only 3 seconds to press any key. If you do not press a key soon enough, the FortiGate unit reboots and you must login and repeat the execute reboot command.

If you successfully interrupt the startup process, the following messages appears:

```
[G]: Get firmware image from TFTP server.
[F]: Format boot device.
[B]: Boot with backup firmware and set as default
[C]: Configuration and information
[Q]: Quit menu and continue to boot with default firmware.
    [H]: Display this list of options.
Enter G, F, Q, or H:
```

8. Type **G** to get the new firmware image from the TFTP server.

   The following message appears:

   ```
   Enter TFTP server address [192.168.1.168]:
   ```

9. Type the address of the TFTP server and press **Enter**.

   The following message appears:

   ```
   Enter Local Address [192.168.1.188]:
   ```

10. Type an IP address of the FortiGate unit to connect to the TFTP server.

    The IP address must be on the same network as the TFTP server.

Make sure you do not enter the IP address of another device on this network.

    The following message appears:

    ```
    Enter File Name [image.out]:
    ```

11. Enter the firmware image file name and press **Enter**.

    The TFTP server uploads the firmware image file to the FortiGate unit and the following appears.

    ```
    Save as Default firmware/Backup firmware/Run image without saving: [D/B/R]
    ```

12. Type `R`.

    The FortiGate image is installed to system memory and the FortiGate unit starts running the new firmware image, but with its current configuration.

You can test the new firmware image as required. When done testing, you can reboot the FortiGate unit, and the FortiGate unit will resume using the firmware that was running before you installed the test firmware.

Upgrading the firmware - web-based manager

Installing firmware replaces your current antivirus and attack definitions, along with the definitions included with the firmware release you are installing. After you install new firmware, make sure that antivirus and attack definitions are up to date.

Always remember to back up your configuration before making any changes to the firmware.

To upgrade the firmware

1. Log into the web-based manager as the admin administrative user.
2. Go to **System > Dashboard > Status** and locate the **System Information** widget.
3. Beside **Firmware Version**, select **Update**.
4. Type the path and filename of the firmware image file, or select **Browse** and locate the file.
5. Select **OK**.

The FortiGate unit uploads the firmware image file, upgrades to the new firmware version, restarts, and displays the FortiGate login. This process takes a few minutes.

Upgrading the firmware - CLI

Installing firmware replaces your current antivirus and attack definitions, along with the definitions included with the firmware release you are installing. After you install new firmware, make sure that antivirus and attack definitions are up to date. You can also use the CLI command `execute update-now` to update the antivirus and attack definitions. For more information, see the System Administration handbook.

Before you begin, ensure you have a TFTP server running and accessible to the FortiGate unit.

Always remember to back up your configuration before making any changes to the firmware.

To upgrade the firmware using the CLI

1. Make sure the TFTP server is running.
2. Copy the new firmware image file to the root directory of the TFTP server.
3. Log into the CLI.
4. Make sure the FortiGate unit can connect to the TFTP server.

   You can use the following command to ping the computer running the TFTP server. For example, if the IP address of the TFTP server is 192.168.1.168:

   ```
   execute ping 192.168.1.168
   ```

5. Enter the following command to copy the firmware image from the TFTP server to the FortiGate unit:

   ```
   execute restore image tftp <filename> <tftp_ipv4>
   ```

   Where `<name_str>` is the name of the firmware image file and `<tftp_ip4>` is the IP address of the TFTP server. For example, if the firmware image file name is `image.out` and the IP address of the TFTP server is 192.168.1.168, enter:

   ```
   execute restore image tftp image.out 192.168.1.168
   ```

   The FortiGate unit responds with the message:

   ```
   This operation will replace the current firmware version!
       Do you want to continue? (y/n)
   ```

6. Type `y`.
7. The FortiGate unit uploads the firmware image file, upgrades to the new firmware version, and restarts. This process takes a few minutes.

8. Reconnect to the CLI.
9. Update antivirus and attack definitions, by entering:

```
execute update-now
```

Installing firmware from a system reboot using the CLI

There is a possibility that the firmware upgrade does not load properly and the FortiGate unit will not boot, or continuously reboots. If this occurs, it is best to perform a fresh install of the firmware from a reboot using the CLI.

This procedure installs a firmware image and resets the FortiGate unit to default settings. You can use this procedure to upgrade to a new firmware version, revert to an older firmware version, or re-install the current firmware.

To use this procedure, you must connect to the CLI using the FortiGate console port and a RJ-45 to DB-9, or null modem cable. This procedure reverts the FortiGate unit to its factory default configuration.

For this procedure you install a TFTP server that you can connect to from the FortiGate internal interface. The TFTP server should be on the same subnet as the internal interface.

Before beginning this procedure, ensure you back up the FortiGate unit configuration.

If you are reverting to a previous FortiOS version, you might not be able to restore the previous configuration from the backup configuration file.

Installing firmware replaces your current antivirus and attack definitions, along with the definitions included with the firmware release you are installing. After you install new firmware, make sure that antivirus and attack definitions are up to date.

To install firmware from a system reboot

1. Connect to the CLI using the RJ-45 to DB-9 or null modem cable.
2. Make sure the TFTP server is running.
3. Copy the new firmware image file to the root directory of the TFTP server.
4. Make sure the internal interface is connected to the same network as the TFTP server.
5. To confirm the FortiGate unit can connect to the TFTP server, use the following command to ping the computer running the TFTP server. For example, if the IP address of the TFTP server is 192.168.1.168:

```
execute ping 192.168.1.168
```

6. Enter the following command to restart the FortiGate unit.

```
execute reboot
```

   The FortiGate unit responds with the following message:

```
This operation will reboot the system!
Do you want to continue? (y/n)
```

7. Type `y`.

   As the FortiGate unit starts, a series of system startup messages appears. When the following messages appears:

```
Press any key to display configuration menu.....
```

Immediately press any key to interrupt the system startup.

You have only 3 seconds to press any key. If you do not press a key soon enough, the FortiGate unit reboots and you must log in and repeat the execute reboot command.

If you successfully interrupt the startup process, the following messages appears:

```
[G]: Get firmware image from TFTP server.
[F]: Format boot device.
[B]: Boot with backup firmware and set as default
[C]: Configuration and information
[Q]: Quit menu and continue to boot with default firmware.
[H]: Display this list of options.
Enter G, F, Q, or H:
```

8. Type **G** to get to the new firmware image form the TFTP server.

   The following message appears:

   ```
   Enter TFTP server address [192.168.1.168]:
   ```

9. Type the address of the TFTP server and press **Enter**.

   The following message appears:

   ```
   Enter Local Address [192.168.1.188]:
   ```

10. Type an IP address the FortiGate unit can use to connect to the TFTP server. The IP address can be any IP address that is valid for the network the interface is connected to.

Make sure you do not enter the IP address of another device on this network.

The following message appears:

```
Enter File Name [image.out]:
```

11. Enter the firmware image filename and press **Enter**.

    The TFTP server uploads the firmware image file to the FortiGate unit and a message similar to the following appears:

    ```
    Save as Default firmware/Backup firmware/Run image without saving: [D/B/R]
    ```

12. Type `D`.

    The FortiGate unit installs the new firmware image and restarts. The installation might take a few minutes to complete.

Reverting to a previous firmware version - web-based manager

The following procedures revert the FortiGate unit to its factory default configuration and deletes any configuration settings. If you are reverting to a previous FortiOS version, you might not be able to restore the previous configuration from the backup configuration file.

Always remember to back up your configuration before making any changes to the firmware.

To revert to a previous firmware version

1. Go to **System > Dashboard > Status** and locate the **System Information widget**.
2. Beside **Firmware Version**, select **Update**.
3. Type the path and filename of the firmware image file, or select **Browse** and locate the file.
4. Select **OK**.

The FortiGate unit uploads the firmware image file, reverts to the old firmware version, resets the configuration, restarts, and displays the FortiGate login. This process takes a few minutes.

Reverting to a previous firmware version - CLI

This procedure reverts the FortiGate unit to its factory default configuration and deletes IPS custom signatures, web content lists, email filtering lists, and changes to replacement messages.

Before beginning this procedure, it is recommended that you:

- back up the FortiGate unit system configuration using the command `execute backup config`
- back up the IPS custom signatures using the command `execute backup ipsuserdefsig`
- back up web content and email filtering lists

To use the following procedure, you must have a TFTP server the FortiGate unit can connect to.

To revert to a previous firmware version using the CLI

1. Make sure the TFTP server is running
2. Copy the firmware image file to the root directory of the TFTP server.
3. Log into the FortiGate CLI.
4. Make sure the FortiGate unit can connect to the TFTP server execute by using the `execute ping` command.
5. Enter the following command to copy the firmware image from the TFTP server to the FortiGate unit:

   ```
   execute restore image tftp <name_str> <tftp_ipv4>
   ```

   Where `<name_str>` is the name of the firmware image file and `<tftp_ip4>` is the IP address of the TFTP server. For example, if the firmware image file name is `imagev28.out` and the IP address of the TFTP server is 192.168.1.168, enter:

   ```
   execute restore image tftp image28.out 192.168.1.168
   ```

   The FortiGate unit responds with this message:

   ```
   This operation will replace the current firmware version!
       Do you want to continue? (y/n)
   ```

6. Type `y`.

   The FortiGate unit uploads the firmware image file. After the file uploads, a message similar to the following appears:

   ```
   Get image from tftp server OK.
   ```

```
Check image OK.
This operation will downgrade the current firmware version!
Do you want to continue? (y/n)
```

7. Type `y`.
8. The FortiGate unit reverts to the old firmware version, resets the configuration to factory defaults, and restarts. This process takes a few minutes.
9. Reconnect to the CLI.
10. To restore your previous configuration, if needed, use the command:
```
execute restore config <name_str> <tftp_ip4>
```
11. Update antivirus and attack definitions using the command:
```
execute update-now.
```

Configuration revision

The **Configuration Revisions** menu enables you to manage multiple versions of configuration files on models that have a 512 flash memory and higher. Revision control requires either a configured central management server or the local hard drive. The central management server can either be a FortiManager unit or FortiCloud.

If central management is not configured on your FortiGate unit, a message appears to tell you to do one of the following:

- enable central management
- obtain a valid license.

When revision control is enabled on your FortiGate unit, and configurations backups have been made, a list of saved revisions of those backed-up configurations appears.

Configuration revisions are viewed in the **System Information** widget on the Dashboard.

Controlled upgrade

Using a controlled upgrade, you can upload a new version of the FortiOS firmware to a separate partition in the FortiGate memory for later upgrade. The FortiGate unit can also be configured so that when it is rebooted, it will automatically load the new firmware (CLI only). Using this option, you can stage a number of FortiGate units to do an upgrade simultaneously to all devices using FortiManager or script.

To load the firmware for later installation - web-based manager

1. Go to **System > Dashboard > Status**.
2. Under **System Information > Firmware Version**, select **Update**.
3. Type the path and filename of the firmware image file, or select **Browse** and locate the file.
4. Deselect the **Boot the New Firmware** option.
5. Select **OK**.

To load the firmware for later installation - CLI

```
execute restore secondary-image {ftp | tftp | usb}
```

To set the FortiGate unit so that when it reboots, the new firmware is loaded, use the CLI command…

```
execute set-next-reboot {primary | secondary}
```

... where `{primary | secondary}` is the partition with the preloaded firmware.

To trigger the upgrade using the web-based manager

1. Go to **System > Dashboard > Status**.
2. Under **System Information > Firmware Version**, select **Details**.
3. Select the check box for the new firmware version.
   The **Comments** column indicates which firmware version is the current active version.
4. Select **Upgrade** icon.

Interfaces

Interfaces, both physical and virtual, enable traffic to flow to and from the internal network, and the Internet and between internal networks. The FortiGate unit has a number of options for setting up interfaces and groupings of subnetworks that can scale to a company's growing requirements.

This chapter includes:

- Physical
- Interface settings
- Software switch
- Virtual Switch
- Loopback interfaces
- Redundant interfaces
- One-armed sniffer
- Aggregate Interfaces
- DHCP addressing mode on an interface
- Administrative access
- Wireless
- Interface MTU packet size
- Secondary IP addresses to an interface
- Virtual domains
- Virtual LANs
- Zones

Physical

FortiGate units have a number of physical ports where you connect ethernet or optical cables. Depending on the model, they can have anywhere from four to 40 physical ports. Some units have a grouping of ports labelled as internal, providing a built-in switch functionality.

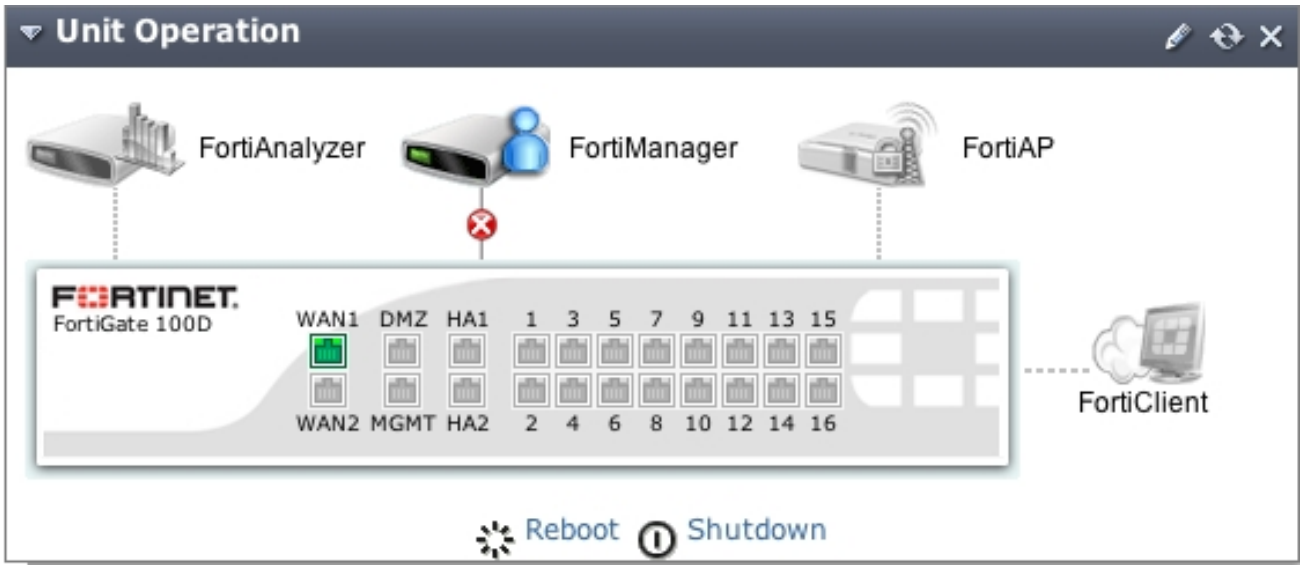
In FortiOS, the port names, as labeled on the FortiGate unit, appear in the web-based manager in the **Unit Operation** widget, found on the Dashboard. They also appear when you are configuring the interfaces, by going to **System > Network > Interface**. As shown below, the FortiGate-100D (Generation 2) has 22 interfaces.

Two of the physical ports on the FortiGate-100D (Generation 2) are SFP ports. These ports share the numbers 15 and 16 with RJ-45 ports. Because of this, when SFP port 15 is used, RJ-45 port 15 cannot be used, and vice versa.

These ports also share the same MAC address.

FortiGate-100D physical interfaces

FortiGate-100D interfaces on the Dashboard



Configuring the FortiGate-100D ports

	Name	Type	IP/Netmask	Access	Administrative Status	Link Status	Ref.
☐	wan1	Physical	172.20.120.230 / 255.255.255.0	HTTP,HTTPS,PING,SSH	↑	↑ 100 Mbps/Full Duplex	1
☐	dmz	Physical	10.10.10.1 / 255.255.255.0	HTTPS,PING,FMG-Access	↑	↓	1
☐	modem	Physical	0.0.0.0 / 0.0.0.0		↓	↓	0
☐	wan2	Physical	0.0.0.0 / 0.0.0.0	PING,FMG-Access	↑	↓	1
☐	mgmt	Physical	192.168.1.99 / 255.255.255.0	HTTPS,PING,FMG-Access	↑	↓	0
☐	ha1	Physical	0.0.0.0 / 0.0.0.0		↑	↓	0
☐	ha2	Physical	0.0.0.0 / 0.0.0.0		↑	↓	0
☐	internal	Physical	192.168.100.99 / 255.255.255.0	HTTPS,PING,FMG-Access	↑	↑ 100 Mbps/Full Duplex	3

Normally the internal interface is configured as a single interface shared by all physical interface connections - a switch. The switch mode feature has two states - switch mode and interface mode. Switch mode is the default mode with only one interface and one address for the entire internal switch. Interface mode enables you to configure each of the internal switch physical interface connections separately. This enables you to assign different subnets and netmasks to each of the internal physical interface connections.

The larger FortiGate units can also include Advanced Mezzanine Cards (AMC), which can provide additional interfaces (Ethernet or optical), with throughput enhancements for more efficient handling of specialized traffic. These interfaces appear in FortiOS as port amc/sw1, amc/sw2 and so on. In the following illustration, the FortiGate-3810A has three AMC cards installed: two single-width (amc/sw1, amc/sw2) and one double-width (amc/dw).

FortiGate-3810A AMC card port naming

	Name	IP/Netmask	Access	Administrative Status	Link Status
☐	amc-dw2/1	0.0.0.0 / 0.0.0.0		↑	↓
☐	amc-dw2/2	0.0.0.0 / 0.0.0.0		↑	↓
☐	amc-sw1/1	0.0.0.0 / 0.0.0.0		↑	↓
☐	amc-sw1/2	0.0.0.0 / 0.0.0.0		↑	↓
☐	amc-sw1/3	0.0.0.0 / 0.0.0.0		↑	↓
☐	amc-sw1/4	0.0.0.0 / 0.0.0.0		↑	↓
☐	amc-sw2/1	0.0.0.0 / 0.0.0.0		↑	↓
☐	amc-sw2/2	0.0.0.0 / 0.0.0.0		↑	↓
☐	amc-sw2/3	0.0.0.0 / 0.0.0.0		↑	↓
☐	amc-sw2/4	0.0.0.0 / 0.0.0.0		↑	↓
☐	april	0.0.0.0 / 0.0.0.0		↑	
☐	port1	10.21.101.101 / 255.255.255.0	HTTPS,PING,SSH	↑	↑
☐	port2	192.168.100.99 / 255.255.255.0	PING	↑	↓
☐	port3	0.0.0.0 / 0.0.0.0	PING	↑	↓
☐	port4	0.0.0.0 / 0.0.0.0	PING	↑	↓
☐	port5	0.0.0.0 / 0.0.0.0	PING	↑	↓
☐	port6	0.0.0.0 / 0.0.0.0	PING	↑	↓
☐	port7	0.0.0.0 / 0.0.0.0	PING	↑	↓
☐	port8	0.0.0.0 / 0.0.0.0	PING	↑	↓
☐	port9	0.0.0.0 / 0.0.0.0	PING	↑	↓
☐	port10	0.0.0.0 / 0.0.0.0	PING	↑	↓

Interface settings

In **System > Network > Interface**, you configure the interfaces, physical and virtual, for the FortiGate unit. There are different options for configuring interfaces when the FortiGate unit is in NAT mode or transparent mode. On FortiOS Carrier, you can also enable the Gi gatekeeper on each interface for anti-overbilling.

Interface page	
Create New	Select to add a new interface, zone or, in transparent mode, port pair. For more information on configuring zones, see Zones. Depending on the model you can add a VLAN interface, a loopback interface, a IEEE 802.3ad aggregated interface, or a redundant interface. When VDOMs are enabled, you can also add Inter-VDOM links.
Name	The names of the physical interfaces on your FortiGate unit. This includes any alias names that have been configured. When you combine several interfaces into an aggregate or redundant interface, only the aggregate or redundant interface is listed, not the component interfaces. If you have added VLAN interfaces, they also appear in the name list, below the physical or aggregated interface to which they have been added. If you have added loopback interfaces, they also appear in the interface list, below the physical interface to which they have been added. If you have software switch interfaces configured, you will be able to view them. If your FortiGate unit supports AMC modules, the interfaces are named amc-sw1/1, amc-dw1/2, and so on.
Type	The configuration type for the interface.
IP/Netmask	The current IP address and netmask of the interface. In VDOM, when VDOMs are not all in NAT or transparent mode some values may not be available for display and will be displayed as “-”.
Access	The administrative access configuration for the interface.
Administrative Status	Indicates if the interface can be accessed for administrative purposes. If the administrative status is a green arrow, and administrator could connect to the interface using the configured access. If the administrative status is a red arrow, the interface is administratively down and cannot be accessed for administrative purposes.
Link Status	The status of the interface physical connection. Link status can be either up (green arrow) or down (red arrow). If link status is up the interface is connected to the network and accepting traffic. If link status is down the interface is not connected to the network or there is a problem with the connection. You cannot change link status from the web-based manager, and typically is indicative of an ethernet cable plugged into the interface. Link status is only displayed for physical interfaces.

Interface page	
MAC	The MAC address of the interface.
Mode	Shows the addressing mode of the interface. The addressing mode can be manual, DHCP, or PPPoE.
Secondary IP	Displays the secondary IP addresses added to the interface.
MTU	The maximum number of bytes per transmission unit (MTU) for the interface.
Virtual Domain	The virtual domain to which the interface belongs. This column is visible when VDOM configuration is enabled.
VLAN ID	The configured VLAN ID for VLAN subinterfaces.

Interface configuration and settings

To configure an interface, go to **System > Network > Interface and** select **Create New**.

Name	Enter a name of the interface. Physical interface names cannot be changed.
Alias	Enter an alternate name for a physical interface on the FortiGate unit. This field appears when editing an existing physical interface. The alias can be a maximum of 25 characters. The alias name will not appears in logs.
Link Status	Indicates whether the interface is connected to a network (link status is **Up**) or not (link status is **Down**). This field appears when editing an existing physical interface.
Type	Select the type of interface that you want to add. On some models you can set **Type** to **802.3ad Aggregate** or **Redundant Interface**.
Interface	Displayed when **Type** is set to **VLAN**. Select the name of the physical interface to which to add a VLAN interface. Once created, the VLAN interface is listed below its physical interface in the Interface list. You cannot change the physical interface of a VLAN interface except when adding a new VLAN interface.
VLAN ID	Displayed when **Type** is set to **VLAN**. Enter the VLAN ID. You cannot change the **VLAN ID** except when adding a new VLAN interface. The VLAN ID can be any number between 1 and 4094 and must match the VLAN ID added by the IEEE 802.1Q-compliant router or switch connected to the VLAN subinterface.
Virtual Domain	Select the virtual domain to add the interface to. Admin accounts with super_admin profile can change the **Virtual Domain**.

Physical Interface Members	This section has two different forms depending on the interface type: • **Software switch interface** - this section is a display-only field showing the interfaces that belong to the software switch virtual interface. • **802.3ad aggregate or Redundant interface** - this section includes available interface and selected interface lists to enable adding or removing interfaces from the interface. Select interfaces from this **Available Interfaces** list and select the right arrow to add an interface to the **Selected Interface** list.
Addressing mode	Select the addressing mode for the interface. • Select **Manual** and add an **IP/Netmask** for the interface. If IPv6 configuration is enabled you can add both a IPv4 and an IPv6 IP address. • Select **DHCP** to get the interface IP address and other network settings from a DHCP server. • Select **PPPoE** to get the interface IP address and other network settings from a PPPoE server. • Select **One-Arm Sniffer** to enable the interface as a means to detect possible traffic threats. This option is available on physical ports not configured for the primary Internet connection. • Select **Dedicate to FortiAP/FortiSwitch** to have a FortiAP unit or FortiSwitch unit connect exclusively to the interface. This option is only available when editing a physical interface, and it has a static IP address. When you enter the IP address, the FortiGate unit automatically creates a DHCP server using the subnet entered. This option is not available on the ADSL interface. The FortiSwitch option is currently only available on the FortiGate-100D.
IP/Netmask	If **Addressing Mode** is set to **Manual**, enter an IPv4 address/subnet mask for the interface. FortiGate interfaces cannot have IP addresses on the same subnet.
IPv6 Address	If **Addressing Mode** is set to **Manual** and IPv6 support is enabled, enter an IPv6 address/subnet mask for the interface. A single interface can have both an IPv4 and IPv6 address or just one or the other.
Administrative Access	Select the types of administrative access permitted for IPv4 connections to this interface.
HTTPS	Allow secure HTTPS connections to the web-based manager through this interface. If configured, this option will enable automatically when selecting the **HTTP** option.
PING	Interface responds to pings. Use this setting to verify your installation and for testing.

HTTP	Allow HTTP connections to the web-based manager through this interface. If configured, this option will also enable the **HTTPS** option.
SSH	Allow SSH connections to the CLI through this interface.
SNMP	Allow a remote SNMP manager to request SNMP information by connecting to this interface.
TELNET	Allow Telnet connections to the CLI through this interface. Telnet connections are not secure and can be intercepted by a third party.
FMG-Access	Allow FortiManager authorization automatically during the communication exchange between the FortiManager and FortiGate units.
FCT-Access	You can configure a FortiGate interface as an interface that will accept FortiClient connections. When configured, the FortiGate unit sends broadcast messages which the FortiClient software running on a end user PC is listening for.
CAPWAP	Allows the FortiGate unit's wireless controller to manage a wireless access point, such as a FortiAP unit.
IPv6 Administrative Access	Select the types of administrative access permitted for IPv6 connections to this interface. These types are the same as for Administrative Access.
Security Mode	Select a captive portal for the interface. When selected, you can define the portal message and look that the user sees when logging into the interface. You can also define one or more user groups that have access to the interface.
DHCP Server	Select to enable a DHCP server for the interface. For more information on configuring a DHCP server on the interface, see DHCP servers and relays.
Detect and Identify Devices	Select to enable the interface to be used with BYOD hardware such as iPhones. Define the device definitions by going to **User & Device > Device**.
Add New Devices to Vulnerability Scan List	This option appears when **Detect and Identify Devices** is enabled. When enabled, the FortiGate unit performs a network vulnerability scan of any devices detected or seen on the interface. The vulnerability scan occur as configured, either on demand, or as scheduled.

Broadcast Discovery Messages	Available when **FCT-Access** is enabled for the **Administrative Access**. Select to enable sends broadcast messages which the FortiClient software running on a end user PC is listening for. Once enabled, the FortiGate unit broadcasts a discovery message that includes the IP address of the interface and listening port number to the local network. All PCs running FortiClient on that network listen for this discovery message.
Enable Explicit Web Proxy	Available when enabling explicit proxy on the **System Information** Dashboard (**System > Dashboard > Status**). This option is not available for a VLAN interface selection. Select to enable explicit web proxying on this interface. When enabled, this interface will be displayed on **System > Network > Explicit Proxy** under **Listen on Interfaces** and web traffic on this interface will be proxied according to the Web Proxy settings.
Enable STP	With FortiGate units with a switch interface is in switch mode, this option is enabled by default. It enables the single instance MSTP spanning tree protocol.
Listen for RADIUS Accounting Messages	Select to use the interface as a listening port for RADIUS content.
Secondary IP Address	Add additional IPv4 addresses to this interface. Select the Expand Arrow to expand or hide the section.
Comments	Enter a description up to 255 characters to describe the interface.
Administrative Status	Select either **Up** (green arrow) or **Down** (red arrow) as the status of this interface. **Up** indicates the interface is active and can accept network traffic. **Down** indicates the interface is not active and cannot accept traffic.
Gi Gatekeeper (FortiOS Carrier only)	For FortiOS Carrier, enable Gi Gatekeeper to enable the Gi firewall as part of the anti-overbilling configuration. You must also configure **Gi Gatekeeper Settings** by going to **System > Admin > Settings**.

Software switch

A software switch, or soft switch, is a virtual switch that is implemented at the software, or firmware level, rather than the hardware level. A software switch can be used to simplify communication between devices connected to different FortiGate interfaces. For example, using a software switch, you can place the FortiGate interface connected to an internal network on the same subnet as your wireless interfaces. Then devices on the internal network can communicate with devices on the wireless network without any additional configuration such as additional security policies, on the FortiGate unit.

It can also be useful if you require more hardware ports on for the switch on a FortiGate unit. For example, if your FortiGate unit has a 4-port switch, WAN1, WAN2 and DMZ interfaces, and you need one more port, you can create a soft switch that can include the 4-port switch and the DMZ interface all on the same subnet. These types of applications also apply to wireless interfaces and virtual wireless interfaces and physical interfaces such as those with FortiWiFi and FortiAP unit.

Similar to a hardware switch, a software switch functions like a single interface. A software switch has one IP address; all of the interfaces in the software switch are on the same subnet. Traffic between devices connected to each interface are not regulated by security policies, and traffic passing in and out of the switch are affected by the same policy.

There are a few things to consider when setting up a software switch:

- Ensure you create a back up of the configuration.
- Ensure you have at least one port or connection such as the console port to connect to the FortiGate unit. If you accidentally combine too many ports, you will need a way to undo any errors.
- The ports that you include must not have any link or relation to any other aspect of the FortiGate unit. For example, DHCP servers, security policies, and so on.
- For increased security, you can create a captive portal for the switch, allowing only specific user groups access to the resources connected to the switch.

To create a software switch - web-based manager

1. Go to **System > Network > Interface** and select **Create New**.
2. For **Type**, select **Software Switch**.
3. In the **Physical Interface Members** option, select the interfaces to include.
4. Configure the remaining interface settings
5. Select **OK**.

To create a software switch - CLI

```
config system switch-interface
   edit <switch-name>
      set type switch
      set member <interface_list>
end
config system interface
   edit <switch_name>
      set ip <ip_address>
      set allowaccess https ssh ping
end
```

Soft switch example

For this example, the wireless interface (WiFi) needs to be on the same subnet as the DMZ1 interface to facilitate wireless syncing from an iPhone and a local computer. The synching between two subnets is problematic. By putting both interfaces on the same subnet the synching will work. The software switch will accomplish this.

In this example, the soft switch includes a wireless interface. Remember to configure any wireless security before proceeding. If you leave this interface open without any password or other security, it leaves open access to not only the wireless interface but to any other interfaces and devices connected within the software switch.

Clear the interfaces and back up the configuration

First, ensure that the interfaces are not being used with any other security policy or other use on the FortiGate unit. Check the WiFi and DMZ1 ports to ensure DHCP is not enabled on the interface and there are no other dependencies with these interfaces.

Next, save the current configuration, in the event something doesn't work, recovery can be quick.

Merge the interfaces

The plan is to merge the WiFi port and DMZ1 port. This will create a software switch with a name of "synchro" with an IP address of 10.10.21.12. The steps will create the switch, add the IP and then set the administrative access for HTTPS, SSH and Ping.

To merge the interfaces - CLI

```
config system switch-interface
   edit synchro
      set type switch
      set member dmz1 wifi
end
config system interface
   edit synchro
      set ip 10.10.21.12
      set allowaccess https ssh ping
end
```

Final steps

With the switch set up, you can now add security policies, DHCP servers an any other configuration that you would normally do to configure interfaces on the FortiGate unit.

Virtual Switch

Virtual switch feature enables you create virtual switches on top of the physical switch(es) with designated interfaces/ports so that a virtual switch can build up its forwarding table through learning and forward traffic accordingly. When traffic is forwarded among interfaces belonging to the same virtual switch, the traffic doesn't need to go up to the software stack, but forwarded directly by the switch. When traffic has to be relayed to interfaces not on the virtual switch, the traffic will go through the normal data path and be offloaded to NP4 when possible.

This feature is only available on mid to high end FortiGate units, including the 100D, 600C, 1000C, and 1240B.

To enable and configure the virtual switch, enter the CLI commands:

```
config system virtual-switch
   edit vs1
      set physical-switch sw0
         config port
            edit 1
               set port port1
               set speed xx
               set duplex xx
```

```
            set status [up|down]
        edit 2
            set port port2
            set ...
        end
    end
end
```

Loopback interfaces

A loopback interface is a logical interface that is always up (no physical link dependency) and the attached subnet is always present in the routing table.

The FortiGate's loopback IP address does not depend on one specific external port, and is therefore possible to access it through several physical or VLAN interfaces. Multiple loopback interfaces can be configured in either non-VDOM mode or in each VDOM.

Loopback interfaces still require appropriate firewall policies to allow traffic to and from this type of interface.

A loopback interface can be used with:

- Management access
- BGP (TCP) peering
- PIM RP

Loopback interfaces are a good practice for OSPF. Setting the OSPF router ID the same as loopback IP address troubleshooting OSPF easier, and remembering the management IP addresses (telnet to “router ID”).

Dynamic routing protocols can be enabled on loopback interfaces

For black hole static route, use the black hole route type instead of the loopback interface.

Redundant interfaces

On some models you can combine two or more physical interfaces to provide link redundancy. This feature enables you to connect to two or more switches to ensure connectivity in the event one physical interface or the equipment on that interface fails.

In a redundant interface, traffic is only going over one interface at any time. This differs from an aggregated interface where traffic is going over all interfaces for distribution of increased bandwidth. This difference means redundant interfaces can have more robust configurations with fewer possible points of failure. This is important in a fully-meshed HA configuration.

An interface is available to be in a redundant interface if:

- it is a physical interface, not a VLAN interface
- it is not already part of an aggregated or redundant interface
- it is in the same VDOM as the redundant interface
- it has no defined IP address
- is not configured for DHCP or PPPoE
- it has no DHCP server or relay configured on it
- it does not have any VLAN subinterfaces
- it is not referenced in any security policy, VIP, or multicast policy

- it is not monitored by HA
- it is not one of the FortiGate-5000 series backplane interfaces

When an interface is included in a redundant interface, it is not listed on the **System > Network > Interface** page. You cannot configure the interface individually and it is not available for inclusion in security policies, VIPs, or routing.

One-armed sniffer

A one-armed sniffer is used to configure a physical interface on the FortiGate unit as a one-arm intrusion detection system (IDS). Traffic sent to the interface is examined for matches to the configured IPS sensor and application control list. Matches are logged and then all received traffic is dropped. Sniffing only reports on attacks. It does not deny or otherwise influence traffic.

Using the one-arm sniffer, you can configure a FortiGate unit to operate as an IDS appliance by sniffing network traffic for attacks without actually processing the packets. To configure one-arm IDS, you enable sniffer mode on a FortiGate interface and connect the interface to a hub or to the SPAN port of a switch that is processing network traffic.

To assign an interface as a sniffer interface, go to **System > Network > Interface**, edit the interface and select **One-Arm Sniffer**.

If the check box is not available, the interface is in use. Ensure that the interface is not selected in any firewall policies, routes, virtual IPs or other features in which a physical interface is specified.

Enable Filters	Select to include filters to define a more granular sniff of network traffic. Select specific addresses, ports, VLANs and protocols. In all cases, enter a number, or number range, for the filtering type. For Protocol values, standard protocols are: • UDP - 17 • TCP - 6 • ICMP - 1
Include IPv6 Packets	If your network is running a combination of IPv4 and IPv6 addressing, select to sniff both addressing types. Otherwise, the FortiGate unit will only sniff IPv4 traffic.
Include Non-IP Packets	Select for a more intense scan of content in the traffic.
UTM Security Profiles	IPS sensors, and application control lists enable you to select specific sensors and application you want to identify within the traffic.

Aggregate Interfaces

Link aggregation (IEEE 802.3ad) enables you to bind two or more physical interfaces together to form an aggregated (combined) link. This new link has the bandwidth of all the links combined. If a link in the group fails, traffic is transferred automatically to the remaining interfaces with the only noticeable effect being a reduced bandwidth.

This is similar to redundant interfaces with the major difference being that a redundant interface group only uses one link at a time, where an aggregate link group uses the total bandwidth of the functioning links in the group, up to eight (or more).

Support of the IEEE standard 802.3ad for link aggregation is available on some models.

An interface is available to be an aggregate interface if:

- it is a physical interface, not a VLAN interface or subinterface
- it is not already part of an aggregate or redundant interface
- it is in the same VDOM as the aggregated interface. Aggregate ports cannot span multiple VDOMs.
- it does not have an IP address and is not configured for DHCP or PPPoE
- it is not referenced in any security policy, VIP, IP Pool or multicast policy
- it is not an HA heartbeat interface
- it is not one of the FortiGate-5000 series backplane interfaces

Some models of FortiGate units do not support aggregate interfaces. In this case, the aggregate option is not an option in the web-based manager or CLI. As well, you cannot create aggregate interfaces from the interfaces in a switch port.

To see if a port is being used or has other dependencies, use the following diagnose command:

```
diagnose sys checkused system.interface.name <interface_name>
```

When an interface is included in an aggregate interface, it is not listed on the **System > Network > Interface** page. Interfaces will still appear in the CLI, although configuration for those interfaces will not take affect. You cannot configure the interface individually and it is not available for inclusion in security policies, VIPs, IP pools, or routing.

Example

This example creates an aggregate interface on a FortiGate-3810A using ports 4-6 with an internal IP address of 10.13.101.100, as well as the administrative access to HTTPS and SSH.

To create an aggregate interface - web-based manager

1. Go to **System > Network > Interface** and select **Create New**.
2. Enter the Name as `Aggregate`.
3. For the **Type**, select **802.3ad Aggregate**.
   If this option does not appear, your FortiGate unit does not support aggregate interfaces.
4. In the **Available Interfaces** list, select port 4, 5 and 6 and move it to the **Selected Interfaces** list.
5. Select the **Addressing Mode** of **Manual**.
6. Enter the IP address for the port of 10.13.101.100/24.
7. For **Administrative Access** select HTTPS and SSH.
8. Select **OK**.

To create aggregate interface - CLI

```
config system interface
   edit Aggregate
      set type aggregate
      set member port4 port5 port6
```

```
    set vdom root
    set ip 172.20.120.100/24
    set allowaccess https ssh
end
```

DHCP addressing mode on an interface

If you configure an interface to use DHCP, the FortiGate unit automatically broadcasts a DHCP request from the interface. The interface is configured with the IP address and any DNS server addresses and default gateway address that the DHCP server provides.

DHCP IPv6 is similar to DHCP IPv4, however there is:

- no default gateway option defined because a host learns the gateway using router advertisement messages
- there is no WINS servers because it is obsolete.

For more information about DHCP IPv6, see RFC 3315.

Configure DHCP for an interface in **System > Network > Interface** and selecting the interface from the list, and selecting **DHCP** in the **Address Mode**. The table describes the DHCP status information when DHCP is configured for an interface.

Addressing mode section of New Interface page for DHCP informatio	
Status	Displays DHCP status messages as the interface connects to the DHCP server and gets addressing information. Select **Status** to refresh the addressing mode status message. Status can be one of: • **initializing** - No activity. • **connecting** - interface attempts to connect to the DHCP server. • **connected** - interface retrieves an IP address, netmask, and other settings from the DHCP server. • **failed** - interface was unable to retrieve an IP address and other settings from the DHCP server.
Obtained IP/Netmask	The IP address and netmask leased from the DHCP server. Only displayed if **Status** is **connected**.
Renew	Select to renew the DHCP license for this interface. Only displayed if **Status** is **connected**.
Expiry Date	The time and date when the leased IP address and netmask is no longer valid for the interface. The IP address is returned to the pool to be allocated to the next user request for an IP address. Only displayed if **Status** is **connected**.
Default Gateway	The IP address of the gateway defined by the DHCP server. Only displayed if **Status** is **connected**, and if **Receive default gateway from server** is selected.
Distance	Enter the administrative distance for the default gateway retrieved from the DHCP server. The administrative distance, an integer from 1-255, specifies the relative priority of a route when there are multiple routes to the same destination. A lower administrative distance indicates a more preferred route.
Retrieve default gateway from server	Enable to retrieve a default gateway IP address from the DHCP server. The default gateway is added to the static routing table.
Override internal DNS	Enable to use the DNS addresses retrieved from the DHCP server instead of the DNS server IP addresses on the DNS page. When VDOMs are enabled, you can override the internal DNS only on the management VDOM.

PPPoE addressing mode on an interface

If you configure the interface to use PPPoE, the FortiGate unit automatically broadcasts a PPPoE request from the interface.

The FortiGate units support many PPPoE RFC features (RFC 2516) including unnumbered IPs, initial discovery timeout and PPPoE Active Discovery Terminate (PADT).

PPPoE is only configurable in the web-based manager on desktop FortiGate units. 1U FortiGates and up must be configured in the CLI using the commands:

```
config system interface
   edit <port_name>
      set mode pppoe
      set username <ISP_username>
      set password <ISP_password>
      set idle-timeout <seconds>
      set distance <integer>
      set ipunnumbered <unumbered-IP>
      set disc-retry-timeout <seconds>
      set padt-retry-timeout <seconds>
      set lcp-echo-interval <seconds>
      set dns-server-override {enable | disable}
end
```

Configure PPPoE on an interface in **System > Network > Interface**. The table describes the PPPoE status information when PPPoE is configured for an interface.

Addressing mode section of New Interface page	
Status	Displays PPPoE status messages as the FortiGate unit connects to the PPPoE server and gets addressing information. Select Status to refresh the addressing mode status message. The status is only displayed if you selected **Edit**. Status can be any one of the following 4 messages.
Initializing	No activity.
Connecting	The interface is attempting to connect to the PPPoE server.
Connected	The interface retrieves an IP address, netmask, and other settings from the PPPoE server. When the status is connected, PPPoE connection information is displayed.
Failed	The interface was unable to retrieve an IP address and other information from the PPPoE server.
Reconnect	Select to reconnect to the PPPoE server. Only displayed if Status is connected.
User Name	The PPPoE account user name.
Password	The PPPoE account password.
Unnumbered IP	Specify the IP address for the interface. If your ISP has assigned you a block of IP addresses, use one of them. Otherwise, this IP address can be the same as the IP address of another interface or can be any IP address.
Initial Disc Timeout	Enter Initial discovery timeout. Enter the time to wait before starting to retry a PPPoE discovery.
Initial PADT timeout	Enter Initial PPPoE Active Discovery Terminate (PADT) timeout in seconds. Use this timeout to shut down the PPPoE session if it is idle for this number of seconds. PADT must be supported by your ISP. Set initial PADT timeout to 0 to disable.
Distance	Enter the administrative distance for the default gateway retrieved from the PPPoE server. The administrative distance, an integer from 1-255, specifies the relative priority of a route when there are multiple routes to the same destination. A lower administrative distance indicates a more preferred route. The default distance for the default gateway is 1.

Addressing mode section of New Interface page	
Retrieve default gateway from server	Enable to retrieve a default gateway IP address from a PPPoE server. The default gateway is added to the static routing table.
Override internal DNS	Enable to replace the DNS server IP addresses on the System DNS page with the DNS addresses retrieved from the PPPoE server. When VDOMs are enabled, you can override the internal DNS only on the management VDOM.

Administrative access

Interfaces, especially the public-facing ports can be potentially accessed by those who you may not want access to the FortiGate unit. When setting up the FortiGate unit, you can set the type of protocol an administrator must use to access the FortiGate unit. The options include:

- HTTPS
- HTTP
- SSH
- TELNET
- SNMP
- PING
- FortiManager Access (FMG-Access)
- FortiClient Access (FCT-Access)

You can select as many, or as few, even none, that are accessible by an administrator.

This example adds an IPv4 address 172.20.120.100 to the WAN1 interface as well as the administrative access to HTTPS and SSH. As a good practice, set the administrative access when you are setting the IP address for the port.

To add an IP address on the WAN1 interface - web-based manager

1. Go to **System > Network > Interface**.
2. Select the WAN1 interface row and select **Edit**.
3. Select the **Addressing Mode** of **Manual**.
4. Enter the IP address for the port of 172.20.120.100/24.
5. For **Administrative Access**, select **HTTPS** and **SSH**.
6. Select **OK**.

To create IP address on the WAN1 interface - CLI

```
config system interface
   edit wan1
      set ip 172.20.120.100/24
      set allowaccess https ssh
end
```

When adding to, or removing a protocol, you must type the entire list again. For example, if you have an access list of HTTPS and SSH, and you want to add PING, typing:

```
set allowaccess ping
```

...only PING will be set. In this case, you must type...

```
set allowaccess https ssh ping
```

Wireless

A wireless interface is similar to a physical interface only it does not include a physical connection. The FortiWiFi units enables you to add multiple wireless interfaces that can be available at the same time (the FortiWiFi-30B can only have one wireless interface). On FortiWiFi units, you can configure the device to be either an access point, or a wireless client. As an access point, the FortiWiFi unit can have up to four separate SSIDs, each on their own subnet for wireless access. In client mode, the FortiWiFi only has one SSID, and is used as a receiver, to enable remote users to connect to the existing network using wireless protocols.

Wireless interfaces also require additional security measures to ensure the signal does not get hijacked and data tampered or stolen.

For more information on configuring wireless interfaces see the Deploying Wireless Networks Guide.

Interface MTU packet size

You can change the maximum transmission unit (MTU) of the packets that the FortiGate unit transmits to improve network performance. Ideally, the MTU should be the same as the smallest MTU of all the networks between the FortiGate unit and the destination of the packets. If the packets that the FortiGate unit sends are larger than the smallest MTU, they are broken up or fragmented, which slows down transmission. You can easily experiment by lowering the MTU to find an MTU size for optimum network performance.

To change the MTU, select Override default MTU value (1500) and enter the MTU size based on the addressing mode of the interface

- 68 to 1 500 bytes for static mode
- 576 to 1 500 bytes for DHCP mode
- 576 to 1 492 bytes for PPPoE mode
- larger frame sizes if supported by the FortiGate model - up to 9216 bytes for NP2, NP4, and NP6-accelerated interfaces

Only available on physical interfaces. Virtual interfaces associated with a physical interface inherit the physical interface MTU size.

Interfaces on some models support frames larger than the traditional 1500 bytes. Jumbo frames are supported on FortiGate models that have either a SOC2 or NP4lite, except for the FortiGate-30D, as well as on FortiGate-100D series models (for information about your FortiGate unit's hardware, see the Hardware Acceleration guide). For other models, please contact Fortinet Customer Support for the maximum frame size that is supported.

If you need to enable sending larger frames over a route, you need all Ethernet devices on that route to support that larger frame size, otherwise your larger frames will not be recognized and are dropped.

If you have standard size and larger size frame traffic on the same interface, routing alone cannot route them to different routes based only on frame size. However, you can use VLANs to make sure the larger frame traffic is routed over network devices that support that larger size. VLANs will inherit the MTU size from the parent interface. You will need to configure the VLAN to include both ends of the route as well as all switches and routers along the route.

MTU packet size is changed in the CLI. If you select an MTU size larger than your FortiGate unit supports, an error message will indicate this. In this situation, try a smaller MTU size until the value is supported.

In Transparent mode, if you change the MTU of an interface, you must change the MTU of all interfaces on the FortiGate unit to match the new MTU.

To change the MTU size, use the following CLI commands:

```
config system interface
   edit <interface_name>
      set mtu-override enable
      set mtu <byte_size>
end
```

Secondary IP addresses to an interface

If an interface is configured with a manual or static IP address, you can also add secondary static IP addresses to the interface. Adding secondary IP addresses effectively adds multiple IP addresses to the interface. Secondary IP addresses cannot be assigned using DCHP or PPPoE.

All of the IP addresses added to an interface are associated with the single MAC address of the physical interface and all secondary IP addresses are in the same VDOM as the interface that are added to. You configure interface status detection for gateway load balancing separately for each secondary IP addresses. As with all other interface IP addresses, secondary IP addresses cannot be on the same subnet as any other primary or secondary IP address assigned to a FortiGate interface unless they are in separate VDOMs.

To configure a secondary IP, go to **System > Network > Interface**, select **Edit** or **Create New** and select the **Secondary IP Address** check box.

Virtual domains

Virtual domains (VDOMs) are a method of dividing a FortiGate unit into two or more virtual units that function as multiple independent units. A single FortiGate unit is then flexible enough to serve multiple departments of an organization, separate organizations, or to act as the basis for a service provider's managed security service.

VDOMs provide separate security domains that allow separate zones, user authentication, security policies, routing, and VPN configurations. By default, each FortiGate unit has a VDOM named root. This VDOM includes all of the FortiGate physical interfaces, modem, VLAN subinterfaces, zones, security policies, routing settings, and VPN settings.

When a packet enters a VDOM, it is confined to that VDOM. In a VDOM, you can create security policies for connections between Virtual LAN (VLAN) subinterfaces or zones in the VDOM. Packets do not cross the virtual domain border internally. To travel between VDOMs, a packet must pass through a firewall on a physical interface. The packet then arrives at another VDOM on a different interface, but it must pass through another firewall before entering the VDOM Both VDOMs are on the same FortiGate unit. Inter-VDOMs change this

behavior in that they are internal interfaces; however their packets go through all the same security measures as on physical interfaces.

This example shows how to enable VDOMs on the FortiGate unit and the basic and create a VDOM accounting on the DMZ2 port and assign an administrator to maintain the VDOM. First enable Virtual Domains on the FortiGate unit. When you enable VDOMs, the FortiGate unit will log you out.

For desktop and low-end FortiGate units, VDOMs are enabled using the CLI. On larger FortiGate units, you can enable on the web-based manager or the CLI. Once enabled all further configuration can be made in the web-based manager or CLI.

To enable VDOMs - web-based manager

1. Go to **System > Dashboard > Status**.
2. In the **System Information** widget, select **Enable for Virtual Domain**.

The FortiGate unit logs you out. Once you log back in, you will notice that the menu structure has changed. This reflects the global settings for all Virtual Domains

To enable VDOMs - CLI

```
config system global
   set vdom-admin enable
end
```

Next, add the VDOM called accounting.

To add a VDOM - web-based manager

1. Go to **System > VDOM > VDOM**, and select **Create New**.
2. Enter the VDOM name `accounting`.
3. Select **OK**.

To add a VDOM - CLI

```
config vdom
   edit <new_vdom_name>
end
```

With the Virtual Domain created, you can assign a physical interface to it, and assign it an IP address.

To assign physical interface to the accounting Virtual Domain - web-based manager

1. Go to **System > Network > Interface**.
2. Select the DMZ2 port row and select **Edit**.
3. For the **Virtual Domain** drop-down list, select **accounting**.
4. Select the **Addressing Mode** of **Manual**.
5. Enter the IP address for the port of 10.13.101.100/24.
6. Set the **Administrative Access** to **HTTPS** and **SSH**.
7. Select **OK**.

To assign physical interface to the accounting Virtual Domain - CLI

```
config global
   config system interface
      edit dmz2
         set vdom accounting
         set ip 10.13.101.100/24
         set allowaccess https ssh
   next
end
```

Virtual LANs

The term VLAN subinterface correctly implies the VLAN interface is not a complete interface by itself. You add a VLAN subinterface to the physical interface that receives VLAN-tagged packets. The physical interface can belong to a different VDOM than the VLAN, but it must be connected to a network route that is configured for this VLAN. Without that route, the VLAN will not be connected to the network, and VLAN traffic will not be able to access this interface.The traffic on the VLAN is separate from any other traffic on the physical interface.

FortiGate unit interfaces cannot have overlapping IP addresses, the IP addresses of all interfaces must be on different subnets. This rule applies to both physical interfaces and to virtual interfaces such as VLAN subinterfaces. Each VLAN subinterface must be configured with its own IP address and netmask. This rule helps prevent a broadcast storm or other similar network problems.

Any FortiGate unit, with or without VDOMs enabled, can have a maximum of 255 interfaces in Transparent operating mode. In NAT/Route operating mode, the number can range from 255 to 8192 interfaces per VDOM, depending on the FortiGate model. These numbers include VLANs, other virtual interfaces, and physical interfaces. To have more than 255 interfaces configured in Transparent operating mode, you need to configure multiple VDOMs with many interfaces on each VDOM.

This example shows how to add a VLAN, vlan_accounting on the FortiGate unit internal interface with an IP address of 10.13.101.101.

To add a VLAN - web-based manager

1. Go to **System > Network > Interface** and select **Create New**.
   The **Type** is by default set to VLAN.
2. Enter a name for the **VLAN** to `vlan_accounting`.
3. Select the **Internal** interface.
4. Enter the **VLAN ID**.
   The VLAN ID is a number between 1 and 4094 that allow groups of IP addresses with the same VLAN ID to be associated together.
5. Select the **Addressing Mode** of **Manual**.
6. Enter the IP address for the port of 10.13.101.101/24.
7. Set the **Administrative Access** to **HTTPS** and **SSH**.
8. Select **OK**.

To add a VLAN - CLI

```
config system interface
```

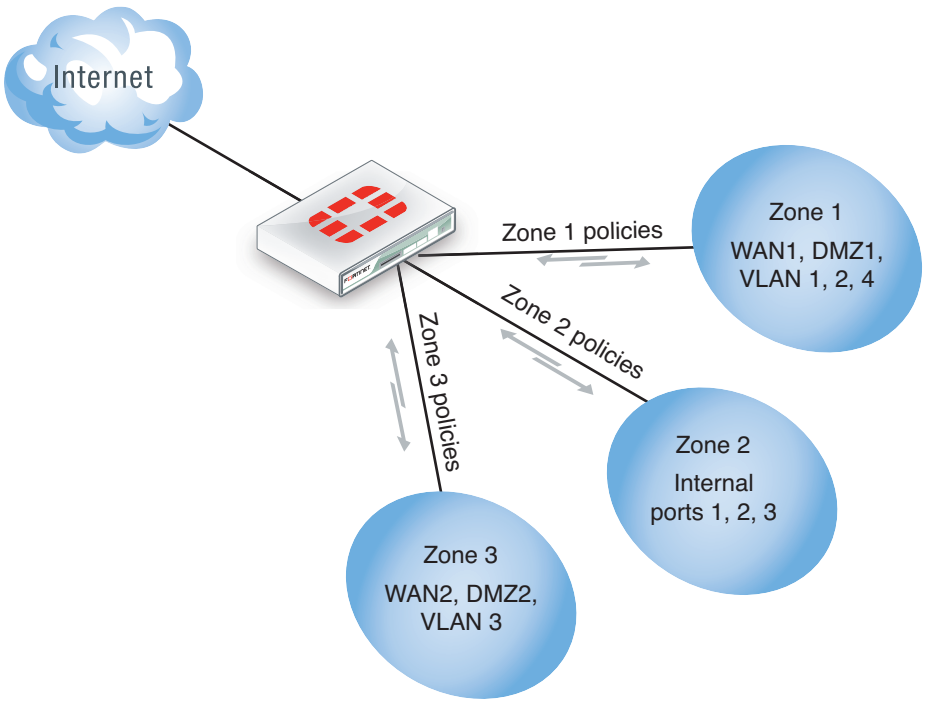
```
    edit VLAN_1
       set interface internal
       set type vlan
       set vlanid 100
       set ip 10.13.101.101/24
       set allowaccess https ssh
    next
end
```

Zones

Zones are a group of one or more FortiGate interfaces, both physical and virtual, that you can apply security policies to control inbound and outbound traffic. Grouping interfaces and VLAN subinterfaces into zones simplifies the creation of security policies where a number of network segments can use the same policy settings and protection profiles. When you add a zone, you select the names of the interfaces and VLAN subinterfaces to add to the zone. Each interface still has its own address and routing is still done between interfaces, that is, routing is not affected by zones. Security policies can also be created to control the flow of intra-zone traffic.

For example, in the illustration below, the network includes three separate groups of users representing different entities on the company network. While each group has its own set of port and VLANs, in each area, they can all use the same security policy and protection profiles to access the Internet. Rather than the administrator making nine separate security policies, he can add the required interfaces to a zone, and create three policies, making administration simpler.

Network zones



You can configure policies for connections to and from a zone, but not between interfaces in a zone. Using the above example, you can create a security policy to go between zone 1 and zone 3, but not between WAN2 and WAN1, or WAN1 and DMZ1.

This example explains how to set up a zone to include the Internal interface and a VLAN.

To create a zone - web-based manager

1. Go to **System > Network > Interface**.
2. Select the arrow on the **Create New** button and select **Zone**.
3. Enter a zone name of `Zone_1`.
4. Select the Internal interface and the virtual LAN interface **vlan_accounting** created previously.
5. Select **OK**.

To create a zone - CLI

```
config system zone
   edit Zone_1
      set interface internal VLAN_1
end
```

Probing interfaces

Server probes can be used on interfaces. In order for this to occur, the probe response mode must first be configured, then the probe response must be allowed administrative access on the interface. The probe response mode can be:

`none`	Disable probe.
`http-probe`	HTTP probe.
`twamp`	Two way active measurement protocol.

Both steps must be done through the CLI.

Configuring the probe

```
config system probe-response
   set mode http-probe
end
```

Allowing the probe response to have administrative access to the interface

```
config system interface
   edit <port>
      set allowaccess probe-response
   end
end
```

Central management

Administering one or two FortiGate units is fairly simple enough, especially when they are in the same room or building. However, if you are administering many FortiGate units that may be located in locations in a large geographical area, or in the world, you will need a more efficient method of maintaining firmware upgrades, configuration changes, and updates.

The FortiManager family of appliances supply the tools needed to effectively manage any size Fortinet security infrastructure, from a few devices to thousands of appliances. FortiManager appliances provide centralized policy-based provisioning, configuration, and update management, as well as end-to-end network monitoring for added control. Managers can control administrative access and simplify policy deployment using role-based administration to define user privileges for specific management domains and functions by aggregating collections of Fortinet appliances and agents into independent management domains. By locally hosting security content updates for managed devices and agents, FortiManager appliances minimize web filtering rating request response time and maximize network protection.

This chapter describes the basics of using FortiManager as an administration tool for multiple FortiGate units. It describes the basics of setting up a FortiGate unit in FortiManager and some key management features you can use within FortiManager to manage the FortiGate unit. For full details and instructions on FortiManager, see the FortiManager Administration Guide.

This section includes the topics:

- Adding a FortiGate to FortiManager
- Configuration through FortiManager
- Firmware updates
- FortiGuard
- Backup and restore configurations
- Administrative domains

In order for the FortiGate unit and FortiManager unit to properly connect, both units must have compatible firmware. To find out if your firmware is compatible, refer to the FortiOS or FortiManager Release Notes.

Adding a FortiGate to FortiManager

Before you can maintain a FortiGate unit using a FortiManager unit, you need to add it to the FortiManager. This requires configuration on both the FortiGate and FortiManager. This section describes the basics to configure management using a FortiManager device. For more information on the interaction of FortiManager with the FortiGate unit, see the FortiManager documentation.

FortiGate configuration

These steps ensure that the FortiGate unit will be able to receive updated antivirus and IPS updates and allow remote management through the FortiManager system. You can add a FortiGate unit whether it is running in either NAT mode or transparent mode. The FortiManager unit provides remote management of a FortiGate unit over TCP port 541.

If you have not already done so, register the FortiGate unit by visiting http://support.fortinet.com and select **Product Registration**. By registering your Fortinet unit, you will receive updates to threat detection and prevention databases (Antivirus, Intrusion Detection, etc.) and will also ensure your access to technical support.

You must enable the FortiGate management option so the FortiGate unit can accept management updates to firmware, antivirus signatures, and IPS signatures.

To configure the FortiGate unit - web-based manager

1. Log in to the FortiGate unit.
2. Go to **System > Admin > Settings**.
3. Enter the **IP address** for the FortiManager unit.
4. Select **Send Request**.

The FortiManager ID now appears in the Trusted FortiManager table.

As an additional security measure, you can also select **Registration Password** and enter a password to concon nect to the FortiManager.

To configure the FortiGate unit - CLI

```
config system central-management
   set fmg <ip_address>
end
```

To use the registration password enter:

```
execute central-mgmt register-device <fmg-serial-no><fmg-register-password><fgt-
    usrname><fgt-password>
```

Configuring an SSL connection

An SSL connection can be configured between the two devices and an encryption level selected. Use the following CLI commands in the FortiGate CLI to configure the connection:

```
config system central-management
   set status enable
   set enc-algorithm {default* | high | low}
end
```

The default encryption automatically sets high and medium encryption algorithms. Algorithms used for high, medium, and low follows openssl definitions:

- **High** - Key lengths larger than 128 bits, and some cipher suites with 128-bit keys.

Algorithms are: DHE-RSA-AES256-SHA:AES256-SHA: EDH-RSA-DES-CBC3-SHA: DES-CBC3-SHA:DES-CBC3-MD5:DHE-RSA-AES128-SHA:AES128-SHA

- **Medium** - Key strengths of 128 bit encryption.

Algorithms are: RC4-SHA:RC4-MD5:RC4-MD

- **Low** - Key strengths of 64 or 56 bit encryption algorithms but excluding export cipher suites

Algorithms are: EDH-RSA-DES-CDBC-SHA; DES-CBC-SHA; DES-CBC-MD5.

FortiManager configuration

Once the connection between the FortiGate unit and the FortiManager unit has been configured, you can add the FortiGate to the Device Manager in the FortiManager unit's web-based manager. For details on completing the configuration, see the FortiManager Administration Guide.

Configuration through FortiManager

With the FortiManager system, you can monitor and configure multiple FortiGate units from one location. Using the FortiManager's Device Manager, you can view the FortiGate units and make the usual configuration updates and changes, without having to log in and out of multiple FortiGate units.

FortiManager enables you to complete the configuration, by going to the Device Manager, selecting the FortiGate unit and using the same menu structure and pages as you would see in the FortiGate web-based manager. All changes to the FortiGate configuration are stored locally on the FortiManager unit until you synchronize with the FortiGate unit.

When a FortiGate unit is under control of a FortiManager system, administrators will not be able to change the configuration using the FortiGate. When trying to change options, the unit displays a message that it is configured through FortiManager, and any changes may be reverted.

Global objects

If you are maintaining a number of FortiGate units within a network, many of the policies and configuration elements will be the same across the corporation. In these instances, the adding and editing of many of the same policies will be come a tedious and error-prone activity. With FortiManager global objects, this level of configuration is simplified.

A global object is an object that is not associated specifically with one device or group. Global objects includes security policies, a DNS server, VPN, and IP pools.

The Global Objects window is where you can configure global objects and copy the configurations to the FortiManager device database for a selected device or a group of devices. You can also import configurations from the FortiManager device database for a selected device and modify the configuration as required.

When configuring or creating a global policy object the interface, prompts, and fields are the same as creating the same object on a FortiGate unit using the FortiGate web-based manager.

Locking the FortiGate web-based manager

When you use the FortiManager to manager multiple FortiGate units, a local FortiGate unit becomes locked from any configuration changes using the web-based manager for most administrators. The super_admin will still be able to make changes to the configuration; however, this is not recommended as it may cause conflicts with the FortiManager.

Firmware updates

A FortiManager unit can also perform firmware updates for multiple FortiGate units, saving time rather than upgrading each FortiGate unit individually.

The FortiManager unit stores local copies of firmware images, either by downloading images from the Fortinet Distribution Network (FDN) or by accepting firmware images that are uploaded from the management computer.

If you are using the FortiManager unit to download firmware images, the FDN first validates device licenses and support contracts and then provides a list of currently available firmware images. For devices with valid Fortinet Technical Support contracts, you can download new firmware images from the FDN and the firmware release notes.

After firmware images have been either downloaded from the FDN or imported to the firmware list, you can either schedule or immediately upgrade/downgrade a device or group of device's firmware.

See the FortiManager Administration Guide for more information on updating the FortiGate firmware using the FortiManager central management.

FortiGuard

FortiManager can also connect to the FortiGuard Distribution Network (FDN) to receive push updates for IPS signatures and antivirus definitions. These updates can then be used to update multiple FortiGate units throughout an organization. By using the FortiManager as the host for updates, bandwidth use is minimized as updates are downloaded to one source instead of many.

To receive IPS and antivirus updates from FortiManager, indicate an alternate IP address on the FortiGate unit.

To configure updates from FortiManager

1. Go to **System > Config > FortiGuard**.
2. Select **AntiVirus and IPS Options** to expand the options.
3. Enable both **Allow Push Update** and **Use override push IP**.
4. Enter the IP address of the FortiManager unit.
5. Select **Apply**.

Backup and restore configurations

A FortiManager unit stores configuration files for backup and restore purposes. A FortiManager also enables you to save revisions of configuration files. Configuration backups occur automatically when the administrator logs out or the administrator login session expires.

FortiManager also enables you to view differences between different configurations to view where changes have been made.

Administrative domains

FortiManager administrative domains enable the super_admin to create groupings of devices for configured administrators to monitor and manage. FortiManager can manage a large number of Fortinet appliances. This enables administrators to maintain managed devices specific to their geographic location or business division. This also includes FortiGate units with multiple configured VDOMs.

Each administrator is tied to an administrative domain (ADOM). When that particular administrator logs in, they see only those devices or VDOMs configured for that administrator and ADOM. The one exception is the super_admin account that can see and maintain all administrative domains and the devices within those domains.

Administrative domains are not enabled by default and enabling and configuring the domains can only be performed by the super_admin.

The maximum number of administrative domains you can add depends on the FortiManager system model. See the FortiManager Administration Guide for information on the maximums for each model.

Monitoring

With network administration, the first step is installing and configuring the FortiGate unit to be the protector of the internal network. Once the system is running efficiently, the next step is to monitor the system and network traffic, making configuration changes as necessary when a threat or vulnerability is discovered.

This chapter discusses the various methods of monitoring both the FortiGate unit and the network traffic through a range of different tools available within FortiOS.

This section includes the topics:

- Dashboard
- sFlow
- Monitor menus
- Logging
- Alert email
- SNMP
- SNMP get command syntax

Dashboard

The FortiOS dashboard provides a location to view real-time system information. By default, the dashboard displays the key statistics of the FortiGate unit itself, providing the memory and CPU status, as well as the health of the ports, whether they are up or down and their throughput.

Widgets

Within the dashboard is a number of smaller windows, called widgets, that provide this status information. Beyond what is visible by default, you can add a number of other widgets that display other key traffic information including application use, traffic per IP address, top attacks, traffic history and logging statistics.

You can add multiple dashboards to reflect what data you want to monitor, and add the widgets accordingly. Dashboard configuration is only available through the web-based manager. Administrators must have read and write privileges to customize and add widgets when in either menu. Administrators must have read privileges if they want to view the information.

To add a dashboard and widgets

1. Go to **System > Dashboard > Status**.
2. Select the **Dashboard** menu at the top of the window and select **Add Dashboard**.
3. Enter a name.
4. Select the **Widget** menu at the top of the window.
5. From the screen, select the type of information you want to add.
6. When done, select the X in the top right of the widget.

Dashboard widgets provide an excellent method to view real-time data about the events occurring on the FortiGate unit and the network. For example, by adding the Network Protocol Usage widget, you can monitor the

activity of various protocols over a selected span of time. Based on that information you can add or adjust traffic shaping and/or security policies to control traffic.

FortiClient software

The **License Information** widget includes information for the FortiClient connections. It displays the number of FortiClient connections allowed and the number of users connecting. By selecting the **Details** link for the number of connections, you can view more information about the connecting user, including IP address, user name, and type of operating system the user is connecting with.

Included with this information is a link for Mac and Windows. Selecting these links automatically downloads the FortiClient install file (.dmg or .exe) to the management computer.

sFlow

sFlow is a method of monitoring the traffic on your network to identify areas on the network that may impact performance and throughput. FortiOS implements sFlow version 5.

sFlow uses packet sampling to monitor network traffic. The sFlow Agent captures packet information at defined intervals and sends them to an sFlow Collector for analysis, providing real-time data analysis. The information sent is only a sampling of the data for minimal impact on network throughput and performance.

The sFlow Agent is embedded in the FortiGate unit. Once configured, the FortiGate unit sends sFlow datagrams of the sampled traffic to the sFlow Collector, also called an sFlow Analyzer. The sFlow Collector receives the datagrams, and provides real-time analysis and graphing to indicate where potential traffic issues are occurring. sFlow Collector software is available from a number of third party software vendors.

sFlow data captures only a sampling of network traffic, not all traffic like the traffic logs on the FortiGate unit. Sampling works by the sFlow Agent looking at traffic packets when they arrive on an interface. A decision is made whether the packet is dropped and allowed to be to its destination or if a copy is forwarded to the sFlow Collector. The sample used and its frequency are determined during configuration.

sFlow is not supported on virtual interfaces such as vdom link, ipsec, ssl.root or gre.

The sFlow datagram sent to the Collector contains the information:

- Packet header (e.g. MAC,IPv4,IPv6,IPX,AppleTalk,TCP,UDP, ICMP)
- Sample process parameters (rate, pool etc.)
- Input/output ports
- Priority (802.1p and TOS)
- VLAN (802.1Q)
- Source/destination prefix
- Next hop address
- Source AS, Source Peer AS
- Destination AS Path
- Communities, local preference
- User IDs (TACACS/RADIUS) for source/destination
- URL associated with source/destination
- Interface statistics (RFC 1573, RFC 2233, and RFC 2358)

sFlow agents can be added to any type of FortiGate interface. sFlow isn't supported on some virtual interfaces such as VDOM link, IPsec, gre, and ssl.root.

For more information on sFlow, Collector software and sFlow MIBs, visit www.sflow.org.

Configuration

sFlow configuration is available only from the CLI. Configuration requires two steps: enabling the sFlow Agent and configuring the interface for the sampling information.

Enable sFlow

```
config system sflow
   set collector-ip <ip_address>
   set collector-port <port_number>
   set source-ip <ip_address>
end
```

The default port for sFlow is UDP 6343. To configure in VDOM, use the commands:

```
config system vdom-sflow
   set vdom-sflow enable
   set collector-ip <ip_address>
   set collector-port <port_number>
   set source-ip <ip_address>
end
```

Configure sFlow agents per interface.

```
config system interface
   edit <interface_name>
      set sflow-sampler enable
      set sample-rate <every_n_packets>
      set sample-direction [tx | rx | both]
      set polling-interval <seconds>
   end
```

Monitor menus

The **Monitor** menus enable you to view session and policy information and other activity occurring on your FortiGate unit. The monitors provide the details of user activity, traffic and policy usage to show live activity. Monitors are available for DHCP, routing, security policies, traffic shaping, load balancing, security features, VPN, users, WiFi, and logging.

Logging

FortiOS provides a robust logging environment that enables you to monitor, store, and report traffic information and FortiGate events, including attempted log ins and hardware status. Depending on your requirements, you can log to a number of different hosts.

To configure logging in the web-based manager, go to **Log & Report > Log Config > Log Settings**.

To configure logging in the CLI use the commands `config log <log_location>`.

For details on configuring logging see the Logging and Reporting Guide.

If you will be using several FortiGate units, you can also use a FortiAnalyzer unit for logging. For more information, see the FortiAnalyzer Administration Guide.

FortiCloud

The FortiCloud is a subscription-based hosted service. With this service, you can have centralized management, logging, and reporting capabilities available in FortiAnalyzer and FortiManager platforms, without any additional hardware to purchase, install or maintain. In most cases, FortiCloud is the recommended location for saving and viewing logs.

This service includes a full range of reporting, analysis and logging, firmware management and configuration revision history. It is hosted within the Fortinet global FortiGuard Network for maximum reliability and performance, and includes reporting, and drill-down analysis widgets makes it easy to develop custom views of network and security events.

The FortiGate unit sends log messages to the FortiCloud using TCP port 443. Configuration is available once a user account has been set up and confirmed. To enable the account on the FortiGate unit, go to **System > Dashboard > Status**, in the **Licence Information** widget select **Activate**, and enter the account ID.

For FortiCloud traffic, you can identify a specific port/IP address for logging traffic. Configuration of these services is performed in the CLI, using the command `set source-ip`. When configured, this becomes the dedicated port to send this traffic over.

For example, to set the source IP of the FortiCloud server to be on the DMZ1 port with an IP of 192.168.4.5, the commands are:

```
config log fortiguard setting
   set status enable
   set source-ip 192.168.4.5
end
```

From the FortiGate unit, you can configure the connection and sending of log messages to be sent over an SSL tunnel to ensure log messages are sent securely. To do this, use the CLI commands to enable the encrypted connection and define the level of encryption.

```
config log fortiguard setting
   set status enable
   set enc-alogorithm {default | high | low | disable}
end
```

FortiGate memory

Logs are saved to the internal memory by default. Inexpensive yet volatile, for basic event logs or verifying traffic, AV or spam patterns, logging to memory is a simple option. However, because logs are stored in the limited space of the internal memory, only a small amount is available for logs. As such logs can fill up and be overridden with new entries, negating the use of recursive data. This is especially true for traffic logs. Also, should the FortiGate unit be shut down or rebooted, all log information will be lost.

FortiGate hard disk

For those FortiGate units with an internal hard disk or SDHC card, you can store logs to this location. Efficient and local, the hard disk provides a convenient storage location. If you choose to store logs in this manner, remember to backup the log data regularly.

Configure log disk settings is performed in the CLI using the commands:

```
config log disk setting
   set status enable
end
```

Further options are available when enabled to configure log file sizes, and uploading/backup events.

As well, note that the write speeds of hard disks compared to the logging of ongoing traffic may cause the dropping such, it is recommended that traffic logging be sent to a FortiAnalyzer or other device meant to handle large volumes of data.

Syslog server

An industry standard for collecting log messages, for off-site storage. In the web-based manager, you are able to send logs to a single syslog server, however in the CLI you can configure up to three syslog servers where you can also use multiple configuration options. For example, send traffic logs to one server, antivirus logs to another. The FortiGate unit sends Syslog traffic over UDP port 514. Note that if a secure tunnel is configured for communication to a FortiAnalyzer unit, then Syslog traffic will be sent over an IPsec connection, using UPD 500/4500, Protocol IP/50.

To configure a Syslog server in the web-based manager, go to **Log & Report > Log Config > Log Settings**. In the CLI use the commands:

```
config log syslogd setting
   set status enable
   set server <IP address or FQDN of syslog server>
end
```

Further options are available when enabled to configure a different port, facility and server IP address.

For Syslog traffic, you can identify a specific port/IP address for logging traffic. Configuration of these services is performed in the CLI, using the command `set source-ip`. When configured, this becomes the dedicated port to send this traffic over.

For example, to set the source IP of a Syslog server to be on the DMZ1 port with an IP of 192.168.4.5, the commands are:

```
config log syslogd setting
   set status enable
   set source-ip 192.168.4.5
end
```

FortiAnalyzer

The FortiAnalyzer family of logging, analyzing, and reporting appliances securely aggregate log data from Fortinet devices and other syslog-compatible devices. Using a comprehensive suite of easily-customized reports, users can filter and review records, including traffic, event, virus, attack, Web content, and email data, mining the data to determine your security stance and assure regulatory compliance. FortiAnalyzer also provides advanced security management functions such as quarantined file archiving, event correlation, vulnerability assessments, traffic analysis, and archiving of email, Web access, instant messaging and file transfer content.

The FortiGate unit sends log messages over UDP port 514 or OFTP (TCP 514). If a secure connection has been configured, log traffic is sent over UDP port 500/4500, Protocol IP/50.

For FortiAnalyzer traffic, you can identify a specific port/IP address for logging traffic. Configuration of these services is performed in the CLI, using the command set `source-ip`. When configured, this becomes the dedicated port to send this traffic over.

For example, to set the source IP of a FortiAnalyzer unit to be on port 3 with an IP of 192.168.21.12, the commands are:

```
config log fortiguard setting
   set status enable
   set source-ip 192.168.21.12
end
```

Sending logs using a secure connection

From the FortiGate unit, you can configure the connection and sending of log messages over an SSL tunnel to ensure log messages are sent securely. To do this, use the CLI commands below to enable the encrypted connection and define the level of encryption.

You must configure the secure tunnel on **both** ends of the tunnel, the FortiGate unit and the FortiAnalyzer unit.

To configure a secure connection to the FortiAnalyzer unit

On the FortiAnalyzer unit, enter the commands:

```
config log device
   edit <device_name>
      set secure psk
      set psk <name_of_IPsec_tunnel>
      set id <fortigate_device_name_on_the_fortianalyzer>
end
```

To configure a secure connection on the FortiGate unit

On the FortiGate CLI, enter the commands:

```
config log fortianalyzer setting
   set status enable
   set server <ip_address>
   set localid <name_of_IPsec_tunnel>
end
```

Configuring an SSL connection

An SSL connection can be configured between the two devices, and an encryption level selected.

Use the CLI commands to configure the encryption connection:

```
config log fortianalyzer setting
   set status enable
   set enc-algorithm {default* | high | low | disable}
end
```

The default encryption automatically sets high and medium encryption algorithms. Algorithms used for high, medium, and low follows openssl definitions:

- **High** - Key lengths larger than 128 bits, and some cipher suites with 128-bit keys.

Algorithms are: DHE-RSA-AES256-SHA:AES256-SHA: EDH-RSA-DES-CBC3-SHA: DES-CBC3-SHA:DES-CBC3-MD5:DHE-RSA-AES128-SHA:AES128-SHA

- **Medium** - Key strengths of 128 bit encryption.

Algorithms are: RC4-SHA:RC4-MD5:RC4-MD

- **Low** - Key strengths of 64 or 56 bit encryption algorithms but excluding export cipher suites

Algorithms are: EDH-RSA-DES-CDBC-SHA; DES-CBC-SHA; DES-CBC-MD5.

If you want to use an IPsec tunnel to connect to the FortiAnalyzer unit, you need to first disable the enc-algorithm:

```
config log fortianalyzer setting
   set status enable
   set enc-algorithm disable
```

Then set the IPsec encryption:

```
set encrypt enable
   set psksecret <preshared_IPsec_tunnel_key>
end
```

Packet Capture

When troubleshooting networks, it helps to look inside the header of the packets. This helps to determine if the packets, route, and destination are all what you expect. Packet capture can also be called a network tap, packet sniffing, or logic analyzing.

To use the packet capture.

1. Go to **System > Network > Packet Capture**.
2. Select **Create New** or an existing entry is there is one that meets your needs.
3. Select the interface to monitor and select the number of packets to keep.
4. Select **Enable Filters**.
5. Enter the information you want to gather from the packet capture.
6. Select **OK**.

To run the capture, select the play button in the progress column in the packet capture list. If not active, **Not Running** will also appear in the column cell. The progress bar will indicate the status of the capture. You can stop and restart it at any time.

When the capture is complete, select the **Download** icon to save the packet capture file to your hard disk for further analysis.

Packet capture tells you what is happening on the network at a low level. This can be very useful for troubleshooting problems, such as:

- finding missing traffic
- seeing if sessions are setting up properly
- locating ARP problems such as broadcast storm sources and causes
- confirming which address a computer is using on the network if they have multiple addresses or are on multiple networks
- confirming routing is working as you expect
- wireless client connection problems
- intermittent missing PING packets
- a particular type of packet is having problems, such as UDP, which is commonly used for streaming video

If you are running a constant traffic application such as ping, packet capture can tell you if the traffic is reaching the destination, how the port enters and exits the FortiGate unit, if the ARP resolution is correct, and if the traffic is returning to the source as expected. You can also use packet switching to verify that NAT or other configuration is translating addresses or routing traffic the way that you want it to.

Before you start capturing packets, you need to have a good idea of what you are looking for. Capture is used to confirm or deny your ideas about what is happening on the network. If you try capture without a plan to narrow your search, you could end up with too much data to effectively analyze. On the other hand, you need to capture enough packets to really understand all of the patterns and behavior that you are looking for.

Alert email

As an administrator, you want to be certain you can respond quickly to issues occurring on your network or on the FortiGate unit. Alert emails provide an efficient and direct method of notifying an administrator of events. By configuring alert messages, you can define the threshold when a problem becomes critical and needs attention. When this threshold is reached, the FortiGate unit will send an email to one or more individuals, notifying them of the issue.

In the following example, the FortiGate unit is configured to send email to two administrators (admin1 and admin2) when multiple intrusions are detected every two minutes. The FortiGate unit has its own email address on the mail server.

To configure the email service

1. Go to **System > Config > Advanced**.
2. In the **Email Service**, complete the following and select **Apply**:

SMTP Server	Enter the address or name of the email server. For example, `smtp.example.com`.
Default Reply To	Enter an email address to associate with the alert email. This field is optional. If you enter an email address here, it overrides the email address entered when configuring alert email in **Log & Report > Alert E-mail**.
Authentication	Enable authentication if required by the email server.
Security mode	Choose between *None*, *SMTPS* or *STARTTLS*
Port	25

To configure alert email - web-based manager

1. Go to **Log & Report > Log Config > Alert E-mail**.
2. Enter the information:

Email from	fortigate@example.com
Email to	admin1@example.com admin2@example.com

3. For the **Interval Time**, enter 2.
4. Select **Intrusion Detected**.
5. Select **Apply**.

To configure alert email - CLI

```
config system email-server
   set port 25
   set server smtp.example.com
   set authenticate enable
   set username FortiGate
   set password *************
end
config alertemail setting
   set username fortigate@example.com
   set mailto1 admin1@example.com
   set mailto2 admin2@example.com
   set filter category
   set IPS-logs enable
end
```

SNMP

Simple Network Management Protocol (SNMP) enables you to monitor hardware on your network. You can configure the hardware, such as the FortiGate SNMP agent, to report system information and send traps (alarms or event messages) to SNMP managers. An SNMP manager, or host, is a typically a computer running an application that can read the incoming trap and event messages from the agent and send out SNMP queries to the SNMP agents. A FortiManager unit can act as an SNMP manager to one or more FortiGate units. FortiOS supports SNMP using IPv4 and IPv6 addressing.

By using an SNMP manager, you can access SNMP traps and data from any FortiGate interface or VLAN subinterface configured for SNMP management access. Part of configuring an SNMP manager is to list it as a host in a community on the FortiGate unit it will be monitoring. Otherwise, the SNMP monitor will not receive any traps from that FortiGate unit or be able to query that unit.

The FortiGate SNMP implementation is read-only. SNMP v1, v2c, and v3 compliant SNMP managers have read-only access to FortiGate system information through queries and can receive trap messages from the FortiGate unit.

To monitor FortiGate system information and receive FortiGate traps, you must first compile the Fortinet and FortiGate Management Information Base (MIB) files. A MIB is a text file that describes a list of SNMP data objects that are used by the SNMP manager. These MIBs provide information the SNMP manager needs to interpret the SNMP trap, event, and query messages sent by the FortiGate unit SNMP agent.

FortiGate core MIB files are available for download by going to **System > Config > SNMP** and selecting the download link on the page.

The Fortinet implementation of SNMP includes support for most of RFC 2665 (Ethernet-like MIB) and most of RFC 1213 (MIB II). For more information, see “Fortinet MIBs”. RFC support for SNMP v3 includes Architecture for SNMP Frameworks (RFC 3411), and partial support of User-based Security Model (RFC 3414).

SNMP traps alert you to events that occur such as an a full log disk or a virus detected.

SNMP fields contain information about the FortiGate unit, such as CPU usage percentage or the number of sessions. This information is useful for monitoring the condition of the unit on an ongoing basis and to provide more information when a trap occurs.

The FortiGate SNMP v3 implementation includes support for queries, traps, authentication, and privacy. Authentication and encryption are configured in the CLI. See the `system snmp user` command in the FortiGate CLI Reference.

SNMP configuration settings

Before a remote SNMP manager can connect to the FortiGate agent, you must configure one or more FortiGate interfaces to accept SNMP connections by going to **System > Network > Interface**. Select the interface and, in the **Administrative Access**, select **SNMP**.

For VDOMS, SNMP traps can only be sent on interfaces in the management VDOM. Traps cannot be sent over other interfaces outside the management VDOM.

To configure SNMP settings, go to **System > Config > SNMP**.

SNMP Agent	Select to enable SNMP communication.
Description	Enter descriptive information about the FortiGate unit. The description can be up to 35 characters.
Location	Enter the physical location of the FortiGate unit. The system location description can be up to 35 characters long.
Contact	Enter the contact information for the person responsible for this FortiGate unit. The contact information can be up to 35 characters.
SNMP v1/v2c section To create a new SNMP community, see SNMP Community page.	
Community Name	The name to identify the community.
Queries	Indicates whether queries protocols (v1 and v2c) are enabled or disabled. A green check mark indicates queries are enabled; a gray x indicates queries are disabled. If one query is disabled and another one enabled, there will still be a green check mark.
Traps	Indicates whether trap protocols (v1 and v2c) are enabled or disabled. A green check mark indicates traps are enabled; a gray x indicates traps are disabled. If one query is disabled and another one enabled, there will still be a green check mark.
Enable	Select the check box to enable or disable the community.
SNMP v3 section To create a new SNMP community, see SNMP Community pager.	
User Name	The name of the SNMPv3 user.
Security Level	The security level of the user.
Notification Host	The IP address or addresses of the host.
Queries	Indicates whether queries are enabled or disabled. A green check mark indicates queries are enabled; a gray x indicates queries are disabled
New SNMP Community page	
Community Name	Enter a name to identify the SNMP community
Hosts (section)	

IP Address	Enter the IP address and Identify the SNMP managers that can use the settings in this SNMP community to monitor the FortiGate unit. You can also set the IP address to 0.0.0.0 to so that any SNMP manager can use this SNMP community.
Interface	Optionally, select the name of the interface that this SNMP manager uses to connect to the FortiGate unit. You only have to select the interface if the SNMP manager is not on the same subnet as the FortiGate unit. This can occur if the SNMP manager is on the Internet or behind a router. In virtual domain mode, the interface must belong to the management VDOM to be able to pass SNMP traps.
Delete	Removes an SNMP manager from the list within the **Hosts** section.
Add	Select to add a blank line to the Hosts list. You can add up to eight SNMP managers to a single community.
Queries (section)	
Protocol	The SNMP protocol. In the v1 row, this means that the settings are for SNMP v1. In the v2c row, this means that the settings are for SNMP v2c.
Port	Enter the port number (161 by default) that the SNMP managers in this community use for SNMP v1 and SNMP v2c queries to receive configuration information from the FortiGate unit. Select the **Enable** check box to activate queries for each SNMP version. **Note:** The SNMP client software and the FortiGate unit must use the same port for queries.
Enable	Select to enable that SNMP protocol.
Traps (section)	
Protocol	The SNMP protocol. In the v1 row, this means that the settings are for SNMP v1. In the v2c row, this means that the settings are for SNMP v2c.
Local	Enter the remote port numbers (port 162 for each by default) that the FortiGate unit uses to send SNMP v1 or SNMP v2c traps to the SNMP managers in this community. Select the **Enable** check box to activate traps for each SNMP version. **Note:** The SNMP client software and the FortiGate unit must use the same port for traps.

Remote	Enter the remote port number (port 162 is default) that the FortiGate unit uses to send SNMP v1 or v2c traps to the SNMP managers in this community. **Note:** The SNMP client software and the FortiGate unit must use the same port for queries.
Enable	Select to activate traps for each SNMP version.
SNMP Event	Enable each SNMP event for which the FortiGate unit should send traps to the SNMP managers in this community. **CPU Over usage** traps sensitivity is slightly reduced, by spreading values out over 8 polling cycles. This prevents sharp spikes due to CPU intensive short-term events such as changing a policy. **Power Supply Failure** event trap is available only on some models. **AMC interfaces enter bypass mode** event trap is available only on models that support AMC modules.
Enable	Select to enable the SNMP event.
Create New SNMP V3 User	
User Name	Enter the name of the user.
Security Level	Select the type of security level the user will have.
Notification Host	Enter the IP address of the notification host. If you want to add more than one host, after entering the IP address of the first host, select the plus sign to add another host.
Enable Query	Select to enable or disable the query. By default, the query is enabled.
Port	Enter the port number in the field.
Events	Select the SNMP events that will be associated with that user.

Gigabit interfaces

When determining the interface speed of a FortiGate unit with a 10G interface, the IF-MIB.ifSpeed may not return the correct value. IF-MIB.ifSpeed is a 32-bit gauge used to report interface speeds in bits/second and cannot convert to a 64-bit value. The 32-bit counter wrap the output too fast to be accurate.

In this case, you can use the value ifHighSpeed. It reports interface speeds in megabits/second. This ensures that 10Gb interfaces report the correct value.

SNMP agent

You need to first enter information and enable the FortiGate SNMP Agent. Enter information about the FortiGate unit to identify it so that when your SNMP manager receives traps from the FortiGate unit, you will know which

unit sent the information.

To configure the SNMP agent - web-based manager

1. Go to **System > Config > SNMP**.
2. Select **Enable** for the **SNMP Agent**.
3. Enter a descriptive name for the agent.
4. Enter the location of the FortiGate unit.
5. Enter a contact or administrator for the SNMP Agent or FortiGate unit.
6. Select **Apply**.

To configure SNMP agent - CLI

```
config system snmp sysinfo
   set status enable
   set contact-info <contact_information>
   set description <description_of_FortiGate>
   set location <FortiGate_location>
end
```

SNMP community

An SNMP community is a grouping of devices for network administration purposes. Within that SNMP community, devices can communicate by sending and receiving traps and other information. One device can belong to multiple communities, such as one administrator terminal monitoring both a firewall SNMP and a printer SNMP community.

Add SNMP communities to your FortiGate unit so that SNMP managers can connect to view system information and receive SNMP traps.

You can add up to three SNMP communities. Each community can have a different configuration for SNMP queries and traps. Each community can be configured to monitor the FortiGate unit for a different set of events. You can also add the IP addresses of up to 8 SNMP managers to each community.

When the FortiGate unit is in virtual domain mode, SNMP traps can only be sent on interfaces in the management virtual domain. Traps cannot be sent over other interfaces.

To add an SNMP v1/v2c community - web-based manager

1. Go to **System > Config > SNMP**.
2. In the **SNMP v1/v2c** area, select **Create New**.
3. Enter a **Community Name**.
4. Enter the IP address and Identify the SNMP managers that can use the settings in this SNMP community to monitor the FortiGate unit.
5. Select the interface if the SNMP manager is not on the same subnet as the FortiGate unit.
6. Enter the **Port** number that the SNMP managers in this community use for SNMP v1 and SNMP v2c queries to receive configuration information from the FortiGate unit. Select the **Enable** check box to activate queries for each SNMP version.
7. Enter the Local and Remote port numbers that the FortiGate unit uses to send SNMP v1 and SNMP v2c traps to the SNMP managers in this community.

8. Select the **Enable** check box to activate traps for each SNMP version.
9. Select **OK**.

To add an SNMP v1/v2c community - CLI

```
config system snmp community
   edit <index_number>
      set events <events_list>
      set name <community_name>
      set query-v1-port <port_number>
      set query-v1-status {enable | disable}
      set query-v2c-port <port_number>
      set query-v2c-status {enable | disable}
      set status {enable | disable}
      set trap-v1-lport <port_number>
      set trap-v1-rport <port_number>
      set trap-v1-status {enable | disable}
      set trap-v2c-lport <port_number>
      set trap-v2c-rport <port_number>
      set trap-v2c-status {enable | disable}
end
```

To add an SNMP v3 community - web-based manager

1. Go to **System > Config > SNMP**.
2. In the **SNMP v3** area, select **Create New**.
3. Enter a **User Name**.
4. Select a **Security Level** and associated authorization algorithms.
5. Enter the IP address of the **Notification Host** SNMP managers that can use the settings in this SNMP community to monitor the FortiGate unit.
6. Enter the **Port** number that the SNMP managers in this community use to receive configuration information from the FortiGate unit. Select the **Enable** check box to activate queries for each SNMP version.
7. Select the **Enable** check box to activate traps.
8. Select **OK**.

To add an SNMP v3 community - CLI

```
config system snmp user
   edit <index_number>
      set security-level [auth-priv | auth-no-priv | no-auth-no-priv}
      set queries enable
      set query-port <port_number>
      set notify-hosts <ip_address>
      set events <event_selections>
end
```

Enabling on the interface

Before a remote SNMP manager can connect to the FortiGate agent, you must configure one or more FortiGate interfaces to accept SNMP connections.

To configure SNMP access - web-based manager

1. Go to **System > Network > Interface**.
2. Choose an interface that an SNMP manager connects to and select **Edit**.
3. In **Administrative Access**, select **SNMP**.
4. Select **OK**.

To configure SNMP access - CLI

```
config system interface
   edit <interface_name>
      set allowaccess snmp
end
```

If the interface you are configuring already has protocols that are allowed access, use the command `append allowaccess snmp` instead, or else the other protocols will be replaced. For more information, see Adding and removing options from lists.

Fortinet MIBs

The FortiGate SNMP agent supports Fortinet proprietary MIBs as well as standard RFC 1213 and RFC 2665 MIBs. RFC support includes support for the parts of RFC 2665 (Ethernet-like MIB) and the parts of RFC 1213 (MIB II) that apply to FortiGate unit configuration.

There are two MIB files for FortiGate units - the Fortinet MIB, and the FortiGate MIB. The Fortinet MIB contains traps, fields and information that is common to all Fortinet products. The FortiGate MIB contains traps, fields and information that is specific to FortiGate units. Each Fortinet product has its own MIB. If you use other Fortinet products you will need to download their MIB files as well. Both MIB files are used for FortiOS and FortiOS Carrier; there are no additional traps for the Carrier version of the operating system.

The Fortinet MIB and FortiGate MIB along with the two RFC MIBs are listed in tables in this section. You can download the two FortiGate MIB files from Fortinet Customer Support. The Fortinet MIB contains information for Fortinet products in general. the Fortinet FortiGate MIB includes the system information for The FortiGate unit and version of FortiOS. Both files are required for proper SNMP data collection.

To download the MIB files, go to **System > Config > SNMP** and select a MIB link in the **FortiGate SNMP MIB** section.

Your SNMP manager may already include standard and private MIBs in a compiled database that is ready to use. You must add the Fortinet proprietary MIB to this database to have access to the Fortinet specific information.

There were major changes to the MIB files between FortiOS Carrier v3.0 and v4.0. You need to use the new MIBs for FortiOS Carrier v4.0 or you may mistakenly access the wrong traps and fields.

MIB files are updated for each version of FortiOS. When upgrading the firmware ensure that you updated the Fortinet FortiGate MIB file as well.

Fortinet MIBs

MIB file name or RFC	Description
FORTINET-CORE-MIB.mib	The Fortinet MIB includes all system configuration information and trap information that is common to all Fortinet products. Your SNMP manager requires this information to monitor FortiGate unit configuration settings and receive traps from the FortiGate SNMP agent.
FORTINET-FORTIGATE-MIB.mib	The FortiGate MIB includes all system configuration information and trap information that is specific to FortiGate units. Your SNMP manager requires this information to monitor FortiGate configuration settings and receive traps from the FortiGate SNMP agent. FortiManager systems require this MIB to monitor FortiGate units.
RFC-1213 (MIB II)	The FortiGate SNMP agent supports MIB II groups with these exceptions. • No support for the EGP group from MIB II (RFC 1213, section 3.11 and 6.10). • Protocol statistics returned for MIB II groups (IP/ICMP/TCP/UDP/etc.) do not accurately capture all FortiGate traffic activity. More accurate information can be obtained from the information reported by the Fortinet MIB.
RFC-2665 (Ethernet-like MIB)	The FortiGate SNMP agent supports Ethernet-like MIB information. FortiGate SNMP does not support for the dot3Tests and dot3Errors groups.

SNMP get command syntax

Normally, to get configuration and status information for a FortiGate unit, an SNMP manager would use an SNMP get commands to get the information in a MIB field. The SNMP get command syntax would be similar to:

```
snmpget -v2c -c <community_name> <address_ipv4> {<OID> | <MIB_field>}
```

…where…

`<community_name>` is an SNMP community name added to the FortiGate configuration. You can add more than one community name to a FortiGate SNMP configuration. The most commonly used community name is `public`.

`<address_ipv4>` is the IP address of the FortiGate interface that the SNMP manager connects to.

`{<OID> | <MIB_field>}` is the object identifier (OID) for the MIB field or the MIB field name itself.

The SNMP `get` command gets firmware version running on the FortiGate unit. The community name is `public`. The IP address of the interface configured for SNMP management access is `10.10.10.1`. The firmware version MIB field is `fgSysVersion` and the OID for this MIB field is `1.3.6.1.4.1.12356.101.4.1.1` The first command uses the MIB field name and the second uses the OID:

```
snmpget -v2c -c public 10.10.10.1 fgSysVersion.0
snmpget -v2c -c public 10.10.10.1 1.3.6.1.4.1.12356.101.4.1.1.0
```

The OIDs and object names used in these examples are dependent on the version of MIB and are subject to change.

VLANs

Virtual Local Area Networks (VLANs) multiply the capabilities of your FortiGate unit, and can also provide added network security. Virtual LANs (VLANs) use ID tags to logically separate devices on a network into smaller broadcast domains. These smaller domains forward packets only to devices that are part of that VLAN domain. This reduces traffic and increases network security.

A Local Area Network (LAN) is a group of connected computers and devices that are arranged into network broadcast domains. A LAN broadcast domain includes all the computers that receive a packet broadcast from any computer in that broadcast domain. A switch will automatically forward the packets to all of its ports; in contrast, routers do not automatically forward network broadcast packets. This means routers separate broadcast domains. If a network has only switches and no routers, that network is considered one broadcast domain, no matter how large or small it is. Smaller broadcast domains are more efficient because fewer devices receive unnecessary packets. They are more secure as well because a hacker reading traffic on the network will have access to only a small portion of the network instead of the entire network's traffic.

Virtual LANs (VLANs) use ID tags to logically separate a LAN into smaller broadcast domains. Each VLAN is its own broadcast domain. Smaller broadcast domains reduce traffic and increase network security. The IEEE 802.1Q standard defines VLANs. All layer-2 and layer-3 devices along a route must be 802.1Q-compliant to support VLANs along that route.

VLANs reduce the size of the broadcast domains by only forwarding packets to interfaces that are part of that VLAN or part of a VLAN trunk link. Trunk links form switch-to-switch or switch-to-router connections, and forward traffic for all VLANs. This enables a VLAN to include devices that are part of the same broadcast domain, but physically distant from each other.

VLAN ID tags consist of a 4-byte frame extension that switches and routers apply to every packet sent and received in the VLAN. Workstations and desktop computers, which are commonly originators or destinations of network traffic, are not an active part of the VLAN process. All the VLAN tagging and tag removal is done after the packet has left the computer.

Any FortiGate unit without VDOMs enabled can have a maximum of 255 interfaces in transparent operating mode. The same is true for any single VDOM. In NAT mode, the number can range from 255 to 8192 interfaces per VDOM, depending on the FortiGate model. These numbers include VLANs, other virtual interfaces, and physical interfaces. To have more than 255 interfaces configured in transparent operating mode, you need to configure multiple VDOMs that enable you to divide the total number of interfaces over all the VDOMs.

One example of an application of VLANs is a company's accounting department. Accounting computers may be located at both main and branch offices. However, accounting computers need to communicate with each other frequently and require increased security. VLANs allow the accounting network traffic to be sent only to accounting computers and to connect accounting computers in different locations as if they were on the same physical subnet.

This guide uses the term "packet" to refer to both layer-2 frames and layer-3 packets.

VLAN ID rules

Layer-2 switches and layer-3 devices add VLAN ID tags to the traffic as it arrives and remove them before they deliver the traffic to its final destination. Devices such as PCs and servers on the network do not require any

special configuration for VLANs. Twelve bits of the 4-byte VLAN tag are reserved for the VLAN ID number. Valid VLAN ID numbers are from 1 to 4094, while 0 is used for high priority frames, and 4095 is reserved.

On a layer-2 switch, you can have only one VLAN subinterface per physical interface, unless that interface is configured as a trunk link. Trunk links can transport traffic for multiple VLANs to other parts of the network.

On a FortiGate unit, you can add multiple VLANs to the same physical interface. However, VLAN subinterfaces added to the same physical interface cannot have the same VLAN ID or have IP addresses on the same subnet. You can add VLAN subinterfaces with the same VLAN ID to different physical interfaces.

Creating VLAN subinterfaces with the same VLAN ID does not create any internal connection between them. For example a VLAN ID of 300 on port1 and VLAN ID of 300 on port2 are allowed, but they are not connected. Their relationship is the same as between any two FortiGate network interfaces.

VLAN switching and routing

VLAN switching takes place on the OSI model layer-2, just like other network switching. VLAN routing takes place on the OSI model layer-3. The difference between them is that during VLAN switching, VLAN packets are simply forwarded to their destination. This is different from VLAN routing where devices can open the VLAN packets and change their VLAN ID tags to route the packets to a new destination.

VLAN layer-2 switching

Ethernet switches are layer-2 devices, and generally are 802.1Q compliant. Layer 2 refers to the second layer of the seven layer Open Systems Interconnect (OSI) basic networking model; the Data Link layer. FortiGate units act as layer-2 switches or bridges when they are in transparent mode. The units simply tag and forward the VLAN traffic or receive and remove the tags from the packets. A layer-2 device does not inspect incoming packets or change their contents; it only adds or removes tags and routes the packet.

A VLAN can have any number of physical interfaces assigned to it. Multiple VLANs can be assigned to the same physical interface. Typically two or more physical interfaces are assigned to a VLAN, one for incoming and one for outgoing traffic. Multiple VLANs can be configured on one FortiGate unit, including trunk links.

Layer-2 VLAN example

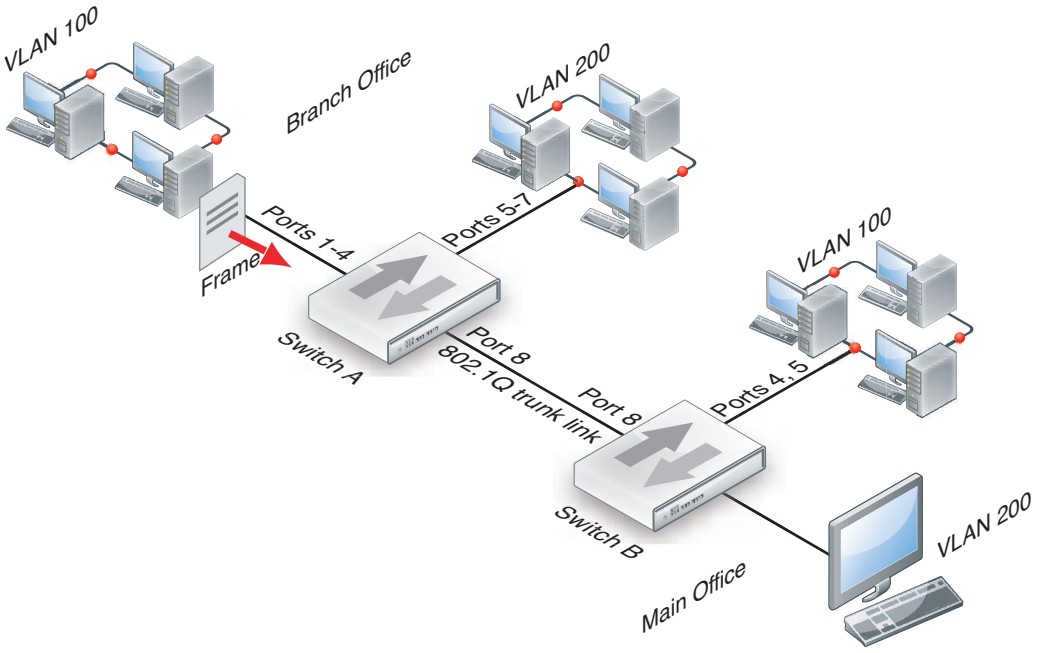
To better understand VLAN operation, this example shows what happens to a data frame on a network that uses VLANs.

The network topology consists of two 8-port switches that are configured to support VLANs on a network. Both switches are connected through port 8 using an 802.1Q trunk link. Subnet 1 is connected to switch A, and subnet 2 is connected to switch B. The ports on the switches are configured as follows.

How ports and VLANs are used on Switch A and Switch B

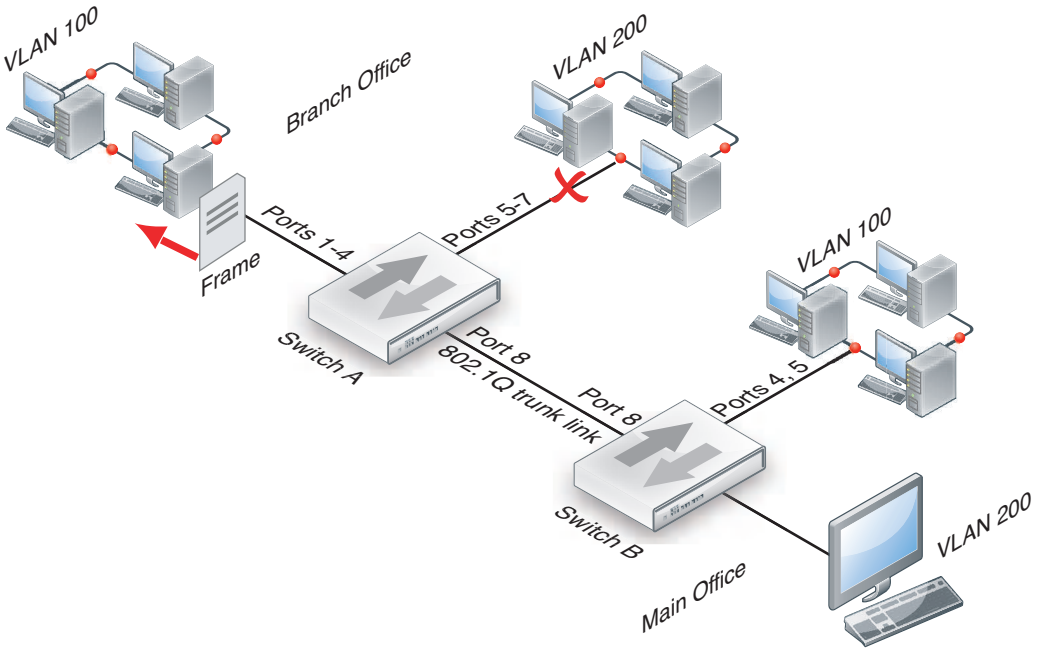
Switch	Ports	VLAN
A	1 - 4	100
A	5 - 7	200
A & B	8	Trunk link
B	4 - 5	100
B	6	200

In this example, switch A is connected to the Branch Office and switch B to the Main Office.



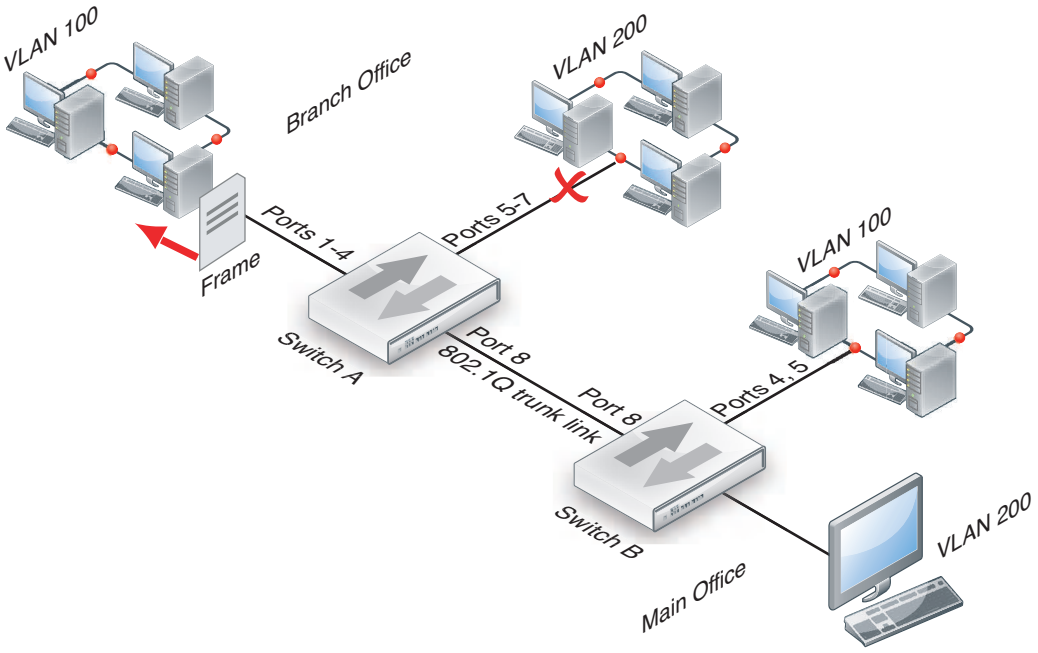
1. A computer on port 1 of switch A sends a data frame over the network.
2. Switch A tags the data frame with a VLAN 100 ID tag upon arrival because port 1 is part of VLAN 100.
3. Switch A forwards the tagged data frame to the other VLAN 100 ports — ports 2 through 4. Switch A also forwards the data frame to the 802.1Q trunk link (port 8) so other parts of the network that may contain VLAN 100 groups will receive VLAN 100 traffic.

This data frame is not forwarded to the other ports on switch A because they are not part of VLAN 100. This increases security and decreases network traffic.



4. Switch B receives the data frame over the trunk link (port 8).
5. Because there are VLAN 100 ports on switch B (ports 4 and 5), the data frame is forwarded to those ports. As with switch A, the data frame is not delivered to VLAN 200.

   If there were no VLAN 100 ports on switch B, the switch would not forward the data frame and it would stop there.



6. The switch removes the VLAN 100 ID tag before it forwards the data frame to an end destination.

The sending and receiving computers are not aware of any VLAN tagging on the data frames that are being transmitted. When any computer receives that data frame, it appears as a normal data frame.

VLAN layer-3 routing

Routers are layer-3 devices. Layer 3 refers to the third layer of the OSI networking model, the Network layer. FortiGate units in NAT mode act as layer-3 devices. As with layer 2, FortiGate units acting as layer-3 devices are 802.1Q-compliant.

The main difference between layer-2 and layer-3 devices is how they process VLAN tags. Layer-2 switches just add, read and remove the tags. They do not alter the tags or do any other high-level actions. Layer-3 routers not only add, read and remove tags but also analyze the data frame and its contents. This analysis allows layer-3 routers to change the VLAN tag if it is appropriate and send the data frame out on a different VLAN.

In a layer-3 environment, the 802.1Q-compliant router receives the data frame and assigns a VLAN ID. The router then forwards the data frame to other members of the same VLAN broadcast domain. The broadcast domain can include local ports, layer-2 devices and layer-3 devices such as routers and firewalls. When a layer-3 device receives the data frame, the device removes the VLAN tag and examines its contents to decide what to do with the data frame. The layer-3 device considers:

- Source and destination addresses
- Protocol
- Port number

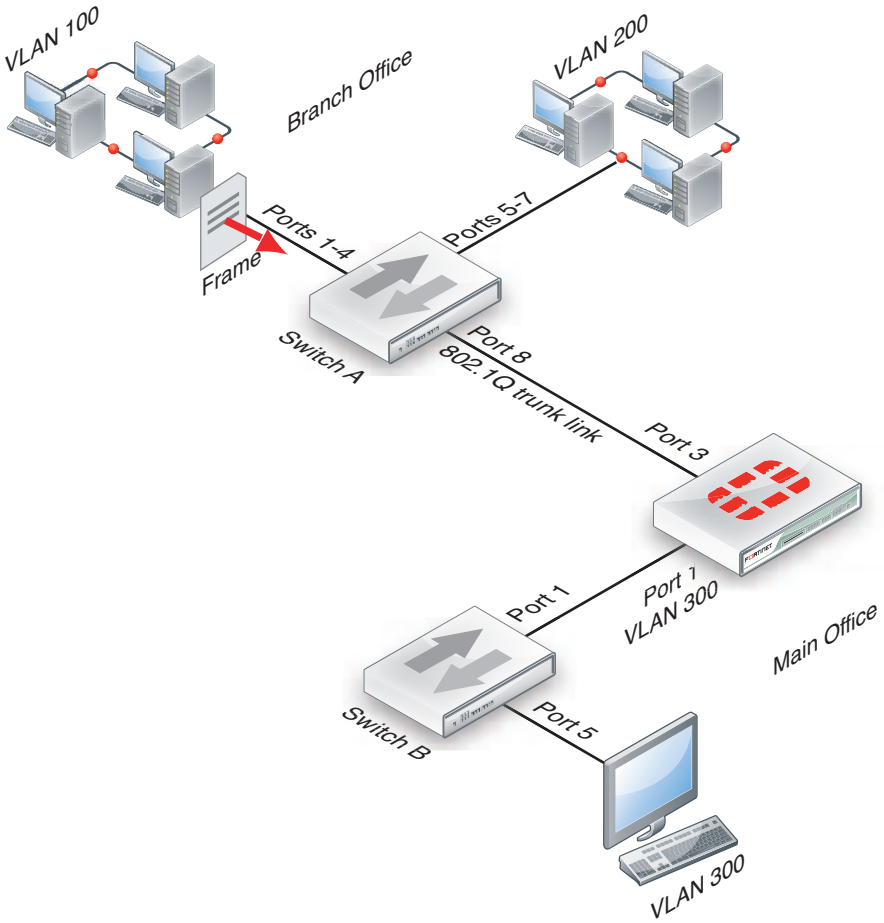
The data frame may be forwarded to another VLAN, sent to a regular non-VLAN-tagged network or just forwarded to the same VLAN as a layer-2 switch would do. Or, the data frame may be discarded if the proper security policy has been configured to do so.

Layer-3 VLAN example

In this example, switch A is connected to the Branch Office subnet, the same as subnet 1 in the layer-2 example. In the Main Office subnet, VLAN 300 is on port 5 of switch B. The FortiGate unit is connected to switch B on port 1 and the trunk link connects the FortiGate unit's port 3 to switch A. The other ports on switch B are unassigned.

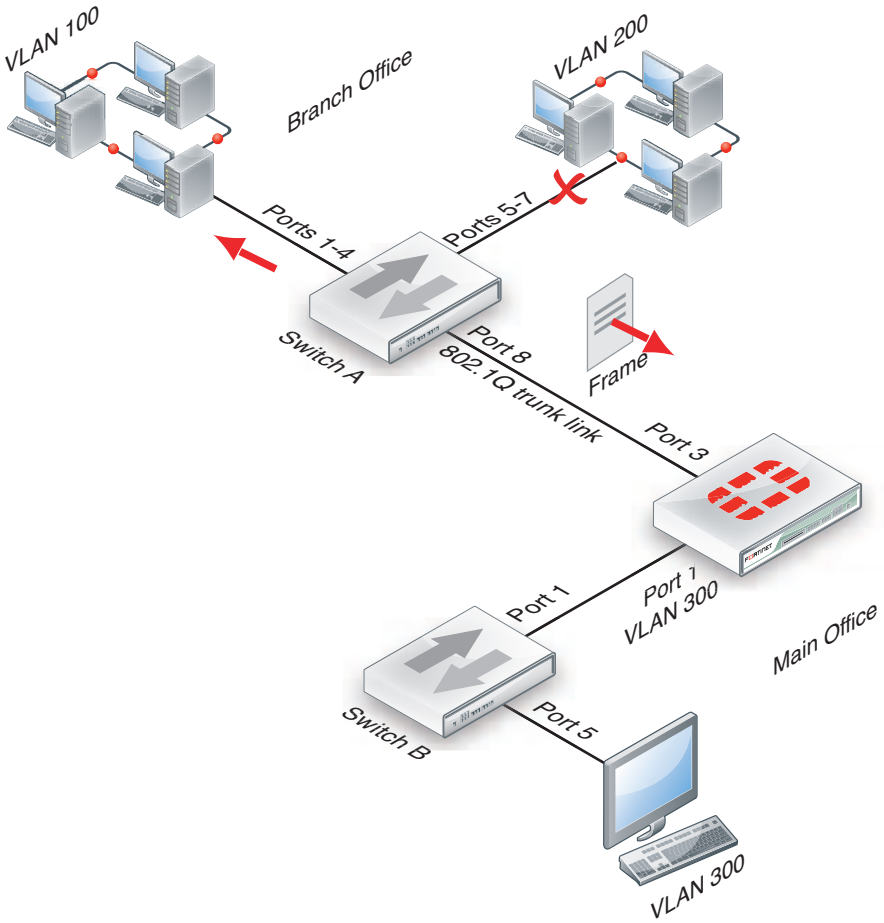
This example explains how traffic can change VLANs originating on VLAN 100 and arriving at a destination on VLAN 300. Layer-2 switches alone cannot accomplish this, but a layer-3 router can.

1. The VLAN 100 computer at the Branch Office sends the data frame to switch A, where the VLAN 100 tag is added.



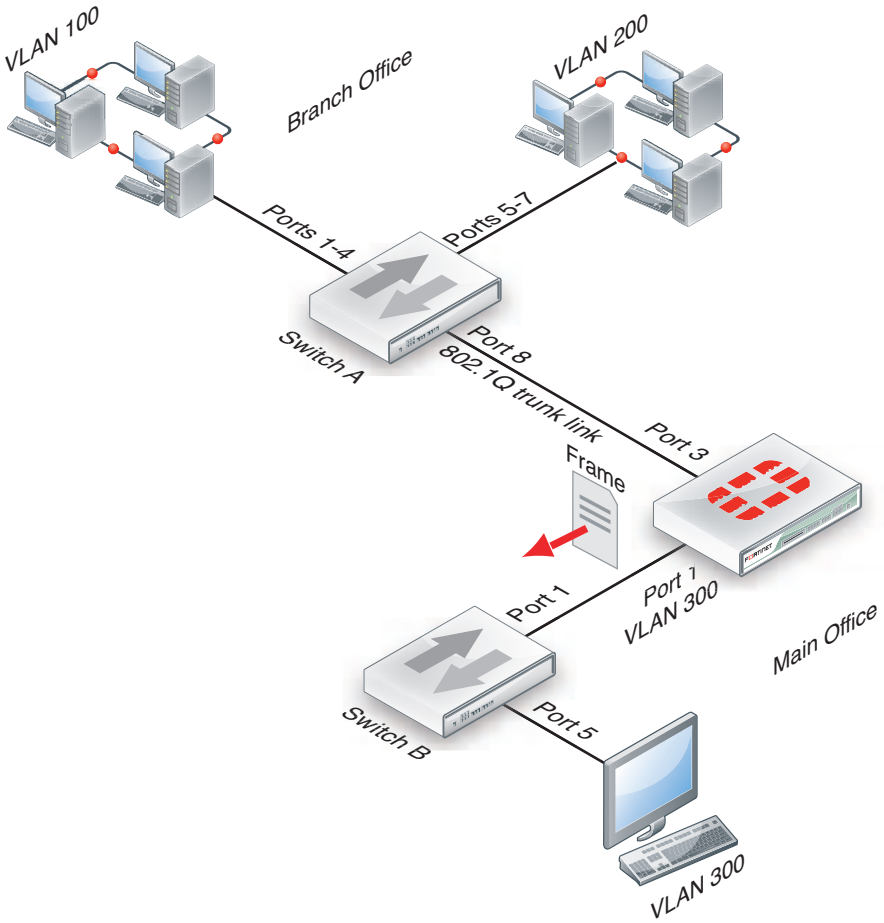
2. Switch A forwards the tagged data frame to the FortiGate unit over the 802.1Q trunk link, and to the VLAN 100 interfaces on Switch A.

   Up to this point everything is the same as in the layer-2 example.

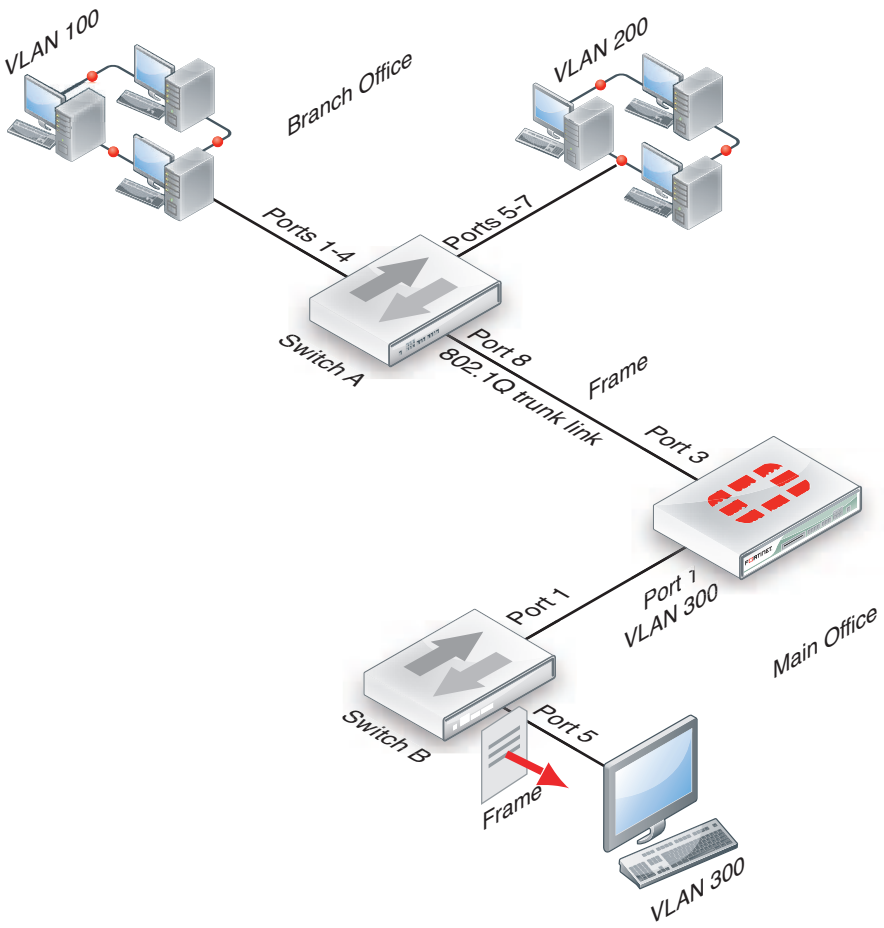


3. The FortiGate unit removes the VLAN 100 tag, and inspects the content of the data frame. The FortiGate unit uses the content to select the correct security policy and routing options.
4. The FortiGate unit's security policy allows the data frame to go to VLAN 300 in this example. The data frame will be sent to all VLAN 300 interfaces, but in the example there is only port 1 on the FortiGate unit. Before the data frame leaves, the FortiGate unit adds the VLAN ID 300 tag to the data frame.

   This is the step that layer 2 cannot do. Only layer 3 can retag a data frame as a different VLAN.



5. Switch B receives the data frame, and removes the VLAN ID 300 tag, because this is the last hop, and forwards the data frame to the computer on port 5.



In this example, a data frame arrived at the FortiGate unit tagged as VLAN 100. After checking its content, the FortiGate unit retagged the data frame for VLAN 300. It is this change from VLAN 100 to VLAN 300 that requires a layer-3 routing device, in this case the FortiGate unit. Layer-2 switches cannot perform this change.

VLANs in NAT mode

In NAT mode the FortiGate unit functions as a layer-3 device. In this mode, the FortiGate unit controls the flow of packets between VLANs, but can also remove VLAN tags from incoming VLAN packets. The FortiGate unit can also forward untagged packets to other networks, such as the Internet.

In NAT mode, the FortiGate unit supports VLAN trunk links with IEEE 802.1Q-compliant switches, or routers. The trunk link transports VLAN-tagged packets between physical subnets or networks. When you add VLAN sub-interfaces to the FortiGate unit physical interfaces, the VLANs have IDs that match the VLAN IDs of packets on the trunk link. The FortiGate unit directs packets with VLAN IDs to sub-interfaces with matching IDs.

You can define VLAN sub-interfaces on all FortiGate physical interfaces. However, if multiple virtual domains are configured on the FortiGate unit, you will have access to only the physical interfaces on your virtual domain. The FortiGate unit can tag packets leaving on a VLAN subinterface. It can also remove VLAN tags from incoming packets and add a different VLAN tag to outgoing packets.

Normally in VLAN configurations, the FortiGate unit's internal interface is connected to a VLAN trunk, and the external interface connects to an Internet router that is not configured for VLANs. In this configuration the

FortiGate unit can apply different policies for traffic on each VLAN interface connected to the internal interface, which results in less network traffic and better security.

Adding VLAN subinterfaces

A VLAN subinterface, also called a VLAN, is a virtual interface on a physical interface. The subinterface allows routing of VLAN tagged packets using that physical interface, but it is separate from any other traffic on the physical interface.

Adding a VLAN subinterface includes configuring:

- Physical interface
- IP address and netmask
- VLAN ID
- VDOM

Physical interface

The term VLAN subinterface correctly implies the VLAN interface is not a complete interface by itself. You add a VLAN subinterface to the physical interface that receives VLAN-tagged packets. The physical interface can belong to a different VDOM than the VLAN, but it must be connected to a network router that is configured for this VLAN. Without that router, the VLAN will not be connected to the network, and VLAN traffic will not be able to access this interface. The traffic on the VLAN is separate from any other traffic on the physical interface.

When you are working with interfaces on your FortiGate unit, use the **Column Settings** on the Interface display to make sure the information you need is displayed. When working with VLANs, it is useful to position the **VLAN ID** column close to the IP address. If you are working with VDOMs, including the **Virtual Domain** column as well will help you troubleshoot problems more quickly.

To view the Interface display, go to **System > Network > Interface**.

IP address and netmask

FortiGate unit interfaces cannot have overlapping IP addresses. The IP addresses of all interfaces must be on different subnets. This rule applies to both physical interfaces and to virtual interfaces such as VLAN subinterfaces. Each VLAN subinterface must be configured with its own IP address and netmask pair. This rule helps prevent a broadcast storm or other similar network problems.

If you are unable to change your existing configurations to prevent IP overlap, enter the CLI command `config system settings` and `set allow-subnet-overlap enable` to allow IP address overlap. If you enter this command, multiple VLAN interfaces can have an IP address that is part of a subnet used by another interface. This command is recommended for advanced users only.

VLAN ID

The VLAN ID is part of the VLAN tag added to the packets by VLAN switches and routers. The VLAN ID is a number between 1 and 4094 that allow groups of IP addresses with the same VLAN ID to be associated together. VLAN ID 0 is used only for high priority frames, and 4095 is reserved.

All devices along a route must support the VLAN ID of the traffic along that route. Otherwise, the traffic will be discarded before reaching its destination. For example, if your computer is part of VLAN_100 and a co-worker on

a different floor of your building is also on the same VLAN_100, you can communicate with each other over VLAN_100, only if all the switches and routers support VLANs and are configured to pass along VLAN_100 traffic properly. Otherwise, any traffic you send your co-worker will be blocked or not delivered.

VDOM

If VDOMs are enabled, each VLAN subinterface must belong to a VDOM. This rule also applies for physical interfaces.

Interface-related CLI commands require a VDOM to be specified, regardless of whether the FortiGate unit has VDOMs enabled.

VLAN subinterfaces on separate VDOMs cannot communicate directly with each other. In this situation, the VLAN traffic must exit the FortiGate unit and re-enter the unit again, passing through firewalls in both directions. This situation is the same for physical interfaces.

A VLAN subinterface can belong to a different VDOM than the physical interface it is part of. This is because the traffic on the VLAN is handled separately from the other traffic on that interface. This is one of the main strengths of VLANs.

The following procedure will add a VLAN subinterface called `VLAN_100` to the FortiGate internal interface with a VLAN ID of 100. It will have an IP address and netmask of `172.100.1.1/255.255.255.0`, and allow HTTPS, PING, and Telnet administrative access. Note that in the CLI, you must enter "`set type vlan`" before setting the vlanid, and that the allowaccess protocols are lower case.

To add a VLAN subinterface in NAT mode - web-based manager

1. If **Current VDOM** appears at the bottom left of the screen, select **Global** from the list of VDOMs.
2. Go to **System > Network > Interface**.
3. Select **Create New** to add a VLAN subinterface.
4. Enter the following:

VLAN Name	VLAN_100
Type	VLAN
Interface	internal
VLAN ID	100
Addressing Mod	Manual
IP/Netmask	172.100.1.1/255.255.255.0
Administrative Access	HTTPS, PING, TELNET

5. Select **OK**.

To view the new VLAN subinterface, select the expand arrow next to the parent physical interface (the internal interface). This will expand the display to show all VLAN subinterfaces on this physical interface. If there is no expand arrow displayed, there are no subinterfaces configured on that physical interface.

For each VLAN, the list displays the name of the VLAN, and, depending on column settings, its IP address, the Administrative access you selected for it, the VLAN ID number, and which VDOM it belongs to if VDOMs are enabled.

To add a VLAN subinterface in NAT mode - CLI

```
config system interface
   edit VLAN_100
      set interface internal
      set type vlan
      set vlanid 100
      set ip 172.100.1.1 255.255.255.0
      set allowaccess https ping telnet
end
```

Configuring security policies and routing

Once you have created a VLAN subinterface on the FortiGate unit, you need to configure security policies and routing for that VLAN. Without these, the FortiGate unit will not pass VLAN traffic to its intended destination. Security policies direct traffic through the FortiGate unit between interfaces. Routing directs traffic across the network.

Configuring security policies

Security policies permit communication between the FortiGate unit's network interfaces based on source and destination IP addresses. Interfaces that communicate with the VLAN interface need security policies to permit traffic to pass between them and the VLAN interface.

Each VLAN needs a security policy for each of the following connections the VLAN will be using:

- From this VLAN to an external network
- From an external network to this VLAN
- From this VLAN to another VLAN in the same virtual domain on the FortiGate unit
- From another VLAN to this VLAN in the same virtual domain on the FortiGate unit.

The packets on each VLAN are subject to antivirus scans and other UTM measures as they pass through the FortiGate unit.

Configuring routing

As a minimum, you need to configure a default static route to a gateway with access to an external network for outbound packets. In more complex cases, you will have to configure different static or dynamic routes based on packet source and destination addresses.

As with firewalls, you need to configure routes for VLAN traffic. VLANs need routing and a gateway configured to send and receive packets outside their local subnet just as physical interfaces do. The type of routing you configure, static or dynamic, will depend on the routing used by the subnet and interfaces you are connecting to. Dynamic routing can be routing information protocol (RIP), border gateway protocol (BGP), open shortest path first (OSPF), or multicast.

If you enable SSH, PING, Telnet, HTTPS and HTTP on the VLAN, you can use those protocols to troubleshoot your routing and test that it is properly configured. Enabling logging on the interfaces and using CLI diagnose commands such as `diagnose sniff packet <interface_name>` can also help locate any possible configuration or hardware issues.

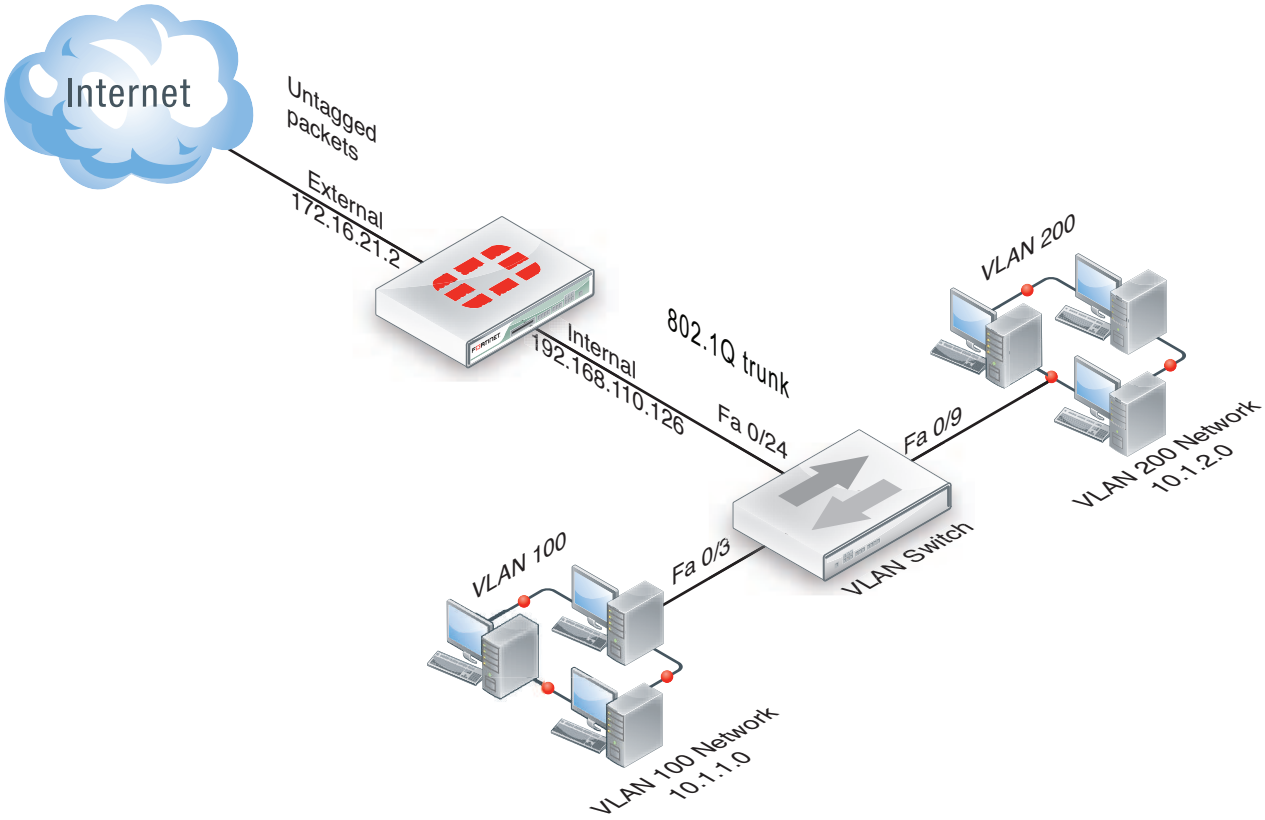
Example VLAN configuration in NAT mode

In this example two different internal VLAN networks share one interface on the FortiGate unit, and share the connection to the Internet. This example shows that two networks can have separate traffic streams while sharing a single interface. This configuration could apply to two departments in a single company, or to different companies.

There are two different internal network VLANs in this example. VLAN_100 is on the 10.1.1.0/255.255.255.0 subnet, and VLAN_200 is on the 10.1.2.0/255.255.255.0 subnet. These VLANs are connected to the VLAN switch, such as a Cisco 2950 Catalyst switch.

The FortiGate internal interface connects to the VLAN switch through an 802.1Q trunk. The internal interface has an IP address of 192.168.110.126 and is configured with two VLAN subinterfaces (VLAN_100 and VLAN_200). The external interface has an IP address of 172.16.21.2 and connects to the Internet. The external interface has no VLAN subinterfaces.

FortiGate unit with VLANs in NAT mode



When the VLAN switch receives packets from VLAN_100 and VLAN_200, it applies VLAN ID tags and forwards the packets of each VLAN both to local ports and to the FortiGate unit across the trunk link. The FortiGate unit has policies that allow traffic to flow between the VLANs, and from the VLANs to the external network.

This section describes how to configure a FortiGate unit and a Cisco Catalyst 2950 switch for this example network topology. The Cisco configuration commands used in this section are IOS commands.

It is assumed that both the FortiGate unit and the Cisco 2950 switch are installed and connected and that basic configuration has been completed. On the switch, you will need to be able to access the CLI to enter commands. Refer to the manual for your FortiGate model as well as the manual for the switch you select for more information.

It is also assumed that no VDOMs are enabled.

General configuration steps

The following steps provide an overview of configuring and testing the hardware used in this example. For best results in this configuration, follow the procedures in the order given. Also, note that if you perform any additional actions between procedures, your configuration may have different results.

1. Configure the FortiGate unit
   - Configure the external interface
   - Add two VLAN subinterfaces to the internal network interface
   - Add firewall addresses and address ranges for the internal and external networks
   - Add security policies to allow:
- the VLAN networks to access each other
- the VLAN networks to access the external network.
2. Configure the VLAN switch

Configure the FortiGate unit

Configuring the FortiGate unit includes:

Configure the external interface

The FortiGate unit's external interface will provide access to the Internet for all internal networks, including the two VLANs.

To configure the external interface - web-based manager

1. Go to **System > Network > Interface**.
2. Select **Edit** for the external interface.
3. Enter the following information and select **OK**:

Addressing mode	Manual
IP/Network Mask	172.16.21.2/255.255.255.0

To configure the external interface - CLI

```
config system interface
   edit external
      set mode static
      set ip 172.16.21.2 255.255.255.0
end
```

Add VLAN subinterfaces

This step creates the VLANs on the FortiGate unit internal physical interface. The IP address of the internal interface does not matter to us, as long as it does not overlap with the subnets of the VLAN subinterfaces we are configuring on it.

The rest of this example shows how to configure the VLAN behavior on the FortiGate unit, configure the switches to direct VLAN traffic the same as the FortiGate unit, and test that the configuration is correct.

Adding VLAN subinterfaces can be completed through the web-based manager, or the CLI.

To add VLAN subinterfaces - web-based manager

1. Go to **System > Network > Interface**.
2. Select **Create New**.
3. Enter the following information and select **OK**:

Name	VLAN_100
Interface	internal
VLAN ID	100
Addressing mode	Manual
IP/Network Mask	10.1.1.1/255.255.255.0
Administrative Access	HTTPS, PING, TELNET

4. Select **Create New**.
5. Enter the following information and select **OK**:

Name	VLAN_200
Interface	internal
VLAN ID	200
Addressing mode	Manual
IP/Network Mask	10.1.2.1/255.255.255.0
Administrative Access	HTTPS, PING, TELNET

To add VLAN subinterfaces - CLI

```
config system interface
   edit VLAN_100
      set vdom root
      set interface internal
      set type vlan
      set vlanid 100
      set mode static
      set ip 10.1.1.1 255.255.255.0
```

```
      set allowaccess https ping telnet
   next
   edit VLAN_200
      set vdom root
      set interface internal
      set type vlan
      set vlanid 200
      set mode static
      set ip 10.1.2.1 255.255.255.0
      set allowaccess https ping telnet
end
```

Add the firewall addresses

You need to define the addresses of the VLAN subnets for use in security policies. The FortiGate unit provides one default address, “all”, that you can use when a security policy applies to all addresses as a source or destination of a packet. However, using “all” is less secure and should be avoided when possible.

In this example, the “_Net” part of the address name indicates a range of addresses instead of a unique address. When choosing firewall address names, use informative and unique names.

To add the firewall addresses - web-based manager

1. Go to **Firewall Objects > Address > Addresses**.
2. Select **Create New**.
3. Enter the following information and select **OK**:

Name	VLAN_100_Net
Type	Subnet
Subnet / IP Range	10.1.1.0/255.255.255.0

4. Select **Create New**.
5. Enter the following information and select **OK**:

Name	VLAN_200_Net
Type	Subnet
Subnet / IP Range	10.1.2.0/255.255.255.0

To add the firewall addresses - CLI

```
config firewall address
   edit VLAN_100_Net
      set type ipmask
      set subnet 10.1.1.0 255.255.255.0
   next
   edit VLAN_200_Net
      set type ipmask
      set subnet 10.1.2.0 255.255.255.0
end
```

Add the security policies

Once you have assigned addresses to the VLANs, you need to configure security policies for them to allow valid packets to pass from one VLAN to another and to the Internet.

You can customize the Security Policy display by including some or all columns, and customize the column order onscreen. Due to this feature, security policy screenshots may not appear the same as on your screen.

If you do not want to allow all services on a VLAN, you can create a security policy for each service you want to allow. This example allows all services.

To add the security policies - web-based manager

1. Go to **Policy & Objects > Policy > IPv4** or **Policy & Objects > Policy > IPv6** and select **Create New**.
2. Leave the **Policy Type** as **Firewall** and the **Policy Subtype** as **Address**.
3. Enter the following information and select **OK**:

Incoming Interface	VLAN_100
Source Address	VLAN_100_Net
Outgoing Interface	VLAN_200
Destination Address	VLAN_200_Net
Schedule	Always
Service	ALL
Action	ACCEPT
Enable NAT	Enable

4. Select **Create New**.
5. Leave the **Policy Type** as **Firewall** and the **Policy Subtype** as **Address**.
6. Enter the following information and select **OK**:

Incoming Interface	VLAN_200
Source Address	VLAN_200_Net
Outgoing Interface	VLAN_100
Destination Address	VLAN_100_Net
Schedule	Always
Service	ALL
Action	ACCEPT

Enable NAT	Enable

7. Select **Create New**.
8. Leave the **Policy Type** as **Firewall** and the **Policy Subtype** as **Address**.
9. Enter the following information and select **OK**:

Incoming Interface	VLAN_100
Source Address	VLAN_100_Net
Outgoing Interface	external
Destination Address	all
Schedule	Always
Service	ALL
Action	ACCEPT
Enable NAT	Enable

10. Select **Create New**.
11. Verify that the **Policy Type** is **Firewall** and the **Policy Subtype** is **Address**.
12. Enter the following information and select **OK**:

Incoming Interface	VLAN_200
Source Address	VLAN_200_Net
Outgoing Interface	external
Destination Address	all
Schedule	Always
Service	ALL
Action	ACCEPT
Enable NAT	Enable

To add the security policies - CLI

```
config firewall policy or Config firewall policy6
   edit 1
      set srcintf VLAN_100
      set srcaddr VLAN_100_Net
      set dstintf VLAN_200
      set dstaddr VLAN_200_Net
      set schedule always
      set service ALL
      set action accept
      set nat enable
```

```
        set status enable
    next
    edit 2
        set srcintf VLAN_200
        set srcaddr VLAN_200_Net
        set dstintf VLAN_100
        set dstaddr VLAN_100_Net
        set schedule always
        set service ALL
        set action accept
        set nat enable
        set status enable
    next
    edit 3
        set srcintf VLAN_100
        set srcaddr VLAN_100_Net
        set dstintf external
        set dstaddr all
        set schedule always
        set service ALL
        set action accept
        set nat enable
        set status enable
    next
    edit 4
        set srcintf VLAN_200
        set srcaddr VLAN_200_Net
        set dstintf external
        set dstaddr all
        set schedule always
        set service ALL
        set action accept
        set nat enable
        set status enable
end
```

Configure the VLAN switch

On the Cisco Catalyst 2950 Catalyst VLAN switch, you need to define VLANs 100 and 200 in the VLAN database, and then add a configuration file to define the VLAN subinterfaces and the 802.1Q trunk interface.

One method to configure a Cisco switch is to connect over a serial connection to the console port on the switch, and enter the commands at the CLI. Another method is to designate one interface on the switch as the management interface and use a web browser to connect to the switch's graphical interface. For details on connecting and configuring your Cisco switch, refer to the installation and configuration manuals for the switch.

The switch used in this example is a Cisco Catalyst 2950 switch. The commands used are IOS commands. Refer to the switch manual for help with these commands.

To configure the VLAN subinterfaces and the trunk interfaces

Add this file to the Cisco switch:

```
!
interface FastEthernet0/3
switchport access vlan 100
!
```

```
interface FastEthernet0/9
switchport access vlan 200
!
interface FastEthernet0/24
switchport trunk encapsulation dot1q
switchport mode trunk
!
```

The switch has the configuration:

Port 0/3	VLAN ID 100
Port 0/9	VLAN ID 200
Port 0/24	802.1Q trunk

To complete the setup, configure devices on VLAN_100 and VLAN_200 with default gateways. The default gateway for VLAN_100 is the FortiGate VLAN_100 subinterface. The default gateway for VLAN_200 is the FortiGate VLAN_200 subinterface.

Test the configuration

Use diagnostic commands, such as `tracert`, to test traffic routed through the FortiGate unit and the Cisco switch.

Testing traffic from VLAN_100 to VLAN_200

In this example, a route is traced between the two internal networks. The route target is a host on VLAN_200.

Access a command prompt on a Windows computer on the VLAN_100 network, and enter the following command:

```
C:\>tracert 10.1.2.2
Tracing route to 10.1.2.2 over a maximum of 30 hops:
   1 <10 ms <10 ms <10 ms 10.1.1.1
   2 <10 ms <10 ms <10 ms 10.1.2.2
Trace complete.
```

Testing traffic from VLAN_200 to the external network

In this example, a route is traced from an internal network to the external network. The route target is the external network interface of the FortiGate-800 unit.

From VLAN_200, access a command prompt and enter this command:

```
C:\>tracert 172.16.21.2
Tracing route to 172.16.21.2 over a maximum of 30 hops:
   1 <10 ms <10 ms <10 ms 10.1.2.1
   2 <10 ms <10 ms <10 ms 172.16.21.2
Trace complete.
```

VLANs in transparent mode

In transparent mode, the FortiGate unit behaves like a layer-2 bridge but can still provide services such as antivirus scanning, web filtering, spam filtering and intrusion protection to traffic. There are some limitations in transparent mode in that you cannot use SSL VPN, PPTP/L2TP VPN, DHCP server, or easily perform NAT on traffic. The limits in transparent mode apply to IEEE 802.1Q VLAN trunks passing through the unit.

VLANs and transparent mode

You can insert the FortiGate unit operating in transparent mode into the VLAN trunk without making changes to your network. In a typical configuration, the FortiGate unit internal interface accepts VLAN packets on a VLAN trunk from a VLAN switch or router connected to internal network VLANs. The FortiGate external interface forwards VLAN-tagged packets through another VLAN trunk to an external VLAN switch or router and on to external networks such as the Internet. You can configure the unit to apply different policies for traffic on each VLAN in the trunk.

To pass VLAN traffic through the FortiGate unit, you add two VLAN subinterfaces with the same VLAN ID, one to the internal interface and the other to the external interface. You then create a security policy to permit packets to flow from the internal VLAN interface to the external VLAN interface. If required, you create another security policy to permit packets to flow from the external VLAN interface to the internal VLAN interface. Typically in transparent mode, you do not permit packets to move between different VLANs. Network protection features, such as spam filtering, web filtering and anti-virus scanning, are applied through the UTM profiles specified in each security policy, enabling very detailed control over traffic.

When the FortiGate unit receives a VLAN-tagged packet at a physical interface, it directs the packet to the VLAN subinterface with the matching VLAN ID. The VLAN tag is removed from the packet, and the FortiGate unit then applies security policies using the same method it uses for non-VLAN packets. If the packet exits the FortiGate unit through a VLAN subinterface, the VLAN ID for that subinterface is added to the packet and the packet is sent to the corresponding physical interface.

There are two essential steps to configure your FortiGate unit to work with VLANs in transparent mode:

- Add VLAN subinterfaces
- Create security policies

You can also configure the protection profiles that manage antivirus scanning, web filtering and spam filtering. For more information on UTM profiles, see the UTM Guide.

Add VLAN subinterfaces

The VLAN ID of each VLAN subinterface must match the VLAN ID added by the IEEE 802.1Q-compliant router or switch. The VLAN ID can be any number between 1 and 4094, with 0 being used only for high priority frames and 4095 being reserved. You add VLAN subinterfaces to the physical interface that receives VLAN-tagged packets.

For this example, we are creating a VLAN called internal_v225 on the internal interface, with a VLAN ID of 225. Administrative access is enabled for HTTPS and SSH. VDOMs are not enabled.

To add VLAN subinterfaces in transparent mode - web-based manager

1. Go to **System > Network > Interface**.
2. Select **Create New**.
3. Enter the following information and select **OK**.

Name	internal_v225
Type	VLAN
Interface	internal
VLAN ID	225
Administrative Access	Enable HTTPS, and SSH. These are very secure access methods.
Comments	VLAN 225 on internal interface

The FortiGate unit adds the new subinterface to the interface that you selected.

Repeat steps 2 and 3 to add additional VLANs. You will need to change the **VLAN ID**, **Name**, and possibly **Interface** when adding additional VLANs.

To add VLAN subinterfaces in transparent mode - CLI

```
config system interface
   edit internal_v225
      set interface internal
      set vlanid 225
      set allowaccess HTTPS SSH
      set description "VLAN 225 on internal interface"
      set vdom root
end
```

Create security policies

In transparent mode, the FortiGate unit performs antivirus and antispam scanning on each VLAN's packets as they pass through the unit. You need security policies to permit packets to pass from the VLAN interface where they enter the unit to the VLAN interface where they exit the unit. If there are no security policies configured, no packets will be allowed to pass from one interface to another.

To add security policies for VLAN subinterfaces - web based manager

1. Go to **Policy & Objects > Objects > Addresses**.
2. Select **Create New** to add firewall addresses that match the source and destination IP addresses of VLAN packets.
3. Go to **Policy & Objects > Policy > IPv4** or **Policy & Objects > Policy > IPv6** and select **Create New**.
4. From the **Incoming Interface/Zone** list, select the VLAN interface where packets enter the unit.
5. From the **Outgoing Interface/Zone** list, select the VLAN interface where packets exit the unit.
6. Select the **Source** and **Destination Address** names that you added in step 2.
7. Select **OK**.

To add security policies for VLAN subinterfaces - CLI

```
config firewall address
   edit incoming_VLAN_address
      set associated-interface <incoming_VLAN_interface>
      set type ipmask
      set subnet <IPv4_address_mask)
```

```
    next
    edit outgoing_VLAN_address
      set associated-interface <outgoing_VLAN_interface>
      set type ipmask
      set subnet <IPv4_address_mask>
    next
  end
  config firewall policy or config firewall policy6
    edit <unused_policy_number>
      set srcintf <incoming_VLAN_interface>
      set srcaddr incoming_VLAN_address
      set destintf <outgoing_VLAN_interface>
      set destaddr outgoing_VLAN_address
      set schedule always
      set service <protocol_to_allow_on VLAN>
      set action ACCEPT
    next
  end
```

Example of VLANs in transparent mode

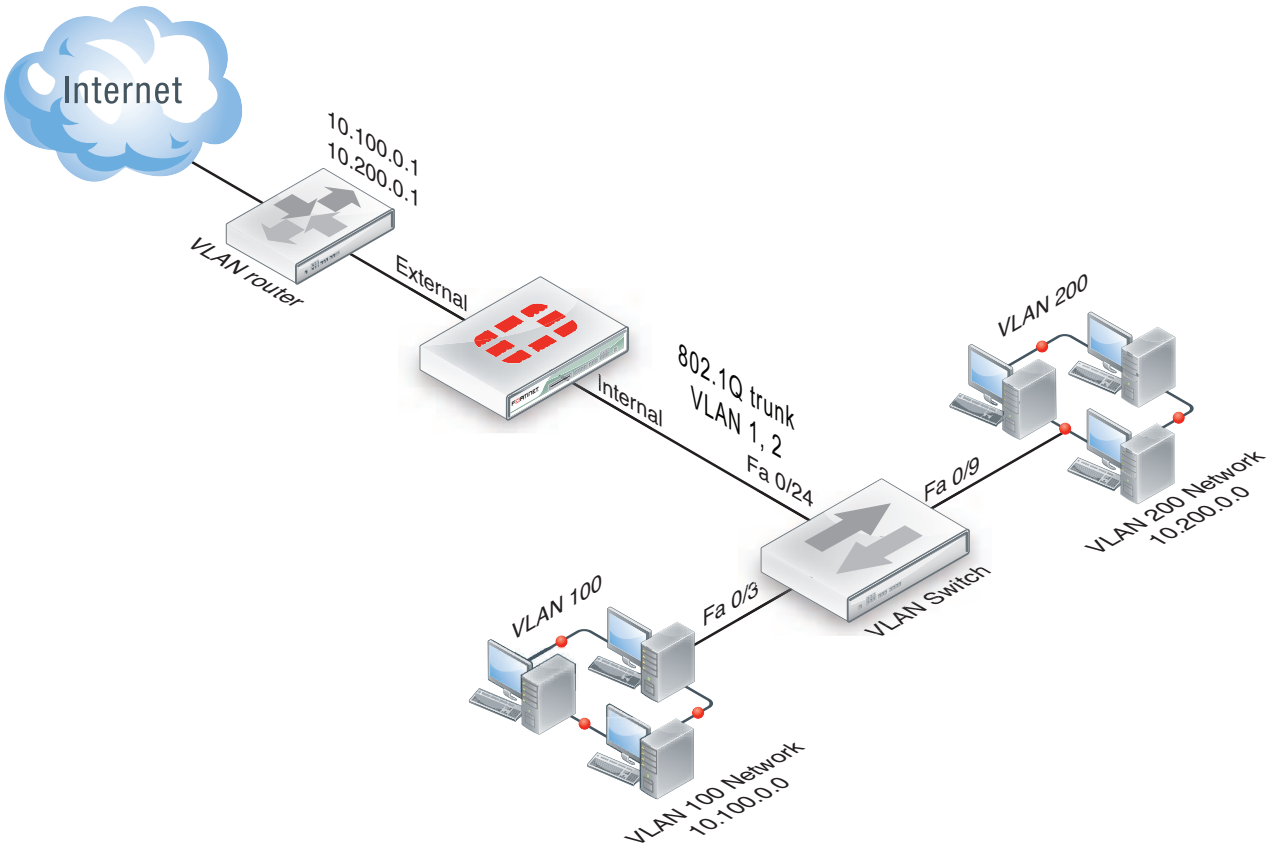
In this example, the FortiGate unit is operating in transparent mode and is configured with two VLANs: one with an ID of 100 and the other with ID 200. The internal and external physical interfaces each have two VLAN subinterfaces, one for VLAN_100 and one for VLAN_200.

The IP range for the internal VLAN_100 network is 10.100.0.0/255.255.0.0, and for the internal VLAN_200 network is 10.200.0.0/255.255.0.0.

The internal networks are connected to a Cisco 2950 VLAN switch, which combines traffic from the two VLANs onto one in the FortiGate unit internal interface. The VLAN traffic leaves the FortiGate unit on the external network interface, goes on to the VLAN switch, and on to the Internet. When the FortiGate units receives a tagged packet, it directs it from the incoming VLAN subinterface to the outgoing VLAN subinterface for that VLAN.

This section describes how to configure a FortiGate-800 unit, Cisco switch, and Cisco router in the network topology shown below.

VLAN transparent network topology



General configuration steps

The following steps summarize the configuration for this example. For best results, follow the procedures in the order given. Also, note that if you perform any additional actions between procedures, your configuration may have different results.

1. Configure the FortiGate unit which includes
   - Adding VLAN subinterfaces
   - Adding the security policies
2. Configure the Cisco switch and router

Configure the FortiGate unit

The FortiGate unit must be configured with the VLAN subinterfaces and the proper security policies to enable traffic to flow through the FortiGate unit.

Add VLAN subinterfaces

For each VLAN, you need to create a VLAN subinterface on the internal interface and another one on the external interface, both with the same VLAN ID.

To add VLAN subinterfaces - web-based manager

1. Go to **System > Network > Interface**.
2. Select **Create New**.
3. Enter the following information and select **OK**:

Name	VLAN_100_int
Interface	internal
VLAN ID	100

4. Select **Create New**.
5. Enter the following information and select **OK**:

Name	VLAN_100_ext
Interface	external
VLAN ID	100

6. Select **Create New**.
7. Enter the following information and select **OK**:

Name	VLAN_200_int
Interface	internal
VLAN ID	200

8. Select **Create New**.
9. Enter the following information and select **OK**:

Name	VLAN_200_ext
Interface	external
VLAN ID	200

To add VLAN subinterfaces - CLI

```
config system interface
   edit VLAN_100_int
      set status down
      set type vlan
      set interface internal
```

```
    set vlanid 100
next
edit VLAN_100_ext
    set status down
    set type vlan
    set interface external
    set vlanid 100
next
edit VLAN_200_int
    set status down
    set type vlan
    set interface internal
    set vlanid 200
next
edit VLAN_200_ext
    set status down
    set type vlan
    set interface external
    set vlanid 200
end
```

Add the security policies

Security policies allow packets to travel between the VLAN_100_int interface and the VLAN_100_ext interface. Two policies are required; one for each direction of traffic. The same is required between the VLAN_200_int interface and the VLAN_200_ext interface, for a total of four required security policies.

To add the security policies - web-based manager

1. Go to **Policy & Objects > Policy > IPv4** or **Policy & Objects > Policy > IPv6** and select **Create New**.
2. Enter the following information and select **OK**:

Incoming Interface	VLAN_100_int
Source Address	all
Outgoing Interface	VLAN_100_ext
Destination Address	all
Schedule	Always
Service	ALL
Action	ACCEPT

3. Select **Create New**.
4. Enter the following information and select **OK**:

Incoming Interface	VLAN_100_ext
Source Address	all

Outgoing Interface	VLAN_100_int
Destination Address	all
Schedule	Always
Service	ALL
Action	ACCEPT

5. Go to **Policy & Objects > Policy > IPv4** or **Policy & Objects > Policy > IPv6** and select **Create New**.
6. Enter the following information and select **OK**:

Incoming Interface	VLAN_200_int
Source Address	all
Outgoing Interface	VLAN_200_ext
Destination Address	all
Schedule	Always
Service	ALL
Action	ACCEPT
Enable NAT	Enable

7. Select **Create New**.
8. Enter the following information and select **OK**:

Incoming Interface	VLAN_200_ext
Source Address	all
Outgoing Interface	VLAN_200_int
Destination Address	all
Schedule	Always
Service	ALL
Action	ACCEPT

To add the security policies - CLI

```
config firewall policy or config firewall policy6
   edit 1
      set srcintf VLAN_100_int
      set srcaddr all
      set dstintf VLAN_100_ext
      set dstaddr all
      set action accept
```

```
      set schedule always
      set service ALL
   next
   edit 2
      set srcintf VLAN_100_ext
      set srcaddr all
      set dstintf VLAN_100_int
      set dstaddr all
      set action accept
      set schedule always
      set service ALL
   next
   edit 3
      set srcintf VLAN_200_int
      set srcaddr all
      set dstintf VLAN_200_ext
      set dstaddr all
      set action accept
      set schedule always
      set service ALL
   next
   edit 4
      set srcintf VLAN_200_ext
      set srcaddr all
      set dstintf VLAN_200_int
      set dstaddr all
      set action accept
      set schedule always
      set service ALL
   end
```

Configure the Cisco switch and router

This example includes configuration for the Cisco Catalyst 2900 ethernet switch, and for the Cisco Multiservice 2620 ethernet router. If you have access to a different VLAN enabled switch or VLAN router you can use them instead, however their configuration is not included in this document.

Configure the Cisco switch

On the VLAN switch, you need to define VLAN_100 and VLAN_200 in the VLAN database and then add a configuration file to define the VLAN subinterfaces and the 802.1Q trunk interface.

Add this file to the Cisco switch:

```
interface FastEthernet0/3
switchport access vlan 100
!
interface FastEthernet0/9
switchport access vlan 200
!
interface FastEthernet0/24
switchport trunk encapsulation dot1q
switchport mode trunk
!
```

The switch has the following configuration:

Port 0/3	VLAN ID 100
Port 0/9	VLAN ID 200
Port 0/24	802.1Q trunk

Configure the Cisco router

You need to add a configuration file to the Cisco Multiservice 2620 ethernet router. The file defines the VLAN subinterfaces and the 802.1Q trunk interface on the router. The 802.1Q trunk is the physical interface on the router.

The IP address for each VLAN on the router is the gateway for that VLAN. For example, all devices on the internal VLAN_100 network will have 10.100.0.1 as their gateway.

Add this file to the Cisco router:

```
!
interface FastEthernet0/0
!
interface FastEthernet0/0.1
encapsulation dot1Q 100
ip address 10.100.0.1 255.255.255.0
!
interface FastEthernet0/0.2
encapsulation dot1Q 200
ip address 10.200.0.1 255.255.255.0
!
```

The router has the following configuration:

Port 0/0.1	VLAN ID 100
Port 0/0.2	VLAN ID 200
Port 0/0	802.1Q trunk

Test the configuration

Use diagnostic network commands such as traceroute (`tracert`) and ping to test traffic routed through the network.

Testing traffic from VLAN_100 to VLAN_200

In this example, a route is traced between the two internal networks. The route target is a host on VLAN_200. The Windows traceroute command `tracert` is used.

From VLAN_100, access a Windows command prompt and enter this command:

```
C:\>tracert 10.1.2.2
Tracing route to 10.1.2.2 over a maximum of 30 hops:
1 <10 ms <10 ms <10 ms 10.1.1.1
2 <10 ms <10 ms <10 ms 10.1.2.2
Trace complete.
```

Troubleshooting VLAN issues

Several problems can occur with your VLANs. Since VLANs are interfaces with IP addresses, they behave as interfaces and can have similar problems that you can diagnose with tools such as ping, traceroute, packet sniffing, and diag debug.

Asymmetric routing

You might discover unexpectedly that hosts on some networks are unable to reach certain other networks. This occurs when request and response packets follow different paths. If the FortiGate unit recognizes the response packets, but not the requests, it blocks the packets as invalid. Also, if the FortiGate unit recognizes the same packets repeated on multiple interfaces, it blocks the session as a potential attack.

This is asymmetric routing. By default, the FortiGate unit blocks packets or drops the session when this happens. You can configure the FortiGate unit to permit asymmetric routing by using the following CLI commands:

```
config system settings
   set asymroute enable
end
```

If VDOMs are enabled, this command is per VDOM. You must set it for each VDOM that has the problem as following:

```
config vdom
   edit <vdom_name>
      config system settings
      set asymroute enable
   end
end
```

If this solves your blocked traffic issue, you know that asymmetric routing is the cause. But allowing asymmetric routing is not the best solution, because it reduces the security of your network.

For a long-term solution, it is better to change your routing configuration or change how your FortiGate unit connects to your network.

If you enable asymmetric routing, antivirus and intrusion prevention systems will not be effective. Your FortiGate unit will be unaware of connections and treat each packet individually. It will become a stateless firewall.

Layer-2 and Arp traffic

By default, FortiGate units do not pass layer-2 traffic. If there are layer-2 protocols such as IPX, PPTP or L2TP in use on your network, you need to configure your FortiGate unit interfaces to pass these protocols without blocking. Another type of layer-2 traffic is ARP traffic.

You can allow these layer-2 protocols using the CLI command:

```
config system interface
   edit <name_str>
      set l2forward enable
   end
```

where `<name_str>` is the name of an interface.

If VDOMs are enabled, this command is per VDOM. You must set it for each VDOM that has the problem as following:

```
config vdom
   edit <vdom_name>
      config system interface
      edit <name_str>
      set l2forward enable
   end
end
```

If you enable layer-2 traffic, you may experience a problem if packets are allowed to repeatedly loop through the network. This repeated looping, very similar to a broadcast storm, occurs when you have more than one layer-2 path to a destination. Traffic may overflow and bring your network to a halt. You can break the loop by enabling Spanning Tree Protocol (STP) on your network's switches and routers. For more information, see "STP forwarding".

ARP traffic

Address Resolution Protocol (ARP) packets are vital to communication on a network, and ARP support is enabled on FortiGate unit interfaces by default. Normally you want ARP packets to pass through the FortiGate unit, especially if it is sitting between a client and a server or between a client and a router.

ARP traffic can cause problems, especially in transparent mode where ARP packets arriving on one interface are sent to all other interfaces including VLAN subinterfaces. Some layer-2 switches become unstable when they detect the same MAC address originating on more than one switch interface or from more than one VLAN. This instability can occur if the layer-2 switch does not maintain separate MAC address tables for each VLAN. Unstable switches may reset and cause network traffic to slow down considerably.

The default ARP timeout value is 5 minutes (300 seconds). So usually ARP entries are removed after 5 minutes. However, some conditions can cause arp entries to remain on the list for a longer time. This is not a configurable value. Enter the `get system arp` CLI command to view the ARP list.

Multiple VDOMs solution

By default, physical interfaces are in the root domain. If you do not configure any of your VLANs in the root VDOM, it will not matter how many interfaces are in the root VDOM.

The multiple VDOMs solution is to configure multiple VDOMs on the FortiGate unit, one for each VLAN. In this solution, you configure one inbound and one outbound VLAN interface in each VDOM. ARP packets are not forwarded between VDOMs. This configuration limits the VLANs in a VDOM and correspondingly reduces the administration needed per VDOM.

As a result of this configuration, the switches do not receive multiple ARP packets with duplicate MACs. Instead, the switches receive ARP packets with different VLAN IDs and different MACs. Your switches are stable.

However, you should **not** use the multiple VDOMs solution under any of the following conditions:

- You have more VLANs than licensed VDOMs
- You do not have enough physical interfaces

Instead, use one of two possible solutions, depending on which operation mode you are using:

- In NAT mode, you can use the `vlan forward` CLI command.
- In transparent mode, you can use the `forward-domain` CLI command. But you still need to be careful in some rare configurations.

Vlanforward solution

If you are using NAT mode, the solution is to use the `vlanforward` CLI command for the interface in question. By default, this command is enabled and will forward VLAN traffic to all VLANs on this interface. When disabled, each VLAN on this physical interface can send traffic only to the same VLAN. There is no cross-talk between VLANs, and ARP packets are forced to take one path along the network which prevents the multiple paths problem.

In the following example, `vlanforward` is disabled on port1. All VLANs configured on port1 will be separate and will not forward any traffic to each other.

```
config system interface
   edit port1
      set vlanforward disable
end
```

Forward-domain solution

If you are using transparent mode, the solution is to use the `forward-domain` CLI command. This command tags VLAN traffic as belonging to a particular collision group, and only VLANs tagged as part of that collision group receive that traffic. It is like an additional set of VLANs. By default, all interfaces and VLANs are part of forward-domain collision group 0. The many benefits of this solution include reduced administration, the need for fewer physical interfaces, and the availability of more flexible network solutions.

In the following example, forward-domain collision group 340 includes VLAN 340 traffic on port1 and untagged traffic on port 2. Forward-domain collision group 341 includes VLAN 341 traffic on port 1 and untagged traffic on port 3. All other interfaces are part of forward-domain collision group 0 by default. This configuration separates VLANs 340 and 341 from each other on port 1, and prevents the ARP packet problems from before.

Use these CLI commands:

```
config system interface
   edit port1
   next
   edit port2
      set forward_domain 340
   next
   edit port3
      set forward_domain 341
   next
   edit port1-340
      set forward_domain 340
      set interface port1
      set vlanid 340
   next
   edit port1-341
      set forward_domain 341
      set interface port1
      set vlanid 341
end
```

You may experience connection issues with layer-2 traffic, such as ping, if your network configuration has:

- Packets going through the FortiGate unit in transparent mode more than once
- More than one forwarding domain (such as incoming on one forwarding domain and outgoing on another)
- IPS and AV enabled.

Now IPS and AV is applied the first time packets go through the FortiGate unit, but not on subsequent passes. Only applying IPS and AV to this first pass fixes the network layer-2 related connection issues.

NetBIOS

Computers running Microsoft Windows operating systems that are connected through a network rely on a WINS server to resolve host names to IP addresses. The hosts communicate with the WINS server by using the NetBIOS protocol.

To support this type of network, you need to enable the forwarding of NetBIOS requests to a WINS server. The following example will forward NetBIOS requests on the internal interface for the WINS server located at an IP address of 192.168.111.222.

```
config system interface
   edit internal
      set netbios_forward enable
      set wins-ip 192.168.111.222
end
```

These commands apply only in NAT mode. If VDOMs are enabled, these commands are per VDOM. You must set them for each VDOM that has the problem.

STP forwarding

The FortiGate unit does not participate in the Spanning Tree Protocol (STP). STP is an IEEE 802.1 protocol that ensures there are no layer-2 loops on the network. Loops are created when there is more than one route for traffic to take and that traffic is broadcast back to the original switch. This loop floods the network with traffic, reducing available bandwidth to nothing.

If you use your FortiGate unit in a network topology that relies on STP for network loop protection, you need to make changes to your FortiGate configuration. Otherwise, STP recognizes your FortiGate unit as a blocked link and forwards the data to another path. By default, your FortiGate unit blocks STP as well as other non-IP protocol traffic.

Using the CLI, you can enable forwarding of STP and other layer-2 protocols through the interface. In this example, layer-2 forwarding is enabled on the external interface:

```
config system interface
   edit external
      set l2forward enable
      set stpforward enable
end
```

By substituting different commands for `stpforward enable`, you can also allow layer-2 protocols such as IPX, PPTP or L2TP to be used on the network.

Too many VLAN interfaces

Any virtual domain can have a maximum of 255 interfaces in transparent mode. This includes VLANs, other virtual interfaces, and physical interfaces. NAT mode supports from 255 to 8192 depending on the FortiGate model. This total number of interfaces includes VLANs, other virtual interfaces, and physical interfaces.

Your FortiGate unit may allow you to configure more interfaces than this. However, if you configure more than 255 interfaces, your system will become unstable and, over time, will not work properly. As all interfaces are used, they will overflow the routing table that stores the interface information, and connections will fail. When you try to add more interfaces, an error message will state that the maximum limit has already been reached.

If you see this error message, chances are you already have too many VLANs on your system and your routing has become unstable. To verify, delete a VLAN and try to add it back. If you have too many, you will not be able to add it back on to the system. In this case, you will need to remove enough interfaces (including VLANs) so that the total number of interfaces drops to 255 or less. After doing this, you should also reboot your FortiGate unit to clean up its memory and buffers, or you will continue to experience unstable behavior.

To configure more than 255 interfaces on your FortiGate unit in transparent mode, you have to configure multiple VDOMs, each with many VLANs. However, if you want to create more than the default 10 VDOMs (or a maximum of 2550 interfaces), you must buy a license for additional VDOMs.

With these extra licenses, you can configure up to 500 VDOMs, with each VDOM containing up to 255 VLANs in transparent mode. This is a theoretical maximum of over 127 500 interfaces. However, system resources will quickly get used up before reaching that theoretical maximum. To achieve the maximum number of VDOMs, you need to have top-end hardware with the most resources possible.

In NAT mode, if you have a top-end model, the maximum interfaces per VDOM can be as high as 8192, enough for all the VLANs in your configuration.

Your FortiGate unit has limited resources, such as CPU load and memory, that are divided between all configured VDOMs. When running 250 or more VDOMs, you may need to monitor the system resources to ensure there is enough to support the configured traffic processing.

PPTP and L2TP

A virtual private network (VPN) is a way to use a public network, such as the Internet, as a vehicle to provide remote offices or individual users with secure access to private networks. FortiOS supports the Point-to-Point Tunneling Protocol (PPTP), which enables interoperability between FortiGate units and Windows or Linux PPTP clients. Because FortiGate units support industry standard PPTP VPN technologies, you can configure a PPTP VPN between a FortiGate unit and most third-party PPTP VPN peers.

This section describes how to configure PPTP and L2TP VPNs as well as PPTP passthrough.

This section includes the topics:

- How PPTP VPNs work
- FortiGate unit as a PPTP server
- Configuring the FortiGate unit for PPTP VPN
- Configuring the FortiGate unit for PPTP pass through
- Testing PPTP VPN connections
- Logging VPN events
- Configuring L2TP VPNs
- L2TP configuration overview

How PPTP VPNs work

The Point-to-Point Tunneling Protocol enables you to create a VPN between a remote client and your internal network. Because it is a Microsoft Windows standard, PPTP does not require third-party software on the client computer. As long as the ISP supports PPTP on its servers, you can create a secure connection by making relatively simple configuration changes to the client computer and the FortiGate unit.

PPTP uses Point-to-Point protocol (PPP) authentication protocols so that standard PPP software can operate on tunneled PPP links. PPTP packages data in PPP packets and then encapsulates the PPP packets within IP packets for transmission through a VPN tunnel.

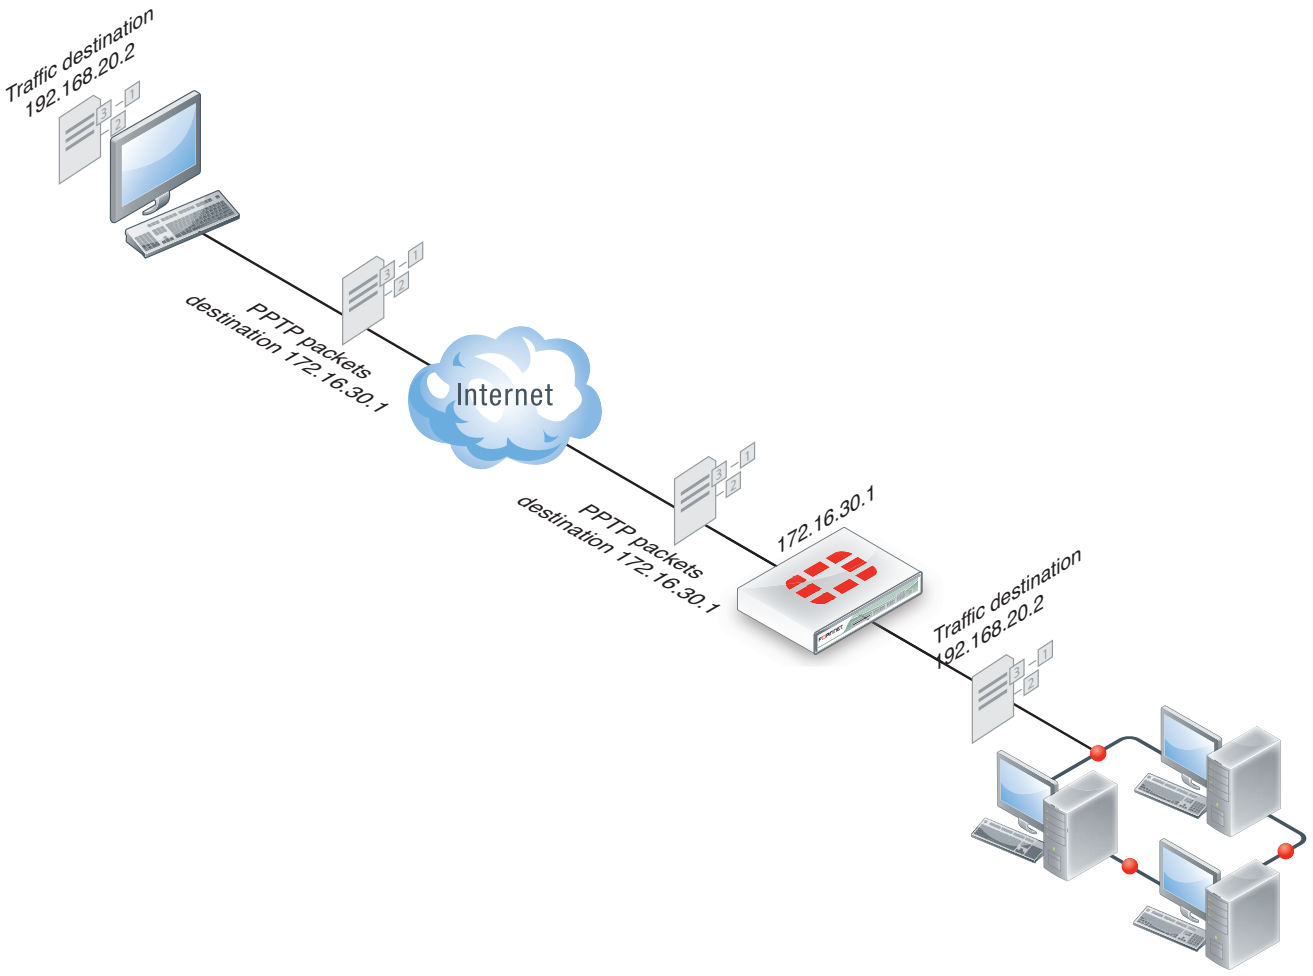
When the FortiGate unit acts as a PPTP server, a PPTP session and tunnel is created as soon as the PPTP client connects to the FortiGate unit. More than one PPTP session can be supported on the same tunnel. FortiGate units support PAP, CHAP, and plain text authentication. PPTP clients are authenticated as members of a user group.

Traffic from one PPTP peer is encrypted using PPP before it is encapsulated using Generic Routing Encapsulation (GRE) and routed to the other PPTP peer through an ISP network. PPP packets from the remote client are addressed to a computer on the private network behind the FortiGate unit. PPTP packets from the remote client are addressed to the public interface of the FortiGate unit. Seethe figure below.

PPTP control channel messages are not authenticated, and their integrity is not protected. Furthermore, encapsulated PPP packets are not cryptographically protected and may be read or modified unless appropriate encryption software such as Secure Shell (SSH) or Secure File Transfer Protocol (SFTP) is used to transfer data after the tunnel has been established.

As an alternative, you can use encryption software such as Microsoft Point-to-Point Encryption (MPPE) to secure the channel. MPPE is built into Microsoft Windows clients and can be installed on Linux clients. FortiGate units support MPPE.

Packet encapsulation



Shown above, traffic from the remote client is addressed to a computer on the network behind the FortiGate unit. When the PPTP tunnel is established, packets from the remote client are encapsulated and addressed to the FortiGate unit. The FortiGate unit forwards disassembled packets to the computer on the internal network.

When the remote PPTP client connects, the FortiGate unit assigns an IP address from a reserved range of IP addresses to the client PPTP interface. The PPTP client uses the assigned IP address as its source address for the duration of the connection.

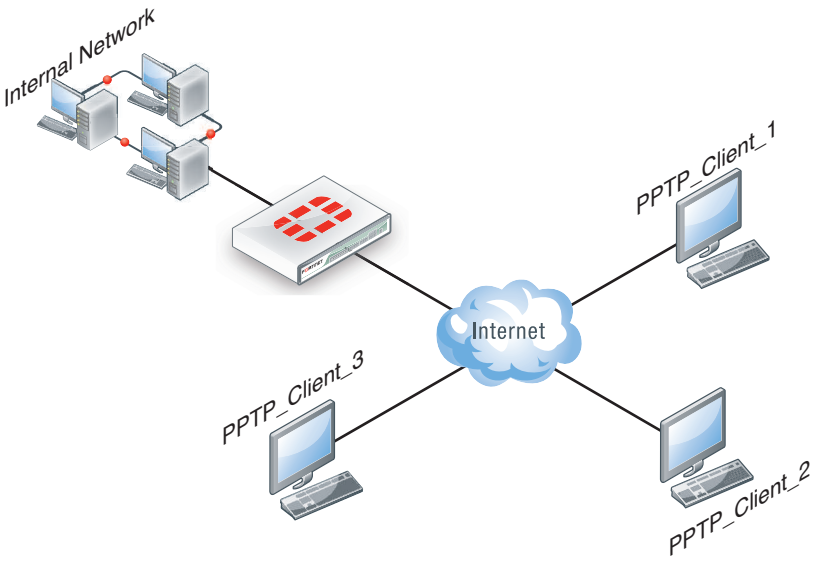
When the FortiGate unit receives a PPTP packet, the unit disassembles the PPTP packet and forwards the packet to the correct computer on the internal network. The security policy and protection profiles on the FortiGate unit ensure that inbound traffic is screened and processed securely.

PPTP clients must be authenticated before a tunnel is established. The authentication process relies on FortiGate user group definitions, which can optionally use established authentication mechanisms such as RADIUS or LDAP to authenticate PPTP clients. All PPTP clients are challenged when a connection attempt is made.

FortiGate unit as a PPTP server

In the most common Internet scenario, the PPTP client connects to an ISP that offers PPP connections with dynamically-assigned IP addresses. The ISP forwards PPTP packets to the Internet, where they are routed to the FortiGate unit.

FortiGate unit as a PPTP server



If the FortiGate unit will act as a PPTP server, there are a number of steps to complete:

- Configure user authentication for PPTP clients.
- Enable PPTP.
- Specify the range of addresses that are assigned to PPTP clients when connecting
- Configure the security policy.

Configuring user authentication for PPTP clients

To enable authentication for PPTP clients, you must create user accounts and a user group to identify the PPTP clients that need access to the network behind the FortiGate unit. Within the user group, you must add a user for each PPTP client.

You can choose to use a plain text password for authentication or forward authentication requests to an external RADIUS, LDAP, or TACACS+ server. If password protection will be provided through a RADIUS, LDAP, or

TACACS+ server, you must configure the FortiGate unit to forward authentication requests to the authentication server.

This example creates a basic user/password combination.

Configuring a user account

To add a local user - web-based manager

1. Go to **User & Device > User > User Definition** and select **Create New.**
2. Select **Local User**
3. Enter a **User Name**.
4. Enter a **Password** for the user. The password should be at least six characters.
5. Select **OK**.

To add a local user - CLI

```
config user local
   edit <username>
      set type password
      set passwd <password>
end
```

Configuring a user group

To ease configuration, create user groups that contain users in similar categories or departments.

To create a user group - web-based manager

1. Go to **User & Device > User > User Group** and select **Create New**.
2. Enter a **Name** for the group.
3. Select the **Type** of **Firewall**.
4. From the **Available Users** list, select the required users and select the right-facing arrow to add them to the **Members** list.
5. Select **OK**.

To create a user group - CLI

```
config user group
   edit <group_name>
      set group-type firewall
      set member <user_names>
end
```

Enabling PPTP and specifying the PPTP IP address range

The PPTP address range specifies the range of addresses reserved for remote PPTP clients. When a PPTP client connects to the FortiGate unit, the client is assigned an IP address from this range. Afterward, the FortiGate unit uses the assigned address to communicate with the PPTP client.

The address range that you reserve can be associated with private or routable IP addresses. If you specify a private address range that matches a network behind the FortiGate unit, the assigned address will make the PPTP client appear to be part of the internal network.

PPTP requires two IP addresses, one for each end of the tunnel. The PPTP address range is the range of addresses reserved for remote PPTP clients. When the remote PPTP client establishes a connection, the FortiGate unit assigns an IP address from the reserved range of IP addresses to the client PPTP interface or retrieves the assigned IP address from the PPTP user group. If you use the PPTP user group, you must also define the FortiGate end of the tunnel by entering the IP address of the unit in **Local IP** (web-based manager) ***or*** `local-ip` (CLI). The PPTP client uses the assigned IP address as its source address for the duration of the connection.

PPTP configuration is only available through the CLI. In the example below, PPTP is enabled with the use of an IP range of `182.168.1.1` to `192.168.1.10` for addressing and the user group is hr_staff.

The start and end IPs in the PPTP address range must be in the same 24-bit subnet, for example, 192.168.1.1 - 192.168.1.254.

```
config vpn pptp
   set status enable
   set ip-mode range
   set eip 192.168.1.10
   set sip 192.168.1.1
   set usrgrp hr_staff
end
```

In this example, PPTP is enabled with the use of a user group for addressing, where the IP address of the PPTP server is `192.168.1.2` and the user group is `hr_admin`.

```
config vpn pptp
   set status enable
   set ip-mode range
   set local-ip 192.168.2.1
   set usrgrp hr_admin
end
```

Adding the security policy

The security policy specifies the source and destination addresses that can generate traffic inside the PPTP tunnel and defines the scope of services permitted through the tunnel. If a selection of services are required, define a service group.

To configure the firewall for the PPTP tunnel - web-based manager

1. Go to **Policy & Objects > Policy > IPv4** or **Policy & Objects > Policy > IPv6** and select **Create New**.
2. Complete the following and select **OK**:

Incoming Interface	The FortiGate interface connected to the Internet.
Source Address	Select the name that corresponds to the range of addresses that you reserved for PPTP clients.

Outgoing Interface	The FortiGate interface connected to the internal network.
Destination Address	Select the name that corresponds to the IP addresses behind the FortiGate unit.
Schedule	always
Service	ALL
Action	ACCEPT

To configure the firewall for the PPTP tunnel - CLI

```
config firewall policy or config firewall policy6
   edit 1
      set srcintf <interface to internet>
      set dstintf <interface to internal network>
      set srcaddr <reserved_range>
      set dstaddr <internal_addresses>
      set action accept
      set schedule always
      set service ALL
end
```

Configuring the FortiGate unit for PPTP VPN

To arrange for PPTP packets to pass through the FortiGate unit to an external PPTP server, perform the following tasks in the order given:

- Configure user authentication for PPTP clients.
- Enable PPTP on the FortiGate unit and specify the range of addresses that can be assigned to PPTP clients when they connect.
- Configure PPTP pass through on the FortiGate unit.

Configuring the FortiGate unit for PPTP pass through

To forward PPTP packets to a PPTP server on the network behind the FortiGate unit, you need to perform the following configuration tasks on the FortiGate unit:

- Define a virtual IP address that points to the PPTP server.
- Create a security policy that allows incoming PPTP packets to pass through to the PPTP server.

The address range is the external (public) ip address range which requires access to the internal PPTP server through the FortiGate virtual port-forwarding firewall.

IP addresses used in this document are fictional and follow the technical documentation guidelines specific to Fortinet. Real external IP addresses are not used.

Configuring a virtual IP address

The virtual IP address will be the address of the PPTP server host.

To define a virtual IP for PPTP pass through - web-based manager

1. Go to **Policy & Objects > Objects > Virtual IPs**.
2. Select **Create New**.
3. Choose the **VIP Type**.
4. Enter the name of the VIP, for example, `PPTP_Server`.
5. Select the **External Interface** where the packets will be received for the PPTP server.
6. Enter the **External IP Address** for the VIP.
7. Select **Port Forwarding**.
8. Set the **Protocol to TCP**.
9. Enter the **External Service Port** of `1723`, the default for PPTP.
10. Enter the **Map to Port** to `1723`.
11. Select **OK**.

To define a virtual IP for PPTP pass through - web-based manager

```
config firewall vip or config firewall vip6
   edit PPTP_Server
      set extintf <interface>
      set extip <ip_address>
      set portforward enable
      set protocol tcp
      set extport 1723
      set mappedport 1723
      set mappedip <destination IP address range>
      end
```

You can also use `config firewall vip46` to define a virtual IP from an IPv4 address to an IPv6 address or `config firewall vip64` to define a virtual IP from an IPv6 address to an IPv4 address.

Configuring a port-forwarding security policy

To create a port-forwarding security policy for PPTP pass through you must first create an address range reserved for the PPTP clients.

To create an address range - web-based manager

1. Go to **Policy & Objects > Objects > Addresses** and select **Create New**.
2. Select a **Category**.
3. Enter a **Name** for the range, for example, `External_PPTP`.
4. Select a **Type** of **Subnet/IP Range**.
5. Enter the IP address range.
6. Select the **Interface** to the Internet.
7. Select **OK**.

To create an address range - CLI

```
config firewall address OR config firewall address6
   edit External_PPTP
      set type iprange
```

```
        set start-ip <ip_address>
        set end-ip <ip_address>
        set associated-interface <internet_interface>
end
```

With the address set, you can add the security policy.

To add the security policy - web-based manager

1. Go to **Policy & Objects > Policy > IPv4** or **Policy & Objects > Policy > IPv6** and select **Create New**.
2. Complete the following and select **OK**:

Incoming Interface	The FortiGate interface connected to the Internet.
Source Address	Select the address range created in the previous step.
Outgoing Interface	The FortiGate interface connected to the PPTP server.
Destination Address	Select the VIP address created in the previous steps.
Schedule	always
Service	PPTP
Action	ACCEPT

To add the security policy - CLI

```
config firewall policy or config firewall policy6
   edit <policy_number>
      set srcintf <interface to internet>
      set dstintf <interface to PPTP server>
      set srcaddr <address_range>
      set dstaddr <PPTP_server_address>
      set action accept
      set schedule always
      set service PPTP
end
```

Testing PPTP VPN connections

To confirm that a PPTP VPN between a local network and a dialup client has been configured correctly, at the dialup client, issue a ping command to test the connection to the local network. The PPTP VPN tunnel initializes when the dialup client attempts to connect.

Logging VPN events

PPTP VPN, activity is logged when enabling VPN logging. The FortiGate unit connection events and tunnel status (up/down) are logged.

To log VPN events

1. Go to **Log & Report > Log Config > Log Settings**.
2. Enable the storage of log messages to one or more locations.

3. Select **VPN activity event**.
4. Select **Apply**.

To view event logs

1. Go to **Log & Report > Event Log > VPN**.
2. If the option is available from the Log Type list, select the log file from disk or memory.

Configuring L2TP VPNs

This section describes how to configure a FortiGate unit to establish a Layer Two Tunneling Protocol (L2TP) tunnel with a remote dialup client. The FortiGate implementation of L2TP enables a remote dialup client to establish an L2TP tunnel with the FortiGate unit directly.

According to RFC 2661, an Access Concentrator (LAC) can establish an L2TP tunnel with an L2TP Network Server (LNS). In a typical scenario, the LAC is managed by an ISP and located on the ISP premises; the LNS is the gateway to a private network. When a remote dialup client connects to the Internet through the ISP, the ISP uses a local database to establish the identity of the caller and determine whether the caller needs access to an LNS through an L2TP tunnel. If the services registered to the caller indicate that an L2TP connection to the LNS is required, the ISP LAC attempts to establish an L2TP tunnel with the LNS.

A FortiGate unit can be configured to act as an LNS. The FortiGate implementation of L2TP enables a remote dialup client to establish an L2TP tunnel with the FortiGate unit directly, bypassing any LAC managed by an ISP. The ISP must configure its network access server to forward L2TP traffic from the remote client to the FortiGate unit directly whenever the remote client requires an L2TP connection to the FortiGate unit.

When the FortiGate unit acts as an LNS, an L2TP session and tunnel is created as soon as the remote client connects to the FortiGate unit. The FortiGate unit assigns an IP address to the client from a reserved range of IP addresses. The remote client uses the assigned IP address as its source address for the duration of the connection.

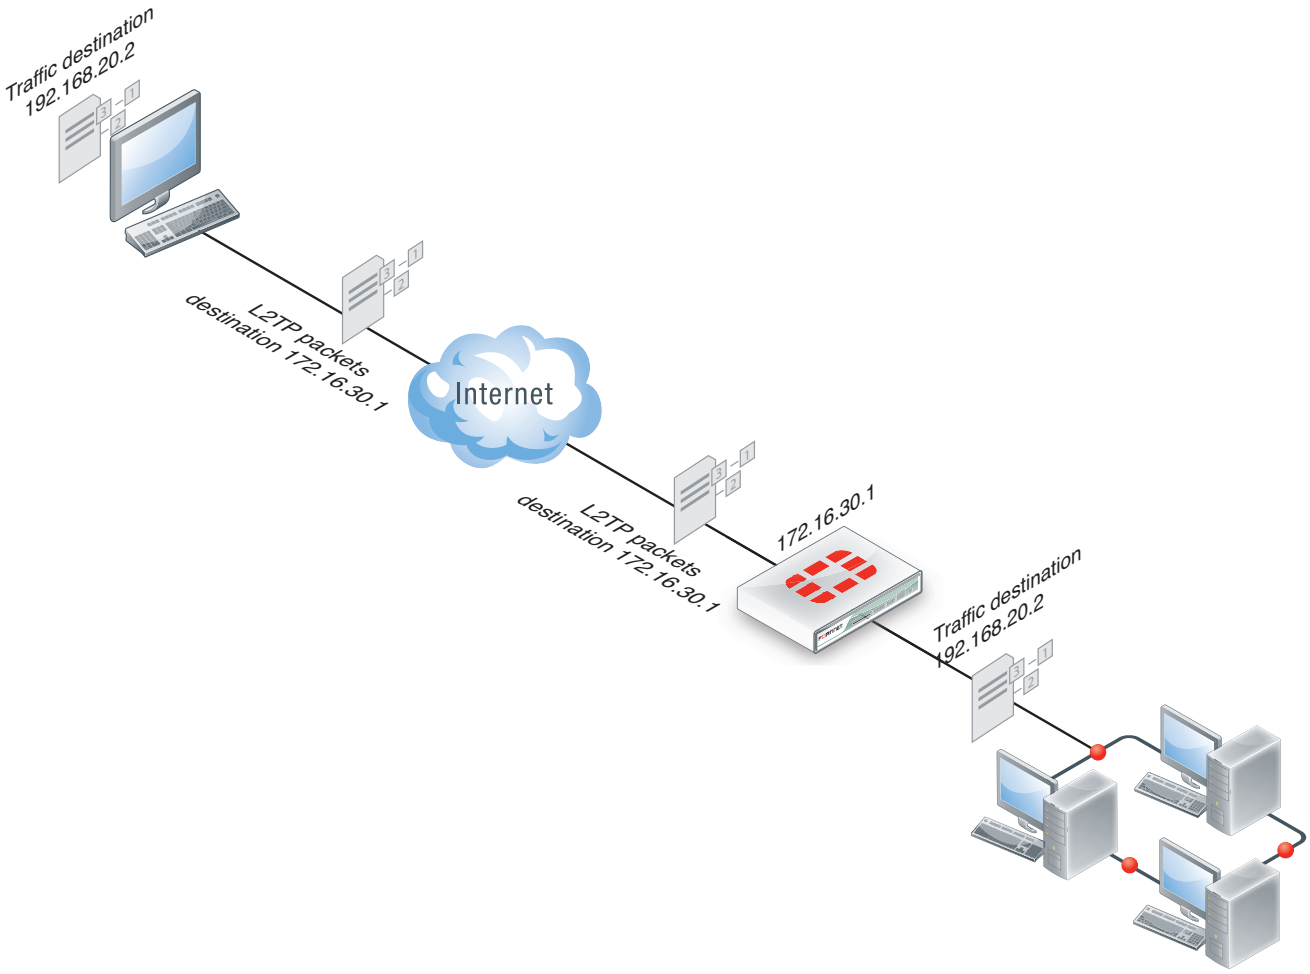
More than one L2TP session can be supported on the same tunnel. FortiGate units can be configured to authenticate remote clients using a plain text user name and password, or authentication can be forwarded to an external RADIUS or LDAP server. L2TP clients are authenticated as members of a user group.

For site-to-site connections, Windows servers use IPsec encryption when you configure the VPN to connect to an L2TP server.

Traffic from the remote client must be encrypted using IPsec before it is encapsulated and routed to the FortiGate unit. Packets originating at the remote client are addressed to a computer on the private network behind the FortiGate unit. Encapsulated packets are addressed to the public interface of the FortiGate unit. See the figure below.

When the FortiGate unit receives an L2TP packet, the unit disassembles the packet and forwards the packet to the correct computer on the internal network. The security policy and protection profiles on the FortiGate unit ensure that inbound traffic is screened and processed securely.

L2TP encapsulation

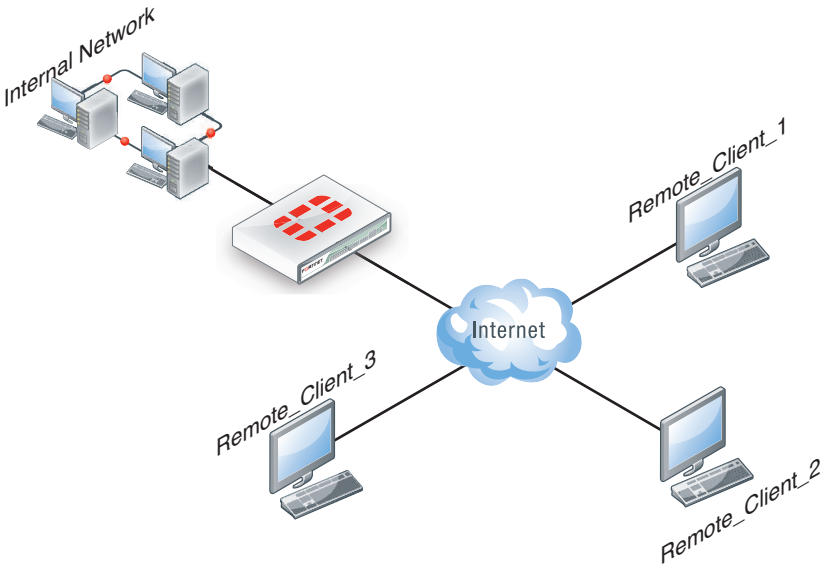


FortiGate units cannot deliver non-IP traffic such as Frame Relay or ATM frames encapsulated in L2TP packets — FortiGate units support the IPv4 and IPv6 addressing schemes only

Network topology

The remote client connects to an ISP that determines whether the client requires an L2TP connection to the FortiGate unit. If an L2TP connection is required, the connection request is forwarded to the FortiGate unit directly.

Example L2TP configuration



L2TP infrastructure requirements

- The FortiGate unit must be operating in NAT mode and have a static public IP address.
- The ISP must configure its network access server to forward L2TP traffic from remote clients to the FortiGate unit directly.
- The remote client must not generate non-IP traffic (Frame Relay or ATM frames).

L2TP configuration overview

To configure a FortiGate unit to act as an LNS, you perform the following tasks:

- Create an L2TP user group containing one user for each remote client.
- Enable L2TP on the FortiGate unit and specify the range of addresses that can be assigned to remote clients when they connect.
- Define firewall source and destination addresses to indicate where packets transported through the L2TP tunnel will originate and be delivered.
- Create the security policy and define the scope of permitted services between the source and destination addresses.
- Configure the remote clients.

Authenticating L2TP clients

L2TP clients must be authenticated before a tunnel is established. The authentication process relies on FortiGate user group definitions, which can optionally use established authentication mechanisms such as RADIUS or LDAP to authenticate L2TP clients. All L2TP clients are challenged when a connection attempt is made.

To enable authentication, you must create user accounts and a user group to identify the L2TP clients that need access to the network behind the FortiGate unit.

You can choose to use a plain text password for authentication or forward authentication requests to an external RADIUS or LDAP server. If password protection will be provided through a RADIUS or LDAP server, you must configure the FortiGate unit to forward authentication requests to the authentication server.

Enabling L2TP and specifying an address range

The L2TP address range specifies the range of addresses reserved for remote clients. When a remote client connects to the FortiGate unit, the client is assigned an IP address from this range. Afterward, the FortiGate unit uses the assigned address to communicate with the remote client.

The address range that you reserve can be associated with private or routable IP addresses. If you specify a private address range that matches a network behind the FortiGate unit, the assigned address will make the remote client appear to be part of the internal network.

To enable L2TP and specify the L2TP address range, use the `config vpn l2tp` CLI command.

The following example shows how to enable L2TP and set the L2TP address range using a starting address of `192.168.10.80` and an ending address of `192.168.10.100` for an existing group of L2TP users named `L2TP_users`:

```
config vpn l2tp
   set sip 192.168.10.80
   set eip 192.168.10.100
   set status enable
   set usrgrp L2TP_users
end
```

Defining firewall source and destination addresses

Before you define the security policy, you must define the source and destination addresses of packets that are to be transported through the L2TP tunnel:

- For the source address, enter the range of addresses that you reserved for remote L2TP clients (for example `192.168.10.[80-100]`).
- For the destination address, enter the IP addresses of the computers that the L2TP clients need to access on the private network behind the FortiGate unit (for example, `172.16.5.0/24` for a subnet, or `172.16.5.1` for a server or host, or `192.168.10.[10-15]` for an IP address range).

To define the firewall source address

1. Go to **Policy & Objects > Objects > Addresses** and select **Create New**.
2. Select a **Category**.
3. In the **Address Name** field, type a name that represents the range of addresses that you reserved for remote clients (for example, `Ext_L2TPrange`).
4. In **Type**, select **IP Range**.
5. In the **IP Range** field, type the corresponding IP address range.
6. In **Interface**, select the FortiGate interface that connects to the clients.
7. This is usually the interface that connects to the Internet.
8. Select **OK**.

To define the firewall destination address

1. Go to **Policy & Objects > Objects > Addresses** and select **Create New**.
2. In the **Address Name** field, type a name that represents a range of IP addresses on the network behind the FortiGate unit (for example, `Int_L2TPaccess`).
3. In **Type**, select **IP Range**.
4. In the **IP Range** field, type the corresponding IP address range.
5. In **Interface**, select the FortiGate interface that connects to the network behind the FortiGate unit.
6. Select **OK**.

Adding the security policy

The security policy specifies the source and destination addresses that can generate traffic inside the L2TP tunnel and defines the scope of services permitted through the tunnel. If a selection of services are required, define a service group.

To define the traffic and services permitted inside the L2TP tunnel

1. Go to **Policy & Objects > Policy > IPv4** or **Policy & Objects > Policy > IPv6** and select **Create New**.
2. Enter these settings:

Incoming Interface	Select the FortiGate interface to the Internet.
Source Address	Select the name that corresponds to the address range that reserved for L2TP clients (for example, `Ext_L2TPrange`).
Outgoing Interface	Select the FortiGate interface to the internal (private) network.
Destination Address	Select the name that corresponds to the IP addresses behind the FortiGate unit (for example, `Int_L2TPaccess`).
Service	Select ALL, or if selected services are required instead, select the service group that you defined previously.
Action	ACCEPT

3. Select **OK**.

Configuring a Linux client

This procedure outlines how to install L2TP client software and run an L2TP tunnel on a Linux computer. Obtain an L2TP client package that meets your requirements (for example, `rp-l2tp`). If needed to encrypt traffic, obtain L2TP client software that supports encryption using IPsec.

To establish an L2TP tunnel with a FortiGate unit that has been set up to accept L2TP connections, you can obtain and install the client software following these guidelines:

1. If encryption is required, you will need to verify the IPsec configuration.
2. Download and install the L2TP client package.
3. Configure an L2TP connection to run the L2TP program.

4. Configure routes to determine whether all or some of your network traffic will be sent through the tunnel. You must define a route to the remote network over the L2TP link and a host route to the FortiGate unit.
5. Run `l2tpd` to start the tunnel.

Follow the software supplier's documentation to complete the steps.

To configure the system, you need to know the public IP address of the FortiGate unit, and the user name and password that has been set up on the FortiGate unit to authenticate L2TP clients. Contact the FortiGate administrator if required to obtain this information.

Monitoring L2TP sessions

You can display a list of all active sessions and view activity by port number. By default, port 1701 is used for L2TP VPN-related communications. If required, active sessions can be stopped from this view. Use the Top Sessions Dashboard Widget.

Testing L2TP VPN connections

To confirm that a VPN between a local network and a dialup client has been configured correctly, at the dialup client, issue a ping command to test the connection to the local network. The VPN tunnel initializes when the dialup client attempts to connect.

Logging L2TP VPN events

You can configure the FortiGate unit to log VPN events. For L2TP VPNs, connection events and tunnel status (up/down) are logged.

To log VPN events - web-based manager

1. Go to **Log & Report > Log Config > Log Settings**.
2. Enable the storage of log messages to one or more locations.
3. Select **Enable**, and then select **VPN activity event**.
4. Select **Apply**.

To log VPN events - CLI

```
config log memory setting
   set diskfull overwrite
   set status enable
end
config log eventfilter
   set vpn enable
end
```

Session helpers

The FortiOS firewall can analyze most TCP/IP protocol traffic by comparing packet header information to security policies. This comparison determines whether to accept or deny the packet and the session that the packet belongs to.

Some protocols include information in the packet body (or payload) that must be analyzed to successfully process sessions for this protocol. For example, the SIP VoIP protocol uses TCP control packets with a standard destination port to set up SIP calls. But the packets that carry the actual conversation can use a variety of UDP protocols with a variety of source and destination port numbers. The information about the protocols and port numbers used for a SIP call is contained in the body of the SIP TCP control packets. To successfully process SIP VoIP calls, FortiOS must be able to extract information from the body of the SIP packet and use this information to allow the voice-carrying packets through the firewall.

FortiOS uses session helpers to analyze the data in the packet bodies of some protocols and adjust the firewall to allow those protocols to send packets through the firewall.

This section includes the topics:

- Viewing the session helper configuration
- Changing the session helper configuration
- DCE-RPC session helper (dcerpc)
- DNS session helpers (dns-tcp and dns-udp)
- File transfer protocol (FTP) session helper (ftp)
- H.245 session helpers (h245I and h245O)
- H.323 and RAS session helpers (h323 and ras)
- Media Gateway Controller Protocol (MGCP) session helper (mgcp)
- ONC-RPC portmapper session helper (pmap)
- PPTP session helper for PPTP traffic (pptp)
- Remote shell session helper (rsh)
- Real-Time Streaming Protocol (RTSP) session helper (rtsp)
- Session Initiation Protocol (SIP) session helper (sip)
- Trivial File Transfer Protocol (TFTP) session helper (tftp)
- Oracle TNS listener session helper (tns)

Viewing the session helper configuration

You can view the session helpers enabled on your FortiGate unit in the CLI using the commands below. The following output shows the first two session helpers. The number of session helpers can vary to around 20.

```
show system session-helper
   config system session-helper
      edit 1
         set name pptp
         set port 1723
         set protocol 6
         next
         set name h323
```

```
        set port 1720
        set protocol 6
        end
    .
    .
```

The configuration for each session helper includes the name of the session helper and the port and protocol number on which the session helper listens for sessions. Session helpers listed on protocol number 6 (TCP) or 17 (UDP). For a complete list of protocol numbers see Assigned Internet Protocol Numbers.

For example, the output above shows that FortiOS listens for PPTP packets on TCP port 1723 and H.323 packets on port TCP port 1720.

If a session helper listens on more than one port or protocol the more than one entry for the session helper appears in the `config system session-helper` list. For example, the pmap session helper appears twice because it listens on TCP port 111 and UDP port 111. The rsh session helper appears twice because it listens on TCP ports 514 and 512.

Changing the session helper configuration

Normally you will not need to change the configuration of the session helpers. However in some cases you may need to change the protocol or port the session helper listens on.

Changing the protocol or port that a session helper listens on

Most session helpers are configured to listen for their sessions on the port and protocol that they typically use. If your FortiGate unit receives sessions that should be handled by a session helper on a non-standard port or protocol you can use the following procedure to change the port and protocol used by a session helper. The following example shows how to change the port that the pmap session helper listens on for Sun RPC portmapper TCP sessions. By default pmap listens on TCP port 111.

To change the port that the pmap session helper listens on to TCP port 112

1. Confirm that the TCP pmap session helper entry is 11 in the session-helper list:

```
show system session-helper 11
    config system session-helper
        edit 11
            set name pmap
            set port 111
            set protocol 6
        next
    end
```

2. Enter the following command to change the TCP port to 112.

```
config system session-helper
    edit 11
        set port 112
        end
```

3. The pmap session helper also listens on UDP port 111. Confirm that the UDP pmap session helper entry is 12 in the session-helper list:

```
show system session-helper 12
    config system session-helper
        edit 12
```

```
            set name pmap
            set port 111
            set protocol 17
            end
```

4. Enter the following command to change the UDP port to 112.

```
config system session-helper
   edit 12
      set port 112
      end
```

Use the following command to set the h323 session helper to listen for ports on the UDP protocol.

To change the protocol that the h323 session helper listens on

1. Confirm that the h323 session helper entry is 2 in the session-helper list:

```
show system session-helper 2
   config system session-helper
      edit 2
         set name h323
         set port 1720
         set protocol 6
      next
   end
```

2. Enter the following command to change the protocol to UDP.

```
config system session-helper
   edit 2
      set protocol 17
   end
end
```

If a session helper listens on more than one port or protocol, then multiple entries for the session helper must be added to the session helper list, one for each port and protocol combination. For example, the rtsp session helper listens on TCP ports 554, 7070, and 8554 so there are three rtsp entries in the session-helper list. If your FortiGate unit receives rtsp packets on a different TCP port (for example, 6677) you can use the following command to configure the rtsp session helper to listen on TCP port 6677.

To configure a session helper to listen on a new port and protocol

```
config system session-helper
   edit 0
      set name rtsp
      set port 6677
      set protocol 6
end
```

Disabling a session helper

In some cases you may need to disable a session helper. Disabling a session helper just means removing it from the session-helper list so that the session helper is not listening on a port. You can completely disable a session helper by deleting all of its entries from the session helper list. If there are multiple entries for a session helper on the list you can delete one of the entries to prevent the session helper from listening on that port.

To disable the mgcp session helper from listening on UDP port 2427

1. Enter the following command to find the mgcp session helper entry that listens on UDP port 2427:

```
show system session-helper
   .
   .
   .
edit 19
   set name mgcp
   set port 2427
   set protocol 17
next
   .
   .
   .
```

2. Enter the following command to delete session-helper list entry number 19 to disable the mgcp session helper from listening on UDP port 2427:

```
config system session-helper
   delete 19
```

By default the mgcp session helper listens on UDP ports 2427 and 2727. The previous procedure shows how to disable the mgcp protocol from listening on port 2427. The following procedure completely disables the mgcp session helper by also disabling it from listening on UDP port 2727.

To completely disable the mgcp session helper

1. Enter the following command to find the mgcp session helper entry that listens on UDP port 2727:

```
show system session-helper
   .
   .
   .
edit 20
   set name mgcp
   set port 2727
   set protocol 17
next
   .
   .
   .
```

2. Enter the following command to delete session-helper list entry number 20 to disable the mgcp session helper from listening on UDP port 2727:

```
config system session-helper
   delete 20
```

DCE-RPC session helper (dcerpc)

Distributed Computing Environment Remote Procedure Call (DCE-RPC) provides a way for a program running on one host to call procedures in a program running on another host. DCE-RPC (also called MS RPC for Microsoft RPC) is similar to ONC-RPC. Because of the large number of RPC services, for example, MAPI, the transport address of an RPC service is dynamically negotiated based on the service program's universal unique identifier (UUID). The Endpoint Mapper (EPM) binding protocol in FortiOS maps the specific UUID to a transport address.

To accept DCE-RPC sessions you must add a security policy with service set to any or to the DEC-RPC pre-defined service (which listens on TCP and UDP ports 135). The dcerpc session helper also listens on TCP and UDP ports 135.

The session allows FortiOS to handle DCE-RPC dynamic transport address negotiation and to ensure UUID-based security policy enforcement. You can define a security policy to permit all RPC requests or to permit by specific UUID number.

In addition, because a TCP segment in a DCE-RPC stream might be fragmented, it might not include an intact RPC PDU. This fragmentation occurs in the RPC layer; so FortiOS does not support parsing fragmented packets.

DNS session helpers (dns-tcp and dns-udp)

FortiOS includes two DNS session helpers, dns-tcp, a session helper for DNS over TCP, and dns-udp, a session helper for DNS over UDP.

To accept DNS sessions you must add a security policy with service set to any or to the DNS pre-defined service (which listens on TCP and UDP ports 53). The dns-udp session helper also listens on UDP port 53. By default the dns-tcp session helper is disabled. If needed you can use the following command to enable the dns-tcp session helper to listen for DNS sessions on TCP port 53:

```
config system session-helper
   edit 0
      set name dns-tcp
      set port 53
      set protocol 6
end
```

File transfer protocol (FTP) session helper (ftp)

The FTP session helper monitors PORT, PASV and 227 commands and NATs the IP addresses and port numbers in the body of the FTP packets and opens ports on the FortiGate unit as required.

To accept FTP sessions you must add a security policy with service set to any or to the FTP, FTP_Put, and FTP_GET pre-defined services (which all listen on TCP port 21).

H.245 session helpers (h245I and h245O)

H.245 is a control channel protocol used for H.323 and other similar communication sessions. H.245 sessions transmit non-telephone signals. H.245 sessions carry information needed for multimedia communication, such as encryption, flow control jitter management and others.

FortiOS includes two H.245 sessions helpers, h245I which is for H.245 call in and h245O which is for H.245 call out sessions. There is no standard port for H.245. By default the H.245 sessions helpers are disabled. You can enable them as you would any other session helper. When you enable them, you should specify the port and protocol on which the FortiGate unit receives H.245 sessions.

H.323 and RAS session helpers (h323 and ras)

The H.323 session helper supports secure H.323 voice over IP (VoIP) sessions between terminal endpoints such as IP phones and multimedia devices. In H.323 VoIP networks, gatekeeper devices manage call registration, admission, and call status for VoIP calls. The FortiOS h323 session helper supports gatekeepers installed on two different networks or on the same network.

To accept H.323 sessions you must add a security policy with service set to any or to the H323 pre-defined service (which listens on TCP port numbers 1720 and 1503 and on UDP port number 1719). The h323 session helper listens on TCP port 1720.

The ras session helper is used with the h323 session helper for H.323 Registration, Admission, and Status (RAS) services. The ras session helper listens on UDP port 1719.

Alternate H.323 gatekeepers

The h323 session helper supports using H.323 alternate gatekeepers. All the H.323 end points must register with a gatekeeper through the Registration, Admission, and Status (RAS) protocol before they make calls. During the registration process, the primary gatekeeper sends Gatekeeper Confirm (GCF) and Registration Confirm (RCF) messages to the H.323 end points that contain the list of available alternate gatekeepers.

The alternate gatekeeper provides redundancy and scalability for the H.323 end points. If the primary gatekeeper fails the H.323 end points that have registered with that gatekeeper are automatically registered with the alternate gatekeeper. To use the H.323 alternate gatekeeper, you need to configure security policies that allow H.323 end points to reach the alternate gatekeeper.

Media Gateway Controller Protocol (MGCP) session helper (mgcp)

The Media Gateway Control Protocol (MGCP) is a text-based application layer protocol used for VoIP call setup and control. MGCP uses a master-slave call control architecture in which the media gateway controller uses a call agent to maintain call control intelligence, while the media gateways perform the instructions of the call agent.

To accept MGCP sessions you must add a security policy with service set to any or to the MGCP pre-defined service (which listens on UDP port numbers 2427 and 2727). The h323 session helper also listens on UDP port numbers 2427 and 2727.

The MGCP session helper does the following:

- VoIP signalling payload inspection. The payload of the incoming VoIP signalling packet is inspected and malformed packets are blocked.
- Signaling packet body inspection. The payload of the incoming MGCP signaling packet is inspected according to RFC 3435. Malformed packets are blocked.
- Stateful processing of MGCP sessions. State machines are invoked to process the parsed information. Any out-of-state or out-of-transaction packet is identified and properly handled.
- MGCP Network Address Translation (NAT). Embedded IP addresses and ports in packet bodies is properly translated based on current routing information and network topology, and is replaced with the translated IP address and port number, if necessary.
- Manages pinholes for VoIP traffic. To keep the VoIP network secure, the IP address and port information used for media or signalling is identified by the session helper, and pinholes are dynamically created and closed during call setup.

ONC-RPC portmapper session helper (pmap)

Open Network Computing Remote Procedure Call (ONC-RPC) is a widely deployed remote procedure call system. Also called Sun RPC, ONC-RPC allows a program running on one host to call a program running on another. The transport address of an ONC-RPC service is dynamically negotiated based on the service's program number and version number. Several binding protocols are defined for mapping the RPC program number and version number to a transport address.

To accept ONC-RPC sessions you must add a security policy with service set to any or to the ONC-RPC pre-defined service (which listens on TCP and UDP port number 111). The RPC portmapper session helper (called pmap) handles the dynamic transport address negotiation mechanisms of ONC-RPC.

PPTP session helper for PPTP traffic (pptp)

The PPTP session help supports port address translation (PAT) for PPTP traffic. PPTP provides IP security at the Network Layer. PPTP consists of a control session and a data tunnel. The control session runs over TCP and helps in establishing and disconnecting the data tunnel. The data tunnel handles encapsulated Point-to-Point Protocol (PPP) packets carried over IP.

To accept PPTP sessions that pass through the FortiGate unit you must add a security policy with service set to any or to the PPTP pre-defined service (which listens on IP port 47 and TCP port 1723). The pptp session helper listens on TCP port 1723.

PPTP uses TCP port 1723 for control sessions and Generic Routing Encapsulation (GRE) (IP protocol 47) for tunneling the encapsulated PPP data. The GRE traffic carries no port number, making it difficult to distinguish between two clients with the same public IP address. PPTP uses the source IP address and the Call ID field in the GRE header to identify a tunnel. When multiple clients sharing the same IP address establish tunnels with the same PPTP server, they may get the same Call ID. The call ID value can be translated in both the control message and the data traffic, but only when the client is in a private network and the server is in a public network.

PPTP clients can either directly connect to the Internet or dial into a network access server to reach the Internet. A FortiGate unit that protects PPTP clients can translate the clients' private IP addresses to a pool of public IP addresses using NAT port translation (NAT-PT). Because the GRE traffic carries no port number for address translation, the pptp session helper treats the Call ID field as a port number as a way of distinguishing multiple clients.

After the PPTP establishing a TCP connection with the PPTP server, the client sends a start control connection request message to establish a control connection. The server replies with a start control connection reply message. The client then sends a request to establish a call and sends an outgoing call request message. FortiOS assigns a Call ID (bytes 12-13 of the control message) that is unique to each PPTP tunnel. The server replies with an outgoing call reply message that carries its own Call ID in bytes 12-13 and the client's call ID in bytes 14-15. The pptp session helper parses the control connection messages for the Call ID to identify the call to which a specific PPP packet belongs. The session helper also identifies an outgoing call request message using the control message type field (bytes 8-9) with the value 7. When the session helper receives this message, it parses the control message for the call ID field (bytes 12-13). FortiOS translates the call ID so that it is unique across multiple calls from the same translated client IP. After receiving outgoing call response message, the session helper holds this message and opens a port that accepts GRE traffic that the PPTP server sends. An outgoing call request message contains the following parts:

- The protocol used for the outgoing call request message (usually GRE)
- Source IP address (PPTP server IP)
- Destination IP address (translated client IP)
- Destination port number (translated client call ID)

The session helper identifies an outgoing call reply message using the control message type field (bytes 8-9) with the value 8. The session helper parses these control messages for the call ID field (bytes 12-13) and the client's call ID (bytes 14-15). The session helper then uses the client's call ID value to find the mapping created for the other direction, and then opens a pinhole to accept the GRE traffic that the client sends.

An outgoing call reply message contains the following parts:

- Protocol used for the outgoing call reply message (usually GRE)
- Source IP address (PPTP client IP)
- Destination IP address (PPTP server IP)
- Destination port number (PPTP server Call ID)

Each port that the session opens creates a session for data traffic arriving in that direction. The session helper opens the following two data sessions for each tunnel:

- Traffic from the PPTP client to the server, using the server's call ID as the destination port
- Traffic from the PPTP server to the client, using the client's translated call ID as the destination port

The default timeout value of the control connection is 30 minutes. The session helper closes the pinhole when the data session exceeds the timeout value or is idle for an extended period.

Remote shell session helper (rsh)

Using the remote shell program (RSH), authenticated users can run shell commands on remote hosts. RSH sessions most often use TCP port 514. To accept RSH sessions you must add a security policy with service set to any or to the RSH pre-defined service (which listens on TCP port number 514).

FortiOS automatically invokes the rsh session helper to process all RSH sessions on TCP port 514. The rsh session helper opens ports required for the RSH service to operate through a FortiGate unit running NAT or transparent and supports port translation of RSH traffic.

Real-Time Streaming Protocol (RTSP) session helper (rtsp)

The Real-Time Streaming Protocol (RTSP) is an application layer protocol often used by SIP to control the delivery of multiple synchronized multimedia streams, for example, related audio and video streams. Although RTSP is capable of delivering the data streams itself it is usually used like a network remote control for multimedia servers. The protocol is intended for selecting delivery channels (like UDP, multicast UDP, and TCP) and for selecting a delivery mechanism based on the Real-Time Protocol (RTP). RTSP may also use the SIP Session Description Protocol (SDP) as a means of providing information to clients for aggregate control of a presentation consisting of streams from one or more servers, and non-aggregate control of a presentation consisting of multiple streams from a single server.

To accept RTSP sessions you must add a security policy with service set to any or to the RTSP pre-defined service (which listens on TCP ports 554, 770, and 8554 and on UDP port 554). The rtsp session helper listens on TCP ports 554, 770, and 8554.

The rtsp session help is required because RTSP uses dynamically assigned port numbers that are communicated in the packet body when end points establish a control connection. The session helper keeps track of the port numbers and opens pinholes as required. In Network Address Translation (NAT) mode, the session helper translates IP addresses and port numbers as necessary.

In a typical RTSP session the client starts the session (for example, when the user selects the Play button on a media player application) and establishes a TCP connection to the RTSP server on port 554. The client then sends an OPTIONS message to find out what audio and video features the server supports. The server responds to the OPTIONS message by specifying the name and version of the server, and a session identifier, for example, 24256-1.

The client then sends the DESCRIBE message with the URL of the actual media file the client wants to play. The server responds to the DESCRIBE message with a description of the media in the form of SDP code. The client

then sends the SETUP message, which specifies the transport mechanisms acceptable to the client for streamed media, for example RTP/RTCP or RDT, and the ports on which it receives the media.

In a NAT configuration the rtsp session helper keeps track of these ports and addresses translates them as necessary. The server responds to the SETUP message and selects one of the transport protocols. When both client and server agree on a mechanism for media transport the client sends the PLAY message, and the server begins streaming the media.

Session Initiation Protocol (SIP) session helper (sip)

The sip session helper is described in the VoIP Solutions: SIP Guide.

Trivial File Transfer Protocol (TFTP) session helper (tftp)

To accept TFTP sessions you must add a security policy with service set to any or to the TFTP pre-defined service (which listens on UDP port number 69). The TFTP session helper also listens on UTP port number 69.

TFTP initiates transfers on UDP port 69, but the actual data transfer ports are selected by the server and client during initialization of the connection. The tftp session helper reads the transfer ports selected by the TFTP client and server during negotiation and opens these ports on the firewall so that the TFTP data transfer can be completed. When the transfer is complete the tftp session helper closes the open ports.

Oracle TNS listener session helper (tns)

The Oracle Transparent Network Substrate (TNS) listener listens on port TCP port 1521 for network requests to be passed to a database instance. The Oracle TNS listener session helper (tns) listens for TNS sessions on TCP port 1521. TNS is a foundation technology built into the Oracle Net foundation layer and used by SQLNET.

Advanced concepts

This chapter provides configuration concepts and techniques to enhance your network security.

This section includes the topics:

- Dual internet connections (redundant Internet connections)
- Single firewall vs. multiple virtual domains
- Modem
- FortiExtender
- DHCP servers and relays
- Assigning IP address by MAC address
- DNS services
- Dynamic DNS
- FortiClient discovery and registration
- IP addresses for self-originated traffic
- Administration for schools
- Replacement messages list
- Disk
- CLI Scripts
- Rejecting PING requests
- Opening TCP 113
- Obfuscate HTTP responses

Dual internet connections (redundant Internet connections)

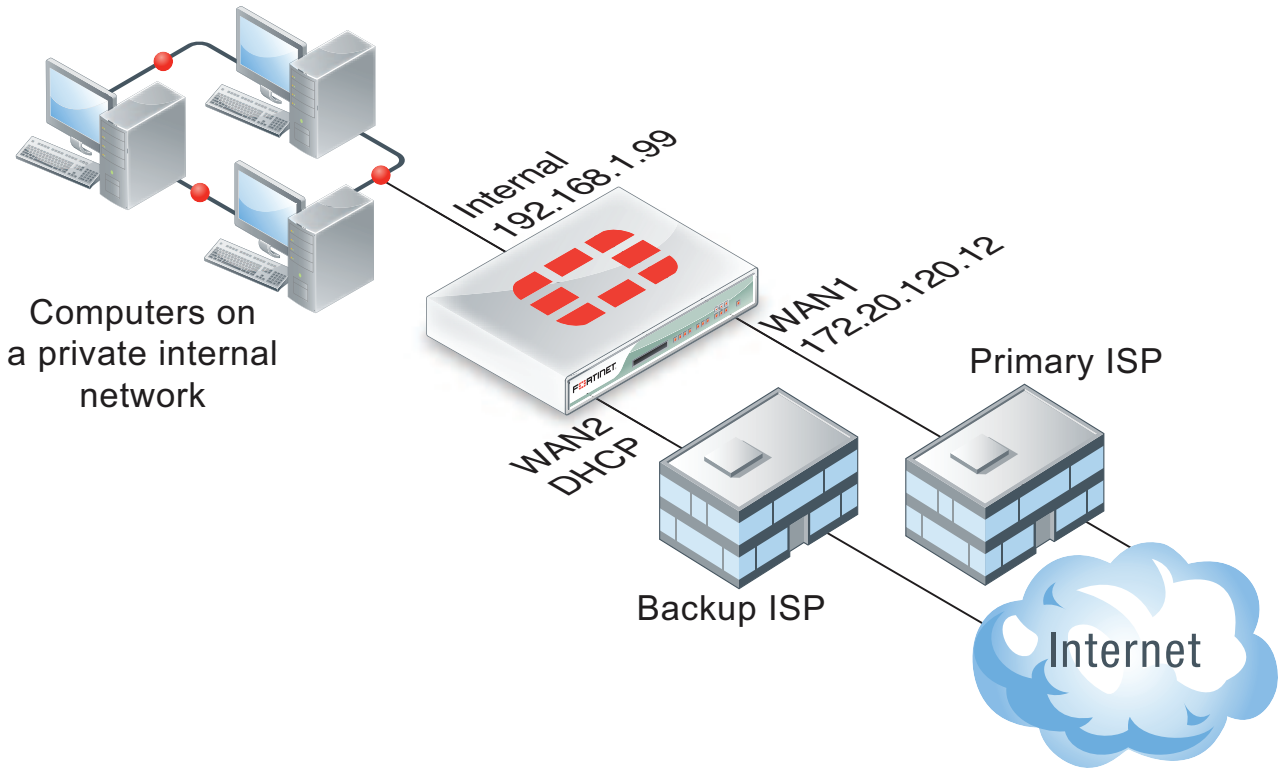
Dual internet connection, dual WAN, or redundant internet connection refers to using two FortiGate interfaces to connect to the Internet. Dual internet connections can be used in three ways:

- Redundant interfaces, should one interface go down, the second automatically becomes the main internet connection
- For load sharing to ensure better throughput.
- A combination of redundancy and load sharing.

Redundant interfaces

Redundant interfaces, ensures that should your internet access be no longer available through a certain port, the FortiGate unit will use an alternate port to connect to the Internet.

Configuring redundant interfaces



In this scenario, two interfaces, WAN1 and WAN2 are connected to the Internet using two different ISPs. WAN1 is the primary connection. In an event of a failure of WAN1, WAN2 automatically becomes the connection to the Internet. For this configuration to function correctly, you need to configure three specific settings:

- Configure a link health monitor to determine when the primary interface (WAN1) is down and when the connection returns
- Configure a default route for each interface.
- Configure security policies to allow traffic through each interface to the internal network.

Link Health Monitor

Adding a link health monitor is required for routing fail over traffic. A link health monitor will confirm the connectivity of the device's interface

To add a link health monitor - web-based manager

1. Go to **Router > Static > Settings** and select **Create New**.
   For low-end FortiGate units, go to **System > Network > Routing** and select **Create New**.
2. Choose a name.
3. Select the **Interface** that will send probe requests.
4. Specify the **Gateway** IP address if required, if not keep it set to *0.0.0.0*.
5. Make sure that **Health Check** is enabled.
6. Set the **Probe Type** to **Ping** or **HTTP**.

7. For the **Server** field, enter the IP address of a server that the FortiGate unit will send ping or http requests to.
8. For the **Ping Interval**, enter the number of seconds to send ping requests.
9. For the **Failover Threshold**, enter the number of lost pings or http requests is acceptable before the port is determined to be down.
10. Make sure to enable **Update Routing Table when Gateway Detection Status Changes**.
11. Enable **Bring Down (Up)** and select **WAN2** interface.
12. Select **OK**.

To add a link health monitor - CLI

```
config system link-monitor
   edit "Example1"
      set srcint <Interface_sending_probe>
      set server <ISP_IP_address>
      set protocol <Ping or http>
      set gateway-ip <the_gateway_IP_to_reach_the_server_if_required>
      set failtime <failure_count>
      set interval <seconds>
      set update-cascade-interface enable
      set update-static-route enable
      set status enable
end
```

Routing

You need to configure a default route for each interface and indicate which route is preferred by specifying the distance. The lower distance is declared active and placed higher in the routing table.

When you have dual WAN interfaces that are configured to provide fail over, you might not be able to connect to the backup WAN interface because the FortiGate unit may not route traffic (even responses) out of the backup interface. The FortiGate unit performs a reverse path lookup to prevent spoofed traffic. If no entry can be found in the routing table which sends the return traffic out the same interface, then the incoming traffic is dropped.

To configure the routing of the two interfaces - web-based manager

1. Go to **Router > Static > Static Routes** and select **Create New Route** or **IPv6 Route**.
   For low-end FortiGate units, go to **System > Network > Routing** and select **Create New Route** or **IPv6 Route**.
2. Set the **Destination IP/Mask** to the address and netmask of 0.0.0.0/0.0.0.0 if it's an IPv4 route. If it's an IPv6 route, set **Destination IP/Mask** to the address and netmask of ::/0
3. Select the **Device** to the primary connection, **WAN1**.
4. Enter the **Gateway** address.
5. Select **Advanced**.
6. Set the **Distance** to `10`.
7. Select **OK**.
8. Repeat steps 1 through 7 setting the **Device** to **WAN2** and a **Distance** of `20`.

To configure the IPv4 routing of the two interfaces - CLI

```
config router static
   edit 0
      set dst 0.0.0.0 0.0.0.0
      set device WAN1
      set gateway <gateway_address>
      set distance 10
   next
   edit 0
      set dst 0.0.0.0 0.0.0.0
      set device WAN2
      set gateway <gateway_address>
      set distance 20
   next
end
```

To configure the IPv6 routing of the two interfaces - CLI

```
config router static6
   edit 0
      set dst ::/0
      set device WAN1
      set gateway <gateway_address>
      set distance 10
   next
   edit 0
      set dst ::/0
      set device WAN2
      set gateway <gateway_address>
      set distance 20
   next
end
```

Security policies

When creating security policies, you need to configure duplicate policies to ensure that after traffic fails over WAN1, regular traffic will be allowed to pass through WAN2 as it did with WAN1. This ensures that fail-over will occur with minimal affect to users. For more information on creating security policies see the Firewall Guide.

Load sharing

Load sharing enables you to use both connections to the internet at the same time, but do not provide fail over support. When configuring for load sharing, you need to ensure routing is configured for both external ports, for example, WAN1 and WAN2, have static routes with the same distance and priority.

Further configuration can be done using Equal Cost Multiple Path (ECMP). For more information on ECMP and load sharing, see the Advanced Routing Guide.

Link redundancy and load sharing

In this scenario, both links are available to distribute Internet traffic over both links. Should one of the interfaces fail, the FortiGate unit will continue to send traffic over the other active interface. Configuration is similar to the

Redundant interfaces configuration, with the main difference being that the configured routes should have equal distance settings.

This means both routes will remain active in the routing table. To make one interface the preferred interface, use a default policy route to indicate the interface that is preferred for accessing the Internet. If traffic matches the security policy, the policy overrides all entries in the routing table, including connected routes. You may need to add a specific policy routes that override these default policy routes.

To redirect traffic over the secondary interface, create policy routes to direct some traffic onto it rather than the primary interface. When adding the policy route, only define the outgoing interface and leave the gateway blank. This ensures that the policy route will not be active when the link is down.

Single firewall vs. multiple virtual domains

A typical FortiGate setup, with a small to mid-range appliance, enables you to include a number of subnets on your network using the available ports and switch interfaces. This can potentially provide a means of having three or more mini networks for the various groups in a company. Within this infrastructure, multiple network administrators have access to the FortiGate to maintain security policies.

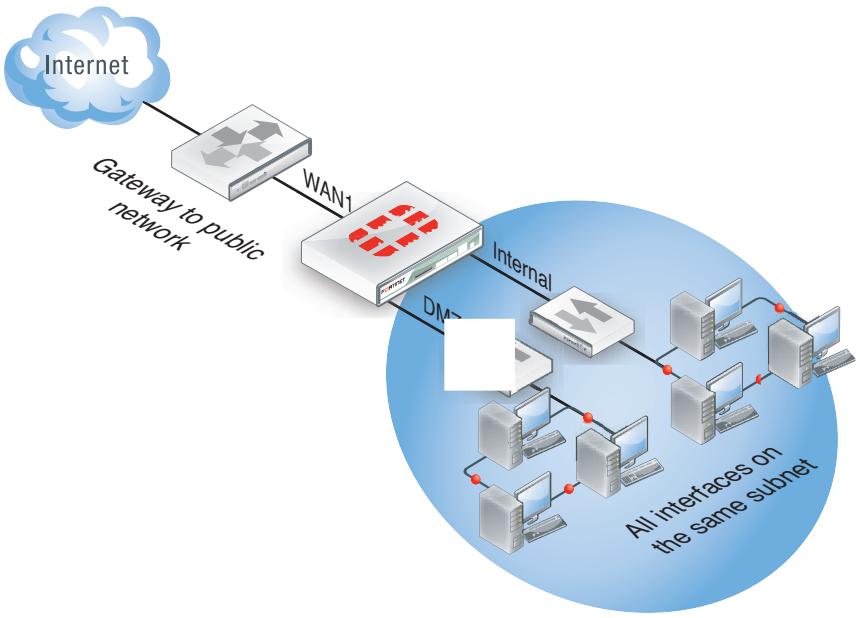
However, the FortiGate unit may not have enough interfaces to match the number of departments in the organization. If the FortiGate unit it running in transparent mode however, there is only one interface, and multiple network branches through the FortiGate are not possible.

A FortiGate unit with Virtual Domains (VDOMs) enabled, provides a means to provide the same functionality in transparent mode as a FortiGate in NAT mode. VDOMs are a method of dividing a FortiGate unit into two or more virtual units that function as multiple independent units. VDOMs can provide separate security policies and, in NAT mode, completely separate configurations for routing and VPN services for each connected network. For administration, an administrator can be assigned to each VDOM, minimizing the possibility of error or fouling network communications.

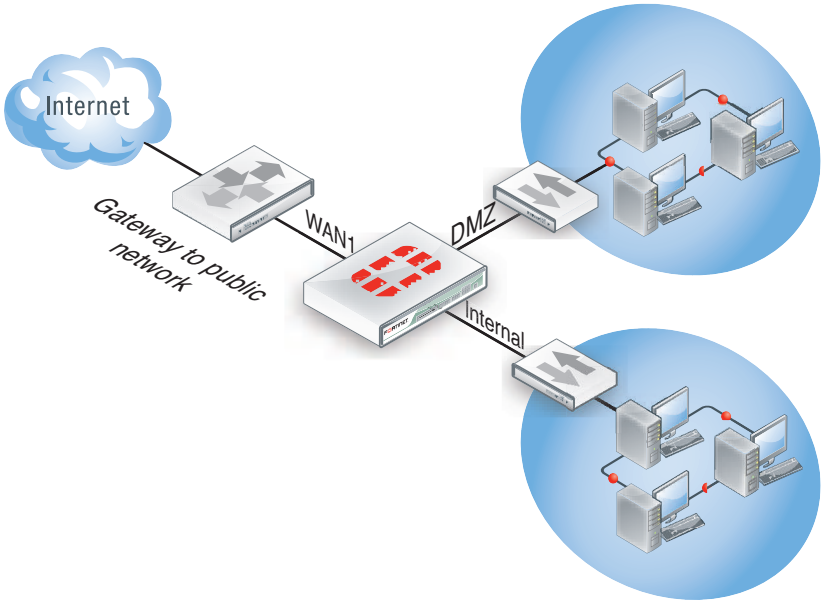
By default, most FortiGate units support 10 VDOMs. Many FortiGate models support purchasing a license key to increase the maximum number.

Single firewall vs. vdoms

When VDOMs are not enabled, and the FortiGate unit is in transparent mode, all the interfaces on your unit become broadcast interfaces. The problem is there are no interfaces free for additional network segments.



A FortiGate with three interfaces means only limited network segments are possible without purchasing more FortiGate devices.



With multiple VDOMs you can have one of them configured in transparent mode, and the rest in NAT mode. In this configuration, you have an available transparent mode FortiGate unit you can drop into your network for troubleshooting, and you also have the standard.

This example shows how to enable VDOMs on the FortiGate unit and the basic and create a VDOM accounting on the DMZ2 port and assign an administrator to maintain the VDOM. First enable Virtual Domains on the FortiGate unit.

To enable VDOMs - web-based manager

1. Go to **System > Dashboard > Status**.
2. In the **System Information** widget, select **Enable** for **Virtual Domain**.

Note that on FortiGate-60 series and lower models, you need to enable VDOMs in the CLI only.

The FortiGate unit logs you out. Once you log back in, you will notice that the menu structure has changed. This reflects the global settings for all Virtual Domains.

To enable VDOMs - CLI

```
config system global
   set vdom-admin enable
end
```

Next, add the VDOM called accounting.

To add a VDOM - web-based manager

1. Go to **Global > VDOM > VDOM**, and select **Create New**.
2. Enter the VDOM name `accounting`.
3. Select **OK**.

To add a VDOM - CLI

```
config vdom
   edit <new_vdom_name>
end
```

With the Virtual Domain created, you can assign a physical interface to it, and assign it an IP address.

To assign physical interface to the accounting Virtual Domain - web-based manager

1. Go to **Global > Network > Interface**.
2. Select the DMZ2 port row and select **Edit**.
3. For the **Virtual Domain** drop-down list, select **accounting**.
4. Select the **Addressing Mode** of **Manual**.
5. Enter the IP address for the port of 10.13.101.100/24.
6. Set the **Administrative Access** to **HTTPS** and **SSH**.
7. Select **OK**.

To assign physical interface to the accounting Virtual Domain - CLI

```
config global
   config system interface
      edit dmz2
      set vdom accounting
      set ip 10.13.101.100/24
      set allowaccess https ssh
   next
end
```

Modem

FortiGate units support the use of wireless, 3G and 4G modems connected using the USB port or, if available, the express card slot. Modem access provides either primary or secondary (redundant) access to the Internet. For FortiGate units that do not include an internal modem (those units with an “M” designation), the modem interface will not appear in the web-based manager until enabled in the CLI. To enable the modem interface enter the CLI commands:

```
config system modem
   set status enable
end
```

You will need to log out of the FortiGate and log back in to see the modem configuration page at **System > Network > Modem**. Once enabled, modem options become available by going to **System > Network > Interface**.

Note that the modem interface is only available when the FortiGate unit is in NAT mode.

To configure modem settings, go to **System > Network > Modem**.

Configuring the modem settings is a matter of entering the ISP phone number, user name and password. Depending on the modem, additional information may need to be supplied such as product identifiers, and initialization strings.

The FortiGate unit includes a number of common modems within its internal database. You can view these by selecting the **Configure Modem** link on the **Modem Settings** page. If your modem is not on the list, select **Create New** to add the information. This information is stored on the device, and will remain after a reboot.

Fortinet has an online database of modem models and configuration settings through FortiGuard. A subscription to the FortiGuard services is not required to access the information. As models are added, you can select the **Configure Modem** link and select **Update Now** to download new configurations.

USB modem port

Each USB modem has a specific dial-out port. This will be indicated with the documentation for your modem. To enable the correct USB port, use the CLI commands:

```
config system modem
   set wireless-port {0 | 1 | 2}
end
```

To test the port, use the diagnose command:

```
diagnose sys modem com /1
```

The 1 will be the value of your USB port selected. The response will be:

```
Serial port: /dev/1
Press Ctrl+W to exit.
```

If the port does not respond the output will be:

```
Can not open modem device '/dev/1' : Broken pipe
```

Modes

The FortiGate unit allows for two modes of operation for the modem; stand alone and redundant. In stand alone mode, the modem connects to a dialup ISP account to provide the connection to the Internet. In redundant mode, the modem acts as a backup method of connecting to the Internet, should the primary port for this function fails.

Configuring either stand alone or redundant modes are very similar. The primary difference is the selection of the interface that the modem will replace in the event of it failing, and the configuration of a PING server to monitor the chosen interface.

Configuring stand alone mode

Configuring stand alone mode is a matter of configuring the modem information and the dialing mode. The dial mode is either **Always Connect** or **Dial on demand**. Selecting **Always Connect** ensures that once the modem has connected, it remains connected to the ISP. Selecting **Dial on Demand**, the modem only calls the ISP if packets are routed to the modem interface. Once sent, the modem will disconnect after a specified amount of time.

To configure standalone mode as needed - web-based manager

1. Go to **System > Network > Modem**.
2. Select the **Mode** of **Standalone**.
3. Select the **Dial Mode** of **Dial on Demand**.
4. Select the number of redials the modem attempts if connection fails to 5.
5. Select **Apply**.

To configure standalone mode as needed- CLI

```
config system modem
   set status enable
   set mode standalone
   set auto-dial enable
   set redial 5
end
```

Configuring redundant mode

Redundant mode provides a backup to an interface, typically to the Internet. If that interface fails or disconnects, the modem automatically dials the configured phone number(s). Once connected, the FortiGate unit routes all traffic to the modem interface until the monitored interface is up again. The FortiGate unit pings the connection to determine when it is back online.

For the FortiGate to verify when the interface is back up, you need to configure a Ping server for that interface. You will also need to configure security policies between the modem interface and the other interfaces of the FortiGate unit to ensure traffic flow.

To configure redundant mode as needed - web-based manager

1. Go to **System > Network > Modem**.
2. Select the **Mode** of **Redundant**.

3. Select the interface the modem takes over from if it fails.
4. Select the **Dial Mode** of **Dial on Demand**.
5. Select the number of redials the modem attempts if connection fails to 5.
6. Select **Apply**.

To configure standalone mode as needed- CLI

```
config system modem
   set status enable
   set mode redundant
   set interface wan1
   set auto-dial enable
   set redial 5
end
```

Link Health Monitor

Adding a link health monitor is required for routing fail over traffic. A link health monitor will confirm the connectivity of the device's interface

To add a link health monitor - web-based manager

1. Go to **Router > Static > Settings** and select **Create New**.
   For low-end FortiGate units, go to **System > Network > Routing** and select **Create New**.
2. Choose a name.
3. Select the **Interface** that will send probe requests which is the modem.
4. Specify the **Gateway** IP address if required, if not keep it set to *0.0.0.0*.
5. Make sure that **Health Check** is enabled.
6. Set the **Probe Type** to **Ping** or **HTTP**.
7. For the **Server** field, enter the IP address of a server that the FortiGate unit will send ping or http requests to.
8. For the **Ping Interval**, enter the number of seconds to send ping requests.
9. For the **Failover Threshold**, enter the number of lost pings or http requests is acceptable before the port is determined to be down.
10. Make sure to enable **Update Routing Table when Gateway Detection Status Changes**.
11. Enable **Bring Down (Up)** and select the redundant interface.
12. Select **OK**.

To add a link health monitor - CLI

```
config system link-monitor
   edit "Example1"
      set srcint <Interface_sending_probe>
      set server <ISP_IP_address>
      set protocol <Ping or http>
      set gateway-ip <the_gateway_IP_to_reach_the_server_if_required>
      set failtime <failure_count>
      set interval <seconds>
      set update-cascade-interface enable
      set update-static-route enable
      set status enable
end
```

Additional modem configuration

The CLI provides additional configuration options when setting up the modem options including adding multiple ISP dialing and initialization options and routing. For more information, see the CLI Reference.

Modem interface routing

The modem interface can be used in FortiOS as a dedicated interface. Once enabled and configured, you can use it in security policies and define static and dynamic routing. Within the CLI commands for the modem, you can configure the distance and priority of routes involving the modem interface. The CLI commands are:

```
config sysetm modem
   set distance <route_distance>
   set priority <priority_value>
end
```

For more information on the routing configuration in the CLI, see the CLI Reference. For more information on routing and configuring routing, see the Advanced Routing Guide.

FortiExtender

FortiGate units support the use of wireless, 3G and 4G modems connected to a FortiExtender which will be connected to the FortiGate unit.

Installing the 3G/4G modem

Remove the housing cover of the FortiExtender and use the provided USB extension cable to connect your 3G/4G modem to the device.

For more information on installing the 3G/4G modem, see the QuickStart Guide.

Connecting the FortiExtender unit

If you are using the provided PoE injector:

1. Plug the provided Ethernet cable into the Ethernet port of the FortiExtender and insert the other end of the Ethernet cable into the AP/Bridge port on the injector, then plug the injector into an electrical outlet.
2. Connect the LAN port of the PoE injector to a FortiGate, FortiWifi, or FortiSwitch device.

If you are not using the PoE injector:

1. Insert the other end of the Ethernet cable into a PoE LAN port on an appropriate FortiGate, FortiWifi or FortiSwitch device.

For more information on connecting the FortiExtender unit, see the QuickStart Guide.

Once connected, your FortiGate appliance can automatically detect, connect with, and control the FortiExtender and modem via a CAPWAP tunnel.To do this, FortiExtender and FortiGate must be on the same Layer 2/3 subnet (or have DHCP relay between) and FortiGate must respond to FortiExtender's request. In this example FortiExtender is connected to the ***lan*** interface of the FortiGate unit.

By default, FortiExtender is hidden and disabled.Enable it in FortiGate's CLI:

```
config system global
   set fortiextender enable
```

```
    set wireless-cotnroller enable
end
```

The control and provisioning of Wireless Access Point (CAPWAP) service must be enabled on the port to which the FortiExtender unit is connected (***lan*** interface in this example) using the following CLI commands:

```
config system interface
   edit lan
   append allowaccess capwap
end
```

Once FortiExtender is discovered and authorized, a virtual WAN interface such as ***fext-wan1*** is created on the Fortigate.

Configuring the FortiExtender unit

At this point, you can fully manage the FortiExtender from the FortiGate unit. To achieve this, you need to authorize the FortiExtender by going to ***System > Network > FortiExtender*** and click on ***Authorize.*** Once authorized, you can configure you device as required:

Link Status: Shows you if the link is ***Up*** or ***Down,*** click on ***Details*** to see the System and Modem Status.

IP Address: Shows you the current FortiExtender's IP address, click on the link of the IP address to connect to the FortiExtender GUI.

OS Version: Shows the current FortiExtender's build, click on ***Upgrade*** if you wish to upgrade the Firmware.

Configure Settings: Allows you to configure the Modem Settings, PPP Authentication, General, GSM / LTE, and CDMA.

Diagnostics: Allows you to diagnose the FortiExtender unit, you can choose a command form the existing commands and click on ***Run***.

Existing commands are: `Show device info, Show data session connection status, test connection, test disconnection, Get signal strength, AT Command.`

Simple output of `Show device info:`

```
Manufacturer: Sierra Wireless, Incorporated
Model: AirCard 330U
Revision: SWI9200X_03.00.08.03AP R4019 CARMD-EN-10527 2011/12/07 18:43:13
IMEI: 359615040996060
IMEI SV: 7
FSN: CDU3153118210
3GPP Release 8
+GCAP: +CGSM
OK
```

Modem Settings

The FortiExtender unit allows for two modes of operation for the modem; ***On Demand*** and ***Always Connect***.

In ***On Demand*** mode, the modem connects to an ISP only upon execution of the dial up operation and disconnects only upon subsequent hang up operation from the CLI.

Syntax

To connect, run the following CLI command:

```
execute extender dial <SN>  // <SN> is the FortiExtender's serial number.
```

To disconnect, run the following CLI command:

```
execute extender hangup <SN> // <SN> is the FortiExtender's serial number.
```

In ***Always Connect*** mode, the modem is always connected to the internet, it can acts as a primary or backup method of connecting to the Internet.

By default, the Fortiextender will be in ***Always Connect*** mode once authorized.

Modem Settings is a matter of configuring the dialing mode. The ***dial mode*** is either ***Always Connect*** or ***On demand***. Selecting ***Always Connect*** ensures that once the modem has connected, it remains connected to the ISP.

To configure the dial mode as needed - web-based manager

1. Go to ***System > Network > FortiExtender*** and click ***Configuring Settings***.
2. Extend ***Modem Settings***.
3. Select the ***Dial Mode*** of ***Always Connect*** or ***On Demand***.
4. Enter the ***Redial Limit*** to 5 - Only applicable in ***On Demand*** mode.
5. If needed, enter the ***Quota Limit*** to the desired limit in Mega Byte -The recorded quota usage values are not persistent and lost upon rebooting Fortigate.
6. Select ***Ok***.

Configuring the FortiGate unit

In order to allow inbound and outbound traffic through the 3G/4G modem, you need to add a security policy and, depending the scenario, a static route in the FortiGate unit.

Adding a policy

If your network will be using IPv4 addresses, go to ***Policy & Objects > Policy > IPv4*** and select ***Create New*** to add a policy that allows users on the private network to access the Internet.

In the policy, set the ***Incoming Interface*** to the internal interface and the ***Outgoing Interface*** to ***fext-wan1*** interface. You will also need to set ***Source Address***, ***Destination Address***, ***Schedule***, and ***Service*** according to your network requirements.

Make sure the ***Action*** is set to ***ACCEPT***. Turn on ***NAT*** and make sure ***Use Destination Interface Address*** is selected. Select ***OK.***

Always-on, redundant of wan1

No route required as in FortiOS 5.2.2 the routing shows only active routes.

Use the following CLI command to show all routes:

```
get router info routing-table all
```

Sample Output

```
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
O - OSPF, IA - OSPF inter area
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
```

```
E1 - OSPF external type 1, E2 - OSPF external type 2
i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
* - candidate default
S* 0.0.0.0/0 [10/0] via 172.20.120.2, wan1
C 25.49.248.0/24 is directly connected, fext-wan1
C 169.254.1.1/32 is directly connected, ssl.root
is directly connected, ssl.root
C 172.20.120.0/24 is directly connected, wan1
C 192.168.1.0/24 is directly connected, lan
```

Always-on, with select traffic going through the FortiExtender

In this scenario, a static route is required, if your network using IPv4 addresses, go to ***Router > Static > Static Routes*** or ***System > Network > Routing***, depending on your FortiGate model, and select ***Create New***. Set the ***Destination IP/Mask*** to 0.0.0.0/0.0.0.0, ***Device*** to ***fext-wan1***, and set the ***Gateway*** to your gateway IP or to the next hop router, depending on your network requirements. Select ***OK.***

ECMP across fext-wan1 and wan1

Go to ***Router > Static > Settings*** to configure ***ECMP Load Balancing Method***, choose between ***Source IP based, Weighted Load Balance, Spillover, Source-Destination IP based*** and configure your settings as required.

Go to ***System > Network > Interfaces*** and edit ***fext-wan1***, set the ***distance*** to the same distance as wan1 interface under ***Router > Static > Static Routes*** (in this example distance =10)

Now the traffic is shared between ***wan1*** and ***fext-wan1*** links respecting the ***ECMP Load Balancing Method*** used.

This deployment can be extrapolated for dual FortiExtender installation.

DHCP servers and relays

Note that DHCP server options are not available in transparent mode.

A DHCP server provides an address to a client on the network, when requested, from a defined address range.

An interface cannot provide both a server and a relay for connections of the same type (regular or IPsec). However, you can configure a Regular DHCP server on an interface only if the interface is a physical interface with a static IP address. You can configure an IPsec DHCP server on an interface that has either a static or a dynamic IP address.

You can configure one or more DHCP servers on any FortiGate interface. A DHCP server dynamically assigns IP addresses to hosts on the network connected to the interface. The host computers must be configured to obtain their IP addresses using DHCP.

If an interface is connected to multiple networks via routers, you can add a DHCP server for each network. The IP range of each DHCP server must match the network address range. The routers must be configured for DHCP relay.

You can configure a FortiGate interface as a DHCP relay. The interface forwards DHCP requests from DHCP clients to an external DHCP server and returns the responses to the DHCP clients. The DHCP server must have appropriate routing so that its response packets to the DHCP clients arrive at the unit.

DHCP Server configuration

To add a DHCP server, go to **System > Network > Interface**. Edit the interface, and select **Enable** for the **DHCP Server** row.

DHCP Server IP	This appears only when **Mode** is **Relay**. Enter the IP address of the DHCP server where the FortiGate unit obtains the requested IP address.
Address Range	By default, the FortiGate unit assigns an address range based on the address of the interface for the complete scope of the address. For example, if the interface address is 172.20.120.230, the default range created is 172.20.120.231 to 172.20.120.254. Select the range and select **Edit** to adjust the range as needed, or select **Create New** to add a different range.
Netmask	Enter the netmask of the addresses that the DHCP server assigns.
Default Gateway	Select to either use the same IP as the interface or select **Specify** and enter the IP address of the default gateway that the DHCP server assigns to DHCP clients.
DNS Server	Select to use the system's DNS settings or select **Specify** and enter the IP address of the DNS server.
Advanced... (expand to reveal more options)	
Mode	Select the type of DHCP server the FortiGate unit will be. By default, it is a server. Select **Relay** if needed. When **Relay** is selected, the above configuration is replaced by a field to enter the **DHCP Server IP** address.
Type	Select to use the DHCP in regular or IPsec mode.
MAC Address Access Control List	Select to match an IP address from the DHCP server to a specific client or device using its MAC address. In a typical situation, an IP address is assigned ad hoc to a client, and that assignment times out after a specific time of inactivity from the client, known as the lease time. To ensure a client or device always has the same IP address, that is, there is no lease time, use IP reservation.
Add from DHCP Client List	If the client is currently connected and using an IP address from the DHCP server, you can select this option to select the client from the list.

DHCP in IPv6

You can use DHCP with IPv6 using the CLI. To configure DHCP, ensure IPv6 is enabled by going to **System > Config > Features** and enable **IPv6**. Use the CLI command

```
config system dhcp6 server
```

For more information on the configuration options, see the CLI Reference.

Service

On low-end FortiGate units, a DHCP server is configured, by default on the Internal interface:

IP Range	192.168.1.110 to 192.168.1.210
Netmask	255.255.255.0
Default gateway	192.168.1.99
Lease time	7 days
DNS Server 1	192.168.1.99

These settings are appropriate for the default Internal interface IP address of 192.168.1.99. If you change this address to a different network, you need to change the DHCP server settings to match.

Alternatively, after the FortiGate unit assigns an address, you can go to **System > Monitor > DHCP Monitor**, locate the particular user. Select the check box for the user and select **Add to Reserved**.

Lease time

The lease time determines the length of time an IP address remains assigned to a client. Once the lease expires, the address is released for allocation to the next client request for an IP address The default lease time is seven days. To change the lease time, use the following CLI commands:

```
config system dhcp server
   edit <server_entry_number>
      set lease-time <seconds>
   end
```

To have an unlimited lease time, set the value to zero.

DHCP options

When adding a DHCP server, you have the ability to include DHCP codes and options. The DHCP options are BOOTP vendor information fields that provide additional vendor-independent configuration parameters to manage the DHCP server. For example, you may need to configure a FortiGate DHCP server that gives out a separate option as well as an IP address. For example, an environment that needs to support PXE boot with Windows images.

The option numbers and codes are specific to the particular application. The documentation for the application will indicate the values to use. Option codes are represented in a option value/HEX value pairs. The option is a value 1 and 255.

You can add up to three DHCP code/option pairs per DHCP server.

To configure option 252 with value http://192.168.1.1/wpad.dat - CLI

```
config system dhcp server
   edit <server_entry_number>
      set option1 252 687474703a2f2f3139322e3136382e312e312f777061642e646174
end
```

For detailed information about DHCP options, see RFC 2132, DHCP Options and BOOTP Vendor Extensions.

Exclude addresses in DHCP a range

If you have a large address range for the DHCP server, you can block a range of addresses that will not be included in the available addresses for the connecting users. To do this, go to the CLI and enter the commands:

```
config system dhcp server
   edit <server_entry_number>
      config exclude-range
         edit <sequence_number>
            set start-ip <address>
            set end-ip <address>
         end
      end
   end
```

DHCP Monitor

To view information about DHCP server connections, go to **System > Monitor > DHCP Monitor**. On this page, you can also add IP address to the reserved IP address list.

Breaking an address lease

Should you need to end an IP address lease, you can break the lease using the CLI. This is useful if you have limited addresses, longer lease times where leases are no longer necessary. For example, with corporate visitors.

To break a lease enter the CLI command:

```
execute dhcp lease-clear <ip_address>
```

Assigning IP address by MAC address

To prevent users in the from changing their IP addresses and causing IP address conflicts or unauthorized use of IP addresses, you can bind an IP address to a specific MAC address using DHCP.

Use the CLI to reserve an IP address for a particular client identified by its device MAC address and type of connection. The DHCP server then always assigns the reserved IP address to the client. The number of reserved addresses that you can define ranges from 10 to 200 depending on the FortiGate model.

After setting up a DHCP server on an interface by going to **System > Network > Interface**, select the blue arrow next to **Advanced** to expand the options. If you know the MAC address of the system select **Create New** to add it, or if the system has already connected, locate it in the list, select its check box and select A**dd from DHCP Client List**.

You can also match an address to a MAC address in the CLI. In the example below, the IP address 10.10.10.55 is assigned to MAC address 00:09:0F:30:CA:4F.

```
config system dhcp server
   edit 1
      config reserved-address
         edit 1
            set ip 10.10.10.55
            set mac 00:09:0F:30:CA:4F
end
```

DNS services

A DNS server is a public service that converts symbolic node names to IP addresses. A Domain Name System (DNS) server implements the protocol. In simple terms, it acts as a phone book for the Internet. A DNS server matches domain names with the computer IP address. This enables you to use readable locations, such as fortinet.com when browsing the Internet. FortiOS supports DNS configuration for both IPv4 and IPv6 addressing.

The FortiGate unit includes default DNS server addresses. However, these should be changed to those provided by your Internet Service Provider. The defaults are DNS proxies and are not as reliable as those from your ISP.

Within FortiOS, there are two DNS configuration options; each provide a specific service, and can work together to provide a complete DNS solution.

DNS settings

Basic DNS queries are configured on interfaces that connect to the Internet. When a website is requested, for example, the FortiGate unit will look to the configured DNS servers to provide the IP address to know which server to contact to complete the transaction.

DNS server addresses are configured by going to **System > Network > DNS**. Here you specify the DNS server addresses. Typically, these addresses are supplied by your ISP. An additional option is available if you have local Microsoft domains on the network, by entering a domain name in the **Local Domain Name** field.

In a situation where all three fields are configured, the FortiGate unit will first look to the local domain. If no match is found, a request is sent to the external DNS servers.

If virtual domains are enabled, you create a DNS database in each VDOM. All of the interfaces in a VDOM share the DNS database in that VDOM.

Additional DNS CLI configuration

Further options are available from the CLI with the command `config system dns`. Within this command you can set the following commands:

- `dns-cache-limit` - enables you to set how many DNS entries are stored in the cache. Entries that remain in the cache provide a quicker response to requests than going out to the Internet to get the same information.
- `dns-cache-ttl` - enables you to set how long entries remain in the cache in seconds, between 60 and 86,400 (24 hours).
- `cache-notfound-responses` - when enabled, any DNS requests that are returned with NOTFOUND can be stored in the cache.
- `source-ip` - enables you to define a dedicated IP address for communications with the DNS server.

DNS server

You can also create local DNS servers for your network. Depending on your requirements, you can manually maintain your entries (master DNS server), or use it as a jumping point, where the server refers to an outside source (slave DNS server). A local master DNS server works similarly to the DNS server addresses configured in ***System > Network > DNS***, but all entries must be added manually. This enables you to add a local DNS server to include specific URL/IP address combinations.

The DNS server options are not visible in the web-based manager by default. To enable the server, go to ***System > Config > Features*** and select ***DNS Database***.

While a master DNS server is an easy method of including regularly used addresses to save on going to an outside DNS server, it is not recommended to make it the authoritative DNS server. IP addresses may change, and maintaining any type of list can quickly become labor-intensive.

A FortiGate master DNS server is best set for local services. For example, if your company has a web server on the DMZ that is accessed by internal employees as well as external users, such as customers or remote users. In this situation, the internal users when accessing the site would send a request for website.example.com, that would go out to the DNS server on the web, to return an IP address or virtual IP. With an internal DNS, the same site request is resolved internally to the internal web server IP address, minimizing inbound/outbound traffic and access time.

As a slave, DNS server, the FortiGate server refers to an external or alternate source as way to obtain the url/IP combination. This useful if there is a master DNS server for a large company where a list is maintained. Satellite offices can then connect to the master DNS server to obtain the correct addressing.

The DNS server entries does not allow CNAME entries, as per RFC 1912, section 2.4.

To configure a master DNS server - web-based manager

1. Go to ***System > Network > DNS Server***, and select ***Create New*** for ***DNS Database***.
2. Select the ***Type*** of ***Master***.
3. Select the ***View*** as ***Shadow***.
4. The view is the accessibility of the DNS server. Selecting ***Public***, external users can access, or use, the DNS server. Selecting ***Shadow***, only internal users can use it.
5. Enter the DNS ***Zone***, for example, `WebServer`.
6. Enter the domain name for the zone, for example `example.com`.
7. Enter the hostname of the DNS server, for example, `Corporate`.
8. Enter the contact address for the administrator, for example, `admin@example.com`.
9. Set ***Authoritative*** to ***Disable***.
10. Select ***OK***.
11. Enter the DNS entries for the server by selecting ***Create New***.
12. Select the ***Type***, for example, ***Address (A)***.
13. Enter the ***Hostname***, for example `web.example.com`.
14. Enter the remaining information, which varies depending on the **Type** selected.
15. Select ***OK***.

To configure a DNS server - CLI

```
config system dns-database
   edit WebServer
      set domain example.com
      set type master
      set view shadow
      set ttl 86400
      set primary-name corporate
      set contact admin@exmple.com
      set authoritative disable
         config dns-entry
            edit 1
               set hostname web.example.com
               set type A
               set ip 192.168.21.12
```

```
            set status enable
        end
    end
```

Recursive DNS

You can set an option to ensure these types of DNS server is not the authoritative server. When configured, the FortiGate unit will check its internal DNS server (Master or Slave). If the request cannot be fulfilled, it will look to the external DNS servers. This is known as a split DNS configuration.

You can also have the FortiGate unit look to an internal server should the Master or Slave not fulfill the request by using the CLI commands:

```
config system dns-database
   edit example.com
      ...
      set view shadow
end
```

For this behavior to work completely, for the external port, you must set the DNS query for the external interface to be recursive. This option is configured in the CLI only.

To set the DNS query

```
config system dns-server
   edit wan1
      set mode recursive
end
```

Dynamic DNS

If your ISP changes your external IP address on a regular basis, and you have a static domain name, you can configure the external interface to use a dynamic DNS service to ensure external users and/or customers can always connect to your company firewall.

If you have a FortiGuard subscription, you can use FortiGuard as your DDNS server. To configure dynamic DNS in the web-based manager, go to ***System > Network > DNS***, select ***Enable FortiGuard DDNS***, and enter the relevant information for the interface communicating to the server, and which server to use, and relevant information.

If you do not have a FortiGuard subscription, or want to use an alternate server, you can configure dynamic DNS in the CLI use the commands below. Within the CLI you can configure a DDNS for each interface. Only the first configured port appears in the web-based manager. Additional commands vary with the DDNS server you select.

```
config system ddns
   edit <instance_value>
      set monitor-interface <external_interface>
      set ddns-server <ddns_server_selection>
end
```

You can also use FortiGuard (when subscribed) as a DDNS as well. To configure, use the CLI commands:

```
config system fortiguard
   set ddns-server-ip
   set ddns-server-port
end
```

FortiClient discovery and registration

FortiOS provides a means of allowing users running FortiClient Endpoint Control software to connect to specific interfaces when connecting to the FortiGate unit. As well as ensuring that remote or local users have FortiClient Endpoint Control software installed on their PC or mobile device.

FortiClient discovery

You can configure a FortiGate interface as an interface that will accept FortiClient connections. When configured, the FortiGate unit sends broadcast messages which the FortiClient software running on an end user PC is listening for.

To enable the broadcast message

1. Go to ***System > Network > Interface***.
2. Edit the interface to send the broadcast messages.
3. Select **FCT-Access**.
4. In **Device Management**, select **Broadcast Discovery Messages**.
5. Select **OK**.

Once enabled, the FortiGate unit broadcasts a discovery message that includes the IP address of the interface and listening port number to the local network. All PCs running FortiClient on that network listen for this discovery message.

You also have the option of including a registration key. When the FortiClient discovers the FortiGate unit, it is prompted to enter a registration key, defined by the administrator.

To add a registration key

1. Go to **System > Config > Advanced**.
2. Select **Enable Registration Key for FortiClient**, and enter the key.
3. Select **Apply**.

Ensure you distribute the key to the users that need to connect to the FortiGate unit.

FortiClient Registration

On the end user side, if FortiClient has not been registered with the FortiGate unit, it is continually listening for the FortiGate discovery message. When this message is detected the un-registered client will pop-up a FortiGate Detected message. The user can choose to either register or ignore the message.

Clients that have registered with that FortiGate unit will not be listening for these messages and will not display the message again.

If you enabled the registration key, the user is prompted to enter the key before a connection can be completed.

There can be some confusion when discussing the compatibility of FortiClient with FortiGate. There is technical compatibility and licensing compatibility. FortiClient software may not be licence compatible with previous versions of FortiOS.

For instance, while FortiClient 5.2 software is technologically compatible with a FortiGate running FortiOS 5.0 firmware. A FortiGate running FortiOS 5.0 will not recognize the FortiClient 5.2 licence code. Depending on the restrictions of your particular situation, you can:

- Use FortiClient 5.2 without licensing
- Use FortiClient 5.0 with licensing
- Upgrade to FortiOS firmware 5.2

For more information on FortiGate registration, see the FortiClient Administration Guide.

IP addresses for self-originated traffic

On the FortiGate unit, there are a number of protocols and traffic that is specific to the internal workings of FortiOS. For many of these traffic sources, you can identify a specific port/IP address for this self-originating traffic. The following traffic can be configured to a specific port/IP address:

- SNMP
- Syslog
- alert email
- FortiManager connection IP
- FortiGuard services
- FortiAnalyzer logging
- NTP
- DNS
- Authorization requests such as RADIUS
- FSSO

Configuration of these services is performed in the CLI. In each instance, there is a command set `source-ip`. For example, to set the source IP of NTP to be on the DMZ1 port with an IP of 192.168.4.5, the commands are:

```
config system ntp
   set ntpsync enable
   set syncinterval 5
   set source-ip 192.168.4.5
end
```

To see which services are configured with source-ip settings, use the get command:

```
get system source-ip status
```

The output will appear similar to the sample below:

```
NTP: x.x.x.x
DNS: x.x.x.x
SNMP: x.x.x.x
Central Management: x.x.x.x
```

```
FortiGuard Updates (AV/IPS): x.x.x.x
FortiGuard Queries (WebFilter/SpamFilter): x.x.x.x
```

Administration for schools

For system administrator in the school system it is particularly difficult to maintain a network and access to the Internet. There are potential legal liabilities if content is not properly filtered and children are allowed to view pornography and other non-productive and potentially dangerous content. For a school, too much filtering is better than too little. This section describes some basic practices administrators can employ to help maintain control without being too draconian for access to the internet.

Security policies

The default security policies in FortiOS allow all traffic on all ports and all IP addresses. Not the most secure. While applying UTM profiles can help to block viruses, detect attacks and prevent spam, this doesn't provide a solid overall security option. The best approach is a layered approach; the first layer being the security policy.

When creating outbound security policies, you need to know the answer to the question "What are the students allowed to do?" The answer is surf the web, connect to FTP sites, send/receive email, and so on.

Once you know what the students need to do, you can research the software used and determine the ports the applications use. For example, if the students only require web surfing, then there are only two ports (80 - HTTP and 443 - HTTPS) needed to complete their tasks. Setting the security policies to only allow traffic through two ports (rather than all 65,000), this will significantly lower any possible exploits. By restricting the ports to known services, means stopping the use of proxy servers, as many of them operate on a non-standard port to hide their traffic from URL filtering or HTTP inspection.

DNS

Students should not be allowed to use whatever DNS they want. this opens another port for them to use and potentially smuggle traffic on. The best approach is to point to an internal DNS server and only allow those devices out on port 53. Its the same approach one would use for SMTP. Only allow the mail server to use port 25 since nothing else should be sending email.

If there is no internal DNS server, then the list of allowed DNS servers they can use should be restrictive. One possible exploit would be for them to set up their own DNS server at home that serves different IPs for known hosts, such as having Google.com sent back the IP for playboy.com.

Encrypted traffic (HTTPS)

Generally speaking, students should not be allowed to access encrypted websites. Encrypted traffic cannot be sniffed, and therefore, cannot be monitored. HTTPS traffic should only be allowed when necessary. Most websites a student needs to access are HTTP, not HTTPS. Due to the nature of HTTPS protocol, and the fact that encryption is an inherent security risk to your network, its use should be restricted.

Adding a security policy that encompasses a list of allowed secure sites will ensure that any HTTPS sites that are required are the only sites a student can go to.

FTP

For the most part, students should not be using FTP. FTP is not HTTP or HTTPS so you cannot use URL filtering to restrict where they go. This can be controlled with destination IPs in the security policy. With a policy that specifically outlines which FTP addresses are allowed, all other will be blocked.

Example security policies

Given these requirements, an example set of security policies could look like the following illustration. In a large setup, all the IPs for the students are treated by one of these four policies.

Simple security policy setup

Seq. No.	ID	Source	Destination	Schedule	Service	Action	Status
1	2	Student PCs	Allowed Websites	always	HTTPS	✓	☑
2	3	Student PCs	all	always	HTTP	✓	☑
3	4	Student PCs	Allowed DNS	always	DNS	✓	☑
4	5	Student PCs	Allowed FTP	always	FTP	✓	☑
5		all	all	always	ANY	⊘	Implicit

The last policy in the list, included by default, is a deny policy.This adds to the potential of error that could end up allowing unwanted traffic to pass. The deny policy ensures that any traffic making it to this point is stopped. It can also help in further troubleshooting by viewing the logs for denied traffic.

With these policies in place, even before packet inspection occurs, the FortiGate, and the network are fairly secure. Should any of the UTM profiles fail, there is still a basic level of security.

UTM security profiles

Antivirus profiles

Antivirus screening should be enabled for any service you have enabled in the security policies. In the case above, HTTP, FTP, as well as POP3 and SMTP (assuming there is email access for students). There is not a virus scan option for HTTPS, because the content is encrypted. Generally speaking, most of the network traffic will be students surfing the web.

To configure antivirus profiles in the web-based manager, go to **Security Profiles > Antivirus**, or use the CLI commands under `config antivirus profile`.

Web filtering

The actual filtering of URLs - sites and content - should be performed by FortiGuard. It is easier and websites are constantly being monitored, and new ones reviewed and added to the FortiGuard databases every day. The FortiGuard categories provide an extensive list of offensive, and non-productive sites.

As well, there are additional settings to include in a web filtering profile to best contain a student's web browsing.

- Web URL filtering should be enabled to set up exemptions for websites that are blocked or reasons other than category filtering. It also prevents the use of IP addresses to get around web filtering.
- Block invalid URLs - HTTPS only. This option inspects the HTTPS certificate and looks at the URL to ensure it's valid. It is common for proxy sites to create an HTTPS certificate with a garbage URL. If the site is legitimate, it should be set up correctly. If the site approach to security is to ignore it, then their security policy puts your network at risk and the site should be blocked.

Web filtering options are configured in the web-based manager by going to **Security Profiles > Web filter**, or in the CLI under `config webfilter profile`.

Advanced options

There are a few Advanced options to consider for a web filtering profile:

- Enable **Provide details for blocked HTTP 4xx and 5xx errors**. Under normal circumstances there are exploits that can be used with 400 and 500 series messages to access the website. While most students probably won't know how to do this, there is no harm in being cautious. It only takes one.
- Enable **Rate Images by URL**. This option only works with Google images. It examines the URL that the images is stored at to get a rating on it, then blocks or allows the image based on the rating of the originating URL. It does not inspect the image contents. Most image search engines to a prefect and pass the images directly to the browser.
- Enable **Block HTTP redirects by rating**. An HTTP redirect is one method of getting around ratings. Go to one website that has an allowed rating, and it redirects to another website that may want blocked.

Categories and Classifications

For the selection of what FortiGuard categories and classifications that should be blocked, that is purely based on the school system and its Internet information policy.

Email Filtering

Other than specific teacher-led email inboxes, there is no reason why a student should be able to access, read or send personal email. Ports for POP3, SMTP and IMAP should not be opened in a security policies.

IPS

The intrusion protection profiles should be used to ensure the student PCs are not vulnerable to attacks, nor do you want students making attacks. As well, IPS can do more than simple vulnerability scans. With a FortiGuard subscription, IPS signatures are pushed to the FortiGate unit. New signatures are released constantly for various intrusions as they are discovered.

FortiOS includes a number of predefined IPS sensors that you can enable by default. Selecting the all_default signature is a good place to start as it includes the major signatures.

To configure IPS sensors in the web-based manager, go to **Security Profiles > Intrusion Protection**, on the CLI use commands under `config ips sensor`.

Application control

Application control uses IPS signatures to limit the use of instant messaging and peer-to-peer applications which can lead to possible infections on a student's PC. FortiOS includes a number of pre-defined application categories. To configure and maintain application control profiles in the web-based manager, go to **Security Profiles > Application Control**. In the CLI use commands under `config application list`.

Some applications to consider include proxies, botnets, toolbars and P2P applications.

Logging

Turn on all logging - every option in this section should be enabled. This is not where you decide what you are going to log. It is simply defining what the UTM profiles can log.

Logging everything is a way to monitor traffic on the network, see what student's are utilizing the most, and locate any potential holes in your security plan. As well, keeping this information may help to prove negligence later in necessary.

Replacement messages list

The replacement message list in **System > Config > Replacement Messages**.

The replacement messages list enables you to view and customize replacement messages. Use the expand arrow beside each type to display the replacement messages for that category. Select the **Edit** icon beside each replacement message to customize that message for your requirements.

Should you make a major error to the code, you can select the **Restore Default** to return to the original message and code base.

If you are viewing the replacement messages list in a VDOM, any messages that have been customized for that VDOM are displayed with a Reset icon that you can use to reset the replacement message to the global version.

For connections requiring authentication, the FortiGate unit uses HTTP to send an authentication disclaimer page for the user to accept before a security policy is in effect. Therefore, the user must initiate HTTP traffic first in order to trigger the authentication disclaimer page. Once the disclaimer is accepted, the user can send whatever traffic is allowed by the security policy.

Replacement message images

You can add images to replacement messages to:

- Disclaimer pages
- Login pages
- Declined disclaimer pages
- Login failed page
- Login challenge pages
- Keepalive pages

Image embedding is also available to the endpoint NAC download portal and recommendation portal replacement messages, as well as HTTP replacement messages.

Supported image formats are GIF, JPEG, TIFF and PNG. The maximum file size supported is 6000 bytes.

Adding images to replacement messages

To upload an image for use in a message

1. Go to **System > Config > Replacement Messages**.
2. Select **Manage Images** at the top of the page.
3. Select **Create New**.
4. Enter a **Name** for the image.
5. Select the **Content Type**.
6. Select **Browse** to locate the file and select **OK**.

The image that you include in a replacement message, must have the following html:

```
<img src=%%IMAGE: <config_image_name>%% size=<bytes> >
```

For example:

```
<img src=%%IMAGE: logo_hq%% size=4272>
```

Modifying replacement messages

Replacement messages can be modified to include a message or content that suits your organization.

Use the expand arrows to view the replacement message list for a given category. Messages are in HTML format. To change a replacement message, go to **System > Config > Replacement Messages** select the replacement message that you want to modify. At the bottom pane of the window, you can see the message on one side and the HTML code on the other side. The message view changes in real-time as you change the content.

A list of common replacement messages appears in the main window. To see the entire list and all categories of replacement messages, in the upper-right corner of the window, select **Extended View**.

Alert Mail replacement messages

The FortiGate unit adds the alert mail replacement messages listed in the following table to alert email messages sent to administrators. If you enable the option **Send alert email for logs based on severity**, whether or not replacement messages are sent by alert email depends on how you set the alert email in **Minimum log level**.

Authentication replacement messages

The FortiGate unit uses the text of the authentication replacement messages for various user authentication HTML pages that are displayed when a user is required to authenticate because a security policy includes at least one identity-based policy that requires firewall users to authenticate.

These replacement message pages are for authentication using HTTP and HTTPS. You cannot customize the firewall authentication messages for FTP and Telnet.

The authentication login page and the authentication disclaimer include replacement tags and controls not found on other replacement messages.

Users see the authentication login page when they use a VPN or a security policy that requires authentication. You can customize this page in the same way as you modify other replacement messages.

There are some unique requirements for these replacement messages:

- The login page must be an HTML page containing a form with `ACTION="/"` and `METHOD="POST"`
- The form must contain the following hidden controls:
  - `<INPUT TYPE="hidden" NAME="%%MAGICID%%" VALUE="%%MAGICVAL%%">`
  - `<INPUT TYPE="hidden" NAME="%%STATEID%%" VALUE="%%STATEVAL%%">`
  - `<INPUT TYPE="hidden" NAME="%%REDIRID%%" VALUE="%%PROTURI%%">`
- The form must contain the following visible controls:
  - `<INPUT TYPE="text" NAME="%%USERNAMEID%%" size=25>`
  - `<INPUT TYPE="password" NAME="%%PASSWORDID%%" size=25>`

Example

The following is an example of a simple authentication page that meets the requirements listed above.

```
<HTML><HEAD><TITLE>Firewall Authentication</TITLE></HEAD>
```

```
      <BODY><H4>You must authenticate to use this service.</H4>
<FORM ACTION="/" method="post">
      <INPUT NAME="%%MAGICID%%" VALUE="%%MAGICVAL%%" TYPE="hidden">
<TABLE ALIGN="center" BGCOLOR="#00cccc" BORDER="0"
      CELLPADDING="15" CELLSPACING="0" WIDTH="320"><TBODY>
<TR><TH>Username:</TH>
      <TD><INPUT NAME="%%USERNAMEID%%" SIZE="25" TYPE="text"> </TD></TR>
<TR><TH>Password:</TH>
      <TD><INPUT NAME="%%PASSWORDID%%" SIZE="25" TYPE="password"> </TD></TR>
<TR><TD COLSPAN="2" ALIGN="center" BGCOLOR="#00cccc">
      <INPUT NAME="%%STATEID%%" VALUE="%%STATEVAL%%" TYPE="hidden">
          <INPUT NAME="%%REDIRID%%" VALUE="%%PROTURI%%" TYPE="hidden">
          <INPUT VALUE="Continue" TYPE="submit"> </TD></TR>
</TBODY></TABLE></FORM></BODY></HTML>
```

Captive Portal Default replacement messages

The Captive Portal Default replacement messages are used for wireless authentication only. You must have a VAP interface with the security set as captive portal to trigger these replacement messages.

Device Detection Portal replacement message

The FortiGate unit displays the replacement message when the FortiGate unit cannot determine the type of BYOD or handheld device is used to connect the network.

Email replacement messages

The FortiGate unit sends the mail replacement messages to email clients using IMAP, POP3, or SMTP when an event occurs such as antivirus blocking a file attached to an email that contains a virus. Email replacement messages are text messages.

If the FortiGate unit supports SSL content scanning and inspection these replacement messages can also be added to IMAPS, POP3S, and SMTPS email messages.

Endpoint Control replacement message

The FortiGate unit displays the replacement message when the FortiClient Endpoint Security software is not installed or registered correctly with the FortiGate unit.

FTP replacement messages

The FortiGate unit sends the FTP replacement messages listed in the table below to FTP clients when an event occurs such as antivirus blocking a file that contains a virus in an FTP session. FTP replacement messages are text messages.

FortiGuard Web Filtering replacement messages

The FortiGate unit sends the FortiGuard Web Filtering replacement messages listed in the table to web browsers using the HTTP protocol when FortiGuard web filtering blocks a URL, provides details about blocked HTTP 4xx and 5xx errors, and for FortiGuard overrides. FortiGuard Web Filtering replacement messages are HTTP pages.

If the FortiGate unit supports SSL content scanning and inspection and if **Protocol Recognition > HTTPS Content Filtering Mode** is set to Deep Scan in the antivirus profile, these replacement messages can also replace web pages downloaded using the HTTPS protocol.

HTTP replacement messages

The FortiGate unit sends the HTTP replacement messages listed in the following table to web browsers using the HTTP protocol when an event occurs such as antivirus blocking a file that contains a virus in an HTTP session. HTTP replacement messages are HTML pages.

If the FortiGate unit supports SSL content scanning and inspection, and if under HTTPS in the protocol option list has Enable Deep Scan enabled, these replacement messages can also replace web pages downloaded using the HTTPS protocol.

IM replacement messages

The FortiGate unit sends the IM replacement messages listed in to IM clients using AIM, ICQ, MSN, or Yahoo! Messenger when an event occurs such as antivirus blocking a file attached to an email that contains a virus. IM replacement messages are text messages.

NNTP replacement messages

The FortiGate unit sends the NNTP replacement messages listed in the following table to NNTP clients when an event occurs such as antivirus blocking a file attached to an NNTP message that contains a virus. NNTP replacement messages are text messages.

Spam replacement messages

The FortiGate unit adds the Spam replacement messages listed in the following table to SMTP server responses if the email message is identified as spam and the spam action is discard. If the FortiGate unit supports SSL content scanning and inspection these replacement messages can also be added to SMTPS server responses.

NAC quarantine replacement messages

The page that is displayed for the user depends on whether NAC quarantine blocked the user because a virus was found, a DoS sensor detected an attack, an IPS sensor detected an attack, or a DLP rule with action set to **Quarantine IP address** or **Quarantine Interface** matched a session from the user.

The default messages inform the user of why they are seeing this page and recommend they contact the system administrator. You can customize the pages as required, for example to include an email address or other contact information or if applicable a note about how long the user can expect to be blocked.

SSL VPN replacement message

The SSL VPN login replacement message is an HTML replacement message that formats the FortiGate SSL VPN portal login page. You can customize this replacement message according to your organization's needs. The page is linked to FortiGate functionality and you must construct it according to the following guidelines to ensure that it will work.

- The login page must be an HTML page containing a form with `ACTION="%%SSL_ACT%%"` and `METHOD="%%SSL_METHOD%%"`
- The form must contain the `%%SSL_LOGIN%%` tag to provide the login form.
- The form must contain the `%%SSL_HIDDEN%%` tag.

Web Proxy replacement messages

The FortiGate unit sends Web Proxy replacement messages listed in the table below when a web proxy event occurs that is detected and matches the web proxy configuration. These replacement messages are web pages that appear within your web browser.

The following web proxy replacement messages require an identity-based security policy so that the web proxy is successful. You can also enable FTP-over-HTTP by selecting the **FTP** option in **System > Network > Explicit Proxy**.

Traffic quota control replacement messages

When user traffic is going through the FortiGate unit and it is blocked by traffic shaping quota controls, users see the **Traffic shaper block message** or the **Per IP traffic shaper block message** when they attempt to connect through the FortiGate unit using HTTP.

The traffic quota HTTP pages should contain the `%%QUOTA_INFO%%` tag to display information about the traffic shaping quota setting that is blocking the user.

MM1 replacement messages

MM1 replacement messages are sent when, during MMS content scanning, FortiOS Carrier detects, for example a virus, using the MMS profile.

You must have **Remove Blocked** selected within the MMS profile if you want to remove the content that is intercepted during MMS scanning on the FortiGate unit.

MM3 replacement messages

MM3 replacement messages are sent when, during MMS content scanning, FortiOS Carrier detects, for example a virus, using the MMS profile.

You must have **Remove Blocked** selected within the MMS profile if you want to remove the content that is intercepted during MMS scanning on the unit.

MM4 replacement messages

MM4 replacement messages are sent when, during MMS content scanning, FortiOS Carrier detects, for example a virus, using the MMS profile.

MM7 replacement messages

MM7 replacement messages are sent when, during MMS content scanning, FortiOS Carrier detects, for example a virus, using the MMS profile.

MMS replacement messages

The MMS replacement message is sent when a section of an MMS message has been replaced because it contains a blocked file. This replacement message is in HTML format.

The message text is:

```
<HTML><BODY>This section of the message has been replaced because it contained a blocked
    file</BODY></HTML>
```

Replacement message groups

Replacement message groups enable you to view common messages in groups for large carriers. Message groups can be configured by going to **Config > Replacement Message Group**.

Using the defined groups, you can manage specific replacement messages from a single location, rather than searching through the entire replacement message list.

If you enable virtual domains (VDOMs) on the FortiGate unit, replacement message groups are configured separately for each virtual domain. Each virtual domain has its own default replacement message group, configured from **System > Config > Replacement Messages Group**.

When you modify a message in a replacement message group, a Reset icon appears beside the message in the group. You can select this Reset icon to reset the message in the replacement message group to the default version.

All MM1/4/7 notification messages for FortiOS Carrier (and MM1 retrieve-conf messages) can contain a SMIL layer and all MM4 notification messages can contain an HTML layer in the message. These layers can be used to brand messages by using logos uploaded to the FortiGate unit via the 'Manage Images' link found on the replacement message group configuration page.

Disk

To view the status and storage information of the local disk on your FortiGate unit, go to **System > Config > Advanced**. The **Disk** menu appears only on FortiGate units with an internal hard or flash disk.

Formatting the disk

The internal disk of the FortiGate unit (if available) can be formatted by going to **System > Config > Advanced** and selecting **Format**.

Formatting the disk will erase all data on it, including databases for antivirus and IPS; logs, quarantine files, and WAN optimization caches. The FortiGate unit requires a reboot once the disk has been formatted.

Setting space quotas

If the FortiGate unit has an internal hard or flash disk, you can allocate the space on the disk for specific logging and archiving, and WAN optimization. By default, the space is used on an as required basis. As such, a disk can fill up with basic disk logging, leaving less potential space for quarantine.

By going to **System > Config > Advanced**, you can select the **Edit** icon for **Logging and Archiving** and **WAN Optimization & Web Cache** and define the amount of space each log, archive and WAN optimization has on the disk.

CLI Scripts

To upload bulk CLI commands and scripts, go to **System > Config > Advanced**.

Scripts are text files containing CLI command sequences. Scripts can be used to deploy identical configurations to many devices. For example, if all of your devices use identical security policies, you can enter the commands required to create the security policies in a script, and then deploy the script to all the devices which should use those same settings.

Use a text editor such as Notepad or other application that creates simple text files. Enter the commands in sequence, with each line as one command, similar to examples throughout the FortiOS documentation set.

If you are using a FortiGate unit that is not remotely managed by a FortiManager unit or the FortiGuard Analysis and Management Service, the scripts you upload are executed and discarded. If you want to execute a script more than once, you must keep a copy on your management PC.

If your FortiGate unit is configured to use a FortiManager unit, you can upload your scripts to the FortiManager unit, and run them from any FortiGate unit configured to use the FortiManager unit. If you upload a script directly to a FortiGate unit, it is executed and discarded.

If your FortiGate unit is configured to use FortiGuard Analysis and Management Service, scripts you upload are executed and stored. You can run uploaded scripts from any FortiGate unit configured with your FortiGuard Analysis and Management Service account. The uploaded script files appear on the FortiGuard Analysis and Management Service portal website.

Uploading script files

After you have created a script file, you can then upload it through **System > Config > Advanced**. When a script is uploaded, it is automatically executed.

Commands that require the FortiGate unit to reboot when entered in the command line will also force a reboot if included in a script.

To execute a script

1. Go to **System > Config > Advanced**.
2. Verify that **Upload Bulk CLI Command File** is selected.
3. Select **Browse** to locate the script file.
4. Select **Apply**.

If the FortiGate unit is not configured for remote management, or if it is configured to use a FortiManager unit, uploaded scripts are discarded after execution. Save script files to your management PC if you want to execute them again later.

If the FortiGate unit is configured to use the FortiGuard Analysis and Management Service, the script file is saved to the remote server for later reuse. You can view the script or run it from the FortiGuard Analysis and Management Service portal website.

Rejecting PING requests

The factory default configuration of your FortiGate unit allows the default external interface to respond to ping requests. Depending on the model of your FortiGate unit the actual name of this interface will vary. For the most secure operation, you should change the configuration of the external interface so that it does not respond to ping requests. Not responding to ping requests makes it more difficult for a potential attacker to detect your FortiGate unit from the Internet. One such potential threat are Denial of Service (DoS) attacks.

A FortiGate unit responds to ping requests if ping administrative access is enabled for that interface.

To disable ping administrative access - web-based manager

1. Go to **System > Network > Interface**.
2. Choose the external interface and select **Edit**.

3. Clear the **Ping Administrative Access** check box.
4. Select **OK**.

In the CLI, when setting the allowaccess settings, by selecting the access types and not including the PING option, that option is then not selected. In this example, only HTTPS is selected.

To disable ping administrative access - CLI

```
config system interface
   edit external
      set allowaccess https
end
```

Opening TCP 113

Although seemingly contrary to conventional wisdom of closing ports from hackers, this port, which is used for ident requests, should be opened.

Port 113 initially was used as an authentication port, and later defined as an identification port (see RFC 1413). Some servers may still use this port to help in identifying users or other servers and establish a connection. Because port 113 receives a lot of unsolicited traffic, many routers, including on the FortiGate unit, close this port.

The issue arises in that unsolicited requests are stopped by the FortiGate unit, which will send a response saying that the port is closed. In doing so, it also lets the requesting server know there is a device at the given address, and thus announcing its presence. By enabling traffic on port 113, requests will travel to this port, and will most likely, be ignored and never responded to.

By default, the ident port is closed. To open it, use the following CLI commands:

```
config system interface
   edit <port_name>
      set ident_accept enable
end
```

You could also further use port forwarding to send the traffic to a non-existent IP address and thus never have a response packet sent.

Obfuscate HTTP responses

The FortiGate unit can obfuscate the HTTP responses from the FortiGate admin GUI and SSL VPN servers. By default this option is not enabled. To obfuscate HTTP headers, use the following CLI command:

```
config system global
   set http-obfuscate {none | header-only | modified | no-error}
end
```

Where:

`none` — do not hide the FortiGate web server identity.

`header-only` — hides the HTTP server banner.

`modified` — provides modified error responses.

`no-error` — suppresses error responses.

Chapter 24 - Traffic Shaping

With the ever-increasing demands on network systems for a number of protocols, including email, HTTP traffic both internally and externally to the internet, voice over IP, FTP, and more, slow traffic is becoming a reality. Important traffic may even be dropped or slowed to an unusable speed. Web traffic delays can result in a loss of revenue for businesses.

Traffic shaping attempts to normalize traffic peaks and bursts to prioritize certain flows over others. There is a physical limitation to the amount of data which can be buffered and to the length of time it can be buffered.

FortiGate units provide Quality of Service (QoS) by applying bandwidth limits and prioritization. Using traffic shaping, you can adjust how your FortiGate unit allocates resources to different traffic types to improve performance and stability of latency sensitive or bandwidth intensive network applications.

This chapter describes Quality of Service (QoS), traffic shaping, FortiGate traffic shaping algorithms, and includes configuration procedures for traffic shaping on FortiGate units.

This guide contains the following sections:

The purpose of traffic shaping describes traffic shaping theories and quality of service.

Traffic shaping methods lists different methods of applying traffic shaping within FortiOS, and explains how to use ToS and Differentiated Services.

Examples provides basic application scenarios for shapers.

Troubleshooting traffic shaping lists diagnose commands to use for determining if traffic shapers are working correctly.

The purpose of traffic shaping

Traffic shaping, or traffic management, controls the bandwidth available and sets the priority of traffic processed by the policy to control the volume of traffic for a specific period (bandwidth throttling) or rate the traffic is sent (rate limiting).

Traffic shaping attempts to normalize traffic peaks and bursts to prioritize certain flows over others. But there is a physical limitation to the amount of data which can be buffered and to the length of time. Once these thresholds have been surpassed, frames and packets will be dropped, and sessions will be affected in other ways.

A basic traffic shaping approach is to prioritize certain traffic flows over other traffic whose potential loss is less disadvantageous. This would mean that you accept certain sacrifices in performance and stability on low-priority traffic, to increase or guarantee performance and stability to high-priority traffic.

If, for example, you are applying bandwidth limitations to certain flows, you must accept the fact that these sessions can be limited and therefore negatively impacted.

Note that traffic shaping is effective for normal IP traffic at normal traffic rates. Traffic shaping is not effective during periods when traffic exceeds the capacity of the FortiGate unit. Because packets must be received by the FortiGate unit before they are subject to traffic shaping, if the FortiGate unit cannot process all of the traffic it receives, then dropped packets, delays, and latency are likely to occur.

To ensure that traffic shaping is working at its best, make sure that the interface Ethernet statistics show no errors, collisions or buffer overruns.

Accelerated interfaces (NPx network processors and CE) affect traffic shaping. For more information, see the FortiOS Chapter 12 - Hardware Acceleration guide.

Quality of Service

Quality of Service (QoS) is the capability to adjust some quality aspects of your overall network traffic. This can include such techniques as priority-based queuing and traffic policing. Because bandwidth is finite and because some types of traffic are slow, jitter or packet loss sensitive, bandwidth intensive, or operation critical, QoS can be a useful tool for optimizing the performance of the various applications on your network.

Before implementing QoS, organizations should first identify the types of traffic that are important to the organization, the types of traffic that use high amounts of bandwidth, and the types of traffic that are sensitive to latency or packet loss.

For example, a company might want to guarantee sufficient bandwidth for revenue producing e-commerce traffic. They need to ensure that transactions can be completed and that clients do not experience service delays and interruptions. At the same time, the company may need to ensure low latency for voice over IP (VoIP) traffic used by sales and customer support, while traffic latency and bursts may be less critical to the success of other network applications such as long term, resumable file transfers. Many organizations discover that QoS is especially important for managing their voice and streaming multi-media traffic. These types of traffic can rapidly consume bandwidth and are sensitive to latency.

Discovering the needs and relative importance of each traffic type on your network will help you to design an appropriate overall approach, including how you will configure each available QoS component technique. Some organizations discover that they only need to configure bandwidth limits for some services. Other organizations

determine that they need to fully configure interface and security policy bandwidth limits for all services, and prioritize queuing of critical services relative to traffic rate.

You can implement QoS on FortiGate units using the following techniques:

Traffic policing	Drops packets that do not conform to bandwidth limitations.
Traffic shaping	Ensures that the traffic may consume bandwidth at least at the guaranteed rate by assigning a greater priority queue if the guarantee is not being met. Also ensures that the traffic cannot consume bandwidth greater than the maximum at any given instant in time. Flows greater than the maximum rate are subject to traffic policing.
Queuing	Transmits packets in order of their assigned priority queue for that physical interface. All traffic in a higher priority traffic queue must be completely transmitted before traffic in lower priority queues will be transmitted.

When deciding how to configure QoS techniques, it can be helpful to know when FortiGate units employ each technique in the overall traffic processing flow, and the considerations that arise from those mechanisms.

Traffic policing

The FortiGate unit begins to process traffic as it arrives (ingress) and departs (egress) on an interface. In later phases of the network processing, such as enforcing maximum bandwidth use on sessions handled by a security policy, if the current rate for the destination interface or traffic regulated by that security policy is too high, the FortiGate unit may drop the packet. Time spent on prior processing, such as web filtering, decryption or IPS, is often wasted on packets that are not forwarded. This applies to VLAN interfaces and physical interfaces.

You can prevent this wasted effort on ingress by configuring the FortiGate unit to preemptively drop excess packets when they are received at the source interface, before most other traffic processing is performed:

```
config system interface
   edit <interface_name>
      set inbandwidth <rate_int>
   next
end
```

where `<rate_int>` is the bandwidth limit in Kb/s. Excess packets will be dropped. If `inbandwidth` is `0`, the rate is not limited.

A similar command is available that can be performed on egress as well using the CLI commands:

```
config system interface
   edit <interface_name>
      set outbandwidth <rate_int>
   next
end
```

As with ingress, setting the rate to 0 (zero) sets the rate to unlimited.

Rate limiting traffic accepted by the interface enables you to restrict incoming traffic to rates that, while no longer the full capacity of the interface, at the traffic shaping point in the processing are more likely to result in acceptable rates of outgoing traffic per destination interface or all security policies. This conserves FortiGate processing resources for those packets that are more likely to be viable completely to the point of egress.

Excessive traffic policing can degrade network performance rather than improve it. For details on factors you may want to consider when configuring traffic policing, see Important considerations on page 2398.

Bandwidth guarantee, limit, and priority interactions

After packet acceptance, the FortiGate unit classifies traffic and may apply traffic policing at additional points during processing. It may also apply additional QoS techniques, such as prioritization and traffic shaping. Traffic shaping consists of a mixture of traffic policing to enforce bandwidth limits, and priority queue adjustment to assist packets in achieving the guaranteed rate.

If you have configured prioritization, the FortiGate unit prioritizes egressing packets by distributing them among FIFO (first in, first out) queues associated with each possible priority number. Each physical interface has six priority queues. Virtual interfaces do not have their own queues, and instead use the priority queues of the physical interface to which they are bound.

Each physical interface's six queues are queue 0 to queue 5, where queue 0 is the highest priority queue. However, for the reasons described below, you may observe that your traffic uses only a subset of those six queues. Some traffic may always use a certain queue number. Some queuing may vary by the packet rate or mixture of services. Some queue numbers may be used only by through traffic for which you have configured traffic shaping in the security policy that applies to that traffic session. For example:

- Administrative access traffic will always use queue 0.
- Traffic matching security policies ***without*** traffic shaping may use queue 0, queue 1, or queue 2. Which queue will be used depends on the priority value you have configured for packets with that ToS (type of service) bit value, if you have configured ToS-based priorities.
- Traffic matching security policies ***with*** traffic shaping may use any queue. Which queue will be used depends on whether the packet rate is currently below the guaranteed bandwidth (queue 0), or above the guaranteed bandwidth. Packets at rates greater than the maximum bandwidth limit are dropped.
- If the global tos-based-priority is low (3), the priority in a traffic-shaper is medium (2) and a packet flows though a policy that refers to the shaper, the packet will be assigned the priority defined by the shaper, in this case medium (2).

Prioritization and traffic shaping behavior varies by your configuration, the service types and traffic volumes, and by whether the traffic is through traffic, or the traffic originates from or terminates at the FortiGate unit itself.

FortiGate traffic

Administrative access to the FortiGate through HTTPS or SSH, or IPsec tunnel negotiations, security policies do not apply, and therefore FortiGate units do not apply traffic shaping. Such traffic also uses the highest priority queue, queue 0. In other words:

packet priority = 0

Exceptions to this rule include traffic types that are connections related to a session governed by a security policy.

For example, if you have enabled scanning by FortiGuard antivirus, traffic from the sender technically terminates at the FortiGate proxy that scans that traffic type; the FortiGate unit initiates a second connection that transmits scanned content to its destination. Because the second connection's traffic is technically originating from the FortiGate proxy and therefore the FortiGate unit itself, it uses the highest priority queue, queue 0. However, this connection is logically associated with through traffic, and is therefore subject to possible bandwidth enforcement and guarantees in its governing security policy. In this way, it behaves partly like other through traffic.

Through traffic

For traffic passing through the FortiGate unit, the method a FortiGate unit uses to determine the priority queue varies by whether Traffic Shaping is enabled or not. Packets may or may not use a priority queue directly or indirectly derived from the type of service (ToS) bit — sometimes used instead with differentiated services — in the packet's IP header.

If Traffic Shaping is not enabled in the security policy, the FortiGate unit neither limits nor guarantees bandwidth, and traffic for that session uses the priority queue determined directly by matching the ToS bit in its header with your configured values:

```
config system global
   set tos-based-priority {high | low | medium}
end
```

or, if you have configured a priority specifically for that ToS bit value:

```
config system tos-based-priority
   edit <id_int>
      set tos [0-15]
      set priority {high | low | medium}
   next
end
```

where `tos` is the value of the ToS bit in the packet's IP header, and `high` has a priority value of 0 and `low` is 2. Priority values configured in the second location will override the global ToS-based priority. In other words:

packet priority = ToS-based priority

For example, you might specify that packets with a ToS bit value of 2 should use queue 0, the highest priority queue:

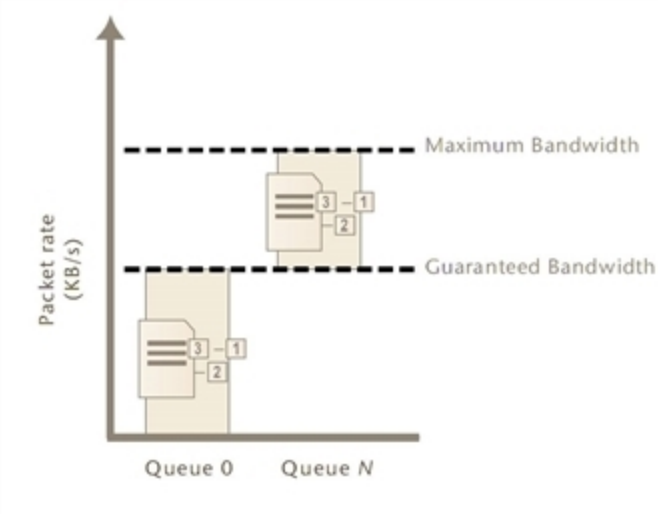
```
config system tos-based-priority
   edit 15
      set tos 2
      set priority high
   next
end
```

If Traffic Shaping is enabled in the security policy using shared traffic shapers, the FortiGate unit may instead or also subject packets to traffic policing, or priority queue increase in an effort to meet bandwidth guarantees configured in the shaper:

```
config firewall shaper traffic-shaper
   edit <shaper_name>
      ...
      set priority {high | medium | low}
      set maximum-bandwidth <rate>
      set guaranteed-bandwidth <rate>
end
```

where `high` has a priority value of 1 and `low` is 3, and `<rate>` is the bandwidth limit in kilobits per second. The diagram below illustrates traffic queuing as the packet rate increases.

Traffic queuing as the packet rate increases



- If the current packet rate is less than Guaranteed Bandwidth, packets use priority queue 0. In other words:

  packet priority = 0
- If the current packet rate is greater than Guaranteed Bandwidth but less than Maximum Bandwidth, the FortiGate unit assigns a priority queue by adding the numerical value of the security policy-based priority, where the value of High is 1, and Low is 3, with the numerical value of the ToS-based priority, where `high` has a priority value of 0 and `low` is 2. Because the two values are added, depending on the your configured ToS-based priorities, packets in this category could use queues from queue 1 to queue 5. In other words:

  packet priority = ToS-based priority + security policy-based priority

  For example, if you have enabled Traffic Shaping in the security policy, and the security policy's Traffic Priority is Low (value 3), and the priority normally applied to packets with that ToS bit is `medium` (value 1), then packets have a total packet priority of 4, and use priority queue 4.
- If the current packet rate exceeds Maximum Bandwidth, excess packets are dropped.

Calculation and regulation of packet rates

Packet rates specified for Maximum Bandwidth or Guaranteed Bandwidth are:

```
rate = amount / time
```

where rate is expressed in kilobits per second (Kb/s).

Burst size at any given instant cannot exceed the amount configured in Maximum Bandwidth. Packets in excess are dropped. Packets deduct from the amount of bandwidth available to subsequent packets and available bandwidth regenerates at a fixed rate. As a result, bandwidth available to a given packet may be less than the configured rate, down to a minimum of 0 Kb/s.

Rate calculation and behavior can alternatively be described using the token bucket metaphor, where:

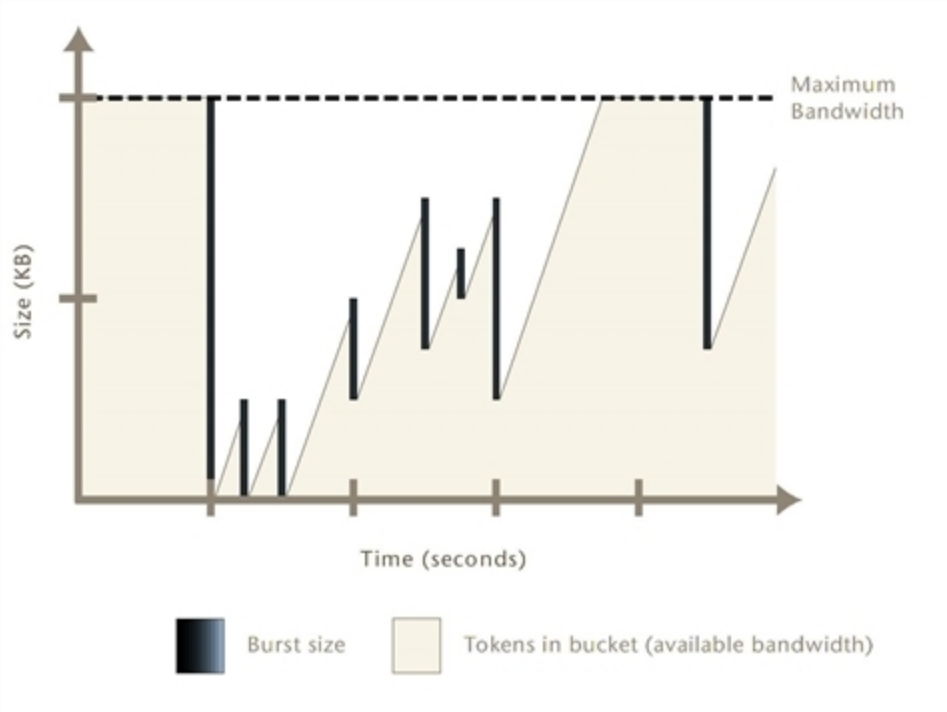
- A traffic flow has an associated bucket, which represents burst size bounds, and is the size of your configured bandwidth limit.
- The bucket receives tokens, which represent available bandwidth, at the fixed configured rate.
- As time passes, tokens are added to the bucket, up to the capacity of the bucket; excess tokens are discarded.

- When a packet arrives, the packet must deduct bandwidth tokens from the bucket equal to its packet size in order to egress.
- Packets cannot egress if there are insufficient tokens to pay for its egress; these nonconforming packets are dropped.

Bursts are not redistributed over a longer interval, so bursts are propagated rather than smoothed, although their peak size is limited.

Maximum burst size is the capacity of the bucket (the configured bandwidth limit); actual size varies by the current number of tokens in the bucket, which may be less than bucket capacity, due to deductions from previous packets and the fixed rate at which tokens accumulate. A depleted bucket refills at the rate of your configured bandwidth limit. Bursts cannot borrow tokens from other time intervals. This behavior is illustrated in the graph below.

Bursts and bandwidth limits over time



By limiting traffic peaks and token regeneration in this way, the available bandwidth at a given moment may be less than bucket capacity, but your limit on the total amount per time interval is ensured. That is, total bandwidth use during each interval of 1 second is at most the integral of your configured rate.

You may observe that external clients, such as FTP or BitTorrent clients, initially report rates between Maximum Bandwidth and twice that of Maximum Bandwidth, depending on the size of their initial burst. This is notably so when a connection is initiated following a period of no network activity.The apparent discrepancy in rates is caused by a difference of perspective when delimiting time intervals. A burst from the client may initially consume all tokens in the bucket, and before the end of 1 second, as the bucket regenerates, be allowed to consume almost another bucket's worth of bandwidth. From the perspective of the client, this constitutes one time interval. From the perspective of the FortiGate unit, however, the bucket cannot accumulate tokens while full; therefore, the time interval for token regeneration begins **after** the initial burst, and does not contain the burst. These different points of reference result in an initial discrepancy equal to the size of the burst — the client's rate contains it, but the FortiGate unit's rate does not. If the connection is sustained to its limit and time progresses

over an increasing number of intervals, however, this discrepancy decreases in importance relative to the bandwidth total, and the client's reported rate will eventually approach that of the FortiGate unit's configured rate limit.

For example, your Maximum Bandwidth might be 50 Kb/s and there has been no network activity for one or more seconds. The bucket is full. A burst from an FTP client immediately consumes 50 Kb. Because the bucket completely regenerates over 1 second, by the time almost another 1 second has elapsed from the initial burst, traffic can consume another 49.999 Kb, for a total of 99.999 Kb between the two points in time. From the vantage point of an external FTP client regulated by this bandwidth limit, it therefore initially appears that the bandwidth limit is 99.999 Kb/s, almost twice the configured limit of 50 Kb/s. However, bucket capacity only regenerates at your configured rate of 50 Kb/s, and so the connection can only consume a maximum of 50 Kb during each second thereafter. The result is that as bandwidth consumption is averaged over an increasing number of time intervals, each of which are limited to 50 Kb/s, the effects of the first interval's doubled bandwidth size diminishes proportionately, and the client's reported rate eventually approaches your configured rate limit. The effects are shown in the table below.

Effects of a 50 Kb/s limit on client reported rates

Total size transferred (Kb)	Time (s)	Rate reported by client (Kb/s)
99.999 (50 + 49.999)	1	99.999
149.999	2	74.999
199.999	3	66.666
249.999	4	62.499
299.999	5	59.998
349.999	6	58.333
…	…	…

Guaranteed Bandwidth can also be described using a token bucket metaphor. However, because this feature attempts to achieve or exceed a rate rather than limit it, the FortiGate unit does not discard non-conforming packets, as it does for Maximum Bandwidth; instead, when the flow does not achieve the rate, the FortiGate unit increases the packets' priority queue, in an effort to increase the rate.

Guaranteed and maximum bandwidth rates apply to the bidirectional total for all sessions controlled by the security policy. For example, an FTP connection may entail two separate connections for the data and control portion of the session; some packets may be reply traffic rather than initiating traffic. All packets for both connections are counted when calculating the packet rate for comparison with the guaranteed and maximum bandwidth rate.

Important considerations

By implementing QoS, you trade some performance and/or stability from traffic X by discarding packets or introducing latency in order to improve performance and stability of traffic Y. The best traffic shaping configuration for your network will balance the needs of each traffic flow by considering not only the needs of your particular organization, but also the resiliency and other characteristics of each particular service.

For example, you may find that web browsing traffic is both more resistant to interruptions or latency and less business critical than UDP or VoIP traffic, and so you might implement less restrictive QoS measures on UDP or VoIP traffic than on HTTP traffic.

An appropriate QoS configuration will also take into account the physical limits of your network devices, and the interactions of the aforementioned QoS mechanisms, described in Bandwidth guarantee, limit, and priority interactions on page 2394.

You may choose to configure QoS differently based upon the hardware limits of your network and FortiGate unit. Traffic shaping may be less beneficial in extremely high-volume situations where traffic exceeds a network interface's or your FortiGate model's overall physical capacity. A FortiGate unit must have enough resources, such as memory and processing power, to process all traffic it receives, and to process it at the required rate; if it does not have this capacity, then dropped packets and increased latency are likely to occur. For example, if the total amount of memory available for queuing on a physical interface is frequently exceeded by your network's typical packet rates, frames and packets must be dropped. In such a situation, you might choose to implement QoS using a higher model FortiGate unit, or to configure an incoming bandwidth limit on each interface.

Incorrect traffic shaping configurations can actually further degrade certain network flows, because excessive discarding of packets or increased latency beyond points that can be gracefully handled by that protocol can create additional overhead at upper layers of the network, which may be attempting to recover from these errors. For example, a configuration might be too restrictive on the bandwidth accepted by an interface, and may therefore drop too many packets, resulting in the inability to complete or maintain a SIP call.

To optimize traffic shaping performance, first ensure that the network interface's Ethernet statistics are clean of errors, collisions, or buffer overruns. To check the interface, enter the following diagnose command to see the traffic statistics:

```
diagnose hardware deviceinfo nic <port_name>
```

If these are not clean, adjust FortiGate unit and settings of routers or other network devices that are connected to the FortiGate unit. For additional information, see Troubleshooting traffic shaping on page 2425.

Once Ethernet statistics are clean, you may want to use only some of the available FortiGate QoS techniques, or configure them differently, based upon the nature of FortiGate QoS mechanisms described in Bandwidth guarantee, limit, and priority interactions on page 2394.

Configuration considerations include:

- For maximum bandwidth limits, ensure that bandwidth limits at the source interface and/or the security policy are not too low, which can cause the FortiGate unit to discard an excessive number of packets.
- For prioritization, consider the ratios of how packets are distributed between available queues, and which queue is used by which types of services. If you assign most packets to the same priority queue, it negates the effects of configuring prioritization. If you assign many high bandwidth services to high priority queues, lower priority queues may be starved for bandwidth and experience increased or indefinite latency. For example, you may want to prioritize a latency-sensitive service such as SIP over a bandwidth-intensive service such as FTP. Consider also that bandwidth guarantees can affect the queue distribution, assigning packets to queue 0 instead of their typical queue in high-volume situations.
- You may or may not want to guarantee bandwidth, because it causes the FortiGate unit to assign packets to queue 0 if the guaranteed packet rate is not currently being met. Comparing queuing behavior for lower-bandwidth and higher-bandwidth situations, this would mean that effects of prioritization only become visible as traffic volumes rise and exceed their guarantees. Because of this, you might want only some services to use bandwidth guarantees, to avoid the possibility that in high-volume situations all traffic uses the same queue, thereby negating the effects of configuring prioritization.

- For prioritization, configure prioritization for all through traffic. You may want to configure prioritization by either ToS-based priority or security policy priority, but not both. This simplifies analysis and troubleshooting.

  Traffic subject to both security policy and ToS-based priorities will use a combined priority from both of those parts of the configuration, while traffic subject to only one of the prioritization methods will use only that priority. If you configure both methods, or if you configure either method for only a subset of your traffic, packets for which a combined priority applies will frequently receive a lower priority queue than packets for which you have only configured one priority method, or for which you have not configured prioritization.

  For example, if both ToS-based priority and security policy priority both dictate that a packet should receive a “medium” priority, in the absence of bandwidth guarantees, a packet will use queue 3, while if only ToS-based priority had been configured, the packet would have used queue 1, and if only security policy-based priority had been configured, the packet would have used queue 2. If no prioritization had been configured at all, the packet would have used queue 0.

For example alternative QoS implementations that illustrate these considerations, see Examples on page 2418.

Traffic shaping methods

In FortiOS, there are three types of traffic shaping configurations. Each has a specific function, and all can be used together in varying configurations. Policy shaping enables you to define the maximum bandwidth and the guaranteed bandwidth set for a security policy. Per-IP shaping enables you to define traffic control on a more granular level. Application traffic shaping goes further, enabling traffic controls on specific applications or application groupings.

This chapter describes the types of traffic shapers and how to configure them in the web-based manager and the CLI.

Traffic shaping options

When configuring traffic shaping for your network, there are three different methods to control the flow of network traffic to ensure that the desired traffic gets through while also limiting the bandwidth that users use for other less important or bandwidth consuming traffic. The three shaping options are:

- Shared policy shaping - bandwidth management by security policies
- Per-IP shaping - bandwidth management by user IP addresses
- Application control shaping - bandwidth management by application

Shared policy shaping and Per-IP shaping are enabled within the security policy under **Policy & Objects** > **Policy**. Application control shaping is enabled under **Security Profiles** > **Application Control**, and setting the **Action** to **Traffic Shaping**.

The three different traffic shaping options offered by the FortiGate unit can also be enabled at the same time within the same security policy. Generally, the hierarchy for traffic shapers in FortiOS is:

- Application Control shaper
- Security policy shaper
- Per-IP shaper

Within this hierarchy, if an application control list has a traffic shaper defined, it will always have precedence over any other security policy shaper. For example, the Facebook application control example shown in Application control shaping on page 2407 will supersede any security policy enabled traffic shapers. While the Facebook application may reach its maximum bandwidth, the user can still have the bandwidth room available from the shared shaper and, if enabled, the per-IP shaper.

Equally, any security policy shared shaper will have precedence over any per-IP shaper. However, traffic that exceeds any of these shapers will be dropped. For example, the policy shaper will take effect first, however, if the per-IP shaper limit is reached first, then traffic for that user will be dropped even if the shared shaper limit for the policy has not been exceeded.

Shared policy shaping

Traffic shaping by security policy enables you to control the maximum and/or guaranteed throughput for a selected security policy. When configuring a shaper, you can select to apply the bandwidth shaping per policy or for all policies. Depending on your selection, the FortiGate unit will apply the shaping rules differently.

Per policy

When selecting a shaper to be **per policy**, the FortiGate unit will apply the shaping rules defined to each security policy individually.

For example, the shaper is set to be per policy with a maximum bandwidth of 1000 Kb/s. There are four security policies monitoring traffic through the FortiGate unit. Three of these have the shaper enabled. Each security policy has the same maximum bandwidth of 1000 Kb/s.

Per policy traffic shaping is compatible with client/server (active-passive) transparent mode WAN optimization rules. Traffic shaping is ignored for peer-to-peer WAN optimization and for client/server WAN optimization not operating in transparent mode.

All policies

When selecting a shaper to be for all policies -**All Policies using this shaper** - the FortiGate unit applies the shaping rules to all policies using the same shaper. For example, the shaper is set to be per policy with a maximum bandwidth of 1000 Kb/s. There are four security policies monitoring traffic through the FortiGate unit. All four have the shaper enabled. Each security policy must share the defined 1000 Kb/s, and is set on a first come, first served basis. For example, if policy 1 uses 800 Kb/s, the remaining three must share 200 Kb/s. As policy 1 uses less bandwidth, it is opened up to the other policies to use as required. Once used, any other policies will encounter latency until free bandwidth opens from a policy currently in use.

Maximum and guaranteed bandwidth

The maximum bandwidth instructs the security policy what the largest amount of traffic allowed using the policy. Depending on the service or the users included for the security policy, this number can provide a larger or smaller throughput depending on the priority you set for the shaper.

The **Maximum Bandwidth** can be set to a value of between 1 and 16776000 kbit/s. The Web-Based Manager gives an error if any value outside of this range is used, but in the CLI a value of 0 can be entered. Setting `maximum-bandwidth` to 0 (zero) prevents any traffic from going through the policy.

The guaranteed bandwidth ensures there is a consistent reserved bandwidth available for a given service or user. When setting the guaranteed bandwidth, ensure that the value is significantly less than the bandwidth capacity of the interface, otherwise no other traffic will pass through the interface or very little an potentially causing unwanted latency.

Traffic priority

Select a Traffic Priority of high, medium or low, so the FortiGate unit manages the relative priorities of different types of traffic. For example, a policy for connecting to a secure web server that needed to support e-commerce traffic should be assigned a high traffic priority. Less important services should be assigned a low priority. The firewall provides bandwidth to low-priority connections only when bandwidth is not needed for high-priority connections.

Be sure to enable traffic shaping on all security policies. If you do not apply any traffic shaping rule to a policy, the policy is set to high priority by default. Distribute security policies over all three priority queues.

VLAN, VDOM and virtual interfaces

Policy-based traffic shaping does not use queues directly. It shapes the traffic and if the packet is allowed by the security policy, then a priority is assigned. That priority controls what queue the packet will be put in upon egress. VLANs, VDOMs, aggregate ports and other virtual devices do not have queues and as such, traffic is sent directly

to the underlying physical device where it is queued and affected by the physical ports. This is also the case with IPsec connections.

Shared traffic shaper configuration settings

To configure a shared traffic shaper go to **Policy & Objects > Objects > Traffic Shapers** and select the **Create New** "Plus" sign to create a new traffic shaper.

Type	Select **Shared**.
Name	Enter a name for the traffic shaper.
Apply Shaper	When selecting a shaper to be **Per Policy**, the FortiGate unit will apply the shaping rules defined to each security policy individually. For example, the shaper is set to be per policy with a maximum bandwidth of 1000 Kb/s. There are four security policies monitoring traffic through the FortiGate unit. Three of these have the shaper enabled. Each security policy has the same maximum bandwidth of 1000 Kb/s. Per policy traffic shaping is compatible with client/server (active-passive) transparent mode WAN optimization rules. Traffic shaping is ignored for peer-to-peer WAN optimization and for client/server WAN optimization not operating in transparent mode. When selecting a shaper to be for all policies - **For All Policies Using This Shaper** - the FortiGate unit applies the shaping rules to all policies using the same shaper. For example, the shaper is set to be per policy with a maximum bandwidth of 1000 Kb/s. There are four security policies monitoring traffic through the FortiGate unit. All four have the shaper enabled. Each security policy must share the defined 1000 Kb/s, and is set on a first come, first served basis. For example, if policy 1 uses 800 Kb/s, the remaining three must share 200 Kb/s. As policy 1 uses less bandwidth, it is opened up to the other policies to use as required. Once used, any other policies will encounter latency until free bandwidth opens from a policy currently in use.
Traffic Priority	Select level of importance **Priority** so the FortiGate unit manages the relative priorities of different types of traffic. For example, a policy for connecting to a secure web server needed to support e-commerce traffic should be assigned a high traffic priority. Less important services should be assigned a low priority. If you do not apply any traffic shaping priority, the priority is set to high priority by default.
Maximum Bandwidth	The maximum bandwidth instructs the security policy what the largest amount of traffic allowed using the policy. Depending on the service or the users included for the security policy, this number can provide a larger or smaller throughput depending on the priority you set for the shaper. Setting **Maximum Bandwidth** to 0 (zero) provides unlimited bandwidth.

Guaranteed Bandwidth	The guaranteed bandwidth ensures there is a consistent reserved bandwidth available for a given service or user. When setting the guaranteed bandwidth, ensure that the value is significantly less than the bandwidth capacity of the interface, otherwise no other traffic will pass through the interface or very little and potentially causing unwanted latency. Setting **Guaranteed Bandwidth** to 0 (zero) provides unlimited bandwidth.
DSCP	Enter the number for the DSCP value. You can use the FortiGate Differentiated Services feature to change the DSCP (Differentiated Services Code Point) value for all packets accepted by a policy. The network can use these DSCP values to classify, mark, shape, and police traffic, and to perform intelligent queuing. DSCP features are applied to traffic by configuring the routers on your network to apply different service levels to packets depending on the DSCP value of the packet. For more information, see Differentiated Services.

Example

The following steps creates a Per Policy traffic shaper called “Throughput” with a maximum traffic amount of 720,000 Kb/s, and a guaranteed traffic of 150,000 Kb/s with a high traffic priority.

To create the shared shaper - web-based manager:

1. Go to **Policy & Objects** > Objects > Traffic Shapers and select the Create New “Plus” sign.
2. Set the **Type** to **Shared**.
3. Enter the **Name** `Throughput`.
4. Set the **Apply shaper** field to **Per Policy**.
5. Set the **Traffic Priority** to **High**.
6. Select the **Maximum Bandwidth** check box and enter the value `150000`.
7. Select the **Guaranteed Bandwidth** check box and enter the value `120000`.
8. Select **OK**.

To create the shared shaper - CLI:

```
config firewall shaper traffic-shaper
   edit Throughput
      set per-policy enable
      set maximum-bandwidth 150000
      set guaranteed-bandwidth 120000
      set priority high
   end
```

Per-IP shaping

Traffic shaping by IP enables you to apply traffic shaping to all source IP addresses in the security policy. As well as controlling the maximum bandwidth users of a selected policy, you can also define the maximum number of concurrent sessions.

Per-IP traffic shaping enables you limit the behavior of every member of a policy to avoid one user from using all the available bandwidth - it now is shared within a group equally. Using a per-IP shaper avoids having to create multiple policies for every user you want to apply a shaper to. Per-IP traffic shaping is not supported over NP2 interfaces.

Per-IP traffic shaping configuration settings

To configure per-IP traffic shaping go to **Firewall Policy & Objects > Objects > Traffic Shapers > Per-IP** and select the **Create New "Plus" sign**.

Type	Select **Per-IP**.
Name	Enter a name for the per-IP traffic shaper.
Maximum Bandwidth	The maximum bandwidth instructs the security policy what the largest amount of traffic allowed using the policy. Depending on the service or the users included for the security policy, this number can provide a larger or smaller throughput depending on the priority you set for the shaper. Setting **Maximum Bandwidth** to 0 (zero) provides unlimited bandwidth.
Maximum Concurrent Connections	Enter the maximum allowed concurrent connection.
Forward DSCP **Reverse DSCP**	Enter the number for the DSCP value. You can use the FortiGate Differentiated Services feature to change the DSCP (Differentiated Services Code Point) value for all packets accepted by a policy. The network can use these DSCP values to classify, mark, shape, and police traffic, and to perform intelligent queuing. DSCP features are applied to traffic by configuring the routers on your network to apply different service levels to packets depending on the DSCP value of the packet. For more information, see Differentiated Services.

Example

The following steps create a Per-IP traffic shaper called "Accounting" with a maximum traffic amount of 720,000 Kb/s, and the number of concurrent sessions of 200.

To create the Per-IP shaper - web-based manager:

1. Go to **Policy & Objects** > **Objects** > **Traffic Shapers** and select the **Create New** "Plus" Icon.
2. Set the **Type** to **Per-IP**.
3. Enter the **Name** `Accounting`.
4. Select the **Maximum Bandwidth** checkbox and enter the value `720000`.
5. Select the **Maximum Concurrent Sessions** checkbox and enter the value `200`.
6. Select **OK**.

To create the shared shaper - CLI:

```
config firewall shaper per-ip-shaper
   edit Accounting
```

```
    set max-bandwidth 720000
    set max-concurrent-session 200
  end
```

Adding Per-IP traffic shapers to a security policy

Per-IP traffic shaping is supported by IPv6 security policies. You can add any Per-IP traffic shaper to an IPv6 security policy in the CLI.

Example

The following steps show you how to add an existing Per-IP traffic shaper to an IPv6 security policy. Ensure that you have already created a Per-IP traffic shaper.

To add a Per-IP traffic shaper to an IPv6 security policy - web-based manager:

1. Go to **Policy & Objects** > **Policy** > **IPv6** and click the **Create New** "Plus" icon.
2. Set the **Incoming Interface** to internal.
3. Set the **Source Address** to **All**.
4. Set the **Outgoing interface** to **any**.
5. Set the **Destination address** to **all**.
6. Set the **Schedule** to **Always**.
7. Set the **Service** to **Any**.
8. Set the **Action** to **Accept**.
9. Under **Traffic Shaping** enable **Per-IP Shaper** and select your shaper from the dropdown menu.

To add a Per-IP traffic shaper to an IPv6 security policy- CLI:

```
config firewall policy6
   edit <security_policy_ID_number>
      set per-ip-shaper <per_ip_shaper>
   end
```

Application control shaping

Traffic shaping is also possible for specific applications for both shared and per-IP shaping. Through the **Security Profiles > Application Control** feature, you can configure a specific application's maximum bandwidth. When configuring the application control features, if the application is set to pass, you can set the traffic shaping options. The shapers available are those set up in the **Policy & Objects > Objects > Traffic Shaping** menu.

For more information on configuring application control shapers, see the FortiOS Chapter 21 - Security Profiles Guide.

Example

This example sets the traffic shaping definition for Facebook to a medium priority, a default traffic shaper.

To add traffic shaping for Facebook - web-based manager:

1. Go to **Security Profiles > Application Control**.
2. Select the **Create New** "Plus" icon in the upper right corner of the screen to create a new application group, and enter the name `Web`.
3. Select **OK**.
4. In the **Categories** section, click **Social.Media** and select **Traffic Shaping** from the dropdown menu. The **Traffic Shaping Settings** are now displayed below.
5. In the Traffic Shaping Settings section, set **Forward** to medium-priority.
6. Click **Apply**.

To add traffic shaping for Facebook using a Shared Shaper- CLI:

```
config application list
   edit web
      config entries
         edit 1
            set category 23
            set application 17735
            set action pass
            set shaper medium-priority
         end
```

Application Control Per-IP shaping options are not available in the web-based manager, but you can apply Per-IP shapers in the CLI.

To add traffic shaping for Facebook using a Per-IP Shaper- CLI:

```
config application list
   edit web
      config entries
         edit 1
            set category 23
            set application 17735
            set action pass
            set per-ip-shaper {per_ip_shaper_name}
         end
```

Enabling traffic shaping in the security policy

All traffic shapers are enabled within a security policy, including the Application Control shapers. As such, the shapers go into effect after any DoS detection policies, and before any routing or packet scanning occurs.

Traffic shaping is also supported for IPv6 policies.

To enable traffic shaping - web-based manager:

- Go to **Policy & Objects > Policy > IPv4**.
- Click **Create New** or select an existing policy and click **Edit**.

- Navigate to the **Traffic Shaping** section, enable the **Per-IP Shaper** and select an option from the drop down list.
- Select **OK**.

Shapers applied in the security policy affect outbound or traffic to a destination. To affect inbound, or download, traffic, enable both the **Shared Traffic Shaper** and the **Reverse Shaper**. For more information, see Reverse direction traffic shaping on page 2409.

To enable traffic shaping - CLI:

```
config firewall {policy or policy6}
   edit <policy_number>
      ...
      set traffic-shaper <shaper_name>
      set per-ip-shaper <per_ip_shaper_name>
   end
```

Reverse direction traffic shaping

The shaper you select for the security policy (shared shaper) will affect the traffic in the direction defined in the policy. For example, if the source port is port 1 and the destination is port 3, the shaping affects the flow in this direction only, that is, the upload or outbound direction. By selecting **Shared Traffic Shaper Reverse Direction**, you can define the traffic shaper for the policy in the opposite direction, that is, the download or inbound direction. In this example, from port 3 to port 1.

To add a reverse shaper

1. Go to **Policy & Objects > Policy > IPv4**.
2. Click **Create New** or select an existing policy and click **Edit**.
3. Navigate to the **Traffic Shaping** section, enable the **Shared Shaper** and select a shaper from the dropdown list.
4. Enable the **Reverse Shaper** and select a shaper from the dropdown list.
5. Select **OK**.

Setting the reverse direction only

There may be instances where you only need traffic shaping for incoming connections, which is in the “reverse” direction of typical traffic shapers.

To add a reverse shaper - web-based manager:

1. Go to **Policy & Objects > Policy > IPv4**.
2. Select **Traffic Shaping**.
3. Select **Shared Traffic Shaper Reverse Direction** and select the shaper from the list.
4. Select **OK**.

To configure a reverse-only shaper - CLI:

```
config firewall policy
   edit <policy_number>
      ...
      set traffic-shaper-reverse <shaper_name>
   end
```

Type of Service priority

Type of service (ToS) is an 8-bit field in the IP header that enables you to determine how the IP datagram should be delivered, using criteria of Delay, Throughput, Priority, Reliability, and Cost. Each quality helps gateways determine the best way to route datagrams. A router maintains a ToS value for each route in its routing table. The lowest priority ToS is 0; the highest is 7 when bits 3, 4, and 5 are all set to 1. There are other seldom used or reserved bits that are not listed here.

Together these bits are the ToS variable of the `tos-based-priority` command. The router tries to match the ToS of the datagram to the ToS on one of the possible routes to the destination. If there is no match, the datagram is sent over a zero ToS route. Using increased quality may increase the cost of delivery because better performance may consume limited network resources.

Each bit represents the priority as per RFC 1349:

- 1000 - minimize delay
- 0100 - maximize throughput
- 0010 - maximize reliability
- 0001 - minimize monetary cost

The ToS value is set in the CLI using the commands:

```
config system tos-based-priority
   edit <sequence-number>
      set tos [0-15]
      set priority [high | medium | low]
end
```

Where `tos` is the value of the type of service bit in the IP datagram header with a value between 0 and 15, and `priority` is the priority of this type of service priority. These priority levels conform to the firewall traffic shaping priorities, as defined in RFC 1349.

For example, if you want to configure the FortiGate unit so that reliability is the first priority, set the tos value to 4.

```
config system tos-based-priority
   edit 1
      set tos 4
      set priority high
end
```

For a list of ToS values and their DSCP equivalents see ToS and DSCP traffic mapping on page 2415.

Example

```
config system tos-based-priority
   edit 1
      set tos 1
      set priority low
   next
   edit 4
      set tos 4
      set priority medium
   next
   edit 6
      set tos 6
      set priority high
```

```
    next
end
```

ToS in FortiOS

Traffic shaping and ToS follow the following sequence:

- The CLI command `tos-based-priority` acts as a `tos-to-priority` mapping. FortiOS maps the ToS to a priority when it receives a packet.
- Traffic shaping settings adjust the packet's priority according the traffic.
- Deliver the packet based on its priority.

Differentiated Services

Differentiated Services describes a set of end-to-end Quality of Service (QoS) capabilities. End-to-end QoS is the ability of a network to deliver service required by specific network traffic from one end of the network to another. By configuring differentiated services, you configure your network to deliver particular levels of service for different packets based on the QoS specified by each packet.

Differentiated Services (also called DiffServ) is defined by RFC 2474 and 2475 as enhancements to IP networking to enable scalable service discrimination in the IP network without the need for per-flow state and signaling at every hop. Routers that can understand differentiated services sort IP traffic into classes by inspecting the DS field in IPv4 header or the Traffic Class field in the IPv6 header.

You can use the FortiGate Differentiated Services feature to change the DSCP (Differentiated Services Code Point) value for all packets accepted by a policy. The network can use these DSCP values to classify, mark, shape, and police traffic, and to perform intelligent queuing. DSCP features are applied to traffic by configuring the routers on your network to apply different service levels to packets depending on the DSCP value of the packet.

If the differentiated services feature is not enabled, the FortiGate unit treats traffic as if the DSCP value is set to the default (00), and will not change IP packets' DSCP field. DSCP values are also not applied to traffic if the traffic originates from a FortiGate unit itself.

The FortiGate unit applies the DSCP value and IPsec encryption to the differentiated services (formerly ToS) field in the first word of the IP header. The typical first word of an IP header, with the default DSCP value, is 4500:

- 4 for IPv4
- 5 for a length of five words
- 00 for the default DSCP value

You can change the packet's DSCP field for traffic initiating a session (forward) or for reply traffic (reverse) and enable each direction separately and configure it in the security policy.

Changes to DSCP values in a security policy affect new sessions. If traffic must use the new DSCP values immediately, clear all existing sessions.

DSCP is enabled using the CLI command:

```
config firewall policy
   edit <policy_number>
      ...
      set diffserv-forward enable
      set diffservcode-forward <binary_integer>
      set diffserv-reverse enable
      set diffservcode-rev <binary_integer>
```

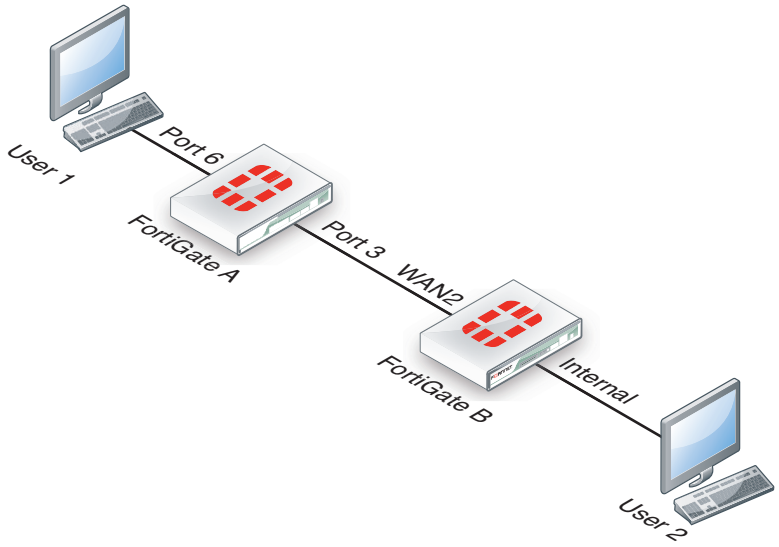
```
end
```

For more information on the different DCSP commands, see the examples below and the CLI Reference. If you only set `diffserv-forward` and `diffserv-reverse` without setting the corresponding `diffvercode` values, the FortiGate unit will reset the bits to zero.

For a list of DSCP values and their ToS equivalents see ToS and DSCP traffic mapping on page 2415. DSCP values can also be defined within a shared shaper as a single value, and per-IP shaper for forward and reverse directions.

DSCP examples

For all the following DSCP examples, the FortiGate and client PC configuration is the following diagram and used firewall-based DSCP configurations.



Example

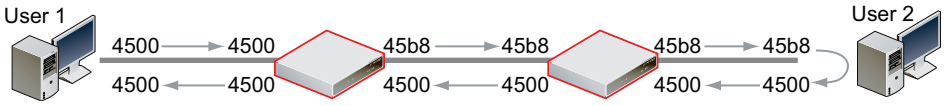
In this example, an ICMP ping is executed between User 1 and FortiGate B, through a FortiGate unit. DSCP is disabled on FortiGate B, and FortiGate A contains the following configuration:

```
config firewall policy
   edit 2
      set srcintf port6
      set dstintf port3
      set src addr all
      set dstaddr all
      set action accept
      set schedule always
      set service ANY
      set diffserv-forward enable
      set diffservcode-forward 101110
end
```

As a result, FortiGate A changes the DSCP field for outgoing traffic, but not to its reply traffic. The binary DSCP values used map to the following hexadecimal ToS field values, which are observable by a sniffer (also known as a packet tracer):

- DSCP 000000 is TOS field 0x00
- DSCP 101110 is TOS field 0xb8, the recommended DSCP value for expedited forwarding (EF)

If you performed an ICMP ping between User 1 and User 2, the following output illustrates the IP headers for the request and the reply by sniffers on each of FortiGate unit's network interfaces. The right-most two digits of each IP header are the ToS field, which contains the DSCP value.



Example

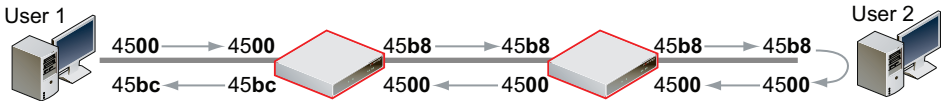
In this example, an ICMP ping is executed between User 1 and FortiGate B, through FortiGate A. DSCP is disabled on FortiGate B, and FortiGate A contains the following configuration:

```
config firewall policy
   edit 2
      set srcintf port6
      set dstintf port3
      set src addr all
      set dstaddr all
      set action accept
      set schedule always
      set service ANY"
      set diffserv-forward enable
      set diffserv-rev enable
      set diffservcode-forward 101110
      set diffservcode-rev 101111
   end
```

As a result, FortiGate A changes the DSCP field for both outgoing traffic and its reply traffic. The binary DSCP values in map to the following hexadecimal ToS field values, which are observable by a sniffer (also known as a packet tracer):

- DSCP 000000 is TOS field 0x**00**
- DSCP 101110 is TOS field 0x**b8**, the recommended DSCP value for expedited forwarding (EF)
- DSCP 101111 is TOS field 0x**bc**

If you performed an ICMP ping between User 1 and User 2, the output below illustrates the IP headers observed for the request and the reply by sniffers on each of FortiGate A's and FortiGate B's network interfaces. The right-most two digits of each IP header are the ToS field, which contains the DSCP value.



Example

In this example, an ICMP ping is executed between User 1 and FortiGate B, through FortiGate A. DSCP is enabled for both traffic directions on FortiGate A, and enabled only for reply traffic on FortiGate B. FortiGate A contains the following configuration:

```
config firewall policy
   edit 2
      set srcintf port6
```

```
      set dstintf port3
      set src addr all
      set dstaddr all
      set action accept
      set schedule always
      set service ANY
      set diffserv-forward enable
      set diffserv-rev enable
      set diffservcode-forward 101110
      set diffservcode-rev 101111
   end
```

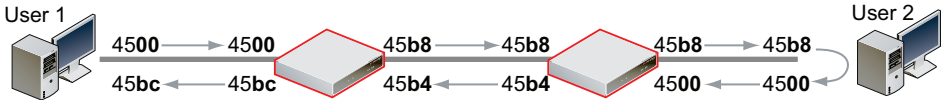
FortiGate B contains the following configuration:

```
config firewall policy
   edit 2
      set srcintf wan2
      set dstintf internal
      set src addr all
      set dstaddr all
      set action accept
      set schedule always
      set service ANY
      set diffserv-rev enable
      set diffservcode-rev 101101
   end
```

As a result, FortiGate A changes the DSCP field for both outgoing traffic and its reply traffic, and FortiGate B changes the DSCP field only for reply traffic. The binary DSCP values in this configuration map to the following hexadecimal ToS field values:

- DSCP 000000 is TOS field 0**x00**
- DSCP 101101 is TOS field 0**xb4**
- DSCP 101110 is TOS field 0**xb8**, the recommended DSCP value for expedited forwarding (EF)
- DSCP 101111 is TOS field 0**xbc**

If you performed an ICMP ping between User 1 and User 2, the output below illustrates the IP headers observed for the request and the reply by sniffers on each of FortiGate A's and FortiGate B's network interfaces. The right-most two digits of each IP header are the ToS field, which contains the DSCP value.



Example

In this example, HTTPS and DNS traffic is sent from User 1 to FortiGate B, through FortiGate A. DSCP is enabled for both traffic directions on FortiGate A, and enabled only for reply traffic on FortiGate B. FortiGate A contains the following configuration:

```
config firewall policy
   edit 2
      set srcintf port6
      set dstintf port3
      set src addr all
      set dstaddr all
```

```
      set action accept
      set schedule always
      set service ANY
      set diffserv-forward enable
      set diffserv-rev enable
      set diffservcode-forward 101110
      set diffservcode-rev 101111
   end
```

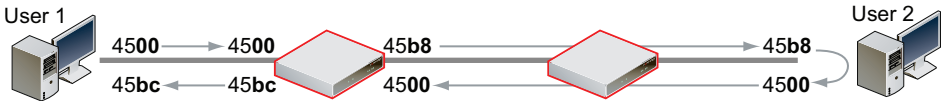
FortiGate B contains the following configuration:

```
config firewall policy
   edit 2
      set srcintf wan2
      set dstintf internal
      set src addr all
      set dstaddr all
      set action accept
      set schedule always
      set service ANY
      set diffserv-rev enable
      set diffservcode-rev 101101
   end
```

As a result, FortiGate A changes the DSCP field for both outgoing traffic and its reply traffic, but FortiGate B changes the DSCP field only for reply traffic which passes through its internal interface. Since the example traffic does not pass through the internal interface, FortiGate B does not mark the packets. The binary DSCP values in this configuration map to the following hexadecimal ToS field values:

- DSCP 000000 is TOS field 0**x00**
- DSCP 101101 is TOS field 0**xb4**, which is configured on FortiGate B but not observed by the sniffer because the example traffic originates from the FortiGate unit itself, and therefore does not match that security policy.
- DSCP 101110 is TOS field 0**xb8**, the recommended DSCP value for expedited forwarding (EF)
- DSCP 101111 is TOS field 0**xbc**

If you sent HTTPS or DNS traffic from User 1 to FortiGate B, the following would illustrate the IP headers observed for the request and the reply by sniffers on each of FortiGate A's and FortiGate B's network interfaces. The right-most two digits of each IP header are the ToS field, which contains the DSCP value.



ToS and DSCP traffic mapping

There are two types of traffic mapping: Type of Service (ToS) or DSCP (Differentiated Services Code Point). Only one method can be used at a time, with ToS set as the default method. You can set the type used and attributes in the CLI.

To set ToS or DSCP traffic mapping

```
config system global
   set traffic-priority {tos | dscp}
   set traffic-priority-level {low | medium | high }
end
```

Mapping of DSCP and ToS hexadecimal values for QoS

Service Class	DSCP Bits	DSCP Value	ToS Value	ToS Hexidecimal
Network Control	111000	56-63	224	0xE0
Internetwork Control	110000	48-55	192	0xC0
Critical - Voice Data (RTP)	101110	46	184	0xB8
	101000	40	160	0xA0
Flash Override Video Data	100010	34	136	0x88
	100100	36	144	0x90
	100110	38	152	0x98
	100000	32	128	0x80
Flash Voice Control	011010	26	104	0x68
	011100	28	112	0x70
	011110	30	120	0x78
	011000	24	96	0x60
Immediate Deterministic (SNA)	010010	18	72	0x48
	010100	20	80	0x50
	010110	22	88	0x58
	010000	16	64	0x40

Traffic Shaper Monitor

You can view statistical information about traffic shapers and their bandwidth from **Policy & Objects** > **Monitor** > **Traffic Shaper Monitor**.

Refresh	Select to refresh the information on the page.
Reset	Select to reset the information to clear the current information from the page. New information is included on the page.
Report By	Select to display dropped packets or current bandwidth. The chart changes its name so you know what current information is displayed.
Traffic Shaper Usage Dropped packets	The bar chart displays the packets dropped by the traffic shaper.
Traffic Shaper Usage Current Bandwidth	The bar chart displays the current bandwidth of traffic shapers.

Examples

While it is possible to configure QoS using a combination of security policies and in ToSbased priorities, and to distribute traffic over all six of the possible queues for each physical interface, the results of those configurations can be more difficult to analyze due to their complexity. In those cases, prioritization behavior can vary by several factors, including traffic volume, ToS (type of service) or differentiated services markings, and correlation of session to a security policy.

The following simple examples illustrate QoS configurations using either prioritization by security policy, or prioritization by ToS bit, but not both. The examples also assume you are not configuring traffic shaping for interfaces that receive hardware acceleration from network processing units (NPU).

QoS using priority from security policies

Configurations implementing QoS using the priority values defined in the security policies are capable of applying bandwidth limits and guarantees.

In addition to configuring traffic shaping, you may also choose to limit the bandwidth accepted by each interface. This can be useful in scenarios where the bandwidth received on source interfaces frequently exceeds the maximum bandwidth limit defined in the security policy. Rather than waste processing power on packets that will get dropped later in the process, you may choose to preemptively police the traffic.

If you decide to implement QoS using security policies rather than ToS bit, the FortiGate unit applies QoS to all packets controlled by the policy. This type of control is less granular than prioritization by ToS bit, but has the benefits of correlating quality of service to a security policy. This correlation enables you to distribute traffic over up to four of the possible 6 priority queues (queue 0 to queue 3), does not require other devices in your network to set or respect the ToS bit, and enables you to configure bandwidth limits and guarantees.

In the following example, we limit the bandwidth accepted by each source interface, limit the bandwidth used by sessions controlled by the security policy, and then configure prioritized queuing on the destination interface based upon the priority in the security policy, subject to alternative assignment to queue 0 when necessary to achieve the guaranteed packet rate.

To limit bandwidth accepted by an interface

In the CLI, enter the following commands:

```
config system interface
   edit <name_str>
      set inbandwidth <rate_int>
   next
end
```

where `<rate_int>` is the bandwidth limit in Kb/s. Excess packets will be dropped.

To configure bandwidth guarantees, limits, and priorities

1. Go to **Policy & Objects > Objects > Traffic Shapers** and select the Create New “Plus” sign.
2. Select **Shared** or **Per-IP**.
3. Enter a name for the shaper.

4. Enter the **Guaranteed Bandwidth**, if any.
   Bandwidth guarantees affect prioritization. While packet rates are less than this rate, they use priority queue 0. If this is not the effect you intend, consider entering a small guaranteed rate, or enter 0 to effectively disable bandwidth guarantees.
5. Enter a **Maximum Bandwidth**.
   Packets greater than this rate will be discarded.
6. Select the **Traffic Priority**.
   High has a priority value of 1, while Low is 3. While the current packet rate is below Guaranteed Bandwidth, the FortiGate unit will disregard this setting, and instead use priority queue 0.
7. Select **OK**.

Sample configuration

This sample configuration limits ingressing bandwidth to 500 Kb/s. It also applies separate traffic shapers to FTP and HTTP traffic. In addition to the interface bandwidth limit, HTTP traffic is subject to a security policy bandwidth limit of 200 Kb/s.

All egressing FTP traffic greater than 10 Kb/s is subject to a low priority queue (queue 3), while all egressing HTTP traffic greater than 100 Kb/s is subject to a medium priority queue (queue 2). That is, unless FTP traffic rates are lower than their guaranteed rate, and web traffic rates are greater than their guaranteed rate, FTP traffic is lower priority than web traffic.

Traffic less than these guaranteed bandwidth rates use the highest priority queue (queue 0).

Set the inbandwidth limits. This setting is only available in the CLI:

```
config system interface
   edit wan1
      set inbandwidth 500
   next
end
```

Create the traffic shapers for FTP and HTTP.

To configure the FTP and HTTP shapers - web-based manager:

1. Go to **Policy and Objects** > **Objects** > **Traffic Shaper**, and select the **Create New** “Plus” icon.
2. Enter `FTP` for the name of the shaper.
3. Set **Apply Shaper** to **Per policy**.
4. Set the **Traffic Priority** to **Low**.
5. Select the **Guaranteed Bandwidth** checkbox and enter `10` Kbps.
6. Select the **Maximum Bandwidth** checkbox and enter `500` Kbps.
7. Select **OK**.
8. Select the **Create New** “Plus” icon.
9. Enter `HTTP` for the name of the shaper.
10. Select the **Traffic Priority of Medium**.
11. Select the **Guaranteed Bandwidth** checkbox and enter `100` Kbps.
12. Select the **Maximum Bandwidth** checkbox and enter `200` Kbps.
13. Select **OK**.

To configure the FTP and HTTP shapers - CLI:

```
config firewall shaper traffic-shaper
   edit FTP
      set maximum-bandwidth 500
      set guaranteed-bandwidth 10
      set per-policy enable
      set priority low
   next
   edit HTTP
      set maximum-bandwidth 200
      set guaranteed-bandwidth 100
      set per-policy enable
      set priority medium
   end
```

QoS using priority from ToS or differentiated services

Configurations implementing QoS using the priority values defined in either global or specific ToS bit values are not capable of applying bandwidth limits and guarantees, but are capable of prioritizing traffic at per-packet levels, rather than uniformly to all services matched by the security policy.

In addition to configuring traffic prioritization, you may also choose to limit bandwidth being received by each interface. This can sometimes be useful in scenarios where you want to limit traffic levels, but do not want to configure traffic shaping within a security policy. This has the benefit of policing traffic at a point before the FortiGate unit performs most processing.

Note that if you implement QoS using ToS octet rather than security policies, the FortiGate unit applies QoS on a packet by packet basis, and priorities may be different for packets and services controlled by the same security policy. This is more granular control than prioritization by security policies, but has the drawbacks that quality of service is may not be uniform for multiple services controlled by the same security policy, packets will only use up to three of the six possible queues (queue 0 to queue 2), and bandwidth cannot be guaranteed. Other devices in your network must also be able to set or preserve ToS bits.

In this example, we limit the bandwidth accepted by each source interface, and then configure prioritized queuing on the destination interface based upon the value of the ToS bit located in the IP header of each accepted packet.

To limit bandwidth accepted by an interface, in the CLI, enter the following commands:

```
config system interface
   edit <name_str>
      set inbandwidth <rate_int>
   next
end
```

where `<rate_int>` is the bandwidth limit in Kb/s. Excess packets will be dropped.

To configure priorities, in the CLI, configure the global priority value using the following commands:

```
config system global
   set tos-based-priority {high | low | medium}
      end
```

where `high` has a priority value of 0 and `low` is 2.

If you want to prioritize some ToS bit values differently than the global ToS-based priority, configure the priority for packets with that ToS bit value using the following commands:

```
config system tos-based-priority
   edit <id_int>
      set tos [0-15]
      set priority {high | low | medium}
   next
end
```

where and `tos` is the value of the ToS bit in the packet's IP header, and `high` has a priority value of 0 and `low` is 2. Priority values configured in this location will override the global ToS-based priority.

Sample configuration

This sample configuration limits ingressing bandwidth to 500 Kb/s. It also queues egressing traffic based upon the ToS bit in the IP header of ingressing packets.

Unless specified for the packet's ToS bit value, packets use the low priority queue (queue 2). For ToS bit values 4 and 15, the priorities are specified as medium (value 1) and high (value 0), respectively.

```
config system interface
   edit wan1
      set inbandwidth 500
   next
end
config system global
   set tos-based-priority low
end
config system tos-based-priority
   edit 4
      set tos 4
      set priority medium
   next
   edit 15
      set tos 15
      set priority high
   next
end
```

Example setup for VoIP

In this example, there are three traffic shaping requirements for a network:

- Voice over IP (VoIP) requires a guaranteed, high-priority for bandwidth for telephone communications.
- FTP bursts must be contained so as not to consume any available bandwidth. As such this traffic needs to be throttled to a smaller amount.
- A consistent bandwidth requirement is needed for all other email and web-based traffic.

To enable this requirement, you need to create three separate shapers and three security policies for each traffic type.

For this example, the actual values are not actual values, they are used for the simplicity of the example.

Creating the traffic shapers

First create the traffic shapers that define the maximum and guaranteed bandwidth. The shared shapers will be used with some applied per-policy and some applied to all policies, to better control traffic.

VoIP shaper

The VoIP functionary is a key component to the business as a communication tool and as such requires a guaranteed bandwidth.

To create a VoIP shaper - web-based manager:

1. Go to **Policy & Objects** > **Objects** > **Traffic Shapers** and select **Create New**.
2. Set the **Type** to **Shared**.
3. Enter the **Name** `voip`.
4. Select **Per Policy**.
5. Set the **Traffic Priority** to **High**.
6. Select **Maximum Bandwidth** and enter `1000` Kb/s.
7. Select **Guaranteed Bandwidth** and enter `800` Kb/s.
8. Select **OK**.

To create a VoIP shaper - CLI:

```
config firewall shaper traffic-shaper
   edit voip
      set maximum-bandwidth 1000
      set guaranteed-bandwidth 800
      set per-policy enable
      set priority high
   end
```

This ensures that regardless of the number of policies that use this shaper, the defined bandwidth will always be the same. At the same time, the bandwidth is continually guaranteed at 800 Kb/s but if available can be as much as 1000 Kb/s. Setting the priority to high ensures that the FortiGate unit always considers VoIP traffic the most important.

FTP shaper

The FTP shaper sets the maximum bandwidth to use to avoid sudden spikes by sudden uploading or downloading of large files, and interfering with other more important traffic.

To create a FTP shaper - web-based manager:

1. Go to **Policy & Objects** > **Objects** > **Traffic Shapers** and **Create New**.
2. Set the **Type** to **Shared**.
3. Enter the **Name** `ftp`.
4. Set **Apply Shaper** to **All Policies using this shaper**.
5. Set the **Traffic Priority** to **Low**.
6. Select **Maximum Bandwidth** and enter `200` Kb/s

7. Select **Guaranteed Bandwidth** and enter `200` Kb/s.
8. Select **OK**.

To create a FTP shaper - CLI:

```
config firewall shaper traffic-shaper
   edit ftp
      set maximum-bandwidth 200
      set guaranteed-bandwidth 200
      set priority low
   end
```

For this shaper, the maximum and guaranteed bandwidth are set low and to the same value. In this case, the bandwidth is restricted to a specific amount. Setting the traffic priority low ensures that more important traffic will be able to pass before FTP traffic.

Regular traffic shaper

The regular shaper sets the maximum bandwidth and guaranteed bandwidth for everyday business traffic such as web and email traffic.

To create a regular shaper - web-based manager:

1. Go to **Policy & Objects** > **Objects** > **Traffic Shapers** and **Create New**.
2. Set the **Type** to **Shared**.
3. Enter the **Name** `daily_traffic`.
4. Set **Apply Shaper** to **Per Policy**.
5. Set the **Traffic Priority** to **Medium**.
6. Select **Maximum Bandwidth** and enter `600` Kb/s
7. Select **Guaranteed Bandwidth** and enter `600` Kb/s.
8. Select **OK**.

To create a regular shaper - CLI:

```
config firewall shaper traffic-shaper
   edit daily_traffic
      set maximum-bandwidth 600
      set guaranteed-bandwidth 600
      set per-policy enable
      set priority medium
   end
```

For this shaper, the maximum and guaranteed bandwidth are set to a moderate value of 600 Kb/s. It is also set for per policy, which ensures each security policy for day-to-day business traffic has the same distribution of bandwidth.

Creating security policies

To employ the shaper, create security policies that use the shapers within the policies. Create a separate policy for each service and enable traffic shaping. For example, a policy for FTP traffic, a policy for SIP and so on.

For the following steps the VoIP traffic shaper is enabled as well as the reverse direction option. This ensures that return traffic for a VoIP call has the same guaranteed bandwidth as the outgoing call.

To enable traffic shaping in the security policy - web-based manager:

1. Go to **Policy & Objects > Policy > IPv4** and select **Create New**.
2. Enter the following:

Incoming interface	Internal interface
Source address	All
Outgoing interface	WAN1
Destination address	All
Schedule	always
Service	SIP
Action	ACCEPT

3. Select **Traffic Shaping**.
4. From the drop-down menu, select the voip shaper created in the previous steps.
5. Select **Reverse Direction Traffic Shaping**.
6. Select **OK**.

To enable traffic shaping in the security policy - CLI:

```
config firewall policy
   edit 6
      set srcintf <internal_interface>
      set scraddr all
      set dstintf wan1
      set dstaddr all
      set action accept
      set schedule always
      set service sip
      set traffic-shaper voip
      set reverse-traffic-shaper voip
   end
```

Troubleshooting traffic shaping

This chapter outlines some troubleshooting tips and steps to diagnose the shapers and whether they are working correctly. These diagnose commands include:

- `diagnose sys tos-based-priority`
- `diagnose firewall shaper traffic-shaper`
- `diagnose firewall per-ip-shaper`
- `diagnose debug flow`

Interface diagnosis

To optimize traffic shaping performance, first ensure that the network interface's Ethernet statistics are clean of errors, collisions, or buffer overruns. To check the interface, enter the following diagnose command to see the traffic statistics:

```
diagnose hardware deviceinfo nic <port_name>
```

Shaper diagnose commands

There are specific diagnose commands you can use to verify the configuration and flow of traffic, including packet loss due to the employed shaper.

All of these diagnose troubleshooting commands are supported in both IPv4 and IPv6.

ToS command

Use the following command to list command to view information of the ToS lists and traffic.

```
diagnose sys tos-based-priority
```

This example displays the priority value currently correlated with each possible ToS bit value. Priority values are displayed in order of their corresponding ToS bit values, which can range between 0 and 15, from lowest ToS bit value to highest.

For example, if you have not configured ToS-based priorities, the following appears…

```
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0
```

…reflecting that all packets are currently using the same default priority, high (value 0).

If you have configured a ToS-based priority of `low` (value 2) for packets with a ToS bit value of 3, the following appears…

```
0 0 0 2 0 0 0 0 0 0 0 0 0 0 0 0
```

…reflecting that most packets are using the default priority value, except those with a ToS bit value of 3.

Shared shaper

To view information for the shared traffic shaper for security policies enter the command

```
diagnose firewall shaper traffic-shaper list
```

The resultant output displays the information on all available shapers. The more shapers available the longer the list. For example:

```
name Throughput
maximum-bandwidth 1200000 Kb/sec
guaranteed-bandwidth 50000 Kb/sec
current-bandwidth 0 B/sec
priority 1
packets dropped 0
```

Additional commands include:

`diagnose firewall shaper traffic-shaper state` - provides the total number of traffic shapers on the FortiGate unit.

`diagnose firewall shaper traffic-shaper stats` - provides summary statistics on the shapers. Sample output looks like the following:

```
shapers 9 ipv4 0 ipv6 0 drops 0
```

Per-IP shaper

To view information for the per-IP shaper for security policies enter the command

```
diagnose firewall shaper per-ip-shaper list
```

The resultant output displays the information on all available per-IP shapers. The more shapers available the longer the list. For example:

```
name accounting_group
maximum-bandwidth 200000 Kb/sec
maximum-concurrent-session 55
packet dropped 0
```

Additional commands include:

`diagnose firewall shaper per-ip-shaper state` - provides the total number of per-ip shapers on the FortiGate unit.

`diagnose firewall shaper per-ip-shaper stats` - provides summary statistics on the shapers. Sample output looks like the following:

```
memory allocated 3 packet dropped: 0
```

You can also clear the per-ip statistical data to begin a fresh diagnoses using:

```
diagnose firewall shaper per-ip-shaper clear
```

Packet loss with statistics on shapers

For each shaper there are counters that allow to verify if packets have been discarded. To view this information, in the CLI, enter the command diagnose firewall shaper. The results will look similar to the following output:

```
diagnose firewall shaper traffic-shaper list
name limit_GB_25_MB_50_LQ
maximum-bandwidth 50 Kb/sec
guaranteed-bandwidth 25 Kb/sec
current-bandwidth 51 Kb/sec
priority 3
dropped 1291985
```

The diagnose command output is different if the shapers are configured either per-policy or shared between policies.

For per-IP the output would be:

```
diagnose firewall shaper per-ip-shaper list

name accounting_group
maximum-bandwidth 200000 Kb/sec
maximum-concurrent-session 55
packet dropped 3264220
```

Packet lost with the debug flow

When using the debug flow diagnostic command, there is a specific message information that a packet has exceed the shaper limits and therefor discarded:

```
diagnose debug flow show console enable
diagnose debug flow filter addr 10.143.0.5
diagnose debug flow trace start 1000

id=20085 trace_id=11 msg="vd-root received a packet(proto=17, 10.141.0.11:3735-
    >10.143.0.5:5001) from port5."
id=20085 trace_id=11 msg="Find an existing session, id-0000eabc, original direction"
id=20085 trace_id=11 msg="exceeded shaper limit, drop"
```

Session list details with dual traffic shaper

When a Security Policy has a different traffic shaper for each direction, it is reflected in the session list output from the CLI:

```
diagnose sys session list

session info: proto=6 proto_state=02 expire=115 timeout=3600 flags=00000000 sock
flag=00000000 sockport=0 av_idx=0 use=4
origin-shaper=Limit_25Mbps prio=1 guarantee 25600/sec max 204800/sec traffic 48/sec

Additional Information

- Packets discarded by the shaper impact flow-control mechanisms like TCP. For more accurate testing results prefer UDP protocol.
- Traffic shaping accuracy is optimum for security policies without a protection profile where no FortiGate content inspection is processed.

- Do not oversubscribe an outbandwith throughput. For example, sum[guaranteed BW] < outbandwith. For accuracy in bandwidth calculation, it is required to set the “outbandwidth” parameter on the interfaces. For more information see Bandwidth guarantee, limit, and priority interactions on page 2394.
- The FortiGate unit is not prioritizing traffic based on the DSCP marking configured in the security policy. However, ToS based prioritizing can be made at ingress. For more information see Differentiated Services on page 2411.

Chapter 25 - Transparent Mode

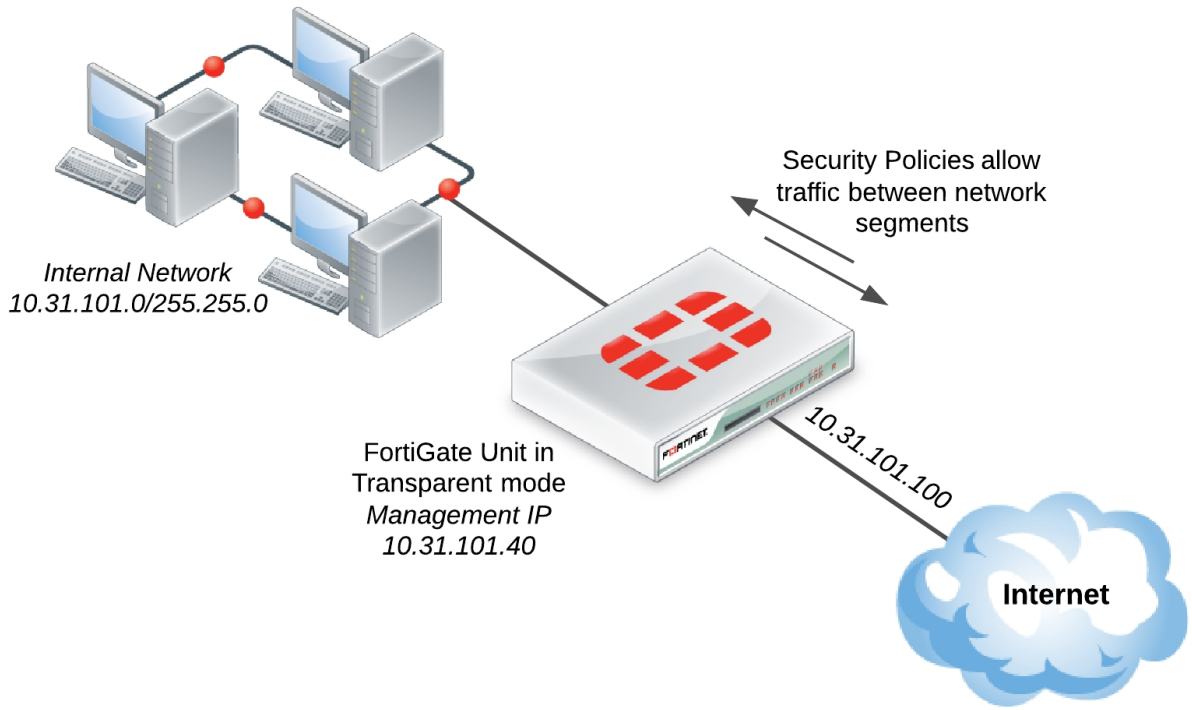
What is Transparent Mode?

A FortiGate unit can operate in one of two modes: Transparent or NAT/Route mode.

In Transparent mode, the FortiGate is installed between the internal network and the router. In this mode, the FortiGate does not make any changes to IP addresses and only applies security scanning to traffic. When a FortiGate is added to a network in Transparent mode, no network changes are required, except to provide the FortiGate with a management IP address. Transparent mode is used primarily when there is a need to increase network protection but changing the configuration of the network itself is impractical.

In NAT/Route mode, a FortiGate unit is installed as a gateway or router between two networks. This allows the FortiGate to hide the IP addresses of the private network using network address translation (NAT).

A Network with a FortiGate unit in Transparent mode



Feature matrix - Maximum values

FortiGate features and capabilities matrix - NAT vs Transparent mode

Feature/capability	NAT	Transparent	Comment
Unicast Routing / Policy Based routing	YES	NO	
VIP / IP pools / NAT	YES	YES	Configurable from CLI only in transparent mode
Multicast routing	YES	NO - Options available to forward multicast packets	
L2 forwarding	NO	YES	In Transparent mode, other frames than IP can be forwarded but with no UTM processing.
Firewall (packet filtering / NAT / Authentication)	YES	YES	
IPv6 capable	YES	YES	
Traffic shaping - TOS classification	YES	YES	
Hardware acceleration	YES	YES	
IPS	YES	YES	
Anti-Virus	YES	YES	
WEB filtering and Fortiguard WEB filtering	YES	YES	
Mail filtering and Anti-Spam	YES	YES	
Other UTM features (IM/P2P, DLP)	YES	YES	
IPsec gateway	YES	YES - Policy based mode only	
SSL gateway	YES	NO	
High-Availability (HA) - Virtual Cluster	YES	YES	
802.3ad (LACP / port aggregation)	YES	YES	

Feature/capability	NAT	Transparent	Comment
HA port redundancy	YES	YES	FortiGate hardware dependent
802.1q - VLAN trunking	YES	YES	
802.1d - Spanning Tree	NO	NO - option to forward BPDUs	
Logging and reporting (FAMS, syslog or FortiAnalyzer)	YES	YES	
Managed by FortiManager	YES	YES	

Interfaces in Transparent Mode

For a FortiGate in Transparent mode, the maximum number of Interfaces per VDOM is 254. This value includes both physical and virtual interfaces.

For any other maximum values, please consult the Maximum Values Table, available at docs.fortinet.com.

Installation

Installing a FortiGate in Transparent mode

Changing to Transparent mode removes most configuration changes made in NAT/Route mode. To keep your current NAT/Route mode configuration, backup the configuration using the **System Information** widget, found at **System > Dashboard > Status**.

1. Before connecting the FortiGate unit to your network, go to **System > Dashboard > Status** and locate the **System Information** widget. Beside **Operation Mode**, select **Change**.
2. Set the **Operation Mode** to **Transparent**. Set the **Management IP/Netmask** and **Default Gateway** to connect the FortiGate unit to the internal network. Select **OK**.
3. Access the web-based manager by browsing to the new management IP.
4. (Optional) The FortiGate unit's DNS Settings are set to use FortiGuard DNS servers by default, which is sufficient for most networks. However, if you need to change the DNS servers, go to **System > Network > DNS** and add **Primary** and **Secondary** DNS servers. Select **Apply**.
5. If your network uses IPv4 addresses, go to **Policy & Objects > Policy > IPv4** and select **Create New** to add a security policy that allows users on the private network to access the Internet.
   If your network uses IPv6 addresses, go to **Policy & Objects > Policy > IPv6** and select **Create New** to add a security policy that allows users on the private network to access the Internet. If the IPv6 menu option is not available, go to **System > Config > Features**, turn on **IPv6**, and select **Apply**. For more information on IPv6 networks, see the IPv6 Handbook.
   Set the **Incoming Interface** to the internal interface and the **Outgoing Interface** to the Internet-facing interface

(typically WAN1). You will also need to set **Source Address**, **Destination Address**, **Schedule**, and **Service** according to your network requirements. You can set these fields to the default all/ANY settings for now but should create the appropriate objects later after the policies have been verified.

6. Make sure the **Action** is set to **ACCEPT**. Select **OK**.

It is recommended to avoid using any security profiles, such as AntiVirus or web filtering, until after you have successfully installed the FortiGate unit. After the installation is verified, you can apply any required security profiles.

For more information about using security profiles, see the Security Profiles handbook.

7. Go to **System > Dashboard > Status** and locate the **System Resources** widget. Select **Shutdown** to power off the FortiGate unit.
   Alternatively, you can also use the CLI command `execute shutdown`.
8. Connect the FortiGate unit between the internal network and the router.
9. Connect the Internet-facing interface to the router's internal interface and connect the internal network to the FortiGate using an internal port (typically port 1).
10. Power on the FortiGate unit. You will experience downtime before the FortiGate unit starts up completely.

Results

Users on the internal network are now able to browse to the Internet. They should also be able to connect to the Internet using any other protocol or connection method that you defined in the security policy.

If a FortiGate unit operating in Transparent mode is installed between your internet network and a server that is providing a network service to the internal network, such as DNS or DHCP, you must add a wan1-to-internal policy to allow the server's response to flow through the FortiGate unit and reach the internal network.

Using Port Pairing to Simplify Transparent Mode

Once you have successfully installed a FortiGate in Transparent mode, you can use port pairing to simplify the configuration.

When you create a port pair, all traffic accepted by one of the paired interfaces can only exit out the other interface. Restricting traffic in this way simplifies your FortiGate configuration because security policies between these interfaces are pre-configured.

Traffic between port-paired interfaces does not check the bridge table and MAC addresses are not learned. Instead traffic received by one interface in a port pair is forwarded out the other (if allowed by a firewall policy). This makes port pairing useful for unusual topologies where MAC addresses do not behave normally. For example, port paring can be used in a Direct Server Return (DSR) topology where the response MAC address pair may not match the request's MAC address pair.

1. Go to *System* > *Network* > *Interfaces*. Select *Create New* > *Port Pair*. Create a port pair that includes both interfaces.
2. Go to *Policy & Objects* > *Policy* > *IPv4*. Create two security policy that allow traffic to flow between the interfaces in the port pair (for example, if you are pairing *wan1* and *Internal*, create a wan1-to-Internal policy and an Internal-to-wan1 policy).

Traffic should now be able to flow between the interfaces in the port pair. You can verify this by going to *Log & Report* > *Traffic Log* > *Forward Traffic*.

Networking

Introduction

Introduce this mess of a section in a way that makes sense!

Packet Forwarding

MAC learning and L2 Forwarding Table

When operating in Transparent mode, a FortiGate behaves like an L2 switch in accordance with 802.1d principles:

- The forwarding database (FDB) is populated with the network devices MAC addresses during a MAC learning process, based on the source addresses seen in the Ethernet frames ingressing a FortiGate port. Static MAC entries can also be configured using the following CLI command:

```
config system mac-address-table
   edit 00:01:02:03:04:05
      set interface "port3"
   next
end
```

  The FDB table can be verified with the following command: `diagnose netlink brctl name host TP.b`

- Ethernet IP frames forwarding is based on known MAC address on each port.
- As Spanning Tree in not running on the FortiGate, a port that comes up goes immediately into forwarding or flooding state. This last state will not occur once unicast MAC addresses are present in the FDB.

If the FortiGate in Transparent mode bridges traffic to a router or host using a virtual MAC for one direction and a different physical MAC for the other direction (for example when VRRP or HSRP protocols are used), it is highly recommended to create a static MAC entry for the virtual MAC. This is to make sure that the virtual MAC address is present in the FDB.

Broadcast, Multicast, and Unicast forwarding

In Transparent mode, IPv4 packets are typically only forwarded by the FortiGate from a port to another port when a firewall policy is matched with action ACCEPT.

Below are exceptions.

- **L2 (IP) Broadcast frames forwarding:**

L2 (IP) means a L2 frame type 0x0800 (IP) or 0x0806 (ARP)

- **ARP:** by default, ARP broadcasts and ARP reply packets are flooded/forwarded on all ports or VLANs belonging to the same forwarding domain, without the need of firewall policies between the ports. This default behavior is necessary to allow the population of the FDB and allow further firewall policy lookup (see section Transparent mode Firewall processing for more details). This option is configurable at the interface settings level with the parameter arpforward (enabled by default).
- **Non-ARP:** To forward non-ARP broadcasts, the following CLI command is used:

```
config system interface
   edit "port2"
      set broadcast-forward enable
   next
end
```

- **L2 (IP) Multicast frames forwarding:** the FortiGate does not forward frames with multicast destination MAC addresses by default. Multicast traffic such as one used by routing protocols or streaming media may need to traverse the FortiGate which should not interfere this communication.

  Fortinet recommends that the FortiGate is set up using Multicast policies. This allows for greater control and predictability on traffic behavior. However Multicast traffic may be forwarded through a Transparent mode device using the multicast-skip-policy setting. This is detailed in the section "Multicast processing" on page 1.
- **L2 (IP) Unicast frames forwarding:** a frame with a unicast destination MAC address is subject to firewall processing before being forwarded (see "Firewall policies" on page 2447 for more details). This does not apply to ARP replies.

Multicast processing

In Transparent mode, a FortiGate does not forward frames with multicast destination MAC addresses by default. If multicast traffic is required, multicast policies are recommended to allow finer control of this traffic.

Forwarding all multicast traffic with policy

Multicast traffic may have to be forwarded through a Transparent mode device using the `multicast-skip-policy`sytem setting. This is the configuration for this solution:

```
config system settings
   set multicast-skip-policy enable
end
```

In that case, no check is performed on sources/destinations/interfaces. A multicast packet received on an interface is flooded unconditionally to all interfaces (except the incoming interface) belonging to the same forwarding domain.

Configuring firewall multicast-policy

The use of `firewall multicast-policy` allows a finer control over the multicast packets. Hereafter are some commented examples. Note that the parameter multicast-skip-policy mentioned above must be left to disabled.

Those policies can only be configured from the CLI.

1- Simple policy

```
config firewall multicast-policy
   edit 1
      set action accept
   next
end
```

In that case, no check is performed on sources/destinations/interfaces. A multicast packet received on an interface is flooded unconditionally to all interfaces (except the incoming interface) belonging to the same forwarding domain.

2- To restrict incoming and outgoing interfaces:

```
config firewall multicast-policy
   edit 1
      set srcintf "port1"
      set dstintf "port2"
      set action accept
   next
end
```

3- To be more restrictive (example to allow RIP2 packets from port1 to port2 and sourced by 10.10.0.10):

```
config firewall multicast-policy
   edit 1
      set srcintf "port1"
      set srcaddr 10.10.0.10 255.255.255.255
      set dstintf "port2"
      set dstaddr 224.0.0.9 255.255.255.255
      set action accept
   next
end
```

4- This policy will allow all 224.0.0.0/255 range (OSPF, RIPv2, DVMPR…) from port1 to port2

```
config firewall multicast-policy
   edit 1
      set srcintf "port1"
      set dstintf "port2"
      set dstaddr 224.0.0.0 255.255.255
      set action accept
   next
end
```

Source MAC addresses in frames sent by or through the FortiGate

When a FortiGate is in Transparent Mode, it does not typically alter the original source and destination address of packets that flow through the unit. Because of this, end devices do not “see” the MAC address of the FortiGate. However, if network address translation (NAT) is enabled by a firewall policy, the source MAC address will be the MAC address of the FortiGate's management interface.

IP packets that are initiated by the FortiGate (remote management, access to FortiGuard server…) are sent in L2 Ethernet frames that have a source MAC address of the interface in the virtual domain (VDOM) with the lowest MAC address. Below is an example with port2 and port3 in the same VDOM, remote access done via port2, but the sniffer trace showing MAC address of port2. The address of port2 is shown in bold.

```
diagnose hardware deviceinfo nic port2
[…]
Current_HWaddr          00:09:0F:85:3F:C4
Permanent_HWaddr        00:09:0F:85:3F:C4

fgt300 (global) # diagnose hardware deviceinfo nic port3
[…]
Current_HWaddr          00:09:0F:85:3F:C5
Permanent_HWaddr        00:09:0F:85:3F:C5

diagnose sniffer packet port3 "port 80" 6
3.774236 port3 -- 192.168.171.165.2619 -> 192.168.182.136.80: syn 3961770249

0x0030   ffff d7e7 0000 0204 05b4 0101 0402
```

ARP table

In Transparent mode, the Address Resolution Protocol (ARP) table is used in the following situations:

- For IP traffic received or originated by the FortiGate itself, and in destination of the management device or next-hop.
- When IPsec is used, the FortiGate uses its ARP table to forward the traffic from the IPsec tunnel to the local destination host(s).

All other forwarding decision is based on the Forwarding Database (FDB) table or optional settings.

Verifying the forwarding database

To view all instances of the forwarding database (FDB), use the following CLI command:

```
diagnose netlink brctl list
```

Example

```
FGT # diagnose netlink brctl list

list bridge information
1. root.b      fdb: size=256    used=6     num=7     depth=2     simple=no
2. mgmt.b      fdb: size=256    used=5     num=4     depth=2     simple=no
Total 2 bridges
```

Here above we can see two bridge instances for 2 VDOMs in Transparent mode: `root` and `mgmt`.

- This command will dump the L2 forwarding table for each VDOM bridge instance:

```
diagnose netlink brctl name host <VDOM_name>.b
```

Example for the root VDOM:

```
FGT# diag netlink brctl name host root.b

show bridge control interface root.b host.
fdb: size=256, used=6, num=7, depth=2, simple=no
Bridge root.b host table
port no device  devname  mac addr                  ttl      atributes
   2     7      wan2     02:09:0f:78:69:00          0        Local Static
   5     6      trunk_1  02:09:0f:78:69:01          0        Local Static
   3     8      dmz      02:09:0f:78:69:01          0        Local Static
   4     9      internal 02:09:0f:78:69:02          0        Local Static
   3     8      dmz      00:80:c8:39:87:5a          194
   4     9      internal 02:09:0f:78:67:68          8
   1     3      wan1     00:09:0f:78:69:fe          0        Local Static
```

Spanning Tree BPDUs forwarding

Spanning tree Bridge Protocol Data Units (BPDUs) are not forwarded by default in Transparent Mode. To forward spanning tree BPDUs, the following setting can be applied on each interface where this is required:

```
config system interface
   edit port1
      set stpforward enable
   next
end
```

Non-IPv4 Ethernet frames forwarding

In the situation where non IP frames (or non Ethernet II) frames need to be accepted on a port, the parameter `l2forward` can be enabled (disabled by default). This can be used to forward frames such as PPPoE PADI, Appletalk, on other ports belonging to the same forwarding domain.

The procedure is the following:

```
config system interface
   edit port1
      set l2forward enable
   next
   edit port2
      set l2forward enable
   next
end
```

NAT

Configuring SNAT

Source Network Address Translation (SNAT) is an option available in Transparent mode and configurable in CLI only, using the following commands:

```
config firewall ippool
   edit "nat-out"
      set endip 192.168.183.48
      set startip 192.168.183.48
      set interface vlan18_p3
   next
end

config firewall policy
   edit 3
      set srcintf "vlan160_p2"
      set dstintf "vlan18_p3"
      set srcaddr "all"
      set dstaddr "all"
      set action accept
      set ippool enable
      set poolname "nat-out"
      set schedule "always"
      set service "ANY"
      set nat enable
   next
end
```

The sniffer trace below shows the source IP 192.168.182.93 being source translated to 192.168.183.48:

```
fgt300 (TP) # diagnose sniffer packet any "host 10.2.2.1" 4

interfaces=[any]
filters=[host 10.2.2.1]
4.891970 vlan160_p2 in 192.168.182.93 -> 10.2.2.1: icmp: echo request
4.892003 vlan18_p3 out 192.168.183.48 -> 10.2.2.1: icmp: echo request
4.892007 port3 out 192.168.183.48 -> 10.2.2.1: icmp: echo request
4.933216 vlan18_p3 in 10.2.2.1 -> 192.168.183.48: icmp: echo reply
```

```
4.933249 vlan160_p2 out 10.2.2.1 -> 192.168.182.93: icmp: echo reply
4.933253 port2 out 10.2.2.1 -> 192.168.182.93: icmp: echo reply
```

Configuring DNAT

The following example shows how to configure Destination Network Address Translation (DNAT) using a virtual IP on a FortiGatein Transparent Mode:

```
config firewall vip
   edit "vip1"
      set extip 192.168.183.48
      set extintf "vlan160_p2"
      set mappedip 192.168.182.78
   next
end

config firewall policy
   edit 4
      set srcintf "vlan160_p2"
      set dstintf "vlan18_p3"
      set srcaddr "all"
      set dstaddr "vip1"
      set action accept
      set schedule "always"
      set service "ANY"
   next
end
```

If the `mappedip` is on a different subnet than the management IP, the FortiGate must have a valid routeto this destination

The sniffer trace below shows the destination IP 192.168.183.48 being translated to 192.168.182.78:

```
fgt300 (TP) # diagnose sniffer packet any "icmp" 4

interfaces=[any]
filters=[icmp]
4.126138 vlan160_p2 in 192.168.182.93 -> 192.168.183.48: icmp: echo request
4.126190 vlan18_p3 out 192.168.182.93 -> 192.168.182.78: icmp: echo request
4.126196 port3 out 192.168.182.93 -> 192.168.182.78: icmp: echo request
4.126628 vlan18_p3 in 192.168.182.78 -> 192.168.182.93: icmp: echo reply
4.126661 vlan160_p2 out 192.168.183.48 -> 192.168.182.93: icmp: echo reply
4.126667 port2 out 192.168.183.48 -> 192.168.182.93: icmp: echo reply
```

VLANs and Forwarding Domains

Forwarding Domains

A forwarding domain is used to create separate broadcast domains and confine traffic across two or more ports. It also allows learning the same MAC in different VLANs (IVL). See section "VLAN trunking and MAC address learning" on page 2444 for more details.

A forwarding domain and its associated ID number are unique across one VDOM, or a FortiGate with VDOMs disabled. Each new VDOM will create a new bridge instance in the FortiGate.

Even though the forwarding domain ID is not in relation with the actual VLAN numbers, it recommended, for maintenance and troubleshooting purposes, to configure one forwarding domain per VLAN and use the same forwarding domain ID as the VLANs ID.

Once forwarding domains are configured, it is possible to configure firewall policies only between ports or VLAN belonging to the same forwarding domain.

Figure 4 shows an example with three forwarding domains and VLANs configured. In this example, there are two VDOMs in Transparent Mode: root and MGMT. Forwarding domain 0 is the default on the FortiGate or VDOM in Transparent Mode.

- Root VDOM has:
  - 3 forwarding domains, 0, 340, and 341.
  - VLAN 340 configured on port1; packets will be tagged with ID 340
  - VLAN 341 configured on port1; packets will be tagged with ID 341
  - All other ports are untagged
- MGMT VDOM has got only the default forwarding domain 0

The expected behavior is the following:

- Packets untagged ingressing port1, port3 and port4 belong to the same broadcast domain in the root VDOM
- Packets tagged with VLAN 340 ingressing port1 and Packets untagged ingressing port2 belong to the same broadcast domain in the root VDOM
- Packets tagged with VLAN 341 ingressing port1 and Packets untagged ingressing port5 belong to the same broadcast domain in the root VDOM
- Packets untagged ingressing port6 belong to a different broadcast domain in the MGMT VDOM

Configuration example for forwarding domain 340:

```
config system interface
   edit "VLAN340"
      set forward-domain 340
      set interface "port1"
      set vlanid 340
   next
      edit "port3"
         set forward-domain 340
   next
end
```

VLANs in Transparent Mode

A VLAN configured on a physical port is used to classify a packet in a broadcast domain in ingress and to tag packet in egress. A VLAN on the FortiGate conforms to the standard 802.1q. The following rules apply to VLAN configuration:

- a VLAN ID can be used only once on the same physical port
- the same VLAN ID can be used on a different port
- the VLAN ID range is from 1 to 4094

VLANs vs a forwarding domain

There are several differences between VLAN and a forwarding domain configured on a FortiGate in Transparent Mode:

- A forwarding domain is used to create separated broadcast domains between VLANs and allow independent VLAN learning - IVL (MAC addresses in the FDB). This would be equivalent to creating VLANs on a regular L2 switch.

When VLANs are used in the network, configuring different forwarding domains is essential to avoid broadcast duplications. See also section Default VLAN forwarding behavior for additional information.

- VLANs configured on interfaces are only used for tagging packets egressing the port and classifying packets at ingress.
- The packets processed by the direct interface (or port) itself are always sent untagged and must be received untagged.

Default VLAN forwarding behaviour

By default, the parameter **vlanforward** is enabled on each physical interface of a FortiGate or VDOM in Transparent mode.

This allows to forward all VLANs traffic of a trunk that was connecting two network devices and where the FortiGate has been introduced, without having to perform any further configuration.

It is recommended to configure forwarding domains for each VLAN and disable this parameter in order to avoid packet from looping into the trunk from one VLAN to another.

Configuration example:

```
config system interface
   edit port1
      set vlanforward disable
   next
   edit port2
      set vlanforward disable
   next
end
```

Unknown VLAN processing

When a FortiGate receives a tagged frame with an unknown VLAN ID, the processing is the following:

- By default, the ports are set with the parameter `vlanforward enable`; in this scenario, all tagged frames are forwarded to the ports belonging to the same forwarding domain. This allows you to insert the FortiGate between two devices using trunk ports without any further configuration.
- When using forwarding domains in association with VLANs, `vlanforward` should be disabled whenever applicable. In this scenario, any new tagged frames with unknown VLAN IDs are dropped by the FortiGate. This is the solution recommended by Fortinet.

For an example VLAN configuration, see"Configuration example" on page 2446.

VLAN trunking and MAC address learning

A FortiGate port becomes a trunk when 2 or more VLANs are configured on this port, in the same or different forwarding domains.

When trunks are configured on a FortiGate, it is essential to create forwarddomains, in order to avoid packets looping back on the VLANs of the trunk. This will confine all broadcasts and multicast traffic between the interfaces belonging to a same forward domain.

In the case where a trunk port is configured with a VLAN in a different forwarding domains, the MAC address of the network device connected to this port learns the FDB of each forwarding domain. This is Independent VLAN Learning (IVL).

VLAN translation

The same forwarding domain can include several different VLANs. Therefore, a frame ingressing an interface with a certain VLAN ID can be forwarded to another port with another VLAN ID. This is sometimes referred as VLAN translation.

Other

Inter-VDOM links between NAT mode and Transparent mode VDOMs

Inter-VDOM links between NAT and Transparent mode VDOMS can be useful for configurations where the NAT based VDOMs that share a common Internet service route, which can be routed through a Transparent VDOM that provides additional functionality, like common Security inspection, WAN optimization, explicit proxying and so on.

Other examples include:

- Performing SSL offloading in the Transparent mode VDOM and providing Internet access through a NAT mode VDOM.
- Applying WAN optimization in a Transparent mode VDOM and other security features in the NAT mode VDOM.
- Using a dedicated Transparent mode VDOM for the explicit web proxy in front of a NAT mode VDOM that applies other security features.
- An ISP configuration with multiple per-tenant NAT mode VDOMs all sharing a single Internet connection but where the ISP only presents a single routed subnet. Each tenant can then be assigned an IP from the subnet for their respective VDOM link interface while using a single physical port to connect to the ISP router.

For more information about inter-VDOM links, please refer to the Virtual Domains handbook.

Packet forwarding using Cisco protocols

In order to pass Cisco Discover Protocol (CDP) or Cisco VLAN Trunk Protocol (VTP) packets through a FortiGate in Transparent mode, the parameter `stpforward` must be applied on the port configuration. VTP and CDP packets are sent to the destination MAC address 01-00-0C-CC-CC-CC

A Cisco NATIVE VLAN carries CDP/VTP frames. The frames of this VLAN must be received on the FortiGate physical interfaces (not VLAN sub-interface). Physical interfaces are the only ones that can send/accept non-tagged packets.

The example below will allow CDP and VTP packets to be sent from port3 up to the Remote unit, through two VDOMs, via one physical port and three port aggregations.

Port and Port aggregation configuration:

```
config system interface
   edit "port1"
      set vdom "VD1"
   next
   edit "port2"
      set vdom "VD1"
   next
   edit "port3"
      set vdom "VD1"
      set stpforward enable
   next
   edit "port5"
      set vdom "VD3"
   next
   edit "port6"
      set vdom "VD3"
   next
   edit "port17"
      set vdom "VD2"
   next
   edit "port18"
      set vdom "VD2"
   next
   edit "port19"
      set vdom "VD2"
   next
   edit "port20"
      set vdom "VD2"
   next
   edit "LACP_VD2_IN"
      set vdom "VD2"
      set stpforward enable
      set type aggregate
         set member "port17" "port18"
   next
   edit "LACP_VD2_OUT"
      set vdom "VD2"
      set stpforward enable
      set type aggregate
         set member "port19" "port20"
   next
   edit "LACP_VD1"
      set vdom "VD1"
      set stpforward enable
      set type aggregate
         set member "port1" "port2"
   next
end
```

- When using aggregation, the `stpforward` setting needs to be applied only on the port aggregation level, not on the physical port
- This will also forward regular Spanning Tree BPDUs

Verification with a sniffer trace:

```
FGT# diagnose sniffer packet any "" 4

41.365434 port3 in llc unnumbered, ui, flags [command], length 72
41.365437 LACP_VD1 out llc unnumbered, ui, flags [command], length 72
41.365439 port2 out llc unnumbered, ui, flags [command], length 72
41.365479 LACP_VD2_IN in llc unnumbered, ui, flags [command], length 72
41.365482 LACP_VD2_OUT out llc unnumbered, ui, flags [command], length 72
41.365484 port19 out llc unnumbered, ui, flags [command], length 72
```

See above the CDP packet flow from port3, LACP_VD1 (port2), LACP_VD2_IN, LACP_VD2_OUT (port19)

The following sniffer trace command will filter only CDP or VTP packets :

```
FGT# diagnose sniffer packet port_name "ether host 01-00-
0C-CC-CC-CC"
```

Configuration example

Step 1: Create VLANs and forwarding domains

```
config system interface
   edit "vlan102_intern"
   set forward-domain 102
   set interface "port2"
   set vlanid 102
next
   edit "vlan102_extern"
   set forward-domain 102
   set interface "port3"
   set vlanid 102
next
   edit "vlan103_intern"
   set forward-domain 103
   set interface "port2"
   set vlanid 103
next
   edit "vlan103_extern"
   set forward-domain 103
   set interface "port3"
   set vlanid 103
next
end
```

Step 2: Create the appropriate Firewall Policies

```
config firewall policy
   edit 1
      set srcintf "vlan102_extern"
```

```
        set dstintf "vlan102_intern"
           set srcaddr "all"
           set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ANY" next
     edit 2
        set srcintf "vlan102_intern"
        set dstintf "vlan102_extern"
           set srcaddr "all"
           set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ANY" next
     edit 3
        set srcintf "vlan103_intern"
        set dstintf "vlan103_extern"
           set srcaddr "all"
           set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ANY" next
     edit 4
        set srcintf "vlan103_extern"
        set dstintf "vlan103_intern"
           set srcaddr "all"
           set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ANY" next
  end
```

Firewall policies

Firewall policy look up

In Transparent mode, like in NAT mode, a firewall policy look up is based on the source and destination interfaces. The matching firewall policy will tell which actions to apply to the traffic, including logging and security scanning.

The FortiGate proceeds as follows to look for a matching firewall policy in Transparent mode:

- **Step 1:** an Ethernet IP frame ingresses a port (or a VLAN on a port), corresponding to a specific bridge instance (from the port VDOM and Forwarding domain). This frame contains a destination MAC address that we will call MAC_D.
- **Step 2:** The FortiGate is making a MAC_D address lookup in the bridge instance to determine the port where MAC_D has been learned. This will be the destination interface.
- **Step 3:** The FortiGate is then looking for a firewall policy corresponding to the couple < source interface + destination interface >. If multiple policies with the same couple < source interface + destination interface > exist, the FortiGate screens all of them from TOP to BOTTOM (as displayed in the configuration), until a match is found. It is important to make sure that the most specific firewall policies are located at the top of the policy list, to make sure that traffic is matched to the appropriate policy.

Security scanning

Security scanning occurs in the same manner in NAT mode and Transparent mode. When a protection profile is enabled on a firewall policy for content inspection, the FortiGate acts like a transparent proxy for the protocols that need to be inspected.

The FortiGate will therefore intercept the TCP sessions and create its own session from client to server and server to client. The source and destination MAC addresses of the original L2 frames are however not altered in this communication, as described in the section Network operation : source MAC addresses in frames sent by or through the FortiGate.

Devices in the network communicating through the FortiGate do not know the presence of the FortiGate.

For more information about security scanning, see the Security Profileshandbook.

Firewall session list

The flag **br** in the state line will indicate that this is a “bridged” session. See example below :

```
FGT# diagnose sys session list

session info: proto=17 proto_state=00 duration=59 expire=128 timeout=0 flags=000
00000 sockflag=00000000 sockport=0 av_idx=0 use=4
origin-shaper=
reply-shaper=
per_ip_shaper=
ha_id=0 hakey=0
policy_dir=0 tunnel=/
state=may_dirty br rem
statistic(bytes/packets/allow_err): org=385/5/1 reply=0/0/0 tuples=2
orgin->sink: org pre->post, reply pre->post dev=3->4/4->3 gwy=0.0.0.0/0.0.0.0
hook=pre dir=org act=noop 192.168.182.93:1025->4.2.2.1:53(0.0.0.0:0)
hook=post dir=reply act=noop 4.2.2.1:53->192.168.182.93:1025(0.0.0.0:0)
misc=0 policy_id=1 auth_info=0 chk_client_info=0 vd=1 serial=000006d3 tos=ff/ff
imp2p=0 app=0
dd_type=0 dd_rule_id=0
```

ISF ACL policies

Traffic accepted and forwarded by an ISF policy is not subject to security inspection. Normally, you should only create ISF policies for traffic that you consider very low risk.

On FortiGate models that include NP4 and XLR ports and an integrated switch fabric , you can create an integrated switch fabric (ISF) access control list (ACL) firewall policy that allows some traffic (for example, multicast traffic) to bypass security inspection, resulting in reduced CPN and NP4 processor load.

This feature is only available in Transparent mode and only between port pairs.

Use the following command to add an ISF ACL shortcut policy:

```
config firewall isf-acl
   config port-pair-1
      edit 1
         set type binary
         set ingressport {port1 | port2}
         set offset
         set length
         set matchpattern <pattern in hex>
         set action {bypass | block}
      next
      edit 2
         set type 5-tuple
         set srcaddr: a.b.c.d/32
         set dstaddr 239.A.A.a/32
         set proto UDP
         set port XXX
         set action {bypass | block}
      end
   end
```

FortiGate remote management

Management IP configuration in Transparent mode

A FortiGate in Transparent mode can be assigned with a single IP address for remote access management and multiple static routes can be configured. This can be used if in-band management wants to be applied.

When out-of-band management is desired (dedicated interface for remote management access), it is recommended to use a separate VDOM in NAT mode.

In-band management details and example

The management IP address is bound to all ports or VLANs belonging to the same VDOM. Remote access services are subject to the same rules as in NAT mode, and must be enabled/disabled on each port.

Example of management IP configuration in Transparent mode:

```
config system settings
   set manageip 10.1.1.100/255.255.255.0
end
config router static
   edit 1
      set gateway 10.1.1.254
   next
end
config system interface
   edit port1
      set allowaccess ping ssh https snmp
end
```

It is also possible to add a second IP address for management and additional default routes:

```
config system settings
   set opmode transparent
   set manageip 192.168.182.136/255.255.254.0 10.1.1.1/255.255.255.0
end

config router static
   edit 1
      set gateway 192.168.183.254
   next
   edit 2
      set gateway 10.1.1.254
   next
end
```

`ping-server` (dead gateway detection) is not supported in Transparent mode.

Out-of-band management details and example

When VDOM is enabled and the VDOMs are operating in Transparent mode, it is recommended, to avoid L2 loops and allow more routing flexibility, to keep one VDOM (generally the root VDOM) in NAT mode, with one or more VLAN or physical interface as out-of-band management.

The management VDOM must have IP connectivity to the Internet to allow communication with the FDS and retrieve services information (AV,IPS, Fortiguard filtering, Support…). All syslog and FortiManager communication also go through the management VDOM.

FortiManager, FortiAnalyzer

FortiManager, logging and reporting and FortiAnalyzer are supported similarly to NAT mode. For more information about this please consult the Fortinet documentation at http://docs.fortinet.com or the Knowledge base at http://kb.fortinet.com.

Establishing a secured IPSec communication to a FortiAnalyzer is done as per the example hereafter (from global level if VDOM is enabled). This setting is independent from being in Transparent mode. However, as stated earlier in this section the management VDOM must have IP connectivity to the FortiAnalyzer.

```
FGT (global) # show system fortianalyzer

config system fortianalyzer
   set status enable
   set server 10.2.2.2
   set encrypt enable
   set psksecret fortinet
end
```

Transparent mode and HA

Transparent mode and HA

For complete information about HA, please refer to the Fortigate Administration Guide or the HA Technical guides available at http://docs.fortinet.com or the Knowledge Base at http://kb.fortinet.com.

Any other statement and feature description in this document apply to a FortiGate Cluster running in Active-Passive mode.

HA MAC address assignment

If a cluster is operating in Transparent mode, the FortiGate Clustering Protocol (FGCP) assigns a virtual MAC address for the Master unit management IP address. Since you can connect to the management IP address from any interface, all of the FortiGate interfaces appear to have the same virtual MAC address.

Virtual cluster

If VDOM (virtual domain) is enabled on a cluster operating Transparent Mode, HA Virtual Clustering can be configured in active-passive mode.

This will provide:

- Failover protection between two instances of a VDOM operating on two different FortiGate in the cluster.
- Load balancing between the FortiGate units on a per-VDOM basis.

The roles have been defined such as, in normal operation:

- FortiGate1 is Master for Vdom1 and Slave for Vdom2
- FortiGate2 is Master for Vdom2 and Slave for Vdom1

In case of a failure or reboot of a FortiGate, the remaining unit will become Master for Vdom1 and Vdom2.

The VDOMs given in this example are showing physical ports but a VDOM can also include VLAN interfaces.

The L2 connectivity between the FortiGate is showing 4 separate L2 switches, but it could also be one single switch one each side configured with appropriate VLANs.

Configuration example

- FortiGate1:

```
FGT1 (global) # show system ha
```

```
config system ha
   set mode a-p
   set hbdev "port5" 0 "port6" 0
   set vcluster2 enable
   set override disable
   set priority 200
      config secondary-vcluster
         set override enable
         set priority 100
         set vdom "Vdom2"
      end
end
```

- FortiGate2:

```
FGT2 (global) # show system ha

config system ha
   set mode a-p
   set hbdev "port5" 0 "port6" 0
   set vcluster2 enable
   set override disable
   set priority 200
      config secondary-vcluster
         set override enable
         set priority 100
         set vdom "Vdom2"
      end
end
```

IPsec VPN in Transparent mode

Rules and details

In Transparent mode, IPsec VPN is supported in Policy-based configuration mode only.

IPsec VPN in Transparent mode can be used in those scenarios:

- Encrypt data over routed networks without changing anything on the routers. See example 1.
- Encrypt data over a non-routed transport network (extension of a LAN for example). See example 2.

The following rules apply to IPsec in Transparent mode:

- If both remote FortiGate IPsec gateways are not in the same broadcast domain (separated by routers):
  - The hosts on each side must be on different subnets.
  - The FortiGate management IP addresses must be in the same subnet as the local hosts. This is the preferred option.
- If both remote FortiGate IPsec gateways are in the same broadcast domain (separated by optical switches for examples), the hosts on each side can be :
  - On the same subnet
  - On different subnet if the appropriate static route is configured on the remote Fortigate
  - The FortiGate management IP addresses can be in any different subnet than the local hosts

- A firewall Policy with the action IPsec is used to send traffic to the remote device into the tunnel. Therefore, it is important to place all remote devices on the appropriate ports of the Fortigate to allow a proper match < source interface + destination interface > . See section Transparent mode Firewall processing for more details.

This scenario requires that the remote hosts located on the remote FortiGate's protected subnets have their MAC addresses hardcoded in FortiGate's static MAC entry list. If this is not configured then it is expected to see outage in network communications.

Example 1 - remote sites in different subnets

This example provides a configuration example for IPsec VPN tunnels between three FortiGate in Transparent Mode in different subnets, as well as some troubleshooting steps.

The expectation for this example is that PC1 will be able to communicate via the IPsec tunnels with PC2 and PC3, which are in different subnets.

The requirements for this example are:

- Because both FortiGate are not in the same broadcast domain (separated by routers), the hosts on each side must be on different subnets.
- FortiGate management IP addresses must be in the same subnet as the local hosts
- The default gateways (router1 ,router2, router3) for PC1 , PC2 and PC3 must be behind port2 in order for the FortiGate to match the appropriate Encrypt firewall policy (port1 --> port2)

Configuration of FortiGate 1 (FGT1):

Only relevant parts of configuration are provided.

```
config system settings
   set opmode transparent
   set manageip 10.1.1.100/255.255.255.0
end

config router static
   edit 1
      set gateway 10.1.1.254
   next
end

config firewall address
   edit "10.1.1.0/24"
      set subnet 10.1.1.0 255.255.255.0
   next
   edit "10.2.2.0/24"
      set subnet 10.2.2.0 255.255.255.0
   next
   edit "10.3.3.0/24"
      set subnet 10.3.3.0 255.255.255.0
   next
end

config vpn ipsec phase1
   edit "to_FGT2"
```

```
      set proposal 3des-sha1 aes128-sha1 des-md5
      set remote-gw 10.2.2.100
      set psksecret fortinet
   next
   edit "to_FGT3"
      set proposal 3des-sha1 aes128-sha1 des-md5
      set remote-gw 10.3.3.100
      set psksecret fortinet
   next
end

config vpn ipsec phase2
   edit "to_FGT2"
      set keepalive enable
      set phase1name "to_FGT2"
      set proposal 3des-sha1 aes128-sha1
      set dst-subnet 10.2.2.0 255.255.255.0
      set src-subnet 10.1.1.0 255.255.255.0
   next
   edit "to_FGT3"
      set keepalive enable
      set phase1name "to_FGT3"
      set proposal 3des-sha1 aes128-sha1
      set dst-subnet 10.3.3.0 255.255.255.0
      set src-subnet 10.1.1.0 255.255.255.0
   next
end

config firewall policy
   edit 1
      set srcintf "port1"
      set dstintf "port2"
      set srcaddr "10.1.1.0/24"
      set dstaddr "10.2.2.0/24"
      set action ipsec
      set schedule "always"
      set service "ANY"
      set inbound enable
      set outbound enable
      set vpntunnel "to_FGT2"
   next
   edit 3
      set srcintf "port1"
      set dstintf "port2"
      set srcaddr "10.1.1.0/24"
      set dstaddr "10.3.3.0/24"
      set action ipsec
      set schedule "always"
      set service "ANY"
      set inbound enable
      set outbound enable
      set vpntunnel "to_FGT3"
   next
end
```

Configuration of FortiGate 2 (FGT2):

Only relevant parts of configuration are provided.

```
config system settings
   set opmode transparent
   set manageip 10.2.2.100/255.255.255.0
end

config router static
   edit 1
      set gateway 10.2.2.254
   next
end

config firewall address
   edit "10.1.1.0/24"
      set subnet 10.1.1.0 255.255.255.0
   next
   edit "10.2.2.0/24"
      set subnet 10.2.2.0 255.255.255.0
   next
end

config vpn ipsec phase1
   edit "to_FGT1"
      set nattraversal disable
      set proposal 3des-sha1 aes128-sha1 des-md5
      set remote-gw 10.1.1.100
      set psksecret fortinet
   next
end

config vpn ipsec phase2
   edit "to_FGT1"
      set keepalive enable
      set phase1name "to_FGT1"
      set proposal 3des-sha1 aes128-sha1
      set dst-subnet 10.1.1.0 255.255.255.0
      set src-subnet 10.2.2.0 255.255.255.0
   next
end

config firewall policy
   edit 1
      set srcintf "port1"
      set dstintf "port2"
      set srcaddr "10.2.2.0/24"
      set dstaddr "10.1.1.0/24"
      set action ipsec
      set schedule "always"
      set service "ANY"
      set inbound enable
      set outbound enable
      set vpntunnel "to_FGT1"
   next
end
```

Troubleshooting procedure

All steps given when PC1 pings PC2.

Verify if IPsec tunnels are up

```
FGT1 # diagnose vpn tunnel list

list all ipsec tunnel in vd 0
------------------------------------------------------
name=to_FGT2 ver=0 serial=1 10.1.1.100:0->10.2.2.100:0 lgwy=dyn tun=tunnel mode= auto
bound_if=0
proxyid_num=1  child_num=0  refcnt=7  ilast=0  olast=0
stat: rxp=0 txp=0 rxb=0 txb=0
dpd: mode=active on=1 idle=5000ms retry=3 count=0 seqno=1455

```

The above tunnel is up!

Verify that destination local hosts are seen in the ARP table (necessary for IPsec despite being in TP mode)

```
FGT2 # get system arp

Address     Age(min)  Hardware Addr       Interface
10.2.2.10   2         00:50:56:00:76:04   root.b
10.2.2.254  0         00:09:0f:30:29:e4   root.b
```

Using the debug flow command on the initiator side (example on FortiGate1)

```
FGT1 # diagnose debug flow filter addr 10.1.1.10
FGT1 # diagnose debug flow show console enable
FGT1 # diagnose debug enable
FGT1 # diagnose debug flow trace start 50

FGT1 # id=36870 trace_id=615 msg="vd-root received a packet(proto=1, 10.1.1.10:512-
>10.2.2.10:8) from port1."

```

The above ARP process in Transparent mode with IPsec is allowing the Fortigate to:

- Identify the MAC address of the destination device 10.2.2.10
- Populate the MAC table (see below), which in turn will give a destination interface and allow a Firewall policy look-up

Check the FDB entries for the destination

```
FGT2 # diagnose netlink brctl name host root.b

port no   device  devname  mac addr            ttl
[..]
1         2       port1    00:50:56:00:76:04    0
```

Example 2 - remote sites in the same subnet and one remote subnet

This example provides a configuration example for IPsec VPN tunnels between two FortiGate in Transparent Mode in the same subnet separated by a L2 transparent network and one remote subnet on the second site.

This scenario requires that PC1's MAC address is added to the FortiGate's static MAC table. The preferred scenario would be to have a router installed between the 2 FortiGate's.

The expectation for this example is that PC1 will be able to communicate via the IPsec tunnel with Server1 in the same subnet, and Server2 in a different subnet.

The requirements for this example are:

- The default gateway (FGT3) for PC1 and all remote device must be behind port2 of FGT1, in order for this FortiGate to match the appropriate Encrypt firewall policy (port1 --> port2)
- Despite being in Transparent mode, **FGT2 must have a valid route to Server2**
- FGT3 is used as a router between subnet 10.1.1.0/24 and 10.3.3.0/24.

PC1 MAC address added to FGT2 static MAC entries.

Server1 MAC address added to FGT1 static MAC entries.

Configuration of FortiGate 1 (FGT1):

Only relevant parts of configuration are provided.

```
config system settings
   set opmode transparent
   set manageip 10.1.1.100/255.255.255.0
end

config router static
   edit 1
      set gateway 10.1.1.252
   next
end

config system mac-address-table
   edit 00:50:56:00:76:04 ==>Server1
      set interface port2
   next
end

config firewall address
   edit "all"
   next
   edit "Server1"
      set subnet 10.1.1.20 255.255.255.255
   next
   edit "Server2"
      set subnet 10.3.3.30 255.255.255.255
   next
   edit "10.1.1.0/24"
      set subnet 10.1.1.0 255.255.255.0
   next
   edit "gateway"
      set subnet 10.1.1.254 255.255.255.255
   next
end

config vpn ipsec phase1
   edit "to_FGT2"
      set proposal 3des-sha1 aes128-sha1 des-md5
      set remote-gw 10.1.1.200
      set psksecret fortinet
   next
end

config vpn ipsec phase2
   edit "to_FGT2"
```

```
      set keepalive enable
      set phase1name "to_FGT2"
      set proposal 3des-sha1 aes128-sha1
      set src-subnet 10.1.1.0 255.255.255.0
   next
end

config firewall policy
   edit 1
      set srcintf "port1"
      set dstintf "port2"
      set srcaddr "10.1.1.0/24"
      set dstaddr "Server1"
      set action ipsec
      set schedule "always"
      set service "ANY"
      set inbound enable
      set outbound enable
      set vpntunnel "to_FGT2"
   next
   edit 2
      set srcintf "port1"
      set dstintf "port2"
      set srcaddr "10.1.1.0/24"
      set dstaddr "Server2"
      set action ipsec
      set schedule "always"
      set service "ANY"
      set inbound enable
      set outbound enable
      set vpntunnel "to_FGT2"
   next
   edit 3
      set srcintf "port1"
      set dstintf "port2"
      set srcaddr "10.1.1.0/24"
      set dstaddr "gateway"
      set action ipsec
      set schedule "always"
      set service "ANY"
      set inbound enable
      set outbound enable
      set vpntunnel "to_FGT2"
   next
end
```

Firewall Policy 3 is not mandatory and is only used to allow PC1 to test a ping reach-ability to its default gateway 10.1.1.254.

Configuration of FortiGate 2 (FGT2):

Only relevant parts of configuration are provided.

```
config system settings
   set opmode transparent
   set manageip 10.1.1.200/255.255.255.0
end

config router static
   edit 1
      set gateway 10.1.1.252
   next
   edit 2
      set dst 10.3.3.0 255.255.255.0
      set gateway 10.1.1.254
   next
end

config system mac-address-table
   edit 00:50:56:00:76:03
      set interface wan1
   next
end

config firewall address
   edit "all"
   next
   edit "PC1"
      set subnet 10.1.1.10 255.255.255.255
   next
   edit "10.1.1.0/24"
      set subnet 10.1.1.0 255.255.255.0
   next
   edit "10.3.3.0/24"
      set subnet 10.3.3.0 255.255.255.0
   next
end

config vpn ipsec phase1
   edit "to_FGT1"
      set proposal 3des-sha1 aes128-sha1 des-md5
      set remote-gw 10.1.1.100
      set psksecret fortinet
   next
end

config vpn ipsec phase2
   edit "to_FGT1"
      set keepalive enable
      set phase1name "to_FGT1"
      set proposal 3des-sha1 aes128-sha1
      set dst-subnet 10.1.1.0 255.255.255.0
   next
end

config firewall policy
   edit 1
      set srcintf "internal"
      set dstintf "wan1"
      set srcaddr "10.1.1.0/24" set dstaddr "PC1"
```

```
      set action ipsec
      set schedule "always"
      set service "ANY" set inbound enable
      set outbound enable
      set vpntunnel "to_FGT1"
   next
   edit 2
      set srcintf "internal"
      set dstintf "wan1"
      set srcaddr "10.3.3.0/24" set dstaddr "PC1"
      set action ipsec
      set schedule "always"
      set service "ANY" set inbound enable
      set outbound enable
      set vpntunnel "to_FGT1"
   next
end
```

Troubleshooting procedure

Check the ARP entries of PC1

```
C:\ arp -a

Interface: 10.1.1.10 --- 0x20003
Internet Address        Physical Address       Type
10.1.1.20               00-50-56-00-76-04      dynamic
10.1.1.254              00-09-0f-85-3f-c8      dynamic
```

MAC address **00-09-0f-85-3f-c8** is the FGT3 interface in subnet 10.1.1.0/24.

FDB entries of FGT1

```
FGT1 (global) # diagnose netlink brctl name host Vdom1.b

show bridge control interface Vdom1.b host. fdb:
size=256, used=6, num=6, depth=1
Bridge Vdom1.b host table
port no  device devname  mac addr           ttl   attributes
1        10     port1    00:50:56:00:76:03  0
2        9      port2    00:50:56:00:76:04  44    static
2        9      port2    00:09:0f:85:3f:c8  13
1        10     port1    00:09:0f:88:2f:69  0     Local Static
2        9      port2    00:09:0f:88:2f:68  0     Local Static
2        9      port2    00:09:0f:23:01:d6  0
```

MAC address **00:09:0f:23:01:d6** is “internal” port MAC address of FGT2 00:09:0F:23:01:D6. This is the MAC address used for management in the Transparent mode VDOM of FGT2, chosen between the lowest MAC address between wan1 (00:09:0F:78:00:74) and internal (00:09:0F:23:01:D6).

ARP entries of FGT2

```
FGT2 (TP) # get system arp

Address      Age(min)   Hardware Addr         Interface
10.1.1.20    82         00:50:56:00:76:04     TP.b
10.1.1.100   13         00:09:0f:88:2f:68     TP.b
10.1.1.254   76         00:09:0f:85:3f:c8     TP.b
```

it is important to have the entry for 10.1.1.254 which is the route to 10.3.3.0/24 .

IPsec Tunnel verification on FGT1

```
FGT1 (Vdom1) # diagnose vpn tunnel list

list all ipsec tunnel in vd 3

id=20085 trace_id=11 msg="encrypted, and send to 10.1.1.200 with source 10.1.1.100"
id=20085 trace_id=11 msg="send out via dev-port2, dst-mac-00:09:0f:23:01:d6"
id=20085 trace_id=12 msg="vd-Vdom1 received a packet(proto=1, 10.3.3.30:512->10.1.1.10:0)
    from port2."
id=20085 trace_id=12 msg="Find an existing session, id-00004e85, reply direction"
id=20085 trace_id=12 msg="send out via dev-port1, dst-mac-00:50:56:00:76:03"
```

From the trace above, **dst-mac-00:09:0f:23:01:d6** is “internal” port MAC address of FGT2 00:09:0F:23:01:D6. This is the MAC address used for management in the Transparent mode VDOM of FGT2, chosen between the lowest MAC address between wan1 (00:09:0F:78:00:74) and internal (00:09:0F:23:01:D6).

Replay traffic scenario

Replay traffic scenario

Situations can arise where an identical TCP packet enters twice the FortiGate via 2 different ports. This can be due to a firewall or other network device redirecting packets out on the same port it has received it.

The FortiGate will in this condition detect a replay packet and drop it.

If the network topology or culprit devices cannot be changed to avoid this, the workaround on the FortiGate can be to disable TCP replay verification packets.

```
config system global
   set anti-replay | loose | strict | disable |
end
```

In v3.0 this command was:

```
config system global
   set conn-tracking disable
end
```

*

The debug flow diagnosis output hereafter shows the message indicating this condition:

```
   id=20085 trace_id=179 msg="vd-VDOM_VLAN1 received a packet(proto=6, 10.10.253.9:10709
   >10.10.248.5:25) from TO_EXTERNAL ."
   id=20085 trace_id=179 msg="Find an existing session, id-00041475, original direction"
*  id=20085 trace_id=179 msg="replay packet, drop"
```

For additional diagnosis and troubleshooting procedures, please consult the Knowledge Base at http://kb.fortinet.com.

Transparent mode reminder and best practices

1. Create forwarding domains when VLANs are used and set `vlanforward` to `disable` on all relevant physical interface.
2. The forward-domain ID can be different to the VLAN ID, but it is recommended for troubleshooting and readability to keep them the same.
3. Only interfaces from the same forwarding domains can have firewall policies between each others.
4. In order to allow IVL (independent VLAN learning), the VLANs must be placed in separate forwarding domains.
5. If an out-of-band management is desired, use if possible a VDOM in NAT mode as management VDOM and create (an) other Transparent mode VDOM(s) for the user traffic.
6. As Spanning Tree BPDUs are not forwarded by default, insert the FortiGate with caution to avoid L2 loops.
7. Multicast packets are not forwarded by default; this might cause routing protocols (RIP2,OSPF) disruption.

8. When using HSRP or VRRP configure static MAC entries for the Virtual MAC addresses.

Chapter 26 - Troubleshooting

This handbook chapter describes concepts of troubleshooting and solving issues that may occur with FortiGate units.

This FortiOS Handbook chapter contains the following chapters:

Verifying FortiGate admin access security explains how to verify and configure administrative access.

Troubleshooting resources walks you through Fortinet's resources for troubleshooting.

Troubleshooting tools describes some of the basic commands and parts of FortiOS that can help you with troubleshooting.

Troubleshooting methodologies walks you through best practice concepts of FortiOS troubleshooting.

Technical Support Organization Overview describes how Fortinet Support operates, what they will need from you if you contact them, and what you can expect in general.

Common questions answers most of the common questions.

Troubleshooting methodologies

Before you begin troubleshooting anything but the most minor issues, you need to prepare. Doing so will shorten the time to solve your issue. This section helps to explain how you prepare before troubleshooting, as well as creating a troubleshooting plan and contacting support.

This section contains the following topics:

- Establish a baseline
- Define the problem
- Gathering Facts
- Create a troubleshooting plan
- Obtain any required additional equipment
- Ensure you have administrator level access to required equipment
- Contact Fortinet customer support for assistance

Establish a baseline

FortiGate units operate at all layers of the OSI model. For this reason troubleshooting problems can become complex. If you establish a normal operation parameters, or baseline, for your system before the problem occurs it will help reduce the complexity when you are troubleshooting.

Many of the guiding questions in the following sections are some form of comparing the current problem situation to normal operation on your FortiGate unit. For this reason it is a best practice that you know what your normal operating status is, and have a record of it you can refer to. This can easily be accomplished by monitoring the system performance with logs, SNMP tools, or regularly running information gathering commands and saving the output. This regular operation data will show trends, and enable you to see when changes happen and there may be a problem.

Back up your FortiOS configuration on a regular basis. This is a good practice for every-day as well as when troubleshooting. You can restore the backed up configuration when needed and save the time and effort of re-creating it from the factory default settings.

Some fundamental CLI commands you can use to obtain normal operating data for your system:

`get system status`	Displays versions of firmware and FortiGuard engines, and other system information.
`get system performance status`	Displays CPU and memory states, average network usage, average sessions and session setup rate, virus caught, IPS attacks blocked, and uptime.
`get hardware memory`	Displays informations about memory
`get system session status`	Displays total number of sessions
`get router info routing-table all`	Displays all the routes in the routing table including their type, source, and other useful data.
`get ips session`	Displays memory used and max available to IPS as well and counts.
`get webfilter ftgd-statistics`	Displays list of FortiGuard related counts of status, errors, and other data.
`diagnose firewall statistic show`	Displays the amount of network traffic broken down into categories such as email, VoIP, TCP, UDP, IM, Gaming, P2P, and Streaming.
`diag system session list`	Displays current detailed sessions list
`show system dns`	Displays configured DNS servers
`diag sys ntp status`	Displays informations about ntp servers

These commands are just a sample. Feel free to include any extra information gathering commands that apply to your system. For example if you have active VPN connections, record information about them using the `get vpn *` series of commands.

For an extensive snapshot of your system, run the CLI command used by TAC to gather extensive information about a system — `exec tac report`. It runs many diagnostic commands that are for specific configurations. This means no matter what features you are using, this command will record their current state. Then if you need to perform troubleshooting at a later date, you can run the same command again and compare the differences to quickly locate suspicious output you can investigate.

Define the problem

The following questions can help determine the scope of the problem and isolate it:

- **What is the problem?**
  Do not assume that the problem is being experienced is the actual problem. First determine that the problem does not lie elsewhere before starting to troubleshoot the FortiGate device.

- **Has it ever worked before?**
  If the device never worked from the first day, you may not want to spend time troubleshooting something that could

well be defective. See “Troubleshooting bootup”.

- **Can the problem be reproduced at will or is it intermittent?**
  If the problem is intermittent, it may be dependent on system load. Also an intermittent problem can be very difficult to troubleshoot due to the difficulty reproducing the issue.

- **What has changed**?
  Do not assume that nothing has changed in the network. Use the FortiGate event log to see if any configuration changes were made. The change could be in the operating environment, for example, a gradual increase in load as more sites are forwarded through the firewall.

  If something has changed, see what the affect is if the change is rolled back.

- **Determine the scope of the problem - after you have isolated the problem what applications, users, devices, and operating systems does it effect?**

Before you can solve a problem, you need to understand it. Often this step can be the longest in this process.

Ask questions such as:

- What is not working? Be specific.
- Is there more than one thing not working?
- Is it partly working? If so, what parts are working?
- Is it a connectivity issue for the whole device, or is there an application that isn’t reaching the Internet?

Be as specific as possible with your answers, even if it takes awhile to find the answers.

These questions will help you define the problem. Once the problem is defined, you can search for a solution and then create a plan on how to solve it.

Gathering Facts

Fact gathering is an important part of defining the problem. Record the following information as it applies to the problem:

- Where did the problem occur?
- When did the problem occur and to whom?
- What components are involved?
- What is the affected application?
- Can the problem be traced using a packet sniffer?
- Can the problem be traced in the session table or using system debugging?
- Can log files be obtained that indicate a failure has occurred?

Answers to these questions will help you narrow down the problem, and what you have to check during your troubleshooting. The more things you can eliminate, the fewer things you need to check during troubleshooting. For this reason, be as specific and accurate as you can while gathering facts.

Create a troubleshooting plan

Once you have defined the problem, and searched for a solution you can create a plan to solve that problem. Even if your search didn't find a solution to your problem you may have found some additional things to check to further define your problem.

The plan should list all the possible causes of the problem that you can think of, and how to test for each possible cause.

Your troubleshooting plan will act as a checklist so that you know what you have tried and what is left to check. This is important to have if more than one person will be doing the troubleshooting. Without a written plan, people will become easily confused and steps will be skipped. Also if you have to hand over the problem to someone else, providing them with a detailed list of what data has been gathered and what solutions have been already tried demonstrates a good level of professionalism.

Be ready to add to your plan as needed. After you are part way through, you may discover that you forgot some tests or a test you performed discovered new information. This is normal.

Also if you contact support, they will require information about your problem as well as what you have already tried to fix the problem. This should all be part of your plan.

Providing Supporting Elements

If the Fortinet Technology Assistance Center (TAC) needs to be contacted to help you with your issue, be prepared to provide the following information:

- The firmware build version (use the `get system status` command)
- A network topology diagram
- A recent configuration file
- Optionally, a recent debug log
- Tell the support team what troubleshooting steps have already been performed and the results.

Do not provide the output from exec tac report unless Support requests it. The output from that command is very large and is not required in many cases.

For additional information about contacting Fortinet Customer Support, see Technical Support Organization Overview.

All of this is your troubleshooting plan.

Obtain any required additional equipment

You may require additional networking equipment, computers, or other equipment to test your solution.

Normally network administrators have additional networking equipment available either to loan you, or a lab where you can bring the FortiGate unit to test.

If you do not have access to equipment, check for shareware applications that can perform the same task. Often there are software solutions when hardware is too expensive.

Ensure you have administrator level access to required equipment

Before troubleshooting your FortiGate unit, you will need administrator access to the equipment. If you are a client on a FortiGate unit with virtual domains enabled, often you can troubleshoot within your own VDOM. However, you should inform your FortiGate unit's super admin that you will be doing troubleshooting.

Also, you may need access to other networking equipment such as switches, routers, and servers to help you test. If you do not normally have access to this equipment, contact your network administrator for assistance.

Contact Fortinet customer support for assistance

You have defined your problem, researched a solution, put together a plan to find the solution, and executed that plan. At this point if the problem has not been solved, its time to contact Fortinet Customer Support for assistance.

For more information, see Technical Support Organization Overview.

Troubleshooting tools

FortiOS provides a number of tools that help with troubleshooting both hardware and software issues. These tools include diagnostics and ports; ports are used when you need to understand the traffic coming in or going out on a specific port, for example, UDP 53, which is used by the FortiGate unit for DNS lookup and RBL lookup.

This section also contains information about troubleshooting FortiGuard issues.

This section contains the following topics:

- FortiOS diagnostics
- FortiOS ports
- FortiAnalyzer/FortiManager ports
- FortiGuard troubleshooting

FortiOS diagnostics

A collection of diagnostic commands are available in FortiOS for troubleshooting and performance monitoring. Within the CLI commands, the two main groups of diagnostic commands are `get` and `diagnose` commands. Both commands display information about system resources, connections, and settings that enable you to locate and fix problems, or to monitor system performance.

This topic includes diagnostics commands to help with:

- Check date and time
- Resource usage
- Proxy operation
- Hardware NIC
- Traffic trace
- Session table
- Firewall session setup rate
- Finding object dependencies
- Flow trace
- Packet sniffing and packet capture
- NPU based interfaces
- Debug command
- The execute tac report command
- Other commands

Check date and time

The system date and time are important for FortiGuard services, when logging events, and when sending alerts. The wrong time will make the log entries confusing and difficult to use.

Use Network Time Protocol (NTP) to set the date and time if possible. This is an automatic method that does not require manual intervention. However, you must ensure the port is allowed through the firewalls on your network. FortiToken synchronization requires NTP in many situations.

How to check the date and time - web-based manager

1. Go to **System Information > System Time** on the dashboard.
   Alternately, you can check the date and time using the CLI commands `execute date` and `execute time`.
2. If required, select **Change** to adjust the date and time settings.
   You can set the time zone, date and time, and select NTP usage. In the CLI, use the following commands to change the date and time:

```
config system global
   set timezone (use ? to get a list of IDs and descriptions of their timezone)
   end
config system ntp
   set type custom
      config ntpserver
         edit 1
            set server "ntp1.fortinet.net"
         next
         edit 2
            set server "ntp2.fortinet.net"
         next
   end
set ntpsync enable
set syncinterval 60
end
```

Resource usage

Each program running on a computer has one or more processes associated with it. For example if you open a Telnet program, it will have an associated telnet process. The same is true in FortiOS. All the processes have to share the system resources in FortiOS including memory and CPU.

Use `get system performance status` command to show the FortiOS performance status.

Sample output:

```
FGT#get system performance status
CPU states: 0% user 0% system 0% nice 100% idle
CPU0 states: 0% user 0% system 0% nice 100% idle
CPU1 states: 0% user 0% system 0% nice 100% idle
CPU2 states: 0% user 0% system 0% nice 100% idle
CPU3 states: 0% user 0% system 0% nice 100% idle
Memory states: 25% used
Average network usage: 0 kbps in 1 minute, 0 kbps in 10 minutes, 0 kbps in 30 minutes
Average sessions: 5 sessions in 1 minute, 5 sessions in 10 minutes, 4 sessions in 30
    minutes
Average session setup rate: 0 sessions per second in last 1 minute, 0 sessions per second
    in last 10 minutes, 0 sessions per second in last 30 minutes
Virus caught: 0 total in 1 minute
IPS attacks blocked: 0 total in 1 minute
Uptime: 0 days, 12 hours, 7 minutes
```

Monitor the CPU/memory usage of internal processes using the following command:

```
get system performance top <delay> <max_lines>
```

The data listed by the command includes the name of the daemon, the process ID, whether the process is sleeping or running, the CPU percentage being used, and the memory percentage being used.

Sample output:

```
FGT#get system performance top 10 100
Run Time: 0 days, 11 hours and 30 minutes
0U, 0S, 100I; 1977T, 1470F, 121KF

    pyfcgid       120       S              0.0            1.3
    pyfcgid       121       S              0.0            1.3
    pyfcgid       122       S              0.0            1.3
    pyfcgid        53       S              0.0            1.3
  ipsengine        75       S <            0.0            1.3
  ipsengine        66       S <            0.0            1.3
  ipsengine        73       S <            0.0            1.3
  ipsengine        74       S <            0.0            1.3
  ipsengine        79       S <            0.0            1.3
  ipsengine        80       S <            0.0            1.3
    cmdbsvr        43       S              0.0            1.0
proxyworker       110       S              0.0            1.0
proxyworker       111       S              0.0            1.0
     httpsd       125       S              0.0            0.8
     httpsd        52       S              0.0            0.8
     httpsd       124       S              0.0            0.8
     newcli       141       R              0.0            0.7
     newcli       128       S              0.0            0.7
      fgfmd       102       S              0.0            0.7
       iked        86       S              0.0            0.7
```

Proxy operation

Monitor proxy operations using the following command:

```
diag test application <application> <option>
```

The `<application>` value can include the following:

`http`	HTTP proxy.
`smtp`	SMTP proxy.
`ftpd`	FTP proxy.
`pop3`	POP3 proxy.
`imap`	IMAP proxy.
`nntp`	NNTP proxy.
`proxyacceptor`	Proxy acceptor.
`proxyworker`	Proxy worker.
`scanunit`	Scanning unit.
`sslacceptor`	SSL proxy.
`sslworker`	SSL proxy.
`ssh`	SSH proxy.
`harelay`	HA relay daemon.
`hasync`	HA sync daemon.
`forticldd`	FortiCloud daemon.
`miglogd`	Miglog logging daemon.
`urlfilter`	URL filter daemon.
`ovrd`	Override daemon.
`ipsmonitor`	ips monitor
`ipsengine`	ips sensor
`ipldbd`	IP load balancing daemon.
`ddnscd`	DDNS client daemon.
`snmpd`	SNMP daemon.
`acd`	Aggregate Controller.
`dnsproxy`	DNS proxy.

sflowd	sFlow daemon.
init	init process.
l2tpcd	L2TP client daemon.
dhcprelay	DHCP relay daemon.
pptpcd	PPTP client.
wccpd	WCCP daemon.
wad	WAD related processes.
radiusd	RADIUS daemon.
sqldb	SQL database daemon.
reportd	Report daemon.
dlpfingerprint	DLP fingerprint daemon.
dlpfpcache	DLP fingerprint cache daemon.
wpad	WPA daemon.
fsd	FortiExplorer daemon.
ipsufd	IPS urlfilter daemon.
stp	Spanning Tree Protocol daemon.
lted	USB LTE daemon.
swctrl_authd	Switch controller authentication daemon.
forticron	Forticron daemon.
uploadd	Upload daemon.
quarantined	Quarantine daemon.
dhcp6c	DHCP6 client daemon.
info-sslvpnd	SSL-VPN info daemon.
thmd	Traffic history monitor daemon.
dsd	DLP Statistics daemon.

lnkmtd	Link monitor daemon.
dhcp6r	DHCP6 relay daemon.
fnbamd	Fortigate non-blocking auth daemon.

The <option> value depends from the application value used in the command. Here are some examples:

- If the application is http, the CLI command will be:

```
diag test application http <option>
```

The <option> value can be one from the following:

2	Drop all connections.
22	Drop max idle connections.
222	Drop all idle connections.
4	Display connection stat.
44	Display info per connection.
444	Display connections per state.
4444	Display per-VDOM statistics.
44444	Display information about idle connections.
55	Display tcp info per connection.
6	Display ICAP information.
70	Disable ICAP 'Allow: 204' (default).
71	Enable ICAP 'Allow: 204' .
72	Drop all ICAP server connections.
11	Display the SSL session ID cache statistics.
12	Clear the SSL session ID cache statistics.
13	Display the SSL session ID cache.
14	Clear the SSL session ID cache.
80	Show Fortinet bar SSL-VPN bookmark info.
81	Show Fortinet bar SSL-VPN bookmark cache.
82	Show Fortinet bar SSL-VPN bookmark LRU list.

- If the application is `ipsmonitor`, the CLI command will be

```
diag test application ipsmonitor <option>
```

The `<option>` value can be one from the following:

1	Display IPS engine information
2	Toggle IPS engine enable/disable status
3	Display restart log
4	Clear restart log
5	Toggle bypass status
6	Submit attack characteristics now
10	IPS queue length
11	Clear IPS queue length
12	IPS L7 socket statistics
13	IPS session list
14	IPS NTurbo statistics
15	IPSA statistics
97	Start all IPS engines
98	Stop all IPS engines
99	Restart all IPS engines and monitor

Hardware NIC

Monitor hardware network operations using the following command:

```
diag hardware deviceinfo nic <interface>
```

The information displayed by this command is important as errors at the interface are indicative of data link or physical layer issues which may impact the performance of the FortiGate unit.

The following is sample output when `<interface>` = `internal`:

```
System_Device_Name port5
Current_HWaddr 00:09:0f:68:35:60
Permanent_HWaddr 00:09:0f:68:35:60
Link up
Speed 100
Duplex full
[……]
Rx_Packets=5685708
Tx_Packets=4107073
Rx_Bytes=617908014
Tx_Bytes=1269751248
Rx_Errors=0
Tx_Errors=0
```

```
Rx_Dropped=0
Tx_Dropped=0
[…..]
```

The `diag hardware deviceinfo nic` command displays a list of hardware related error names and values. The following table explains the items in the list and their meanings.

Possible hardware errors and meanings

Field	Definition
Rx_Errors = rx error count	Bad frame was marked as error by PHY.
Rx_CRC_Errors + Rx_Length_Errors - Rx_Align_Errors	This error is only valid in 10/100M mode.
Rx_Dropped or Rx_No_Buffer_Count	Running out of buffer space.
Rx_Missed_Errors	Equals Rx_FIFO_Errors + CEXTERR (Carrier Extension Error Count). Only valid in 1000M mode, whichis marked by PHY.
Tx_Errors = Tx_Aborted_ Errors	ECOL (Excessive Collisions Count). Only valid in half-duplex mode.
Tx_Window_Errors	LATECOL (Late Collisions Count). Late collisions are collisions that occur after 64-byte time into the transmission of the packet while working in 10 to100Mb/s data rate and 512-byte timeinto the transmission of the packet while working in the 1000Mb/s data rate. This register only increments if transmits are enabled and the device is in half-duplex mode.
Rx_Dropped	See Rx_Errors.
Tx_Dropped	Not defined.
Collisions	Total number of collisions experienced by the transmitter. Valid in half-duplex mode.
Rx_Length_Errors	Transmission length error.
Rx_Over_Errors	Not defined.
Rx_CRC_Errors	Frame CRC error.
Rx_Frame_Errors	Same as Rx_Align_Errors. This error is only valid in 10/100M mode.
Rx_FIFO_Errors	Same as Rx_Missed_Errors - a missed packet count.
Tx_Aborted_Errors	See Tx_Errors.
Tx_Carrier_Errors	The PHY should assert the internal carrier sense signal during every transmission. Failure to do so may indicate that the link has failed or the PHY has an incorrect link configuration. This register only increments if transmits are enabled. This register is not valid in internal SerDes 1 mode (TBI mode for the 82544GC/EI) and is only valid when the Ethernet controller is operating at full duplex.
Tx_FIFO_Errors	Not defined.

Field	Definition
Tx_Heartbeat_Errors	Not defined.
Tx_Window_Errors	See LATECOL.
Tx_Single_Collision_Frames	Counts the number of times that a successfully transmitted packed encountered a single collision. The value only increments if transmits are enabled and the Ethernet controller is in half-duplex mode.
Tx_Multiple_Collision_Frames	A Multiple Collision Count which counts the number of times that a transmit encountered more than one collision but less than 16. The value only increments if transmits are enabled and the Ethernet controller is in half-duplex mode.
Tx_Deferred	Counts defer events. A defer event occurs when the transmitter cannot immediately send a packet due to the medium being busy because another device is transmitting, the IPG timer has not expired, half-duplex deferral events are occurring, XOFF frames are being received, or the link is not up. This register only increments if transmits are enabled. This counter does not increment for streaming transmits that are deferred due to TX IPG.
Rx_Frame_Too_Longs	The Rx frame is over size.
Rx_Frame_Too_Shorts	The Rx frame is too short.
Rx_Align_Errors	This error is only valid in 10/100M mode.
Symbol Error Count	Counts the number of symbol errors between reads - SYMERRS. The count increases for every bad symbol received, whether or not a packet is currently being received and whether or not the link is up. This register only increments in internal SerDes mode.

Traffic trace

Traffic tracing allows a specific packet stream to be followed. This is useful to confirm packets are taking the route you expected on your network.

View the characteristics of a traffic session though specific security policies using:

```
diag sys session
```

Trace per-packet operations for flow tracing using:

```
diag debug flow
```

Trace per-Ethernet frame using:

```
diag sniffer packet
```

Session table

A session is a communication channel between two devices or applications across the network. Sessions enable FortiOS to inspect and act on a sequential group of packets in a session all together instead of inspecting each

packet individually. Each of these sessions has an entry in the session table that includes important information about the session.

Use as a tool

Session tables are useful troubleshooting tools because they allow you to verify connections that you expect to see open. For example, if you have a web browser open to browse the Fortinet website, you would expect a session entry from your computer, on port 80, to the IP for the Fortinet website. Another troubleshooting method is if there are too many sessions for FortiOS to process, you can examine the session table for evidence why this is happening.

The FortiGate session table can be viewed from either the CLI or the web-based manager. The most useful troubleshooting data comes from the CLI. The session table in web-based manager also provides some useful summary information, particularly the current policy number that the session is using.

Web-based manager session information

In the web-based manager you can view session information in the FortiView page. Sessions are categorized by **Sources, Applications, Destinations,** and **All Sessions**.

How to find which security policy a specific connection is using

Every program and device on your network must have a communication channel, or session, open to pass information. The FortiGate unit manages these sessions with its many features from traffic shaping, to antivirus scanning, and even blocking known bad web sites. Each session has an entry in the session table.

You may want to find information for a specific session, say a secure web browser session, for troubleshooting. For example if that web browser session is not working properly, you can check the session table to ensure the session is still active, and that it is going to the proper address. It can also tell you the security policy number it matches, so you can check what is happening in that policy.

1. **Know your connection information.**
   You need to be able to identify the session you want. For this you need the source IP address (usually your computer), the destination IP address if you have it, and the port number which is determined by the program being used. Some commons ports are:
   - port 80 (HTTP for web browsing),
   - port 22 (SSH used for secure login and file transfers)
   - port 23 (telnet for a text connection)
   - port 443 (HTTPS for secure web browsing

2. **Find your session and policy ID.**
   Follow **System > FortiView> All Sessions**. Find your session by finding your source IP address, destination IP address if you have it, and port number. The policy ID is listed after the destination information. If the list of sessions is very long, you can filter the list to make it easier to find your session.

3. **When there are many sessions, use a filter to help you find your session.**
   If there are multiple pages of sessions it is difficult to find a single session. To help you in your search you can use a filter to block out sessions that you don't want. Click the search icon on the column heading to select the filter. Select **Source IP** and enter your source IP address. Now only sessions

that originate from your IP address will be displayed in the session table. If the list is still too long, you can do the same for the **Source port**. That will make it easy to find your session and the security policy ID. When you are finished remember to clear the filters.

CLI session information

The session table output from the CLI (`diag sys session list`) is very verbose. Even on a system with a small amount of traffic, displaying the session table will generate a large amount of output. For this reason, filters are used to display only the session data of interest.

You can filter a column in the web-based manager by clicking the search icon on the column heading or from the CLI by creating a filter.

An entry is placed in the session table for each traffic session passing through a security policy. The following command will list the information for a session in the table:

```
diag sys session list
```

Sample Output:

```
FGT# diag sys session list
session info: proto=6 proto_state=05 expire=89 timeout=3600 flags=00000000 av_idx=0 use=3
bandwidth=204800/sec guaranteed_bandwidth=102400/sec traffic=332/sec prio=0
    logtype=session ha_id=0 hakey=4450
tunnel=/
state=log shape may_dirty
statistic(bytes/packets/err): org=3408/38/0 reply=3888/31/0 tuples=2
orgin->sink: org pre->post, reply pre->post oif=3/5 gwy=192.168.11.254/10.0.5.100
hook=post dir=org act=snat 10.0.5.100:1251->192.168.11.254:22(192.168.11.105:1251)
hook=pre dir=reply act=dnat 192.168.11.254:22->192.168.11.105:1251(10.0.5.100:1251)
pos/(before,after) 0/(0,0), 0/(0,0)
misc=0 domain_info=0 auth_info=0 ftgd_info=0 ids=0x0 vd=0 serial=00007c33 tos=ff/ff
```

Since output can be verbose, the filter option allows specific information to be displayed, for example:

```
diag sys session filter <option>
```

The `<option>` values available include the following:

clear	Clear session filter.
dintf	Destination interface.
dport	Destination port.
dst	Destination IP address.
duration	duration
expire	expire
negate	Inverse filter.
nport	NAT'd source port
nsrc	NAT'd source ip address
policy	Policy ID.
proto	Protocol number.
proto-state	Protocol state.
sintf	Source interface.
sport	Source port.
src	Source IP address.
vd	Index of virtual domain. -1 matches all.

Even though UDP is a sessionless protocol, the FortiGate unit still keeps track of the following two different states:

- UDP reply not seen with a value of 0
- UDP reply seen with a value of 1

The following illustrates FW session states from the session table:

State	Meaning
log	Session is being logged.
local	Session is originated from or destined for local stack.
ext	Session is created by a firewall session helper.
may_dirty	Session is created by a policy. For example, the session for `ftp control channel` will have this state but `ftp data channel` will not. This is also seen when NAT is enabled.
ndr	Session will be checked by IPS signature.
nds	Session will be checked by IPS anomaly.
br	Session is being bridged (TP) mode.

Firewall session setup rate

The number of sessions that can be established in a set period of time is useful information. A session is an end-to-end TCP/IP connection for communication with a limited lifespan. If you record the setup rate during normal operation, when you experience problems you have that setup rate with the current number to see if its very different. While this will not solve your problems, it can be a useful step to help you define your problem.

A reduced firewall session setup rate could be the result of a number of things from a lack of system resources on the FortiGate unit, to reaching the limit of your session count for your VDOM.

To view your session setup rate method 1- CLI

```
FGT# get sys performance status
CPU states: 0% user 0% system 0% nice 100% idle
Memory states: 10% used
Average network usage: 0 kbps in 1 minute, 0 kbps in 10 minutes,
13 kbps in 30 minutes
Average sessions: 31 sessions in 1 minute, 30 sessions in 10
minutes, 31 sessions in 30 minutes
Average session setup rate: 0.5 sessions per second in last 1
minute, 0 sessions per second in last 10 minutes, 0 sessions per
second in last 30 minutes
Virus caught: 0 total in 1 minute
IPS attacks blocked: 0 total in 1 minute
Uptime: 44 days, 18 hours, 42 minutes
```

The information you are looking for is the Average sessions section, highlighted in the above output. In this example you can see there were 31 sessions in 1 minute, or an average of 0.5 sessions per second. The values for 10 minutes and 30 minutes allow you to take a longer average for a more reliable value if your FortiGate unit is working at maximum capacity. The smallest FortiGate unit can have 1 000 sessions established per second across the unit.

Remember that session setup rate is a global command. If you have multiple VDOMs configured with many sessions in each one, the session setup rate per VDOM will be slower than if there were no VDOMs configured.

Finding object dependencies

An administrator may not be permitted to delete a configuration object if there are other configuration objects that depend on it. This command identifies other objects which depend on or *make reference to* the configuration object in question. If an error is displayed that an object is in use and cannot be deleted, this command can help identify the source of the problem.

Another use is if you have a virtual interface with objects that depend on it, you need to find and remove those dependencies before you delete that interface.

CLI method

When running multiple VDOMs, this command is run in the Global configuration only and it searches for the named object both in the Global and VDOM configuration most recently used:

```
diag sys checkused <path.object.mkey>
```

For example, to verify which objects are referred to in a security policy with an ID of 1, enter the command as follows:

```
diag sys checkused firewall.policy.policyid 1
```

To check what is referred to by interface `port1`, enter the following command:

```
diag sys checkused system.interface.name port1
```

To show all the dependencies for an interface, enter the command as follows:

```
diag sys checkused system.interface.name <interface name>
```

Sample Output:

```
entry used by table firewall.address:name '10.98.23.23_host'
entry used by table firewall.address:name 'NAS'
entry used by table firewall.address:name 'all'
entry used by table firewall.address:name 'fortinet.com'
entry used by table firewall.vip:name 'TORRENT_10.0.0.70:6883'
entry used by table firewall.policy:policyid '21'
entry used by table firewall.policy:policyid '14'
entry used by table firewall.policy:policyid '19'
```

In this example, the interface has dependent objects, including four address objects, one VIP, and three security policies.

Web-based manager method

In the web-based manager, the object dependencies for an interface can be easily checked and removed.

To remove interface object dependencies - web-based manager

1. Go to **System > Interfaces**.
   The number in the **Ref.** column is the number of objects that refer to this interface.
2. Select the number in the **Ref.** column for the desired interface.
   A Window listing the dependencies will appear.

3. Use these detailed entries to locate and remove object references to this interface.
   The trash can icon will change from gray when all object dependencies have been removed.
4. Remove the interface by selecting the check box for the interface, and select **Delete**.

Flow trace

To trace the flow of packets through the FortiGate unit, use the following command:

```
diag debug flow trace start
```

If your network is using IPv4, follow packet flow by setting a flow filter using this command:

```
diag debug flow filter <option>
```

Filtering options include the following:

`addr` IPv4 address
`clear` clear filter
`daddr` destination IPv4 address
`dport` destination port
`negate` inverse IPv4 filter
`port` port
`proto` protocol number
`saddr` source IPv4 address
`sport` source port
`vd` index of virtual domain, -1 matches all

If your network is using IPv6, follow packet flow by setting a flow filter using this command:

```
diag debug flow filter6 <option>
```

Filtering options include the following:

`addr` IPv6 address
`clear` clear filter
`daddr` destination IPv6 address
`dport` destination port
`negate` inverse IPv6 filter
`port` port
`proto` protocol number
`saddr` source IPv6 address
`sport` source port
`vd` index of virtual domain, -1 matches all

Enable the output to be displayed to the CLI console using the following command:

```
diag debug flow show console enable
```

`diag debug flow` output is recorded as event log messages and are sent to a FortiCloud or a FortiAnalyzer unit if connected. Do not let this command run longer than necessary since it generates significant amounts of data.

Start flow monitoring with a specific number of packets using this command:

```
diag debug flow trace start <N>
```

Stop flow tracing at any time using:

```
diag debug flow trace stop
```

The following is an example of the flow trace for the device at the following IP address: `203.160.224.97`

```
diag debug enable
diag debug flow filter addr 203.160.224.97
diag debug flow show console enable
diag debug flow show function-name enable
diag debug flow trace start 100
```

Flow trace output example - HTTP

Connect to the web site at the following address to observe the debug flow trace. The display may vary slightly:

```
http://www.fortinet.com
```

Comment: SYN packet received:

```
id=20085 trace_id=209 func=resolve_ip_tuple_fast
line=2700 msg="vd-root received a packet(proto=6,
192.168.3.221:1487->203.160.224.97:80) from port5."
```

SYN sent and a new session is allocated:

```
id=20085 trace_id=209 func=resolve_ip_tuple line=2799
msg="allocate a new session-00000e90"
```

Lookup for next-hop gateway address:

```
id=20085 trace_id=209 func=vf_ip4_route_input line=1543
msg="find a route: gw-192.168.11.254 via port6"
```

Source NAT, lookup next available port:

```
id=20085 trace_id=209 func=get_new_addr line=1219
msg="find SNAT: IP-192.168.11.59, port-31925"
direction"
```

Matched security policy. Check to see which policy this session matches:

```
id=20085 trace_id=209 func=fw_forward_handler line=317
msg="Allowed by Policy-3: SNAT"
```

Apply source NAT:

```
id=20085 trace_id=209 func=__ip_session_run_tuple
line=1502 msg="SNAT 192.168.3.221->192.168.11.59:31925"
```

SYN ACK received:

```
id=20085 trace_id=210 func=resolve_ip_tuple_fast line=2700
msg="vd-root received a packet(proto=6, 203.160.224.97:80-
>192.168.11.59:31925) from port6."
```

Found existing session ID. Identified as the reply direction:

```
id=20085 trace_id=210 func=resolve_ip_tuple_fast line=2727
msg="Find an existing session, id-00000e90, reply direction"
```

Apply destination NAT to inverse source NAT action:

```
id=20085 trace_id=210 func=__ip_session_run_tuple
line=1516 msg="DNAT 192.168.11.59:31925-
>192.168.3.221:1487"
```

Lookup for next-hop gateway address for reply traffic:

```
id=20085 trace_id=210 func=vf_ip4_route_input line=1543
msg="find a route: gw-192.168.3.221 via port5"
```

ACK received:

```
id=20085 trace_id=211 func=resolve_ip_tuple_fast line=2700
msg="vd-root received a packet(proto=6,
192.168.3.221:1487->203.160.224.97:80) from port5."
```

Match existing session in the original direction:

```
id=20085 trace_id=211 func=resolve_ip_tuple_fast line=2727
msg="Find an existing session, id-00000e90, original
direction"
```

Apply source NAT:

```
id=20085 trace_id=211 func=__ip_session_run_tuple
line=1502 msg="SNAT 192.168.3.221->192.168.11.59:31925"
```

Receive data from client:

```
id=20085 trace_id=212 func=resolve_ip_tuple_fast
line=2700 msg="vd-root received a packet(proto=6,
192.168.3.221:1487->203.160.224.97:80) from port5."
```

Match existing session in the original direction:

```
id=20085 trace_id=212 func=resolve_ip_tuple_fast
line=2727 msg="Find an existing session, id-00000e90,
original direction"
```

Apply source NAT:

```
id=20085 trace_id=212 func=__ip_session_run_tuple
line=1502 msg="SNAT 192.168.3.221->192.168.11.59:31925"
```

Receive data from server:

```
id=20085 trace_id=213 func=resolve_ip_tuple_fast
line=2700 msg="vd-root received a packet(proto=6,
203.160.224.97:80->192.168.11.59:31925) from port6."
```

Match existing session in reply direction:

```
id=20085 trace_id=213 func=resolve_ip_tuple_fast
line=2727 msg="Find an existing session, id-00000e90,
reply direction"
```

Apply destination NAT to inverse source NAT action:

```
id=20085 trace_id=213 func=__ip_session_run_tuple
```

```
line=1516 msg="DNAT 192.168.11.59:31925-
>192.168.3.221:1487"
```

Flow trace output example - IPsec (policy-based)

```
id=20085 trace_id=1 msg="vd-root received a packet(proto=1, 10.72.55.240:1->10.71.55.10:8)
    from internal."
id=20085 trace_id=1 msg="allocate a new session-00001cd3"
id=20085 trace_id=1 msg="find a route: gw-66.236.56.230 via wan1"
id=20085 trace_id=1 msg="Allowed by Policy-2: encrypt"
id=20085 trace_id=1 msg="enter IPsec tunnel-RemotePhase1"
id=20085 trace_id=1 msg="encrypted, and send to 15.215.225.22 with source 66.236.56.226"
id=20085 trace_id=1 msg="send to 66.236.56.230 via intf-wan1"
id=20085 trace_id=2 msg="vd-root received a packet (proto=1, 10.72.55.240:1-1071.55.10:8)
    from internal."
id=20085 trace_id=2 msg="Find an existing session, id-00001cd3, original direction"
id=20085 trace_id=2 msg="enter IPsec ="encrypted, and send to 15.215.225.22 with source
    66.236.56.226" tunnel-RemotePhase1"
id=20085 trace_id=2 msgid=20085 trace_id=2 msg="send to 66.236.56.230 via intf-wan1"
```

Packet sniffing and packet capture

FortiOS devices can sniff packets using commands in the CLI or capture packets using the web-based manager. The differences between the two methods are not large.

Packet sniffing in the CLI is well suited for spot checking traffic from the CLI, but if you have complex filters to enter it can be a lot of work to enter them each time. You can also save the sniffing output; however, you must log to a file and then analyze the file later by hand.

Packet capture in the web-based manager makes it easy to set up multiple filters at once and just run one or two as you need them. You also have controls to start and stop capturing as you wish. Packet capture output is downloaded to your local computer as a *.pcap file which requires a third party application to read the file, such as Wireshark. This method is useful to send Fortinet support information to help resolve an issue.

Features	Packet sniffing	Packet capture
Command location	CLI	web-based manager
Third party software required	puTTY to log plaintext output	Wireshark to read *.pcap files
Read output in plain text file	yes	no
Read output as *.pcap file using Wireshark	no	yes
Easily configure single quick and simple filter	yes	no
Record packet interface	yes	no
Configure complex sniffer filters on multiple interface	no	yes
sniff IPv6	hard	easy
sniff non-IP packets	no	yes
Filter packets by protocol and/or port	easy	easy
Filter packets by source and/or destination address	easy	easy

Packet sniffing

Before you start sniffing packets on the CLI, you should be prepared to capture the output to a file — there can be huge amounts of data that you will not be able to see without saving it to a file. One method is to use a terminal program like puTTY to connect to the FortiGate unit's CLI. Then once the packet sniffing count is reached you can end the session and analyze the output in the file.

Details within packets passing through particular interfaces can be displayed using the packet sniffer with the following command:

```
diag sniffer packet <interface> <filter> <verbose> <count> <tsformat>
```

The `<interface>` value is required, with the rest being optional. If not included the default values will be `"none"`.

For example the simplest valid sniffer command would be:

```
diag sniffer packet any
```

The `<interface>` value can be any physical or virtual interface name. Use *any* to sniff packets on all interfaces.

The `<filter>` value limits the display of packets using filters, including Berkeley Packet Filtering (BPF) syntax. The `<filter>` value must be enclosed in quotes.

```
'[[src|dst] host <host_name_or_IP1>] [[src|dst] host <host_name_or_IP2>]
    [[arp|ip|ip6|gre|esp|udp|tcp] [port_no]] [[arp|ip|ip6|gre|esp|udp|tcp] [port_no]]'
```

If a second host is specified in the filter, only the traffic between the two hosts will be displayed. Optionally, you can use logical OR to match only one of the hosts, or match one of multiple protocols or ports. When defining a port, there are up to two parts — protocol and port number.

For example, to display UDP 1812 traffic or TCP 8080 traffic, use the following:

```
'udp port 1812 or tcp port 8080'
```

To display all IP traffic that has a source of 192.168.1.2 and a destination of 192.168.2.3:

```
'ip src host 192.168.1.2 and dst host 192.168.2.3'
```

The <verbose> option allows different levels of information to be displayed. The verbose levels include:

1 Print header of packets

2 Print header and data from the IP header of the packets

3 Print header and data from the Ethernet header of the packets

4 Print header of packets with interface name

5 Print header and data from ip of packets with interface name

6 Print header and data from ethernet of packets with interface name

The <count> value indicates the number of packets to sniff before stopping. If this variable is not included, or is set to zero, the sniffer will run until you manually halt it with Ctrl-C.

The <tsformat> value define the format of timestamp. It can be:

a: absolute UTC time, yyyy-mm-dd hh:mm:ss.ms

l: absolute LOCAL time, yyyy-mm-dd hh:mm:ss.ms

otherwise: relative to the start of sniffing, ss.ms

Packet capture

FortiOS 5.2 includes packet capture to the web-based manager. The FortiGate unit must have a disk and then capture-packet feature can be enabled from the CLI within the firewall policy as below:

```
config firewall policy
   edit <id>
   set capture-packet enable
end
```

To configure packet capture filters, go to **System > Network > Packet Capture**.

When you add a packet capture filter, enter the following information and select **OK**.

Interface	Select the interface to sniff from the dropdown menu. You must select one interface. You cannot change the interface without deleting the filter and creating a new one, unlike the other fields.
Max Packets to Capture	Enter the number of packets to capture before the filter stops. This number cannot be zero. You can halt the capturing before this number is reached.
Enable Filters	Select this option to specify your filter fields
Host(s)	Enter one or more hosts IP address Separate multiple hosts with commas. Enter a range using a dash without spaces, for example 172.16.1.5-172.16.1.15 or enter a subnet.
Port(s)	Enter one or more ports to capture on the selected interface. Separate multiple ports with commas. Enter a range using a dash without spaces, for example 88-90
VLAN(s)	Enter one or more vlans (if there is any). Separate multiple vlans with commas.
Protocol	Enter one or more protocol. Separate multiple protocol with commas. Enter a range using a dash without spaces, for example 1-6, 17, 21-25
Include IPv6 packets	Select this option if you are troubleshooting IPv6 networking, or if your network uses IPv6. Otherwise, leave it disabled.
Capture Non-IP packets	The protocols available in the list are all IP based except for ICMP (ping). To capture non-IP based packets select this feature. Some examples of non-IP packets include IPsec, IGMP, ARP, and as mentioned ICMP.

If you select a filter and go back to edit it, you have the added option of starting and stopping packet capture in the edit window, or downloading the captured packets. You can also see the filter status and the number of packets captured.

You can also select the filter and select **Start** to start capturing packets. While the filter is running, you will see the number of captured packets increasing until it reaches the max packet count or you select **Stop**. While the filter is running you cannot download the output file.

When the packet capture is complete, you can select **Download** to send the packet capture filter captured packets to your local computer as a *.pcap file. To read this file format, you will need to use Wireshark or a similar third party application. Using this tool you will have extensive analytics available to you and the full contents of the packets that were captured.

NPU based interfaces

Many Fortinet products contain network processors such as NP1, NP2, and NP4 network processors. Therefore offloading requirements, vary by network processor model.

When using the NPU-based interfaces, only the initial session setup will be seen through the `diag debug flow` command. If the session is correctly programmed into the ASIC (fastpath), the debug flow command will no longer see the packets arriving at the CPU. If the NPU functionality is disabled, the CPU will see all the packets, however, this should only be used for troubleshooting purposes.

First, obtain the NP4 id and the port numbers with the following command:

```
diag npu np4 list
```

Sample output:

```
ID Model Slot Interface
0 On-board port1 fabric1 fabric3 fabric5
1 On-board fabric2 port2 base2 fabric4
```

Run the following commands:

```
diag npu np4 fastpaf th disable <dev_id>
```

(where `dev_id` is the NP4 number)

Then, run this command:

```
diag npu np4 fastpath-sniffer enable port1
```

Sample output:

```
NP4 Fast Path Sniffer on port1 enabled
```

This will cause all traffic on **port1** of NP4 to be sent to the CPU meaning a standard sniffer trace can be taken and other diag commands should work if it was a standard CPU driven port.

These commands are only for the newer NP4 interfaces.

Debug command

Debug output provides continuous, real-time event information. Debugging output continues until it is explicitly stopped or until the unit is rebooted. Debugging output can affect system performance and will be continually generated even though output might not be displayed in the CLI console.

Debug information displayed in the console will scroll in the console display and may prevent CLI commands from being entered, for example, the command to disable the debug display. To turn off debugging output as the display is scrolling by, press the ↑ key to recall the recent diag debug command, press backspace, and type “0”, followed by **Enter**.

Debug output display is enabled using the following command:

```
diag debug enable
```

When finished examining the debug output, disable it using:

```
diag debug disable
```

Once enabled, indicate the debug information that is required using this command:

```
diag debug <option> <level>
```

Debug command options include the following:

`enable`	Enable debug output.
`disable`	Disable debug output.
`info`	Show active debug level settings.
`reset`	Reset all debug level to default.
`report`	Report for tech support.
`crashlog`	Crash log info.
`config-error-log`	Configure error log info.
`sql-log-error`	SQL log database error info.
`application`	application.
`kernel`	kernel.
`remote-extender`	remote-extender.
`console`	console.
`cli`	Debug CLI.
`cmdb-trace`	Trace CLI.
`rating`	Display rating info.
`authd`	Authentication daemon.
`fsso-polling`	FSSO active directory poll module.
`flow`	Trace packet flow in kernel.
`urlfilter`	urlfilter.
`admin`	Admin user.

The debug level can be set at the end of the command. Typical values are 2 and 3, for example:

```
diag debug application DHCPS 2
diag debug application spamfilter 2
```

Fortinet support will advise which debugging level to use.

Timestamps can be enabled to the debug output using the following command:

```
diag debug console timestamp enable
```

Debug output example

This example shows the IKE negotiation for a secure logging connection from a FortiGate unit to a FortiAnalyzer system.

```
diag debug reset
diag vpn ike log-filter src-addr4 192.168.11.2
diag debug enable
```

Sample Output:

```
FGh_FtiLog1: IPsec SA connect 0 192.168.11.2->192.168.10.201:500, natt_mode=0 rekey=0
    phase2=FGh_FtiLog1
FGh_FtiLog1: using existing connection, dpd_fail=0
FGh_FtiLog1: found phase2 FGh_FtiLog1
FGh_FtiLog1: IPsec SA connect 0 192.168.11.2 -> 192.168.10.201:500 negotiating
FGh_FtiLog1: overriding selector 225.30.5.8 with 192.168.11.2
FGh_FtiLog1: initiator quick-mode set pfs=1536...
FGh_FtiLog1: try to negotiate with 1800 life seconds.
FGh_FtiLog1: initiate an SA with selectors: 192.168.11.2/0.0.0.0->192.168.10.201,
    ports=0/0, protocol=0/0
Send IKE Packet(quick_outI1):192.168.11.2:500(if0) -> 192.168.10.201:500, len=348
Initiator: sent 192.168.10.201 quick mode message #1 (OK)
FGh_FtiLog1: set retransmit: st=168, timeout=6.
```

In this example:

`192.168.11.2->192.168.10.201:500`	Source and Destination gateway IP address
`dpd_fail=0`	Found existing Phase 1
`pfs=1536...`	Create new Phase 2 tunnel

The execute tac report command

`exec tac report` is an execute command that runs an exhaustive series of diagnostic commands. It runs commands that are only needed if you are using certain features like HA, VPN tunnels, or a modem. The report takes a few minutes to complete due to the amount of output generated. If you have your CLI output logged to a file, you can run this command to familiarize yourself with the CLI commands involved.

When you call Fortinet Customer Support, you will be asked to provide information about your unit and its current state using the output from this CLI command.

Other commands

ARP table

To view the ARP cache, use the following command:

```
get sys arp
```

To view the ARP cache in the system, use this command:

```
diag ip arp list
```

Sample output:

```
index=14 ifname=internal 224.0.0.5 01:00:5e:00:00:05 state=00000040 use=72203
    confirm=78203 update=72203 ref=1
index=13 ifname=dmz 192.168.3.100 state=00000020 use=1843 confirm=650179 update=644179
    ref=2 ? VIP
index=13 ifname=dmz 192.168.3.109 02:09:0f:78:69:ff state=00000004 use=71743 confirm=75743
    update=75743 ref=1
index=14 ifname=internal 192.168.11.56 00:1c:23:10:f8:20 state=00000004 use=10532
    confirm=10532 update=12658 ref=4
```

To remove the ARP cache, use this command:

```
execute clear system arp table
```

To remove a single ARP entry, use:

```
diag ip arp delete <interface name> <IP address>
```

To add static ARP entries, use the following command:

```
config system arp-table
```

Time and date settings

Check time and date settings for log message timestamp synchronization (the Fortinet support group may request this) and for certificates that have a time requirement to check for validity. Use the following commands:

```
execute time
current time is: 12:40:48
last ntp sync:Thu Mar 16 12:00:21 2006
execute date
current date is: 2006-03-16
```

To force synchronization with an NTP server, toggle the following command:

```
Config system ntp
   set ntpsync enable/disable
end
```

If all devices have the same time, it helps to correlate log entries from different devices.

IP address

There may be times when you want to verify the IP addresses assigned to the FortiGate unit interfaces are what you expect them to be. This is easily accomplished from the CLI using the following command.

```
diag ip address list
```

The output from this command lists the IP address and mask if available, the index of the interface (a sort of ID number) and the devname is the name of the interface. While physical interface names are set, virtual interface names can vary. Listing all the virtual interface names is a good use of this command. For vsys_ha and vsys_ fgfm, the IP addresses are the local host — these are internally used virtual interfaces.

```
# diag ip address list
IP=10.31.101.100->10.31.101.100/255.255.255.0 index=3 devname=internal
IP=172.20.120.122->172.20.120.122/255.255.255.0 index=5 devname=wan1
IP=127.0.0.1->127.0.0.1/255.0.0.0 index=8 devname=root
IP=127.0.0.1->127.0.0.1/255.0.0.0 index=11 devname=vsys_ha
IP=127.0.0.1->127.0.0.1/255.0.0.0 index=13 devname=vsys_fgfm
```

FortiOS ports

In the TCP and UDP stacks, there are 65 535 ports available for applications to use when communicating with each other. Many of these ports are commonly known to be associated with specific applications or protocols. These known ports can be useful when troubleshooting your network.

Use the following ports while troubleshooting the FortiGate device:

Port(s)	Functionality
UDP 53	DNS lookup, RBL lookup
UDP 53 or UDP 8888	FortiGuard Antispam or Web Filtering rating lookup
UDP 53 (default) or UDP 8888 and UDP 1027 or UDP 1031	FDN Server List - source and destination port numbers vary by originating or reply traffic. See the article “How do I troubleshoot performance issues when FortiGuard Web Filtering is enabled?” in the Knowledge Base.
UDP 123	NTP Synchronization
UDP 162	SNMP Traps
UDP 514	SYSLOG - All FortiOS versions can use syslog to send log messages to remote syslog servers. FortiOS v2.80 and v3.0 can also view logs stored remotely on a FortiAnalyzer unit.
TCP 22	Configuration backup to FortiManager unit or FortiGuard Analysis and Management Service.
TCP 25	SMTP alert email, encrypted virus sample auto-submit
TCP 389 or TCP 636	LDAP or PKI authentication
TCP 443	FortiGuard Antivirus or IPS update - When requesting updates from a FortiManager unit instead of directly from the FDN, this port must be reconfigured as TCP 8890.
TCP 443	FortiGuard Analysis and Management Service
TCP 514	FortiGuard Analysis and Management Service log transmission (OFTP)
TCP 541	SSL Management Tunnel to FortiGuard Analysis and Management Service (FortiOS v3.0 MR6 or later)
TCP 514	Quarantine, remote access to logs and reports on a FortiAnalyzer unit, device registration with FortiAnalyzer units (OFTP)
TCP 1812	RADIUS authentication
TCP 8000 and TCP 8002	FSSO
TCP 10151	FortiGuard Analysis and Management Service contract validation

FortiAnalyzer/FortiManager ports

If you have a FortiAnalyzer unit or FortiManager unit on your network you may need to use the following ports for troubleshooting network traffic.

Functionality	Port(s)
DNS lookup	UDP 53
NTP synchronization	UDP 123
Windows share	UDP 137-138
SNMP traps	UDP 162
Syslog, log forwarding	UDP 514
Log and report upload	TCP 21 or TCP 22
SMTP alert email	TCP 25
User name LDAP queries for reports	TCP 389 or TCP 636
RVS update	TCP 443
RADIUS authentication	TCP 1812
Log aggregation client	TCP 3000

FortiGuard troubleshooting

The FortiGuard service provides updates to Antivirus, Antispam, IPS, Webfiltering, and more. The FortiGuard Distribution System (FDS) involves a number of servers across the world that provide updates to your FortiGate unit. Problems can occur both with connection to FDS, and its configuration on your local FortiGate unit. Some of the more common troubleshooting methods are listed here including

- Troubleshooting process for FortiGuard updates
- FortiGuard server settings

Troubleshooting process for FortiGuard updates

The following process are the logical steps to take when troubleshooting FortiGuard update problems. This includes antivirus (AV), intrusion protection services (IPS), antispam (AS), and web filtering (WB).

1. **Does the device have a valid licence that includes these services?**
   Each device requires a valid FortiGuard license to access updates for some or all of these services. You can verify the support contract status for your devices at the Fortinet Support website — https://support.fortinet.com/.
2. **If the device is part of an HA cluster, do all members of the cluster have the same level of support?**
   As with the previous step, you can verify the support contract status for all the devices in your HA cluster at the Fortinet Support website.
3. **Have services been enabled on the device?**
   To see the FortiGuard information and status for a device, in the web-based manager go to **System > Config > FortiGuard**. On that page you can verify the status of each component, and if required enable each service. If there are problems, see the FortiGuard section of the FortiOS Handbook.

4. **Is the device able to communicate with FortiGuard servers?**
   At **System > Config > FortiGuard** you can also attempt to update AV and IPS, or test the availability of WF and AS default and alternate ports. If there are problems, see the FortiGuard section of the FortiOS Handbook.
5. **Is there proper routing to reach the FortiGuard servers?**
   Ensure there is a static or dynamic route that enables your ForitGate unit to reach the FortiGuard servers. Usually a generic default route to the internet is enough, but you may need to verify this if your network is complex.
6. **Are there issues with DNS?**
   An easy way to test this is to attempt a traceroute from behind the FortiGate unit to an external network using the FQDN for a location. If the traceroute FQDN name does not resolve, you have general DNS problems.
7. **Is there anything upstream that might be blocking FortiGuard traffic, either on the network or ISP side?**
   Many firewalls block all ports by default, and often ISPs block ports that are low. There may be a firewall between the FortiGate unit and the FortiGuard servers that is blocking the traffic. FortiGuard uses port 53 by default, so if it is being blocked you need to either open a hole for it, or change the port it is using.
8. **Is there an issue with source ports?**
   It is possible that ports used to contact FortiGuard are being changed before reaching FortiGuard or on the return trip before reaching your FortiGate unit. A possible solution for this is to use a fixed-port at NATd firewalls to ensure the port remains the same. Packet sniffing can be used to find more information on what is happening with ports.
9. **Are there security policies that include antivirus?**
   If no security policies include antivirus, the antivirus databse will not be updated. If antivirus is included, only the database type used will be updated.

FortiGuard server settings

Your local FortiGate unit connects to remote FortiGuard servers get updates to FortiGuard information such as new viruses that may have been found or other new threats. This section demonstrates ways to display information about FortiGuard server information on your FortiGate unit, and how to use that information and update it to fix potential problems.

Displaying the server list

The `get webfilter status` or `diag debug rating` command shows the list of FDS servers the FortiGate unit is using to send web filtering requests. Rating requests are only sent to the server on the top of the list in normal operation. Each server is probed for Round Trip Time (RTT) every two minutes.

You can optionally add a refresh rate to the end of this command and that will determine how often the server list will be refreshed.

Rating may not be enabled on your FortiGate unit.

```
get webfilter status
```

Sample Output:

```
Locale : english
License : Contract
Expiration : Thu Oct 9 02:00:00 2011
-=- Server List (Mon Feb 18 12:55:48 2008) -=-
```

IP	Weight	RTT	Flags	TZ	Packets	CurrLost	TotalLost
a.b.c.d	0	1	DI	2	1926879	0	11176

10.1.101.1	10	329	1	10263	0	633
10.2.102.2	20	169	0	16105	0	80
10.3.103.3	20	182	0	6741	0	776
10.4.104.4	20	184	0	5249	0	987
10.5.105.5	25	181	0	12072	0	178

Output Details

The Server List includes the IP addresses of alternate servers if the first entry cannot be reached. In this example the IP addresses are not public addresses

The following flags in `get webfilter status` indicate the server status:

- `D` - the server was found through the DNS lookup of the hostname. If the hostname returns more than one IP address, all of them will be flagged with D and will be used first for INIT requests before falling back to the other servers.
- `I` - the server to which the last INIT request was sent.
- `F` - the server has not responded to requests and is considered to have failed.
- `T` - the server is currently being timed.
- `S` - means that rating requests can be sent to the server. The flag is set for a server only in two cases:
  1. The server exists in the servers list received from the Fortimanager or any other INIT server.
  2. The servers list received from the FortiManager is empty so the Fortimanager itself would be the only server known by Fortigate thus it should be used as the rating server.

  The servers that are not currently serving will be pushed down to the bottom list (under the available serving servers, and on top of the failed servers) in order for the `load-balance-servers` feature in the `config system fortiguard` to work properly.

Sorting the server list

The server list is sorted first by weight. The server with the smallest RTT is put at the top of the list, regardless of weight. When a packet is lost (there has been no response in 2 seconds), it will be resent to the next server in the list. Therefore, the top position in the list is selected based on RTT while the other list positions are based on weight.

Calculating weight

The weight for each server increases with failed packets and decreases with successful packets. To lower the possibility of using a remote server, the weight is not allowed to dip below a base weight, calculated as the difference in hours between the FortiGate unit and the server times 10. The further away the server is, the higher its base weight and the lower in the list it will appear.

Common questions

The general troubleshooting tips include, and can help answer, the following questions:

How to check hardware connections

- Are all the cables and interfaces connected properly?
- Is the LED for the interface green?

How to check FortiOS network settings

- If you are having problems connecting to the management interface, is your protocol enabled on the interface for administrative access?
- Is there an IP address on the interface?

How to check CPU and memory resources

- Is your CPU running at almost 100 percent usage?
- Are you running low on memory?

How to check modem status

- Is the modem connected?
- Are there PPP issues?

How to run ping and traceroute

- Are you experiencing complete packet loss?

How to check the logs

- Do you need to identify a problem?

How to verify the contents of the routing table (in NAT mode)

- Are there routes in the routing table for default and static routes?
- Do all connected subnets have a route in the routing table?
- Does a route wrongly have a higher priority than it should?

How to verify the correct route is being used

- Has the traffic been routed correctly?

How to verify the correct firewall policy is being used

- Is the correct firewall policy applied to the expected traffic?

How to check the bridging information in Transparent mode

- Are you having problems in Transparent mode?

How to check number of sessions used by UTM proxy

- Have you reached the maximum number of sessions for a protocol?
- Are new sessions failing to start for a certain protocol?

How to examine the firewall session list

- Are there active firewall sessions?

How to check wireless information

- Is the wireless network functioning properly?

How to verify FortiGuard connectivity

- Is the FortiGate unit communicating properly with FortiGuard?

How to perform a sniffer trace (CLI and Packet Capture)

- Is traffic entering the FortiGate unit and does it arrive on the expected interface?
- Is the ARP resolution correct for the next-hop destination?
- Is the traffic exiting the FortiGate unit to the destination as expected?
- Is the traffic being sent back to the originator?

How to debug the packet flow

- Is the traffic entering or leaving the FortiGate unit as expected?

How to check hardware connections

If there is no traffic flowing from the FortiGate unit, it may be a hardware problem.

To check hardware connections:

- Ensure the network cables are properly plugged into the interfaces.
- Ensure there are connection lights for the network cables on the unit.
- Change the cable if the cable or its connector are damaged or you are unsure about the cable's type or quality—such as straight through or crossover, or possibly exposed wires at the connector.
- Connect the FortiGate unit to different hardware.
- Ensure the link status is set to **Up** for the interface, (see **Network > Interface > Status)**. The link status is based on the physical connection and cannot be set in FortiOS.

If any of these solve the problem, it was a hardware connection problem. You should still perform some basic software connectivity tests to ensure complete connectivity. It might also be that the interface is disabled, or has its **Administrative Status** set to **Down**.

To enable an interface - web-based manager

1. Using the web-based management interface, go to **System > Network > Interface**.
2. Select and edit the interface to enable, such as **port1**.
3. Find **Administrative Status** at the bottom of the screen, and select **Up**.
4. Select **Apply**.

To enable an interface - CLI

```
config system interface
   edit port1
      set status up
   next
end
```

How to check FortiOS network settings

FortiOS network settings are present in both the web-based manager interface and the CLI. The following information includes troubleshooting and best practice information. The network settings include:

Interface settings

DNS settings

DHCP Server settings

Interface settings

If you can access the FortiGate unit with the management cable only, the first step is to display the interface settings. To display the settings for the internal interface, use the following CLI command:

```
FGT# show system interface <Interface_mane>
```

For a complete listing of all the possible interface settings, use the following CLI command:

```
config system interface
   edit <Interface_name>
   get
end
```

Check the interface settings to ensure they are not preventing traffic. Specific things to check include (only the web-based manager names are shown, CLI names may vary slightly):

- **Link Status —** *Down* until a valid cable is plugged into this interface, after which it will be **Up**. The Link Status is shown physically by the connection LED for the interface. If it lights up green, it is a good connection. If Link Status is *Down*, the interface does not work. Link Status is also displayed on the **System > Network > Interface** screen by default.
- **Addressing mode —** Do not use **DHCP** if you don't have a DHCP server —you will not be able to logon to an interface in DHCP mode as it will not have an IP address.
- **IP/Netmask —** An interface needs an IP address to be able to connect to other devices. Ensure there is a valid IP address in this field. The one exception is if **DHCP** is enabled for this interface to get its IP address from an external DHCP server.
- **IPv6 address —** The same protocol must be used by both ends to complete the connection. Ensure both this interface and the remote connection are both using IPv4 or both using IPv6 addressing.
- **Administrative access —** If no protocols are selected, you will have to use the local management cable to connect to the unit. If you are using IPv6, configure the IPv6 administrative access protocols.
- **Administrative status —** Set to **Up** or the interface will not work.

DNS settings

While this section is not complicated, many networking problems can be traced back to DNS problems. Things to check in this area include:

- Are there values for both primary and secondary entries?
- Is the local domain name correct?
- Are you using IPv6 addressing? If so, are the IPv6 DNS settings correct?
- Are you using Dynamic DNS (DDNS)? If so, is it using the correct server, credentials, and interface?
- Can you contact both DNS servers to verify the servers are operational?

- If an interface addressing mode is set to DHCP and is set to override the internal DNS, is that interface receiving a valid DNS entry from the DHCP server? Is it a reasonable address and can it be contacted to verify it's operational?
- Are there any DENY security policies that need to allow DNS?
- Can any internal device perform a successful traceroute to a location using the FQDN?

DHCP Server settings

DHCP Servers are common on internal and wireless networks. If the DHCP server is not configured properly it can cause problems. Things to check in this area include:

- Is the DHCP server entry set to **Relay**? If so, verify there is another DHCP server to which requests can be relayed. Otherwise, it should be set to **Server**.
- Is the DHCP server enabled?
- Does this DHCP server use a valid range of IP addresses? Are those addresses in use by other devices? If one or more devices are using IP addresses in this range, you can use the IP reservation feature to ensure the DHCP server does not use these addresses.
- Is there a gateway entry? Include a gateway entry to ensure clients of this server have a default route.
- Is the system DNS setting being used? The best practice is to avoid confusion by using the system DNS whenever possible. However, the option to specify up to three custom DNS servers is available, and all three entries should be used for redundancy.

There are some situations, such as a new wireless interface, or during the initial FortiGate unit configuration, where interfaces override the system DNS entries. When this happens, it often shows up as intermittent Internet connectivity. To fix the problem, go to **System > Network > DNS** and ensure to enable **Use FortiGuard Servers**.

How to check CPU and memory resources

System resources are shared and a number of processes run simultaneously on the FortiGate unit. If one of these processes consumes nearly all the resources.

A quick way to monitor CPU and memory usage is on the System Dashboard using the **System Resources** widgets. They have both a visual gauge displayed to show you the usage.

To check the system resources on your FortiGate unit, run the following CLI command:

```
FGT# get system performance status
```

This command provides a quick and easy snapshot of the FortiGate.

The first line of output shows the CPU usage by category. A FortiGate that is doing nothing will look like:

```
CPU states: 0% user 0% system 0% nice 100% idle
```

However, if your network is running slow you might see something like:

```
CPU states: 1% user 98% system 0% nice 1% idle
```

This line shows that all the CPU is used up by system processes. Normally this should not happen as it shows the FortiGate is overloaded for some reason. If you see this overloading, you should investigate farther as it's possible a process, such as scanunitid, is using all the resources to scan traffic, in which case you need to reduce

the amount of traffic being scanned by blocking unwanted protocols, configuring more security policies to limit scanning to certain protocols, or similar actions. It is also possible that a hacker has gained access to your network and is overloading it with malicious activity such as running a spam server or using zombie PCs to attack other networks on the Internet. You can get additional CPU related information with the CLI command `get system performance top`. This command shows you all the top processes running on the FortiGate unit (names on the left) and their CPU usage. If a process is using most of the CPU cycles, investigate it to determine if it's normal activity.

The second line of output from `get system performance status` shows the memory usage. Memory usage should not exceed 90 percent. If memory is too full, some processes will not be able to function properly. For example, if the system is running low on memory, antivirus scanning will go into failopen mode where it will start dropping connections or bypass the antivirus system.

The other lines of output, such as average network usage, average session setup rate, viruses caught, and IPS attacks blocked can also help you determine why system resource usage it high. For example, if network usage is high it will result in high traffic processing on the FortiGate, or if the session setup rate is very low or zero the proxy may be overloaded and not able to do its job.

How to troubleshoot high memory usage

As with any system, FortiOS has a finite set of hardware resources such as memory and all the running processes share that memory. Depending on their workload, each process will use more or less as needed, usually more in high traffic situations. If some processes use all the available memory, other processes will have no memory available and not be able to function.

When high memory usage happens, you may experience services that appear to freeze up and connections are lost or new connections are refused.

If you are seeing high memory usage in the **System Resources** widget, it could mean that the unit is dealing with high traffic volume, which may be causing the problem, or it could be when the unit is dealing with connection pool limits affecting a single proxy. If the unit is receiving large volumes of traffic on a specific proxy, it is possible that the unit will exceed the connection pool limit. If the number of free connections within a proxy connection pool reaches zero, problems may occur.

Use the following CLI command, which uses the antivirus failopen feature. Setting it to idledrop will drop connections based on the clients that have the most connections open. This helps to determine the behavior of the FortiGate antivirus system if it becomes overloaded in high traffic.

```
config system global
   set av-failopen idledrop
end
```

Use the following CLI command, which gives you information about current memory usage:

```
   diagnose hardware sysinfo memory
```

Sample output:

```
total: used: free: shared: buffers: cached: shm:
Mem: 2074185728 756936704 1317249024 0 20701184 194555904 161046528
Swap:       0       0       0
MemTotal:   2025572 kB
MemFree:    1286376 kB

SwapFree:         0 kB
```

How to troubleshoot high CPU usage

FortiOS has many features. If many of them are used at the same time, it can quickly use up all the CPU resources. When this happens, you will experience connection related problems stemming from the FortiOS unit trying to manage its workload by refusing new connections, or even more aggressive methods.

Some examples of features that are CPU intensive are VPN high level encryption, having all traffic undergo all possible scanning, logging all traffic, and packets, and dashboard widgets that frequently update their data.

1. **Determine how high the CPU usage is currently.** There are two main ways to do this. The easiest is to go to **System > Dashboard > Status** and look at the **system resources** widget. This is a dial gauge that displays a percentage use for the CPU. If its at the red-line, you should take action. The other method is to use the Dashboard CLI widget to enter `diag sys top`.

   Sample output:

   ```
   Run Time: 11 days, 23 hours and 36 minutes
   0U, 0S, 98I; 1977T, 758F, 180KF
           newcli 286 R 0.1 0.8
           ipsengine 78 S < 0.0 3.1
           ipsengine 64 S < 0.0 3.0
           ipsengine 77 S < 0.0 3.0
           ipsengine 68 S < 0.0 2.9
           ipsengine 66 S < 0.0 2.9
           ipsengine 79 S < 0.0 2.9
           scanunitd 133 S < 0.0 1.8
           pyfcgid 267 S 0.0 1.8
           pyfcgid 269 S 0.0 1.7
           pyfcgid 268 S 0.0 1.6
           httpsd 139 S 0.0 1.6
           pyfcgid 266 S 0.0 1.5
           scanunitd 131 S < 0.0 1.4
           scanunitd 132 S < 0.0 1.4
           proxyworker 90 S 0.0 1.3
           cmdbsvr 43 S 0.0 1.1
           proxyworker 91 S 0.0 1.1
           miglogd 55 S 0.0 1.1
   ```

```
httpsd 135 S 0.0 1.0
```

Where the codes displayed on the second output line mean the following:

- `U` is % of user space applications using CPU. In the example, `0U` means 0% of the user space applications are using CPU.
- `S` is % of system processes (or kernel processes) using CPU. In the example, `0S` means 0% of the system processes are using the CPU.
- `I` is % of idle CPU. In the example, `98I` means the CPU is 98% idle.
- `T` is the total FortiOS system memory in Mb. In the example, `1977T` means there are 1977 Mb of system memory.
- `F` is free memory in Mb. In the example, `758F` means there is 758 Mb of free memory.
- `KF` is the total shared memory pages used. In the example, `180KF` means the system is using 180 shared memory pages.

Each additional line of the command output displays information for each of the processes running on the FortiGate unit. For example, the third line of the output is:

```
newcli 286 R 0.1 0.8
```

Where:

- `newcli` is the process name. Other process names can include `ipsengine`, `sshd`, `cmdbsrv`, `httpsd`, `scanunitd`, and `miglogd`.
- `286` is the process ID. The process ID can be any number.
- `R` is the current state of the process. The process state can be:

- `R` running
- `S` sleep
- `Z` zombie
- `D` disk sleep.
  - `0.1` is the amount of CPU that the process is using. CPU usage can range from 0.0 for a process that is sleeping to higher values for a process that is taking a lot of CPU time.
  - `0.8` is the amount of memory that the process is using. Memory usage can range from 0.1 to 5.5 and higher.

Enter the following single-key commands when `diagnose sys top` is running:

- Press `q` to quit and return to the normal CLI prompt.
- Press `p` to sort the processes by the amount of CPU that the processes are using.
- Press `m` to sort the processes by the amount of memory that the processes are using.

2. **Determine what features are using most of the CPU resources.**
   There is a command in the CLI to let you see the top few processes currently running that use the most CPU resources. The CLI command `get system performance top` outputs a table of information. You are interested in the second most right column, CPU usage by percentage. If the top few entries are using most of the CPU, note which processes they are and investigate those features to try and reduce their CPU load. Some examples of processes you will see include:
   - `ipsengine` — the IPS engine that scans traffic for intrusions
   - `scanunitd` — antivirus scanner
   - `httpsd` — secure HTTP
   - `iked` — internet key exchange (IKE) in use with IPsec VPN tunnels

- `newcli` — active whenever you are accessing the CLI
- `sshd` — there are active secure socket connections
- `cmdbsrv` — the command database server application

Go to the features that are at the top of the list and look for evidence of them overusing the CPU. Generally the monitor for a feature is a good place to start.

3. Check for unnecessary CPU “wasters”.
These are some best practises that will reduce your CPU usage, even if you are not experiencing high CPU usage. Note that if you require a feature this section tells you to turn off, ignore it.
   - Use hardware acceleration wherever possible to offload tasks from the CPU. Offloading tasks such as encryption frees up the CPU for other tasks.
   - Avoid the use of GUI widgets that require computing cycles, such as the Top Sessions widget. These widgets are constantly polling the system for their information, which uses CPU and other resources.
   - Schedule antivirus, IPS, and firmware updates during off peak hours. Usually these don’t consume CPU resources but they can disrupt normal operation.
   - Check the log levels and which events are being logged. This is the severity of the messages that are recorded. Consider going up one level to reduce the amount of logging. Also if there are events you do not need to monitor, remove them from the list.
   - Log to FortiCloud instead of memory or Disk. Logging to memory quickly uses up resources. Logging to local disk will impact overall performance and reduce the lifetime of the unit. Fortinet recommends logging to FortiCloud which doesn’t use much CPU.
   - If the disk is almost full, transfer the logs or data off the disk to free up space. When a disk is almost full it consumes a lot of resources to find the free space and organize the files.
   - If you have packet logging enabled, consider disabling it. When it’s enabled it records every packet that comes through that policy.
   - Halt all sniffers and traces.
   - Ensure you are not scanning traffic twice. If traffic enters the FortiGate unit on one interface, goes out another, and then comes back in again that traffic does not need to be rescanned. Doing so is a waste of resources. However, ensure that traffic truly is being scanned once.
   - Reduce the session timers to close unused sessions faster. To do this in the CLI enter the following commands and values. These values reduce the values from defaults. Note that `tcp-timewait` has 10 seconds added by the system by default.

     ```
     config system global
        set tcp-halfclose-timer 30
        set tcp-halfopen-timer 30
        set tcp-timewait-timer 0
        set udp-idle-timer 60
     end
     ```
   - Enable only features that you need under **System > Config > Features**.

4. **When CPU usage is under control, use SNMP to monitor CPU usage. Alternately, use logging to record CPU and memory usage every 5 minutes.**
Once things are back to normal, you should set up a warning system to alert you of future CPU overusage. A common method to do this is with SNMP. SNMP monitors many values on the FortiOS and allows you to set high water marks that will generate events. You run an application on your computer to watch for and record these events. Go to **System > Config > SNMP** to enable and configure an SNMP community. If this method is too complicated, you can use the **System Resources** widget to record CPU usage. However, this method will not alert you to problems - it will just record them as they happen.

How to check modem status

Sometimes the modem may not work properly, or the unit may not be detecting the modem. Use the following diagnostic commands to help you troubleshoot issues with the modem.

```
diagnose sys modem {cmd | com | detect | history | external-modem| query| reset}
```

You should always run the following diagnose command after inserting the USB modem into the unit:

```
diagnose sys modem detect
```

You can view the modem configuration by using the `get system modem` command. You can also view the modem's vendor identification as well as the custom product identification number from the information output from the `get system modem` command.

When there are connectivity issues, use the following to help you resolve them:

- `diag debug enable` – activates the debug on the console
- `diag debug application modemd` – dumps communication between the modem and the unit.
- `diag debug application ppp` – dumps the PPP negotiating messages.
- `execute modem dial` – displays modem debug output.

The modem diagnose output should not contain any error on the way to initializing. You should also verify the number that is used to dial with your ISP.

How to run ping and traceroute

Ping and traceroute are useful tools in network troubleshooting. Alone, either one can determine network connectivity between two points. However, ping can be used to generate simple network traffic to view with diagnose commands on the FortiGate unit. This combination can be very powerful when locating network problems.

In addition to their normal uses, ping and traceroute can tell you if your computer or network device has access to a domain name server (DNS). While both tools can use IP addresses alone, they can also use domain names for devices. This is an added troubleshooting feature that can be useful in determining why particular services, such as email or web browsing, may not be working properly.

If ping does not work, you likely have it disabled on at least one of the interface settings, and security policies for that interface.

Both ping and traceroute require particular ports to be open on firewalls, or else they cannot function. Since you typically use these tools to troubleshoot, you can allow them in the security policies and on interfaces only when you need them, and otherwise keep the ports disabled for added security.

Ping

The ping command sends a very small packet to the destination, and waits for a response. The response has a timer that may expire, indicating the destination is unreachable. The behavior of ping is very much like a sonar ping from a submarine, where the command gets its name.

Ping is part of Layer-3 on the OSI Networking Model. Ping sends Internet Control Message Protocol (ICMP) “echo request” packets to the destination, and listens for “echo response” packets in reply. However, many public networks block ICMP packets because ping can be used in a denial of service (DoS) attack (such as Ping of Death or a smurf attack), or by an attacker to find active locations on the network. By default, FortiGate units have ping enabled while broadcast-forward is disabled on the external interface.

What ping can tell you

Beyond the basic connectivity information, ping can tell you the amount of packet loss (if any), how long it takes the packet to make the round trip, and the variation in that time from packet to packet.

If there is some packet loss detected, you should investigate the following:

- Possible ECMP, split horizon, or network loops.
- Cabling to ensure no loose connections.
- Verify which security policy was used (use the packet count column on the **Policy & Objects > Policy** page).

If there is total packet loss, you should investigate the following:

- **Hardware —** ensure cabling is correct, and all equipment between the two locations is accounted for.
- **Addresses and routes —** ensure all IP addresses and routing information along the route is configured as expected.
- **Firewalls —** ensure all firewalls, including FortiGate unit security policies allow PING to pass through.

How to use ping

Ping syntax is the same for nearly every type of system on a network.

To ping from a FortiGate unit

1. Connect to the CLI either through telnet or through the CLI widget on the web-based manager dashboard.
2. Enter `exec ping 10.11.101.101` to send 5 ping packets to the destination IP address. There are no options for this command.

   Sample output:

```
Head_Office_620b # exec ping 10.11.101.101
PING 10.11.101.101 (10.11.101.101): 56 data bytes
64 bytes from 10.11.101.101: icmp_seq=0 ttl=255 time=0.3 ms
64 bytes from 10.11.101.101: icmp_seq=1 ttl=255 time=0.2 ms
64 bytes from 10.11.101.101: icmp_seq=2 ttl=255 time=0.2 ms
64 bytes from 10.11.101.101: icmp_seq=3 ttl=255 time=0.2 ms
64 bytes from 10.11.101.101: icmp_seq=4 ttl=255 time=0.2 ms

--- 10.11.101.101 ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max = 0.2/0.2/0.3 ms
```

To ping from an MS Windows PC

1. Open a command window.
   - In Windows XP, select **Start > Run**, enter cmd, and select **OK**.
   - In Windows 7, select the Start icon, enter cmd in the search box, and select cmd.exe from the list.
2. Enter `ping 10.11.101.100` to ping the default internal interface of the FortiGate unit with four packets.

Other options include:

- `-t` to send packets until you press “Control-C”
- `-a` to resolve addresses to domain names where possible
- `-n X` to send X ping packets and stop

Sample output:

```
C:\>ping 10.11.101.101

Pinging 10.11.101.101 with 32 bytes of data:
Reply from 10.11.101.101: bytes=32 time=10ms TTL=255
Reply from 10.11.101.101: bytes=32 time<1ms TTL=255
Reply from 10.11.101.101: bytes=32 time=1ms TTL=255
Reply from 10.11.101.101: bytes=32 time=1ms TTL=255

Ping statistics for 10.11.101.101:
   Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
   Minimum = 0ms, Maximum = 10ms, Average = 3ms
```

To ping from a Linux PC

1. Go to a shell prompt.
2. Enter “`ping 10.11.101.101`”.

Traceroute

Where ping will only tell you if it reached its destination and came back successfully, traceroute will show each step of its journey to its destination and how long each step takes. If ping finds an outage between two points, traceroute can be used to locate exactly where the problem is.

What is traceroute

Traceroute works by sending ICMP packets to test each hop along the route. It will send out three packets, and then increase the time to live (TTL) setting by one each time. This effectively allows the packets to go one hop farther along the route. This is the reason why most traceroute commands display their maximum hop count before they start tracing the route — that is the maximum number of steps it will take before declaring the destination unreachable. Also, the TTL setting may result in steps along the route timing out due to slow responses. There are many possible reasons for this to occur.

By default, traceroute uses UDP datagrams with destination ports numbered from 33434 to 33534. The traceroute utility usually has an option to specify use of ICMP echo request (type 8) instead, as used by the Windows tracert utility. If you have a firewall and if you want traceroute to work from both machines (Unix-like systems and Windows) you will need to allow both protocols inbound through your FortiGate security policies (UDP with ports from 33434 to 33534 and ICMP type 8).

You can also use the packet count column of the **Policy & Objects > Policy** page to track traceroute packets. This allows you to verify the connection, but also confirm which security policy the traceroute packets are using.

What traceroute can tell you

Ping and traceroute have similar functions—to verify connectivity between two points. The big difference is that traceroute shows you each step of the way, where ping does not. Also, ping and traceroute use different protocols

and ports, so one may succeed where the other fails.

You can verify your DNS connection using traceroute. If you enter an FQDN instead of an IP address for the traceroute, DNS will try to resolve that domain name. If the name does not get resolved, you know you have DNS issues.

How to use traceroute

The traceroute command varies slightly between operating systems. Note that in MS Windows the command name is shortened to "`tracert`". Also, your output will list different domain names and IP addresses along your route.

To use traceroute on an MS Windows PC

1. Open a command window.
   - In Windows XP, select **Start > Run**, enter cmd, and select **OK**.
   - In Windows 7, select the Start icon, enter cmd in the search box, and select cmd.exe from the list.
2. Enter "`tracert fortinet.com`" to trace the route from the PC to the Fortinet web site.
   Sample output:

```
C:\>tracert fortinet.com

Tracing route to fortinet.com [208.70.202.225]
over a maximum of 30 hops:
1 <1 ms <1 ms <1 ms 172.20.120.2
2 66 ms 24 ms 31 ms 209-87-254-xxx.storm.ca [209.87.254.221]
3 52 ms 22 ms 18 ms core-2-g0-0-1104.storm.ca [209.87.239.129]
4 43 ms 36 ms 27 ms core-3-g0-0-1185.storm.ca [209.87.239.222]
5 46 ms 21 ms 16 ms te3-x.1156.mpd01.cogentco.com [38.104.158.69]
6 25 ms 45 ms 53 ms te8-7.mpd01.cogentco.com [154.54.27.249]
7 89 ms 70 ms 36 ms te3-x.mpd01.cogentco.com [154.54.6.206]
8 55 ms 77 ms 58 ms sl-st30-chi-.sprintlink.net [144.232.9.69]
9 53 ms 58 ms 46 ms sl-0-3-3-x.sprintlink.net [144.232.19.181]
10 82 ms 90 ms 75 ms sl-x-12-0-1.sprintlink.net [144.232.20.61]
11 122 ms 123 ms 132 ms sl-0-x-0-3.sprintlink.net [144.232.18.150]
12 129 ms 119 ms 139 ms 144.232.20.7
13 172 ms 164 ms 243 ms sl-321313-0.sprintlink.net [144.223.243.58]
14 99 ms 94 ms 93 ms 203.78.181.18
15 108 ms 102 ms 89 ms 203.78.176.2
16 98 ms 95 ms 97 ms 208.70.202.225

Trace complete.
```

The first, or the left column, is the hop count, which cannot go over 30 hops. When that number is reached, the traceroute ends.

The second, third, and fourth columns display how much time each of the three packets takes to reach this stage of the route. These values are in milliseconds and normally vary quite a bit. Typically a value of `<1ms` indicates a local connection.

The fifth, or the column farthest to the right, is the domain name of that device and its IP address or possibly just the IP address.

To perform a traceroute on a Linux PC

1. Go to a command line prompt.
2. Enter "`traceroute fortinet.com`".

The Linux traceroute output is very similar to the MS Windows tracert output.

To perform a traceroute from the FortiGate

1. Connect to the CLI either through telnet or through the CLI widget on the web-based manager dashboard.
2. Enter `exec traceroute www.fortinet.com` to trace the route to the destination IP address. There are no options for this command.

   Output appears as follows:

```
# execute traceroute www.fortinet.com
traceroute to www.fortinet.com (66.171.121.34), 32 hops max, 84 byte packets
1 172.20.120.2 0.637 ms 0.653 ms 0.279 ms
2 209.87.254.221 <static-209-87-254-221.storm.ca> 2.448 ms 2.519 ms 2.458 ms
3 209.87.239.129 <core-2-g0-2.storm.ca> 2.917 ms 2.828 ms 9.324 ms
4 209.87.239.199 <core-3-bdi1739.storm.ca> 13.248 ms 12.401 ms 13.009 ms
5 216.66.41.113 <v502.core1.tor1.he.net> 17.181 ms 12.422 ms 12.268 ms
6 184.105.80.9 <100ge1-2.core1.nyc4.he.net> 21.355 ms 21.518 ms 21.597 ms
7 198.32.118.41 <ny-paix-gni.twgate.net> 83.297 ms 84.416 ms 83.782 ms
8 203.160.228.217 <217-228-160-203.TWGATE-IP.twgate.net> 82.579 ms 82.187 ms 82.066 ms
9 203.160.228.229 <229-228-160-203.TWGATE-IP.twgate.net> 82.055 ms 82.455 ms 81.808 ms
10 203.78.181.2 82.262 ms 81.572 ms 82.015 ms
11 203.78.186.70 83.283 ms 83.243 ms 83.293 ms
12 66.171.127.177 84.030 ms 84.229 ms 83.550 ms
13 66.171.121.34 <www.fortinet.com> 84.023 ms 83.903 ms 84.032 ms
14 66.171.121.34 <www.fortinet.com> 83.874 ms 84.084 ms 83.810 ms
```

How to check the logs

This step in troubleshooting can be forgotten, but its an important one. Logging records the traffic passing through the FortiGate unit to your network and what action the FortiGate unit took during its scanning process of the traffic. This recorded information is called a log message.

When you configure FortiOS initially, log as much information as you can. If needed, logging of unused features can be turned off or scaled back if the logs generated are too large.

As with most troubleshooting steps, before you can determine if the logs indicate a problem, you need to know what logs result from normal operation. Without a baseline it is difficult to properly troubleshoot.

When troubleshooting with log files:

- Compare current logs to a recorded baseline of normal operation.
- If needed increase the level of logging (such as from Warning to Information) to obtain more information.

When increasing logging levels, ensure that alert email is configured and both disk usage and log quota are selected. This ensures you will be notified if the increased logging causes problems. You can also use Logging Monitor (located in **Log&Report > Monitor > Logging volume Monitor**) to determine the activities that generate the most log entries.

- check all logs to ensure important information is not overlooked
- filter or order log entries based on different fields (such as level, service, or IP address) to look for patterns that may indicate a specific problem (such as frequent blocked connections on a specific port for all IP addresses)

Logs will help identify and locate any problems, but they will not solve the problems. The job of logs is to speed up your problem solving and save you time and effort.

For more information on Logging and Log Reports, see the Logging and Reporting handbook chapter.

How to verify the contents of the routing table (in NAT mode)

When you have some connectivity, or possibly none at all a good place to look for information is the routing table.

The routing table is where all the currently used routes are stored for both static and dynamic protocols. If a route is in the routing table, it saves the time and resources of a lookup. If a route is not used for a while and a new route needs to be added, the oldest least used route is bumped if the routing table is full. This ensures the most recently used routes stay in the table. If your FortiGate unit is in Transparent mode, you are unable to perform this step.

If the FortiGate is running in NAT mode, verify that all desired routes are in the routing table: local subnets, default routes, specific static routes, and dynamic routing protocols.

To check the routing table in the web-based manager, use the Routing Monitor by going to **Router > Monitor > Routing Monitor**.

In the CLI, use the command `get router info routing-table all`. Sample output:

```
FGT# get router info routing-table all

Codes:
        K - kernel, C - connected, S - static, R - RIP, B - BGP
        O - OSPF, IA - OSPF inter area
        N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
        E1 - OSPF external type 1, E2 - OSPF external type 2
        i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
        * - candidate default

S* 0.0.0.0/0 [10/0] via 172.20.120.2, wan1
C 10.31.101.0/24 is directly connected, internal
C 172.20.120.0/24 is directly connected, wan1
```

How to verify the correct route is being used

If you have more than one default route and wants to make sure that traffic is flowing as expected via the right route, you can run a trace route from a machine in the local area network, this will indicate you the first hop that the traffic goes through.

Sample output:

```
C:\>tracert www.fortinet.com

Tracing route to www.fortinet.com [66.171.121.34]
over a maximum of 30 hops:

1 <1 ms <1 ms <1 ms 10.10.1.99
2 1 ms <1 ms <1 ms 172.20.120.2
3 3 ms 3 ms 3 ms static-209-87-254-221.storm.ca [209.87.254.221]
4 3 ms 3 ms 3 ms core-2-g0-2.storm.ca [209.87.239.129]
5 13 ms 13 ms 13 ms core-3-bdi1739.storm.ca [209.87.239.199]
6 12 ms 19 ms 11 ms v502.core1.tor1.he.net [216.66.41.113]
7 22 ms 22 ms 21 ms 100ge1-2.core1.nyc4.he.net [184.105.80.9]
8 84 ms 84 ms 84 ms ny-paix-gni.twgate.net [198.32.118.41]
9 82 ms 84 ms 82 ms 217-228-160-203.TWGATE-IP.twgate.net [203.160.22
8.217]
10 82 ms 81 ms 82 ms 229-228-160-203.TWGATE-IP.twgate.net [203.160.22
8.229]
11 82 ms 82 ms 82 ms 203.78.181.2
12 84 ms 83 ms 83 ms 203.78.186.70
13 84 ms * 85 ms 66.171.127.177
14 84 ms 84 ms 84 ms fortinet.com [66.171.121.34]
15 84 ms 84 ms 83 ms fortinet.com [66.171.121.34]

Trace complete.
```

In this scenario, the first hop contains the IP address `10.10.1.99`, which is the internal interface of the FortiGate. The second hop contains the IP address `172.20.120.2`, to which the wan1 interface of the FortiGate is connected, so we can conclude that the route via wan1 interface is being used for this traffic.

Also debug the packet flow in the CLI shows the route taken for each session.

Sample output:

```
id=20085 trace_id=319 func=vf_ip4_route_input line=1597 msg="find a route: gw-172.20.120.2
    via wan1"
```

For more information on debuging the packet flow, see How to debug the packet flow.

How to verify the correct firewall policy is being used

If you have more than one firewall policy, use the count column to check which policy is being used, the count must show traffic increasing. To do so, go to **Policy & Objects > Policy** page.

Also debuging the packet flow in the CLI shows the policy id allowing the traffic.

Sample output:

```
id=13 trace_id=1 func=fw_forward_handler line=650 msg="Allowed by Policy-14: SNAT"
```

For more information on debuging the packet flow, see How to debug the packet flow.

How to check the bridging information in Transparent mode

When FortiOS is in Transparent mode, the unit acts like a bridge sending all incoming traffic out on the other interfaces. The bridge is between interfaces on the FortiGate unit.

Each bridge listed is a link between interfaces. Where traffic is flowing between interfaces, you expect to find bridges listed. If you are having connectivity issues, and there are no bridges listed, that is a likely cause. Check for the MAC address of the interface or device in question.

How to check the bridging information

To list the existing bridge instances on the FortiGate unit, use the following command:

```
diagnose netlink brctl list
```

Sample output:

```
#diagnose netlink brctl list
list bridge information
1. root.b fdb: size=256 used=6 num=7 depth=2 simple=no
Total 1 bridges
```

How to display forwarding domain information

Forwarding domains, or collision domains, are used in routing to limit where packets are forwarded on the network. Layer-2 broadcasts are limited to the same group. By default, all interfaces are in group 0. For example, if the FortiGate unit has 12 interfaces, only two may be in the same forwarding domain, which will limit packets that are broadcast to only those two interfaces. This reduces traffic on the rest of the network.

Collision domains prevent the forwarding of ARP packets to all VLANs on an interface. Without collision domains, duplicate MAC addresses on VLANs may cause ARP packets to be duplicated. Duplicate ARP packets can cause some switches to reset. It is important to know what interfaces are part of which forwarding domains as this determines which interfaces can communicate with each other.

To manually configure forwarding domains in Transparent mode, use the following FortiOS CLI command:

```
config system interface
   edit <interface_name>
   set forward-domain <integer>
end
```

To display the information for forward domains

Use the following command:

```
diagnose netlink brctl domain <name> <id>
```

where <name> is the name of the forwarding domain to display and <id> is the domain id.

Sample output

```
diagnose netlink brctl domain ione 101
show bridge root.b ione forward domain.
id=101 dev=trunk_1 6
```

To list the existing bridge MAC table, use the following command:

```
diagnose netlink brctl name host <name>
```

Sample output

```
show bridge control interface root.b host.
fdb: size=256, used=6, num=7, depth=2, simple=no
Bridge root.b host table
```

port no	device	devname	mac addr	ttl	attributes
2	7	wan2	02:09:0f:78:69:00	0	Local Static
5	6	vlan_1	02:09:0f:78:69:01	0	Local Static
3	8	dmz	02:09:0f:78:69:01	0	Local Static
4	9	internal	02:09:0f:78:69:02	0	Local Static
3	8	dmz	00:80:c8:39:87:5a	194	
4	9	internal	02:09:0f:78:67:68	8	
1	3	wan1	00:09:0f:78:69:fe	0	Local Static

To list the existing bridge port list, use this command:

```
diagnose netlink brctl name port <name>
```

Sample Output:

```
show bridge root.b data port.
trunk_1 peer_dev=0
```

```
internal peer_dev=0
dmz peer_dev=0
wan2 peer_dev=0
wan1 peer_dev=0
```

How to check number of sessions used by UTM proxy

Each FortiGate model has a set limit of the maximum number of sessions the UTM proxy supports. The UTM proxy handles all the traffic for the following protocols: HTTP, SMTP, POP3, IMAP, FTP, and NNTP. If the proxy for a protocol fills up its session table, the FortiGate unit will enter conserve mode, where it behaves differently, until entries and memory free up again.

Conserve or failopen mode

Once you reach the limit, depending on your FortiGate unit's conserve mode configuration, no new sessions are created until an old ones end. You can configure your FortiGate unit's behavior when memory is running low or the proxy connection limit has been reached. There are two related commands for this in the CLI:

```
config system global
   set av-failopen-session {enable | disable}
   set av-failopen { idledrop | off | one-shot | pass}
end
```

`av-failopen-session` must be enabled to set the behavior for these conditions. When it is enabled, and a proxy for a protocol runs out of room in its session table that protocol goes into failopen mode and behaves as defined in the `av-failopen` command.

`av-failopen` determines the behavior of the proxy until entries are free in the session table again for that proxy.

- **idledrop —** This option removes idle sessions from the session table, starting with the clients that have the most sessions currently open. This method assumes that idle sessions are not being used and it will not cause problems to close these sessions. This is usually true, but some applications may have problems with this and start complaining about either not having or being able to open a session. If this occurs, try another method to check if this is really the problem. This is a secure option as no unscanned traffic is allowed to pass.
- **off —** This option turns off accepting any new AV sessions, but will continue to process any existing AV sessions that are currently active. All the protocols listed (HTTP, SMTP, POP3, IMAP, FTP, and NNTP) are scanned by FortiGate Antivirus. If AV scanning is enabled, av-failopen off is selected, and the proxy session table fills up, then no new sessions of that type will be accepted. For example, if POP3 session table is filled and email AV scanning is enabled, no more POP3 connections will be allowed until the session table gets some free space. This is a secure option because no unscanned traffic is allowed to pass.
- **one-shot —** When memory is low, bypass the antivirus system. The name one-shot comes from the fact that once you are in one-shot av-failopen mode, you must set av-failopen to either *pass* or *off* to restart AV scanning. This is a very unsecure option because it allows all traffic without AV scanning, and it never reverts to normal without manual assistance.
- **pass —** When memory is low, bypass the antivirus system much as one-shot. The difference is that when memory is freed up, the system will start AV scanning automatically again. This is an unsecure option because it allows traffic to pass without AV scanning. However, it is better than one-shot because it automatically restarts AV scanning when possible.

If the proxy session table is full for one or more protocols and your FortiGate unit enters into conserve or failopen mode, it will appear as if you have lost connections, network services are intermittent or non-existent, and yet other services work normally for a while until their sessions end and they join the queue of session-starved applications.

Checking sessions in use

To make troubleshooting this type of problem easier, sessions are broken down by which protocol they use. This provides you with statistics and errors specific to one of the protocols.

Due to the amount of output from this command, you should connect to the CLI with a terminal program, such as puTTY, that logs output. Otherwise, you will likely not be able to access all the output information from the command.

In the following output, only the HTTP entries are displayed. The other protocols have been removed in an attempt to shorten the output. There will be separate entries for each supported protocol (HTTP, SMTP, POP3, IMAP, FTP, and NNTP) in each section of the output.

To check sessions in use and related errors - CLI

```
FGT# # get test proxyworker 4

```

```
scan=0 clt=0 srv=0
```

The output from this command falls into the following sections:

- **HTTP Common current connections —** There is an entry for each protocol that displays the connections currently used, and the maximum connections allowed. This maximum is for the UTM proxy, which means all the protocols connections combined cannot be larger than this number. To support this, note that the maximum session count for each protocol is the same. You may also see a line titled `Max Concurrent Connections` for each protocol. This number is the maximum connections of this type allowed at one time. If VDOMs are enabled, this value is defined either on the global or per-VDOM level at **VDOM > Global Resources**.
- **Worker Stat —** This is statistics about the UTM proxy including how long it has been running, and how many errors it has found.
- **HTTP Stat —** This section includes statistics about the HTTP protocol proxy. This is a very extensive list covering errors, web responses, and any UTM positive matches. There are similar sections for each protocol, but the specific entries in each vary based on what UTM scanning is looking for in each — spam control for email, file transfer blocking for FTP, and so on.
- **Worker Accounting —** Lists accounting information about the UTM proxy such as polling statistics, how many sessions were scanned, and how many were just accepted. This information can tell you if expect AV scanning is taking place or not. Under normal operation there should be no errors or fails.
- **HTTP Accounting —** The accounting sections for each protocol provide information about successful session creation, failures, how many sessions are being scanned or filtered, and how many are client or server originated. If setup_fail is larger than zero, run the command again to see if it is increasing quickly. If it is, your FortiGate unit may be in conserve mode.

Related commands

To dump memory usage:

```
# get test proxyworker 1
```

To display statistics per VDOM:

```
# get test proxyworker 4444
```

To restart the proxy:

```
# get test proxyworker 99
```

How to examine the firewall session list

One further step is to examine the firewall session. The firewall session list displays all the sessions the FortiGate unit has open. You will be able to see if there are strange patterns such as no sessions apart from the internal network, or all sessions are only to one IP address.

When examining the firewall session list in the CLI, filters may be used to reduce the output. In the web-based manager, the filters are part of the interface.

To examine the firewall session list - web-based manager

- Go to **System > FortiView> All Sessions**.

To examine the firewall session list - CLI

When examining the firewall session list, there may be too many sessions to display. In this case it will be necessary to limit or filter the sessions displayed by source or destination address, or NATed address or port. If you want to filter by more than one of these, you need to enter a separate line for each value.

The following example shows filtering the session list based on a source address of 10.11.101.112.

```
FGT# diag sys session filter src 10.11.101.112
FGT# diag sys session list
```

The following example shows filtering the session list based on a destination address of 172.20.120.222.

```
FGT# diag sys session filter dst 172.20.120.222
FGT# diag sys session list
```

To clear all sessions corresponding to a filter - CLI

```
FGT# diag sys session filter dst 172.20.120.222
FGT# diag sys session clear
```

Check source NAT information

Remember NAT when troubleshooting connections. NAT is especially important if you are troubleshooting from the remote end of the connection outside the FortiGate unit firewall. On the dashboard session list, pay attention to **Src address after NAT**, and **Src port after NAT**. These columns display the IP and port values after NAT has been applied.

The NAT values can be helpful to ensure they are the values you expect, and to ensure the remote end of the sessions can see the expected IP address and port number.

When displaying the session list in the CLI, you can match the NATed source address (`nsrc`) and port (`nport`). This can be useful if multiple internal IP addresses are NATed to a common external facing source IP address.

```
FGT# diag sys session filter nsrc 172.20.120.122
FGT# diag sys session filter nport 8888
FGT# diag sys session list
```

How to check wireless information

Wireless connections, stations, and interfaces have different issues than other physical interfaces.

Troubleshooting station connection issue

To check whether station entry is created on Access Control:

```
FG600B3909600253 # diagnose wireless-controller wlac -d sta
* vf=0 wtp=70 rId=2 wlan=open ip=0.0.0.0 mac=00:09:0f:db:c4:03 rssi=0 idle=148 bw=0 use=2
vf=0 wtp=70 rId=2 wlan=open ip=172.30.32.122 mac=00:25:9c:e0:47:88 rssi=-40 idle=0 bw=9
    use=2
```

Enable diagnostic for particular station

This example uses the station MAC address to find where it is failing:

```
FG600B3909600253 # diagnose wireless-controller wlac sta_filter 00:25:9c:e0:47:88 1
Set filter sta 00:25:9c:e0:47:88 level 1
```

```
FG600B3909600253 # 71419.245 <ih> IEEE 802.11 mgmt::disassoc <== 00:25:9c:e0:47:88 vap

    00:09:0f:db:c4:03 sec open reason I2C_STA_DEL
71419.247 <cc> STA_CFG_RESP(34) 00:25:9c:e0:47:88 <== ws (0-192.168.35.1:5246) rc 0
    (Success).
```

How to verify FortiGuard connectivity

You can verify the FortiGuard connectivity in the **License Information** widget under **System > Dashboard > Status.** When FortiGate is connected to FortiGuard, a green check mark appears for available FortiGuard services.

From CLI, execute ping “service.fortiguard.net” and “update.fortiguard.net”.

Sample output:

```
FG100D# execute ping service.fortiguard.net
PING guard.fortinet.net (208.91.112.196): 56 data bytes
64 bytes from 208.91.112.196: icmp_seq=0 ttl=51 time=61.0 ms
64 bytes from 208.91.112.196: icmp_seq=1 ttl=51 time=60.0 ms
64 bytes from 208.91.112.196: icmp_seq=2 ttl=51 time=59.6 ms
64 bytes from 208.91.112.196: icmp_seq=3 ttl=51 time=58.9 ms
64 bytes from 208.91.112.196: icmp_seq=4 ttl=51 time=59.2 ms

--- guard.fortinet.net ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max = 58.9/59.7/61.0 ms

FG100D# execute ping update.fortiguard.net
PING fds1.fortinet.com (208.91.112.68): 56 data bytes
64 bytes from 208.91.112.68: icmp_seq=0 ttl=53 time=62.0 ms
64 bytes from 208.91.112.68: icmp_seq=1 ttl=53 time=61.8 ms
64 bytes from 208.91.112.68: icmp_seq=2 ttl=53 time=61.3 ms
64 bytes from 208.91.112.68: icmp_seq=3 ttl=53 time=61.9 ms
64 bytes from 208.91.112.68: icmp_seq=4 ttl=53 time=61.8 ms
```

How to perform a sniffer trace (CLI and Packet Capture)

When troubleshooting networks and routing in particular, it helps to look inside the headers of packets to determine if they are traveling along the expected route. Packet sniffing can also be called a network tap, packet capture, or logic analyzing.

If your FortiGate unit has NP2/NP4 interfaces that are offloading traffic, this will change the sniffer trace. Before performing a trace on any NP2/NP4 interfaces, you should disable offloading on those interfaces.

What can sniffing packets tell you

If you are running a constant traffic application such as ping, packet sniffing can tell you if the traffic is reaching the destination, what the port of entry is on the FortiGate unit, if the ARP resolution is correct, and if the traffic is

being sent back to the source as expected.

Sniffing packets can also tell you if the FortiGate unit is silently dropping packets for reasons such as Reverse Path Forwarding (RPF), also called Anti Spoofing, which prevents an IP packet from being forwarded if its Source IP does not either belong to a locally attached subnet (local interface), or be part of the routing between the FortiGate unit and another source (static route, RIP, OSPF, BGP). Note that RPF can be disabled by turning on asymmetric routing in the CLI (`config system setting, set asymetric enable`), however this will disable stateful inspection on the FortiGate unit and cause many features to be turned off.

If you configure virtual IP addresses on your FortiGate unit, it will use those addresses in preference to the physical IP addresses. You will notice this when you are sniffing packets because all the traffic will be using the virtual IP addresses. This is due to the ARP update that is sent out when the VIP address is configured.

How do you sniff packets

The general form of the internal FortiOS packet sniffer command is:

```
diag sniffer packet <interface_name> <'filter'> <verbose> <count>
```

To stop the sniffer, type `CTRL+C`.

<interface_name>	The name of the interface to sniff, such as "port1" or "internal". This can also be "any" to sniff all interfaces.
<'filter'>	What to look for in the information the sniffer reads. "none" indicates no filtering, and all packets will be displayed as the other arguments indicate. The filter must be inside single quotes (‘).
<verbose>	The level of verbosity as one of: **1 -** print header of packets **2 -** print header and data from IP of packets **3 -** print header and data from Ethernet of packets **4 -** print header of packets with interface name
<count>	The number of packets the sniffer reads before stopping. If you do not put a number here, the sniffer will run forever unit you stop it with <CTRL C>.

For a simple sniffing example, enter the CLI command `diag sniffer packet port1 none 1 3`. This will display the next three packets on the port1 interface using no filtering, and using verbose level 1. At this verbosity level you can see the source IP and port, the destination IP and port, action (such as ack), and sequence numbers.

In the output below, port 443 indicates these are HTTPS packets, and 172.20.120.17 is both sending and receiving traffic.

```
Head_Office_620b # diag sniffer packet port1 none 1 3
interfaces=[port1]
filters=[none]

0.545306 172.20.120.17.52989 -> 172.20.120.141.443: psh 3177924955 ack 1854307757
```

```
0.545963 172.20.120.141.443 -> 172.20.120.17.52989: psh 1854307757 ack 3177925808

0.562409 172.20.120.17.52988 -> 172.20.120.141.443: psh 4225311614 ack 3314279933
```

For a more advanced example of packet sniffing, the following commands will report packets on any interface travelling between a computer with the host name of “PC1” and the computer with the host name of “PC2”. With verbosity 4 and above, the sniffer trace will display the interface names where traffic enters or leaves the FortiGate unit. Remember to stop the sniffer, type `CTRL+C`.

```
FGT# diagnose sniffer packet any "host <PC1> or host <PC2>" 4
```

or

```
FGT# diagnose sniffer packet any "(host <PC1> or host <PC2>) and icmp" 4
```

The following sniffer CLI command includes the ARP protocol in the filter which may be useful to troubleshoot a failure in the ARP resolution (for instance PC2 may be down and not responding to the FortiGate ARP requests).

```
FGT# diagnose sniffer packet any "host <PC1> or host <PC2> or arp" 4
```

Packet Capture

When troubleshooting networks, it helps to look inside the header of the packets. This helps to determine if the packets, route, and destination are all what you expect. Packet capture can also be called a network tap, packet sniffing, or logic analyzing.

To use the packet capture:

1. Go to **System > Network > Packet Capture**.
2. Select the interface to monitor and select the number of packets to keep.
3. Select **Enable Filters**.
4. Enter the information you want to gather from the packet capture.
5. Select **OK**.

To run the capture, select the **play** button in the progress column in the packet capture list. If not active, **Not Running** will also appear in the column cell. The progress bar will indicate the status of the capture. You can stop and restart it at any time.

When the capture is complete, click the **Download** icon to save the packet capture file to your hard disk for further analysis.

Packet capture tells you what is happening on the network at a low level. This can be very useful for troubleshooting problems, such as:

- Finding missing traffic.
- Seeing if sessions are setting up properly.
- Locating ARP problems such as broadcast storm sources and causes.
- Confirming which address a computer is using on the network if they have multiple addresses or are on multiple networks.
- Confirming routing is working as you expect.
- Wireless client connection problems.
- Intermittent missing PING packets.
- A particular type of packet is having problems, such as UDP, which is commonly used for streaming video.

If you are running a constant traffic application such as ping, packet capture can tell you if the traffic is reaching the destination, how the port enters and exits the FortiGate unit, if the ARP resolution is correct, and if the traffic is returning to the source as expected. You can also use packet switching to verify that NAT or other configuration is translating addresses or routing traffic the way that you want it to.

Before you start capturing packets, you need to have a good idea of what you are looking for. Capture is used to confirm or deny your ideas about what is happening on the network. If you try capture without a plan to narrow your search, you could end up with too much data to effectively analyze. On the other hand, you need to capture enough packets to really understand all of the patterns and behavior that you are looking for.

How to debug the packet flow

Traffic should come in and leave the FortiGate unit. If you have determined that network traffic is not entering and leaving the FortiGate unit as expected, debug the packet flow.

Debugging can only be performed using CLI commands. Debugging the packet flow requires a number of debug commands to be entered as each one configures part of the debug action, with the final command starting the debug.

If your FortiGate unit has FortiASIC NP4 interface pairs that are offloading traffic, this will change the packet flow. Before performing the debug on any NP4 interfaces, you should disable offloading on those interfaces.

The following configuration assumes that PC1 is connected to the internal interface of the FortiGate unit and has an IP address of 10.11.101.200. PC1 is the host name of the computer.

To debug the packet flow in the CLI, enter the following commands:

```
FGT# diag debug disable
FGT# diag debug flow filter add <PC1>
FGT# diag debug flow show console enable
FGT# diag debug flow show function-name enable
FGT# diag debug flow trace start 100
FGT# diag debug enable
```

The `start 100` argument in the above list of commands will limit the output to 100 packets from the flow. This is useful for looking at the flow without flooding your log or displaying too much information.

To stop all other debug activities, enter the command:

```
FGT# diag debug flow trace stop
```

The following is an example of debug flow output for traffic that has no matching security policy, and is in turn blocked by the FortiGate unit. The denied message indicates that the traffic was blocked.

```
id=20085 trace_id=319 func=resolve_ip_tuple_fast line=2825 msg="vd-root received a packet
    (proto=6, 192.168.129.136:2854->192.168.96.153:1863) from port3."

```

Troubleshooting resources

Before you begin troubleshooting, you need to know Fortinet's troubleshooting resources. Doing so will shorten the time to solve your issue. Indeed, an administrator can save time and effort during the troubleshooting process by first checking if the issue has been experienced before. Several self-help resources are available to provide valuable information about FortiOS technical issues, including:

Technical Documentation

Installation Guides, Administration Guides, Quick Start Guides, and other technical documents are available online at the following URL:

http://docs.fortinet.com

Fortinet Video Library

The Fortinet Video Library hosts a collection of video which provide valuable information about Fortinet products.

http://video.fortinet.com

Release Notes

Issues that are uncovered after the technical documentation has been published will often be listed in the Release Notes that accompany the device.

Knowledge Base

The Fortinet Knowledge Base provides access to a variety of articles, white papers, and other documentation providing technical insight into a range of Fortinet products. The Knowledge Base is available online at the following URL:

http://kb.fortinet.com

Fortinet Technical Discussion Forums

An online technical forums allow administrators to contribute to discussions about issues related to their Fortinet products. Searching the forum can help the administrator identify if an issue has been experienced by another user. The support forums can be accessed at the following URL:

http://forum.fortinet.com

Fortinet Training Services Online Campus

The Fortinet Training Services Online Campus hosts a collection of tutorials and training materials which can be used to increase knowledge of the Fortinet products.

http://www.fortinet.com/training/

Fortinet Customer Support

You have defined your problem, researched a solution, put together a plan to find the solution, and executed that plan. At this point if the problem has not been solved, its time to contact Fortinet Customer Support for assistance.

http://support.fortinet.com

Technical Support Organization Overview

This section explains how Fortinet's technical support works, as well as how you can easily create an account to get technical support for when issues arise that you cannot solve yourself.

This section contains the following topics:

- Fortinet Global Customer Services Organization
- Creating an account
- Registering a device
- Reporting problems
- Assisting technical support
- Support priority levels
- Return material authorization process

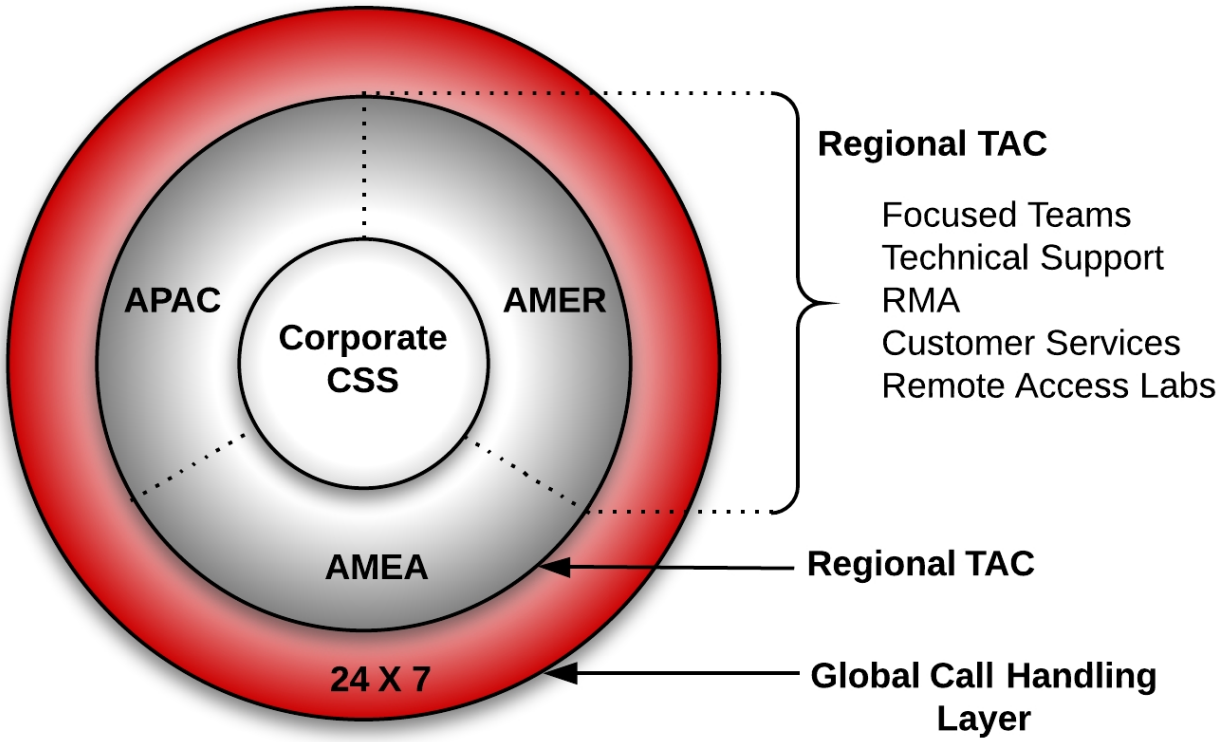
Fortinet Global Customer Services Organization

The Fortinet Global Customer Services Organization is composed of three regional **Technical Assistance Centers** (TAC):

- The Americas (AMER)
- Europe, Middle East, and Africa (EMEA)
- Asia Pacific (APAC)

The regional TACs are contacted through a global call center. Incoming service requests are then routed to the appropriate TAC. Each regional TAC delivers technical support to the customers in its regions during its hours of operation. These TACs also combine to provide seamless, around-the-clock support for all customers.

Fortinet regions and TAC



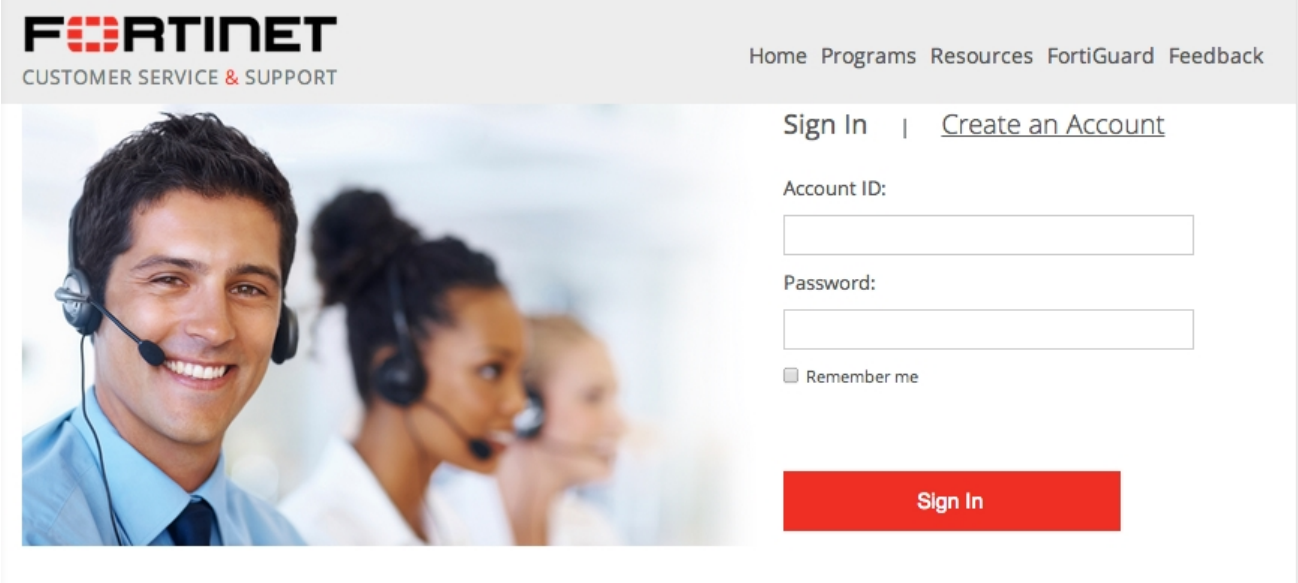
Creating an account

To receive technical support and service updates, Fortinet products in the organization must be registered. The **Product Registration Form** on the support website will allow the registration to be completed online. Creating an account on the support website is the first step in registering products.

Go to the Fortinet support site shown below:

https://support.fortinet.com/

Customer service and support home page



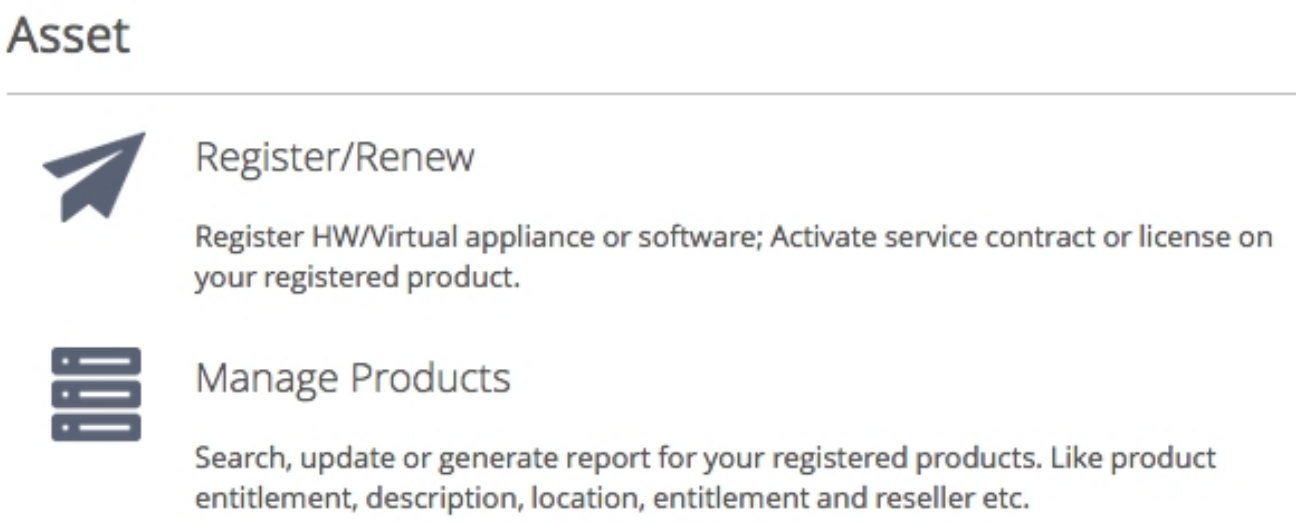
Once the support account has been created, product details can be provided by going to the **Product Register/Renew** and **Manage Product** buttons displayed on the home page. Alternately, the product registration can be completed at a later time.

Registering a device

Complete the following steps when registering a device for support purposes:

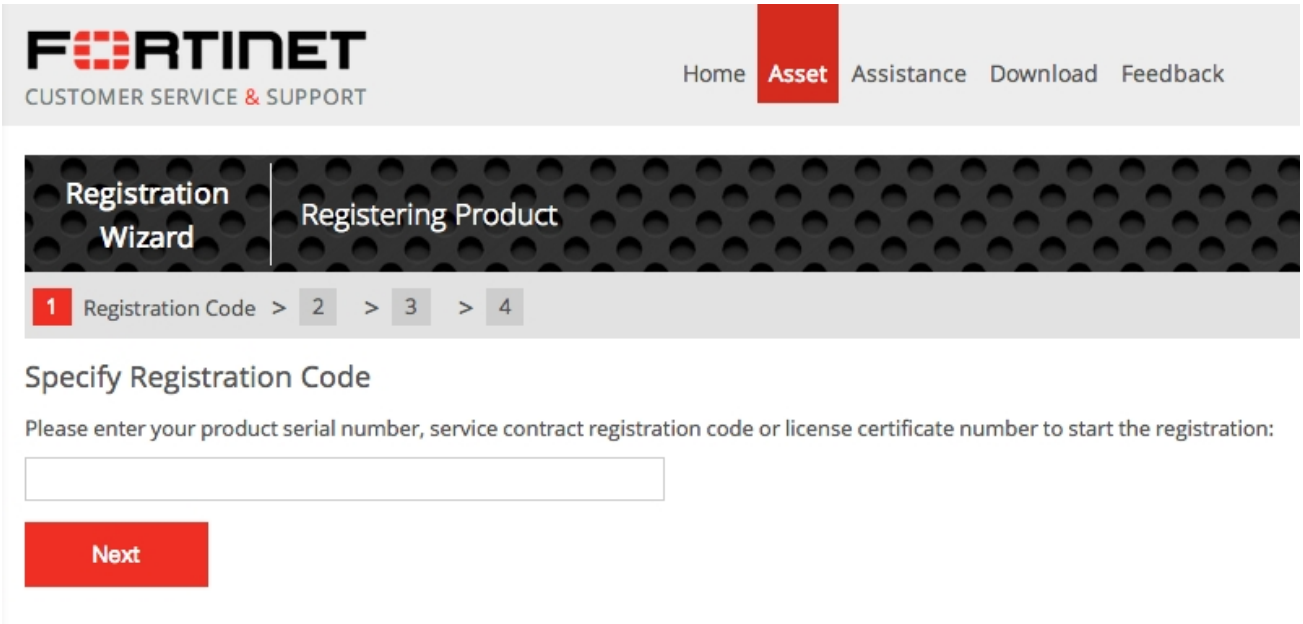
1. Log in using the **Username** and **Password** defined when the account was created
2. Under the Asset section, select **Register/Renew** to go to the Registration Wizard. Alternatively, use the Asset menu at the top of the page.

Register/Renew and Manage Products menu



3. Get a serial number from the back of the FortiGate unit or from the exterior of the FortiGate shipping box.
4. Enter the serial number, service contract registration code or license certificate number to start the product registration.

Adding a product to a support account



5. Enter your registration information.
6. Read and accept the license agreement.
7. Complete the verification process.
8. Select **Finish** to complete the registration process.
9. Registration wizard

Reporting problems

Problems can be reported to a Fortinet Technical Assistance Center in the following ways:

- By logging an online ticket
- By phoning a technical support center

Logging online tickets

Problem reporting methods differ depending on the type of customer.

Fortinet partners

Fortinet Partners are entitled to priority web-based technical support. This service is designed for partners who provide initial support to their customers and who need to open a support ticket with Fortinet on their behalf. We strongly encourage submission and follow up of support tickets using this service.

The support ticket can be submitted after logging into the partner website using one of the following links using FortiPartner account details:

http://partners.fortinet.com

This link will redirect to the general **Fortinet Partner Portal** extranet website. Click **Support** > **Online Support Ticket**.

https://forticare.fortinet.com/customersupport/Login/CommonLogin.aspx

Fortinet customers

There are two methods to report a technical issue on the Fortinet Support website: creating a technical support ticket by product or creating any type of ticket with the Ticket Wizard for more options.

Fortinet customers should complete the following steps to create a support ticket by product:

1. Log in to the support website at the following address with the account credentials used when the account was created: https://support.fortinet.com
2. Navigate to the top menu, click **Asset** and select **Manage/View Products.**
3. In the product list, select the product that is causing the problem.
4. On the left side bar, go to the Assistance category, and select **Technical Request** to create a TA Ticket.
5. Complete the **Create TA Ticket** fields.
6. Click **View Products**.
7. In the **Products List**, select the product that is causing the problem.
8. Complete the **Create Support Ticket** fields.
9. Select **Finish** to complete the support ticket.

Fortinet customers who would like to submit a customer service ticket, DOA ticket, RMA ticket, or FortiGuard service ticket should use the Ticket Wizard and complete the following steps:

1. Log in to the support website at the following address with the account credentials used when the account was created: https://support.fortinet.com

2. Navigate to the top menu, click **Assistance** and select **Create a Ticket** from the drop down menu.
3. Select a ticket type and complete the remaining steps in the Ticket Wizard.
4. Select **Finish** to complete the ticket.

Following up on online tickets

Perform the following steps to follow up on an existing issue.

Partners should log into the following web site:

http://partners.fortinet.com

Customers should log into the following site:

http://support.fortinet.com

1. Log in with the account credentials used when the account was created.
2. Navigate to the top menu, click **Assistance**, and select **Manage Tickets**.
3. Use the search field on the View Tickets page to locate the tickets assigned to the account.
4. Select the appropriate ticket number. Closed tickets cannot be updated. A new ticket must be submitted if it concerns the same problem.
5. Add a **New Comment** or **Attachment**.
6. Click **Submit** when complete.

Every web ticket update triggers a notification to the ticket owner, or ticket queue supervisor.

Telephoning a technical support center

The Fortinet Technical Assistance Centers can also be contacted by phone.

Call Fortinet Support Center at 1-408-486-7899 (international) or go to http://www.fortinet.com/support/contact_support.html and select your country from the drop-down list for local contact number.

Assisting technical support

The more information that can be provided to Fortinet technical support, the better they can assist in resolving the issue. Every new support request should contain the following information:

- A valid contact name, phone number, and email address.
- A clear and accurate problem description.
- A detailed network diagram with complete IP address schema.
- The configuration file, software version, and build number of the Fortinet device.
- Additional log files such as **Antivirus** log, **Attack** log, **Event** log, **Debug** log or similar information to include in the ticket as an attachment. If a third-party product is involved, for example, email server, FTP server, router, or switch, please provide the information on its software revision version, configuration, and brand name.

Support priority levels

Fortinet technical support assigns the following priority levels to support cases:

Priority 1

This **Critical** priority is assigned to support cases in which:

- The network or system is down causing customers to experience a total loss of service.
- There are continuous or frequent instabilities affecting traffic-handling capability on a significant portion of the network.
- There is a loss of connectivity or isolation to a significant portion of the network.
- This issue has created a hazard or an emergency.

Priority 2

This **Major** priority is assigned to support cases in which:

- The network or system event is causing intermittent impact to end customers.
- There is a loss of redundancy.
- There is a loss of routine administrative or diagnostic capability.
- There is an inability to deploy a key feature or function.
- There is a partial loss of service due to a failed hardware component.

Priority 3

This **Medium** priority is assigned to support cases in which:

- The network event is causing only limited impact to end customers.
- Issues seen in a test or pre-production environment exist that would normally cause adverse impact to a production network.
- The customer is making time sensitive information requests.
- There is a successful workaround in place for a higher priority issue.

Priority 4

This **Minor** priority is assigned to support cases in which:

- The customer is making information requests and asking standard questions about the configuration or functionality of equipment.

Customers must report Priority 1 and 2 issues by phone directly to the Fortinet EMEA Support Center.

For lower priority issues, you may submit an assistance request (ticket) via the web system.

The web ticket system also provides a global overview of all ongoing support requests.

Return material authorization process

In some cases hardware issues are experienced and a replacement unit must be sent. This is referred to as a Return Material Authorization (RMA). In these cases or RMAs, the support contract must be moved to the new device. Customers can move the support contract from the failing production unit to the new device through the support web site.

To move the support contract to a new device

1. Log in to the support web site with the credentials indicated when the account was created.
2. From **Manage Products**, locate the serial number of the defective unit from the list of devices displayed for the account. The **Product Info** for the selected device will be displayed.
3. In the left side bar under the **Assistance section**, select **RMA Transfer**.
4. Enter the **Original Serial Number** of the original device, enter the **New Serial Number,** and click **Replace** to complete the transfer.

This will transfer the support contract from the defective unit to the new unit with the serial number provided.

Chapter 27 - Virtual Domains

This FortiOS Handbook chapter contains the following sections:

Virtual Domains provides an overview of the VDOM technologies, and the basic concepts and rules for using them. We recommend that you begin with this chapter before attempting to configure VDOMs on your FortiGate unit.

Virtual Domains in NAT/Route mode on page 2577 provides detailed explanations and examples for configuring VDOM features in your FortiGate unit using the NAT/Route mode.

Virtual Domains in Transparent mode on page 2596 provides detailed explanations, as well as basic and advanced examples for configuring these features in your FortiGate unit using Transparent mode.

Inter-VDOM routing on page 2615 describes inter-VDOM routing concepts and scenarios, and gives examples that illustrate them.

Troubleshooting Virtual Domains on page 2652 provides diagnostic and troubleshooting information for some potential VDOM issues.

Virtual Domains

Virtual domains (VDOMs) are a method of dividing a FortiGate unit into two or more virtual units that function as multiple independent units. VDOMs can provide separate firewall policies and, in NAT/Route mode, completely separate configurations for routing and VPN services for each connected network or organization.

This chapter will cover the basics of VDOMs, how they change your FortiGate unit, and how to work with VDOMs.

VDOMs let you split your physical FortiGate unit into multiple virtual units. The resulting benefits range from limiting Transparent mode ports to simplified administration, to reduced space and power requirements.

When VDOMs are disabled on any FortiGate unit, there is still one VDOM active: the root VDOM. It is always there in the background. When VDOMs are disabled, the root VDOM is not visible but it is still there.

The root VDOM must be there because the FortiGate unit needs a management VDOM for management traffic among other things. It is also why when you enable VDOMs, all your configuration is preserved in the root VDOM- because that is where you originally configured it.

This section includes:

- Benefits of Virtual Domains
- Enabling and accessing Virtual Domains
- Configuring Virtual Domains

Benefits of Virtual Domains

VDOMs provide the following benefits:

- Improving Transparent mode configuration
- Easier administration
- Continued security
- Savings in physical space and power
- More flexible MSSP configurations

Improving Transparent mode configuration

When VDOMs are not enabled and you put your FortiGate unit into Transparent mode, all the interfaces on your unit become broadcast interfaces. The problem with this is that there are no interfaces free to do anything else.

With multiple VDOMs you can have one of them configured in Transparent mode, and the rest in NAT/Route mode. In this configuration, you have an available transparent mode FortiGate unit you can drop into your network for troubleshooting, and you also have the standard NAT for networking.

Easier administration

VDOMs provide separate security domains that allow separate zones, user authentication, firewall policies, routing, and VPN configurations. VDOMs separate security domains and simplify administration of complex configurations—you do not have to manage as many settings at one time. For more information, see Global and per-VDOM settings.

By default, each FortiGate unit has a VDOM named root. This VDOM includes all of the unit's physical interfaces, modem, VLAN subinterfaces, zones, firewall policies, routing settings, and VPN settings.

Also, you can optionally assign an administrator account restricted to one VDOM. If the VDOM is created to serve an organization, this feature enables the organization to manage its own configuration. For more information, see Administrators in Virtual Domains.

Each physical FortiGate unit requires a FortiGuard license to access security updates. VDOMs do not require any additional FortiGuard licenses, or updating — all the security updates for all the VDOMs are performed once per update at the global level. Combined this can be a potentially large money and time saving feature in your network.

Management systems such as SNMP, logging, alert email, FDN-based updates, and NTP-based time setting use addresses and routing in the management VDOM to communicate with the network. They can connect only to network resources that communicate with the management VDOM. Using a separate VDOM for management traffic enables easier management of the FortiGate unit global settings, and VDOM administrators can also manage their VDOMs more easily. For more information, see Changing the management virtual domain.

Continued security

When a packet enters a VDOM, it is confined to that VDOM and is subject to any firewall policies for connections between VLAN subinterfaces or zones in that VDOM, just like those interfaces on a FortiGate unit without VDOMs enabled.

To travel between VDOMs, a packet must first pass through a firewall policy on a physical interface. The packet then arrives at another VDOM on that same FortiGate unit, but on a different interface, where it must pass through another firewall before entering. It doesn't matter if the interface is physical or virtual — inter-VDOM packets still require the same security measures as when passing through physical interfaces.

VDOMs provide an additional level of security because regular administrator accounts are specific to one VDOM — an administrator restricted to one VDOM cannot change information on other VDOMs. Any configuration changes and potential errors will apply only to that VDOM and limit any potential down time. Using this concept, you can farther split settings so that the management domain is only accessible by the super_admin and does not share any settings with the other VDOMs.

Savings in physical space and power

To increase the number of physical FortiGate units, you need more rack space, cables, and power to install the new units. You also need to change your network configuration to accommodate the new physical units. In the future, if you need fewer physical units you are left with expensive hardware that is idle.

Increasing VDOMs involves no additional hardware, no additional cabling, and very few changes to existing networking configurations. VDOMs save physical space and power. You are limited only by the size of the VDOM license you buy and the physical resources on the FortiGate unit.

By default, FortiGate units support a maximum of 10 VDOMs in any combination of NAT/Route and Transparent modes. Many FortiGate models support purchasing a license key to increase the maximum number. For more information on VDOM licences, see Virtual Domain Licensing.

More flexible MSSP configurations

If you are a managed security and service provider (MSSP), VDOMs are fundamental to your business. As a service provider you have multiple customers, each with their own needs and service plans. VDOMs allow you to

have a separate configuration for each customer, or group of customers; with up to 500 VDOMs configured per FortiGate unit on high end models. See Virtual Domain Licensing.

Not only does this provide the exact level of service needed by each customer, but administration of the FortiGate unit is easier as well - you can provide uninterrupted service generally with immediate changes as required. Most importantly, it allows you to only use the resources that each customer needs. Inter-VDOM links allow you to customize the level of interaction you need between each of your customers and your administrators. See Inter-VDOM routing.

Enabling and accessing Virtual Domains

While Virtual Domains are essentially the same as your regular FortiGate unit for menu configuration, CLI command structure, and general task flow, there are some small differences.

After first enabling VDOMs on your FortiGate unit, you should take the time to familiarize yourself with the interface. This section will help walk you through virtual domains.

This section includes:

- Enabling Virtual Domains
- Viewing the VDOM list
- Global and per-VDOM settings
- Resource settings
- Virtual Domain Licensing
- Logging in to VDOMs

Enabling Virtual Domains

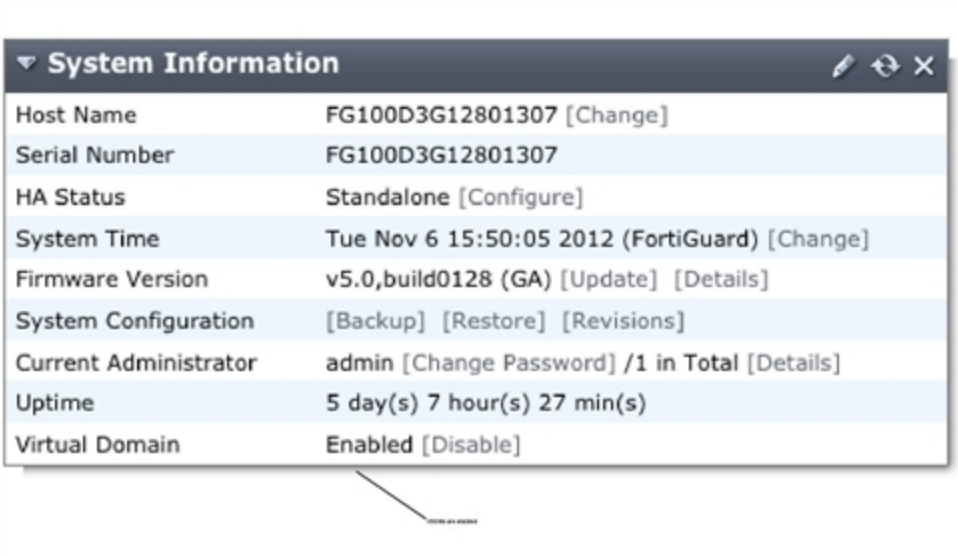
Using the default admin administration account, you can enable or disable VDOM operation on the FortiGate unit.

To enable VDOM configuration - web-based manager:

1. Log in with a super_admin account.
2. Go to **System > Dashboard > Status**.
3. Under **System Information > Virtual Domain**, select **Enable** and confirm your selection.

The FortiGate unit logs off all sessions. You can now log in again as admin. For more information, see Administrators in Virtual Domains.

System Information



To enable VDOM configuration - CLI:

```
config system global
   set vdom-admin enable
end
```

Changes to the web-based manager and CLI

When Virtual Domains are enabled, your FortiGate unit will change. The changes will be visible in both the web-based manager and CLI, just the web-based manager, or just the CLI.

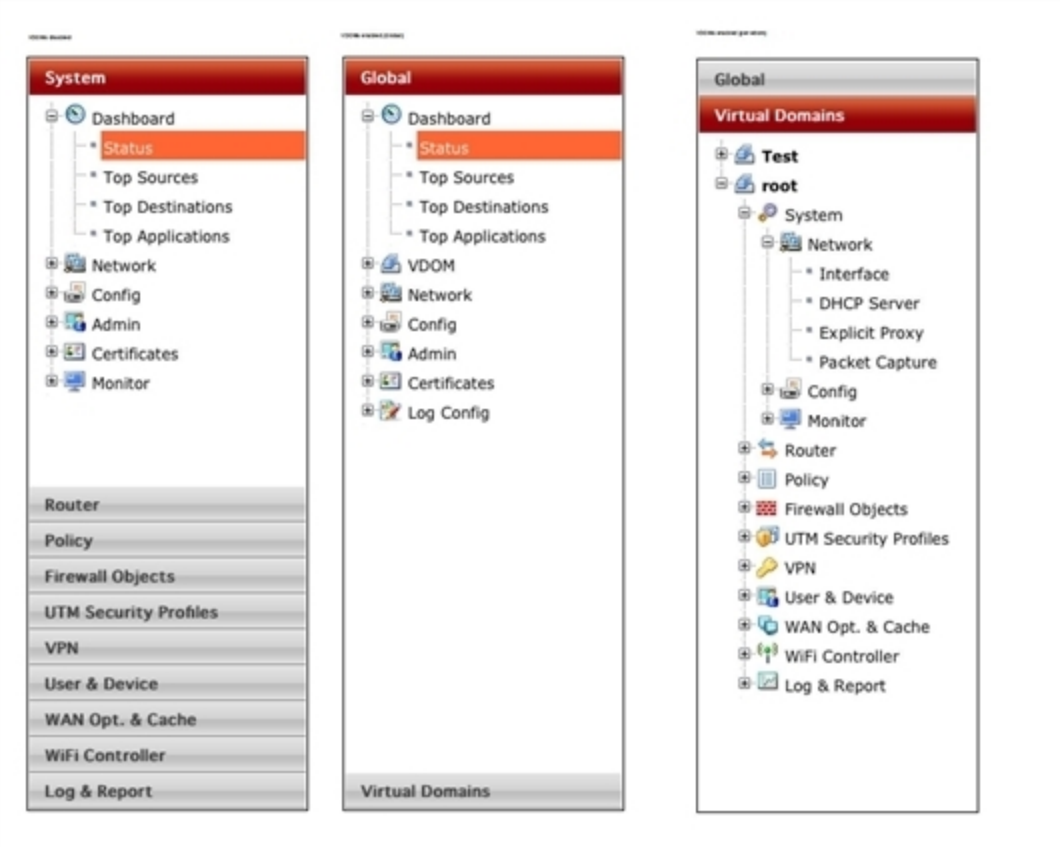
When enabling VDOMs, the web-based manager and the CLI are changed as follows:

- Global and per-VDOM configurations are separated. This is indicated in the Online Help by Global and VDOM icons. See Global and per-VDOM settings.
- Only admin accounts using the super_admin profiles can view or configure global options. See Administrators in Virtual Domains.
- Admin accounts using the super_admin profile can configure all VDOM configurations.
- All other administrator accounts can configure only the VDOM to which they are assigned.

The following changes are specific to the web-based manager:

- In the Global view, the System section of the left-hand menu is renamed to Global, and includes a VDOM sub-menu.
- The Log Config menu is moved from Log & Report into the new Global section.
- For admin accounts using the super_admin profile, a new section called Virtual Domains is added at the bottom of the left-hand menu. It lists all the individual VDOMs as expandable menus, with all VDOM specific options in that menu, which allows you to easily select which VDOM to configure, including the root VDOM. See Menu with VDOMs disabled, at the global level, and VDOM level.

Menu with VDOMs disabled, at the global level, and VDOM level



In the CLI, admin accounts using the super_admin profile must specify either the global or a VDOM-specific shell before entering commands:

- To change FortiGate unit system settings, from the top level you must first enter the following CLI before entering commands:

  ```
  config global
  ```

- To change VDOM settings, from the top level you must first enter the following CLI before entering commands for that VDOM:

  ```
  config vdom
     edit <vdom_na
  ```

Settings configured outside of a VDOM are called global settings. These settings affect the entire FortiGate unit and include areas such as interfaces, HA, maintenance, some antivirus settings, and some logging settings. In general, any unit settings that should only be changed by the top level administrator are global settings.

Settings configured configwithin a VDOM are called VDOM settings. These settings affect only that specific VDOM and include areas such as operating mode, routing, firewall, VPN, some antivirus, some logging, and reporting.

For more information, see Global and per-VDOM settings.

Viewing the VDOM list

The VDOM list shows all virtual domains, their status, and which VDOM is the management VDOM. It is accessible if you are logged in on an administrator account with the super_admin profile such as the “admin” administrator account.

In the VDOM list you can create or delete VDOMs, edit VDOMs, change the management VDOM, and enable or disable VDOMs.

You can access the VDOM list in **Global > VDOM > VDOM**.

The root domain cannot be disabled, even if it is not the management VDOM.

List of VDOMs

Create New	Select to add a new VDOM. See Creating a Virtual Domain.
Edit	Select to change an existing selected VDOM.
Delete	Select to delete the selected VDOM. See Deleting a VDOM.
Switch Management	Select to switch the management VDOM. Also shows the current management VDOM. You must select an active non-management VDOM before this option becomes available. See Changing the management virtual domain.
Selected	When checked, this checkbox indicates this VDOM has been selected. Nearly all operations such as Edit, Delete, and Switch Management require a VDOM to first be selected.
Name	The name of the VDOM. VDOMs are listed in alphabetical order. When the VDOM is active, you can select the VDOM name to enter that VDOM. See Enabling and accessing Virtual Domains.
Operation Mode	Indicates the operation mode as either NAT (for NAT/Route mode) or TP (for Transparent mode).
Interfaces	The interfaces associated with this VDOM. Each VDOM also includes an interface that starts with “ssl.” that is created by default.
Enable	A green checkmark indicates this VDOM is active. See Disabling a Virtual Domain. A grey X indicated this VDOM is disabled. See Disabling a Virtual Domain.
Comments	Comments entered when the VDOM was created are displayed here.
Ref.	The number of references to this VDOM in the configuration.

Global and per-VDOM settings

Settings configured outside of a VDOM are called global settings. These settings affect the entire FortiGate unit and include areas such as interfaces, HA, maintenance, some antivirus, and some logging. In general, any unit settings that should only be changed by the top level administrator are global settings.

Settings configured within a VDOM are called VDOM settings. These settings affect only that specific VDOM and include areas such as operating mode, routing, firewall, VPN, some antivirus, some logging settings, and reporting.

When Virtual Domains are not enabled, the entire FortiGate unit is effectively a single VDOM. Per-VDOM limits apply. For some resource types, the global limit cannot be reached with only one VDOM.

Some FortiGate unit documentation indicates which parts of the web-based manager, or the CLI are global and which are per-VDOM using the icons shown below. These icons are also present in the Online Help, available on your FortiGate unit.

Global and VDOM icons

For more information on CLI commands, see the FortiGate CLI Reference.

This section includes:

- Global settings - web-based manager
- Per-VDOM settings - web-based manager
- Global settings - CLI
- Per-VDOM settings - CLI

Global settings - web-based manager

The following table lists commands in the web-based manager that are considered global settings when VDOMs are enabled.

The following configuration settings affect all virtual domains. When virtual domains are enabled, only accounts with the default super_admin profile can access global settings.

Global configuration settings

System	Dashboard > Status - Host name
	Dashboard > Status - HA Status
	Dashboard > Status - System Time
	Dashboard > Status - Firmware version
	Dashboard > Status - Configuration backup and restore
	VDOM > VDOM - list
	VDOM > VDOM - edit VDOM (mode and resources)
	VDOM > Global Resources
	Network > Interfaces
	Network > DNS - DNS and DDNS settings
	Config > HA
	Config > SNMP
	Config > Replacement Message - messages and images
	Config > FortiGuard - configuration
	Config > Advanced - scripts, USB Auto-install, debug log download
	Config > Messaging Servers
	Admin > Administrators
	Admin > Admin Profile
	Admin > Settings - web administration ports, password policy, display settings, timeouts, LCD panel
	Certificates - local, remote, and CA certificates, CRLs
Log&Report	Log Config - Log Setting

Per-VDOM settings - web-based manager

The following table lists commands in the web-based manager that are considered per-VDOM settings when VDOMs are enabled.

VDOM configuration settings

System	Dashboard > Status - read-only except for administrator password
	Network > Interfaces (and zones)
	Network > DHCP Server
	Network > Explicit Proxy
	Network > Routing Table (Transparent mode only)
	Network > Packet Capture
	Config > Replacement Message (messages and images)
	Config > Advanced
	Monitor > DHCP Monitor
Router	All settings, including dead gateway detection
Policy	All settings
Firewall Objects	All settings
Security Profiles	All settings
VPN	All settings
User & Device	All settings
WiFi Controller	All settings
Log&Report	Traffic and Event Logs
	Reports
	FortiCloud
	Log Config > Log Setting and Alert E-mail
	Logging Monitor

Global settings - CLI

The following table lists commands in the CLI that are considered global settings when VDOMs are enabled.

From a super_admin profile account, use this command to configure features that apply to the complete FortiGate unit including all virtual domains. Virtual domain configuration (vdom-admin) must be enabled first.

This command syntax shows how you access the commands within config global. For information on these commands, refer to the relevant sections in the CLI Reference. If there are multiple versions of the same command with a “2” or “3” added, the additional commands are not listed but fall under the unnumbered command of the same name.

```
config global
   config antivirus heuristic
   config antivirus service
   config application name
   config dlp settings
   config endpoint-control app-detect
   config firewall ssl
   config gui console
   config ips decoder

end
```

Per-VDOM settings - CLI

The following table lists commands in the CLI that are considered VDOM-specific settings when VDOMs are enabled.

From the super_admin account, you can use the commands below to add and configure virtual domains. The number of virtual domains you can add is dependent on the FortiGate model. Virtual domain configuration (vdom-admin) must be enabled.

Once you add a virtual domain you can configure it by adding zones, firewall policies, routing settings, and VPN settings. You can also move physical interfaces from the root virtual domain to other virtual domains and move VLAN subinterfaces from one virtual domain to another.

By default all physical interfaces are in the root virtual domain. You cannot remove an interface from a virtual domain if the interface is part of any of the following configurations:

- routing
- proxy arp
- DHCP server
- zone
- firewall policy
- redundant pair
- link aggregate (802.3ad) group

Delete these objects, or modify them, to be able to remove the interface.

This command syntax shows how you access the commands within a VDOM. Refer to the relevant sections in this Reference for information on these commands.

```
config vdom
   edit <vdom_name>
      config antivirus profile
      config antivirus quarantine
      config antivirus settings

For more information, see Global and per-VDOM settings.

Resource settings

Your FortiGate unit has a limited amount of hardware resources such as memory, disk storage, CPU operations. When Virtual Domains are disabled, this limit is not a major concern because all sessions, users, and other processes share all the resources equally.

When using Virtual Domains, hardware resources can be divided differently between Virtual Domains as they are needed. Minimum levels of resources can be specified for each VDOM, so that no Virtual Domain will suffer a complete lack of resources.

For example, if one VDOM has only a web server and logging server connected, and a second VDOM has an internal network of 20 users, these two VDOMs will require different levels of resources. The first VDOM will require many sessions but no user accounts. This compares to the second VDOM where user accounts and management resources are required, but fewer sessions.

Using the global and per-VDOM resource settings, you can customize the resources allocated to each VDOM to ensure the proper level of service is maintained on each VDOM.

This section includes:

- Global resource settings
- Per-VDOM resource settings

Global resource settings

Global Resources apply to the whole FortiGate unit. They represent all of the hardware capabilities of your unit. By default the values are set to their maximum values. These values vary by your model due to each model having differing hardware capabilities.

It can be useful to change the maximum values for some resources to ensure there is enough memory available for other resources that may be more important to your configuration.

To use the earlier example, if your FortiGate unit is protecting a number of web servers and other publicly accessible servers you would want to maximize the available sessions and proxies while minimizing other settings that are unused such as user settings, VPNs, and dial-up tunnels.

Global Resources are only configurable at the global level, and only the admin account has access to these settings.

Note that global resources, such as the log disk quota resource, will only be visible if your FortiGate unit hardware supports those resources, such as having a hard disk to support the log disk resource.

Global Resources- web-based manager

Edit Reset to default value

Resource	Configured Maximum	Default Maximum	Current Usage
Sessions	0	0	26
VPN IPsec Phase1 Tunnels	10000	10000	0
VPN IPsec Phase2 Tunnels	10000	10000	0
Dial-up Tunnels	0	0	0
Firewall Policies	100000	100000	3
Firewall Addresses	20000	20000	11
Firewall Address Groups	10000	10000	0
Firewall Custom Services	0	0	0
Firewall Service Groups	0	0	0
Firewall One-time Schedules	0	0	0
Firewall Recurring Schedules	0	0	5
Local Users	0	0	0
User Groups	0	0	0
SSL VPN	0	0	0
Concurrent web proxy users	2000	2000	0
log disk quota	0	0	0

To view global resource settings - web-based manager:

1. Select **Global > VDOM > Global Resources**.
   The following information is displayed:

Edit	Select to edit the **Configured Maximum** value for a single selected **Resource**. If multiple **Resources** are selected, **Edit** is not available.
Reset to default value	Select to return one or more selected **Resources** to factory default settings.
Checkbox	Select a **Resource** for editing or resetting to default values.
Resource	The name of the available global resources.
Configured Maximum	The currently configured maximum for this resource. This value can be changed by selecting the **Resource** and editing it.
Default Maximum	The factory configured maximum value for this resource. You cannot set the **Configured Maximum** higher than the **Default Maximum**.

Current Usage	The amount of this resource that is currently being used. This value is useful for determining when and if you may need to adjust **Configured Maximum** values for some resources on your FortiGate unit.

To view global resource settings - CLI:

```
config global
   config system resource-limits
   get
```

When viewing the global resource limits in the CLI, the output appears similar to:

```
FGT1000A (global) # config system resource-limits
FGT1000A (resource-limits) # get

session : 0
ipsec-phase1 : 10000
ipsec-phase2 : 10000
dialup-tunnel : 0
firewall-policy : 100000
firewall-address : 20000
firewall-addrgrp : 10000
custom-service : 0
service-group : 0
onetime-schedule : 0
recurring-schedule : 0
user : 0
user-group : 0
sslvpn : 0
proxy : 2000
```

For explicit proxies, when configuring limits on the number of concurrent users, you need to allow for the number of users based on their authentication method. Otherwise you may run out of user resources prematurely.

Each session-based authenticated user is counted as a single user using their authentication membership (RADIUS, LDAP, FSAE, local database etc.) to match users in other sessions. So one authenticated user in multiple sessions is still one user.

For all other situations, the source IP address is used to determine a user. All sessions from a single source address are assumed to be from the same user.

Per-VDOM resource settings

While Global resources apply to resources shared by the whole FortiGate unit, per-VDOM resources are specific to only one Virtual Domain.

By default all the per-VDOM resource settings are set to no limits. This means that any single VDOM can use up all the resources of the entire FortiGate unit if it needs to do so. This would starve the other VDOMs for resources to the point where they would be unable to function. For this reason, it is recommended that you set some maximums on resources that are most vital to your customers.

Each Virtual Domain has its own resource settings. These settings include both maximum, and minimum levels. The maximum level is the highest amount of that resource that this VDOM can use if it is available on the FortiGate unit. Minimum levels are a guaranteed level that this minimum level of the resource will always be available no matter what the other VDOMs may be using.

Figure 6: Per-VDOM resources - web-based manager:

Resource Usage

Resource	Maximum	Guaranteed	Current
Sessions	0	0	24
VPN IPsec Phase1 Tunnels	0	0	0
VPN IPsec Phase2 Tunnels	0	0	0
Dial-up Tunnels	0	0	0
Firewall Policies	0	0	3
Firewall Addresses	0	0	3
Firewall Address Groups	0	0	0
Firewall Custom Services	0	0	0
Firewall Service Groups	0	0	0
Firewall One-time Schedules	0	0	0
Firewall Recurring Schedules	0	0	1
Local Users	0	0	0
User Groups	0	0	0
SSL VPN	0	0	0
Concurrent web proxy users	0	0	0
log disk quota	0	0	0

For example, consider a FortiGate unit that has ten VDOMs configured. vdom1 has a maximum of 5000 sessions and a minimum of 1000 sessions. If the FortiGate unit has a global maximum of 20,000 sessions, it is possible that vdom1 will not be able to reach its 5000 session upper limit. However, at all times vdom1 is guaranteed to have 1000 sessions available that it can use. On the other hand, if the remaining nine VDOMs use only 1000 sessions each, vdom1 will be able to reach its maximum of 5000.

To view per-VDOM resource settings - web-based manager:

1. Select **Global > VDOM > VDOM**.
2. Select the `root` VDOM, and select **Edit**.
3. Adjust the settings in the **Resource Usage** section of the page.

Resource	Name of the resource. Includes dynamic and static resources.
Maximum	Override the global limit to reduce the amount of each resource available for this VDOM. The maximum must be the same as or lower than the global limit. The default value is 0, which means the maximum is the same as the global limit. **Note:** If you set the maximum resource usage for a VDOM you cannot reduce the default maximum global limit for all VDOMs below this maximum.
Guaranteed	Enter the minimum amount of the resource available to this VDOM regardless of usage by other VDOMs. The default value is 0, which means that an amount of this resource is not guaranteed for this VDOM.
Current	The amount of the resource that this VDOM currently uses.

4. Select **OK**.

To view per-VDOM resource settings - CLI:

```
config global
   config system vdom-property
      edit root
   get
```

When viewing the per-VDOM resource limits in the CLI, the output appears similar to the following. Note that the first two lines are not part of the resource limits. In the CLI, the first number is the maximum value, and the second number is the guaranteed minimum.

```
FGT1KA3607500810 (vdom-property) # edit root
FGT1KA3607500810 (root) # get

name : root
description : property limits for vdom root
session : 0 0
ipsec-phase1 : 0 0
ipsec-phase2 : 0 0
dialup-tunnel : 0 0
firewall-policy : 0 0
firewall-address : 0 0
firewall-addrgrp : 0 0
custom-service : 0 0
service-group : 0 0
onetime-schedule : 0 0
recurring-schedule : 0 0
user : 0 0
user-group : 0 0
```

```
sslvpn : 0 0
proxy : 0 0
```

Virtual Domain Licensing

Many FortiGate models support purchasing a license key to increase the maximum number. For specific information about the number of VDOM licenses that your FortiGate supports, see the product data sheet.

Configuring 500 or more VDOMs will result in reduced system performance. See FortiGate unit running very slowly.

Your FortiGate unit has limited resources that are divided among all configured VDOMs. These resources include system memory and CPU. Running security features on many VDOMs at once can limit resources available for basic processing. If you require many VDOMs, all with active security features, it is recommended to upgrade to a more powerful FortiGate unit.

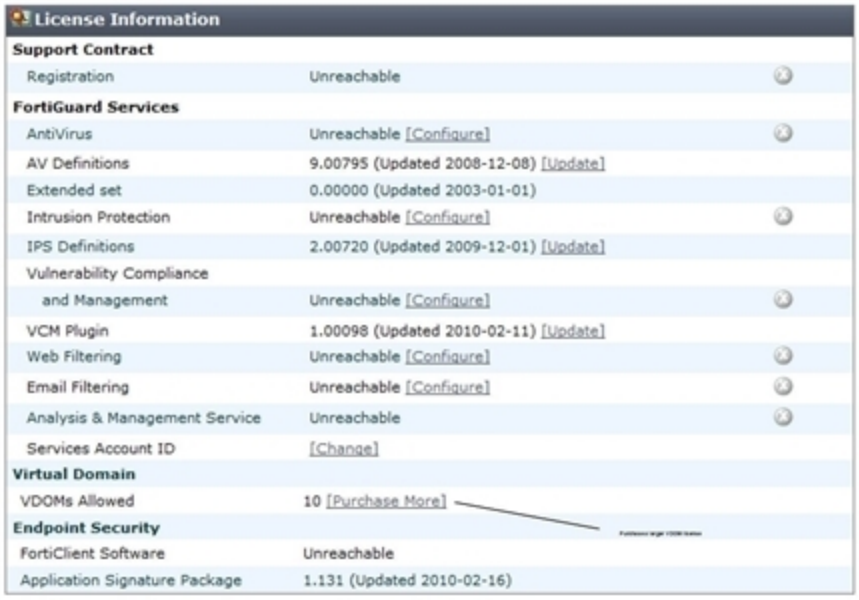
It is important to backup your configuration before upgrading the VDOM license on your FortiGate unit or units, especially with FortiGate units in HA mode.

To obtain a VDOM license key

1. Log in with a super_admin account.
2. Go to **System > Dashboard > Status**.
3. Record your FortiGate unit serial number as shown in System Information.
4. Under **License Information > Virtual Domain**, select **Purchase More**.

If you do not see the **Purchase More** option on the System Dashboard, your FortiGate model does not support more than 10 VDOMs.

VDOM License Information



5. You will be taken to the Fortinet customer support website where you can log in and purchase a license key for 25, 50, 100, 250, 500, or more VDOMs.
6. When you receive your license key, go to the Dashboard and select **Upload License** under **License Information**, **Virtual Domains**.
7. In the **Input License Key** field, enter the 32-character license key you received from Fortinet customer support.
8. Select **Apply**.

To verify the new VDOM license, in global configuration go to **System > Dashboard**. Under **License Information**, **Virtual Domains** the maximum number of VDOMs allowed is shown.

VDOMs created on a registered FortiGate unit are recognized as real devices by any connected FortiAnalyzer unit. The FortiAnalyzer unit includes VDOMs in its total number of registered devices. For example, if three FortiGate units are registered on the FortiAnalyzer unit and they contain a total of four VDOMs, the total number of registered FortiGate units on the FortiAnalyzer unit is seven. For more information, see the FortiAnalyzer Administration Guide.

Logging in to VDOMs

Only super_admin administrator accounts can access all global settings on the FortiGate unit and all of the VDOMs as well. Other administrator accounts can access and configure only their single VDOM and they must connect to an interface that is part of that VDOM. For example, administratorB is the admin for vdomB. If he tries to log into vdomA, or an interface that is part of vdomA he will not be able to log on. For more information on administrators in VDOMs, see Administrators in Virtual Domains.

Management services communicate using the management VDOM, which is the root VDOM by default. For more information, see Changing the management virtual domain.

Management traffic requires an interface that has access to the Internet. If there is no interface assigned to the VDOM containing the management traffic, services including updates will not function. For more information, see Changing the management virtual domain.

To access a VDOM with a super_admin account - web-based manager:

1. Log in with a super_admin account.
2. In the **Virtual Domains** menu on the left-hand side, select the VDOM to configure.
   The menu will expand to show the various pages and settings for that VDOM.
3. When you have finished configuring the VDOM, you can
   - open the **Global** menu to return to global configuration
   - log out

To access a VDOM with a super_admin account - CLI:

With the super_admin, logging into the CLI involves also logging into the specific VDOM. If you need a reminder, use `edit ?` to see a list of existing VDOMs before you editing a VDOM.

If you misspell a VDOM you are trying to switch to, you will create a new VDOM by that name. Any changes you make will be part of the new VDOM, and not the intended VDOM. If you are having problems where your changes aren't visible, back up to the top level and use `edit ?` to see a list of VDOMs to ensure this has not happened. If it has happened, see Deleting a VDOM.

```
config vdom
   edit ?
   edit <chosen_vdom>
      ..
      <enter vdom related commands>
      ..
   end
exit
```

To access a VDOM with a non super_admin account - web-based manager:

1. Connect to the FortiGate unit using an interface that belongs to the VDOM to be configured.
2. Log in using an administrator account that has access to the VDOM.
   The main web-based manager page opens. The interface is largely the same as if the device has VDOMs disabled. From here you can access VDOM-specific settings.

To access a VDOM with a non-super_admin account - CLI:

A non-super_admin account has access to only one VDOM and must log in through an interface that belongs to the same VDOM, but the process is the same as logging into a non-VDOM unit.

```
Login: regular_admin
Password: <password>
..
<enter vdom related commands>
..
exit
```

Configuring Virtual Domains

Only a super_admin administrator account such as the default “admin” account can create, disable, or delete VDOMs. That account can create additional administrators for each VDOM.

This section includes:

- Creating a Virtual Domain
- Disabling a Virtual Domain
- Deleting a VDOM
- Administrators in Virtual Domains

Creating a Virtual Domain

Once you have enabled Virtual Domains on your FortiGate unit, you can create additional Virtual Domains beyond the default root Virtual Domain.

By default new Virtual Domains are set to NAT/Route operation mode. If you want a Virtual Domain to be in Transparent operation mode, you must manually change it. See Virtual Domains in Transparent mode.

You can name new Virtual Domains as you like with the following restrictions:

- only letters, numbers, “-”, and “_” are allowed
- no more than 11 characters are allowed
- no spaces are allowed
- VDOMs cannot have the same names as interfaces, zones, switch interfaces, or other VDOMs.

When creating large numbers of VDOMs you should not enable advanced features such as proxies, web filtering, and antivirus due to limited FortiGate unit resources. Also when creating large numbers of VDOMs, you may experience reduced performance for the same reason.

To create a VDOM - web-based manager:

1. Log in with a super_admin account.
2. Go to **System > Dashboard > Status** and ensure that Virtual Domains are enabled. If not, see Enabling and accessing Virtual Domains.
3. Select **System > VDOM > VDOM**.
4. Select **Create New**.
5. Enter a unique name for your new VDOM.
6. Enter a short and descriptive comment to identify this VDOM.
7. Select **OK**.

Repeat Steps4 through 7 to add additional VDOMs.

To create a VDOM - CLI:

```
config vdom
   edit <new_vdom_name>
end
```

If you want to edit an existing Virtual Domain in the CLI, and mistype the name a new Virtual Domain will be created with this new misspelled name. If you notice expected configuration changes are not visible, this may be the reason. You should periodically check your VDOM list to ensure there are none of these misspelled VDOMs present.

Disabling a Virtual Domain

The status of a VDOM can be Enabled, or Disabled.

Active status VDOMs can be configured. Active is the default status when a VDOM is created. The management VDOM must be an Active VDOM. For more information on the management VDOM, see Changing the management virtual domain.

Disabled status VDOMs are considered “offline”. The configuration remains, but you cannot use the VDOM, and only the super_admin administrator can view it. You cannot delete a disabled VDOM without first enabling it, and removing references to it like usual—there is no **Delete** icon for disabled status VDOMs. You can assign interfaces to a disabled VDOM. See Deleting a VDOM.

The following procedures show how to disable a VDOM called “test-vdom”.

To disable a VDOM - web-based manager:

1. Go to **Global > VDOM** > **VDOM**.
2. Open the VDOM for editing.
3. Ensure **Enable** is not selected and then select **OK**.
   The VDOM’s Enable icon in the VDOM list is a grey X.

To disable a VDOM - CLI:

```
config vdom
   edit test-vdom
      config system settings
         set status disable
      end
end
```

To enable a VDOM - web-based manager:

1. Go to **Global > VDOM** > **VDOM**.
2. Open the VDOM for editing.
3. Ensure **Enable** is selected and then select **OK**.
   The VDOM’s Enable icon in the VDOM list is a green checkmark.

To enable a VDOM - CLI:

```
config vdom
   edit test-vdom
      config system settings
         set status enable
      end
end
```

Deleting a VDOM

Deleting a VDOM removes it from the FortiGate unit configuration.

Before you can delete a VDOM, all references to it must be removed. This includes any objects listed in Per-VDOM settings - web-based manager. If there are any references to the VDOM remaining, you will see an error message and not be able to delete the VDOM.

The VDOM must also be enabled. A disabled VDOM cannot be deleted. You cannot delete the root VDOM or the management VDOM.

Before deleting a VDOM, a good practice is to reset any interface referencing that VDOM to its default configuration, with “root” selected as the Virtual Domain.

The following procedures show how to delete the `test-vdom` VDOM.

To delete a VDOM - web-based manager:

1. Go to **Global > VDOM > VDOM**.
2. Select the check box for the VDOM and then select the **Delete** icon.

   If the **Delete** icon is not active, there are still references to the VDOM that must first be removed. The **Delete** icon is available when all the references to this VDOM are removed.
3. Confirm the deletion.

To delete a VDOM - CLI:

```
config vdom
   delete test-vdom
end
```

Removing references to a VDOM

When you are going to delete a VDOM, all references to that VDOM must first be removed. It can be difficult to find all the references to the VDOM. This section provides a list of common objects that must be removed before a VDOM can be deleted, and a CLI command to help list the dependencies.

Interfaces are an important part of VDOMs. If you can move all the interfaces out of a VDOM, generally you will be able to delete that VDOM.

Common objects that refer to VDOMs

When you are getting ready to delete a VDOM check for, and remove the following objects that refer to that VDOM or its components:

- Routing - both static and dynamic routes
- Firewall addresses, policies, groups, or other settings
- Security Features/Profiles
- VPN configuration
- Users or user groups

- Logging
- DHCP servers
- Network interfaces, zones, custom DNS servers
- VDOM Administrators

Administrators in Virtual Domains

When Virtual Domains are enabled, permissions change for administrators. Administrators are now divided into per-VDOM administrators, and `super_admin` administrators. Only `super_admin` administrator accounts can create other administrator accounts and assign them to a VDOM.

This section includes:

- Administrator VDOM permissions
- Creating administrators for Virtual Domains
- Virtual Domain administrator dashboard display

Administrator VDOM permissions

Different types of administrator accounts have different permissions within VDOMs. For example, if you are using a super_admin profile account, you can perform all tasks. However, if you are using a regular admin account, the tasks available to you depend on whether you have read only or read/write permissions. The following table shows what tasks can be performed by which administrators.

Table 3: Administrator VDOM permissions

Tasks	Regular administrator account		Super_admin profile administrator account
	Read only permission	Read/write permission	
View global settings	yes	yes	yes
Configure global settings	no	no	yes
Create or delete VDOMs	no	no	yes
Configure multiple VDOMs	no	no	yes
Assign interfaces to a VDOM	no	no	yes
Revision Control Backup and Restore	no	no	yes
Create VLANs	no	yes - for 1 VDOM	yes - for all VDOMs
Assign an administrator to a VDOM	no	no	yes
Create additional admin accounts	no	yes - for 1 VDOM	yes - for all VDOMs
Create and edit protection profiles	no	yes - for 1 VDOM	yes - for all VDOMs

The only difference in admin accounts when VDOMs are enabled is selecting which VDOM the admin account belongs to. Otherwise, by default the administration accounts are the same as when VDOMs are disabled and closely resemble the `super_admin` account in their privileges.

Creating administrators for Virtual Domains

Using the admin administrator account, you can create additional administrator accounts and assign them to VDOMs.

The newly-created administrator can access the FortiGate unit only through network interfaces that belong to their assigned VDOM or through the console interface. The network interface must be configured to allow management access, such as HTTPS and SSH. Without these in place, the new administrator will not be able to access the FortiGate unit and will have to contact the super_admin administrator for access.

The following procedure creates a new Local administrator account called `admin_sales` with a password of `fortinet` in the `sales` VDOM using the `admin_prof` default profile.

To create an administrator for a VDOM - web-based manager:

1. Log in with a super_admin account.
2. Go to **System > Admin > Administrators**.
3. Select **Create New**.
4. Select **Regular** for Type, as you are creating a Local administrator account.
5. Enter the necessary information about the administrator: email, password, etc.
6. If this admin will be accessing the VDOM from a particular IP address or subnet, enable **Restrict this Admin Login from Trusted Hosts Only** and enter the IP in **Trusted Host #1**. See Using trusted hosts.
7. Select `prof_admin` for the **Admin Profile**.
8. Select `sales` from the list of **Virtual Domains**.
9. Select **OK**.

To create administrators for VDOMs - CLI:

```
config global
   config system admin
      edit <new_admin_name>
         set vdom <vdom_for_this_account>
         set password <pwd>
         set accprofile <an_admin_profile>
         ...
      end
```

Using trusted hosts

Setting trusted hosts for all of your administrators increases the security of your network by further restricting administrative access. In addition to knowing the password, an administrator must connect only through the subnet or subnets you specify. You can even restrict an administrator to a single IP address if you define only one trusted host IP address with a netmask of 255.255.255.255.

When you set trusted hosts for all administrators, the FortiGate unit does not respond to administrative access attempts from any other hosts. This provides the highest security. If you leave even one administrator unrestricted, the unit accepts administrative access attempts on any interface that has administrative access enabled, potentially exposing the unit to attempts to gain unauthorized access.

The trusted hosts you define apply both to the web-based manager and to the CLI when accessed through Telnet or SSH. CLI access through the console is not affected.

The trusted host addresses all default to 0.0.0.0/0.0.0.0 for IPv4, or ::/0 for IPv6. If you set one of the zero addresses to a non-zero address, the other zero addresses will be ignored. The only way to use a wildcard entry is to leave the trusted hosts at 0.0.0.0/0.0.0.0 or ::0. However, this configuration is less secure.

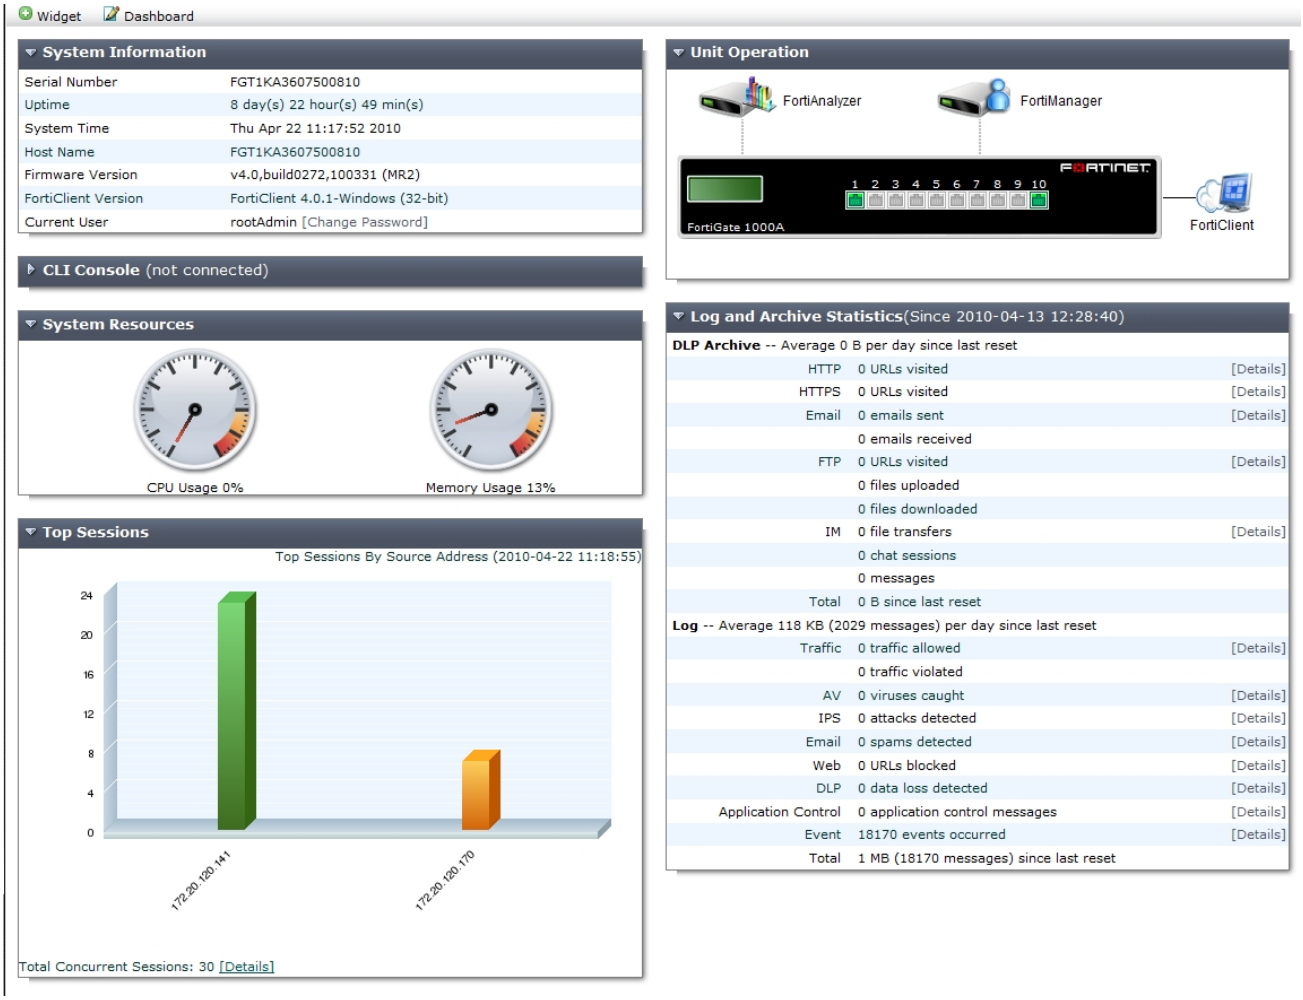
Virtual Domain administrator dashboard display

When administrators logs into their virtual domain, they see a different dashboard than the global administrator will see. The VDOM dashboard displays information only relevant to that VDOM — no global or other VDOM information is displayed.

Table 4: VDOM dashboard information

Information	per-VDOM	Global
System Information	read-only	yes
License Information	no	yes
CLI console	yes	yes
Unit Operation	read-only	yes
Alert Message Console	no	yes
Top Sessions	limited to VDOM sessions	yes
Traffic	limited to VDOM interfaces	yes
Statistics	yes	yes

VDOM administrator dashboard



Virtual Domains in NAT/Route mode

Virtual domains (VDOMs) are a method of dividing a FortiGate unit into two or more virtual units that each function as independent units. Each virtual domain has separate routing and security policies. A single FortiGate unit with virtual domains is flexible enough to serve multiple departments of an organization, separate organizations, or be the basis for a service provider's managed security service.

The examples in this chapter are intended to be followed in order as procedures build on previous procedures. If you do not complete the previous procedures, the procedure you are working on may not work properly. If this happens, consult previous procedures or FortiGate documentation.

This chapter contains the following sections:

- Virtual domains in NAT/Route mode
- Example NAT/Route VDOM configuration
- Figure 9: Example VDOM configuration

Virtual domains in NAT/Route mode

Once you have enabled virtual domains and created one or more VDOMs, you need to configure them. Configuring VDOMs on your FortiGate unit includes tasks such as the ones listed here; while you may not require all for your network topology, it is recommended that you perform them in the order given:

- Changing the management virtual domain
- Configuring interfaces in a NAT/Route VDOM
- Configuring VDOM routing
- Configuring security policies for NAT/Route VDOMs
- Configuring security profiles for NAT/Route VDOMs

Changing the management virtual domain

The management virtual domain is the virtual domain where all the management traffic for the FortiGate unit originates. This management traffic needs access to remote servers, such as FortiGuard services and NTP, to perform its duties. It needs access to the Internet to send and receive this traffic.

Management traffic includes, but is not limited to

- DNS lookups
- logging to FortiAnalyzer or syslog
- FortiGuard service
- sending alert emails
- Network time protocol traffic (NTP)
- Sending SNMP traps
- Quarantining suspicious files and email.

By default the management VDOM is the root domain. When other VDOMs are configured on your FortiGate unit, management traffic can be moved to one of these other VDOMs.

Reasons to move the management VDOM include selecting a non-root VDOM to be your administration VDOM, or the root VDOM not having an interface with a connection to the Internet.

You cannot change the management VDOM if any administrators are using RADIUS authentication.

The following procedure will change the management VDOM from the default `root` to a VDOM named `mgmt_vdom`. It is assumed that `mgmt_vdom` has already been created and has an interface that can access the Internet.

To change the management VDOM - web-based manager:

1. Select **Global > VDOM > VDOM.**
2. Select the checkbox next to the required VDOM.
3. Select **Switch Management.**
   The current management VDOM is shown in square brackets, “[root]” for example.

To change the management VDOM - CLI:

```
config global
   config system global
      set management-vdom mgmt_vdom
   end
```

Management traffic will now originate from `mgmt_vdom`.

Configuring interfaces in a NAT/Route VDOM

A VDOM must contain at least two interfaces to be useful. These can be physical interfaces or VLAN interfaces. By default, all physical interfaces are in the root VDOM. When you create a new VLAN, it is in the root VDOM by default.

When there are VDOMs on the FortiGate unit in both NAT and Transparent operation modes, some interface fields will be displayed as “-” on **System > Network > Interfaces**. Only someone with a super_admin account can view all the VDOMs.

When moving an interface to a different VDOM, firewall IP pools and virtual IPs for this interface are deleted. You should manually delete any routes that refer to this interface. Once the interface has been moved to the new VDOM, you can add these services to the interface again.

When configuring VDOMs on FortiGate units with accelerated interfaces you must assign both interfaces in the pair to the same VDOM for those interfaces to retain their acceleration. Otherwise they will become normal interfaces.

This section includes the following topics:

- Adding a VLAN to a NAT/Route VDOM
- Moving an interface to a VDOM
- Deleting an interface
- Adding a zone to a VDOM

Adding a VLAN to a NAT/Route VDOM

The following example shows one way that multiple companies can maintain their security when they are using one FortiGate unit with VLANs that share interfaces on the unit.

This procedure will add a VLAN interface called `client1-v100` with a VLAN ID of 100 to an existing VDOM called `client1` using the physical interface called `port2`.

The physical interface does not need to belong to the VDOM that the VLAN belongs to.

To add a VLAN subinterface to a VDOM - web-based manager:

1. Go to **Global > Network > Interfaces**.
2. Select **Create New**.
3. Enter the following information and select **OK**:

Name	client1-v100
Interface	port2
VLAN ID	100
Virtual Domain	Client1
Addressing mode	Manual
IP/Netmask	172.20.120.110/255.255.255.0
Administrative Access	HTTPS, SSH

You will see an expand arrow added to the port2 interface. When the arrow is expanded, the interface shows the `client1-v100` VLAN subinterface.

To add a VLAN subinterface to a VDOM - CLI:

```
config global
   config system interface
      edit client1-v100
         set type vlan
         set vlanid 100
         set vdom Client1
         set interface port2
         set ip 172.20.120.110 255.255.255.0
         set allowaccess https ssh
      end
```

Moving an interface to a VDOM

Interfaces belong to the root VDOM by default. Moving an interface is the same procedure no matter if its moving from the root VDOM or a any other VDOM.

If you have an accelerated pair of physical interfaces both interfaces must be in the same VDOM or you will lose their acceleration.

The following procedure will move the port3 interface to the Client2 VDOM. This is a common action when configuring a VDOM. It is assumed that the Client2 VDOM has already been created. It is also assumed that your FortiGate unit has a port3 interface. If you are using a different model, your physical interfaces may not be named `port2`, `external` or `port3`.

To move an existing interface to a different VDOM - web-based manager:

1. Go to **Global > Network > Interfaces**.
2. Select **Edit** for the port3 interface.
3. Select `Client2` as the new **Virtual Domain**.
4. Select **OK**.

To move an existing interface to a different VDOM - CLI:

```
config global
   config system interface
      edit port3
         set vdom Client2
      end
```

Deleting an interface

Before you can delete a virtual interface, or move an interface from one VDOM to another, all references to that interface must be removed. For a list of objects that can refer to an interface see Per-VDOM settings - web-based manager.

The easiest way to be sure an interface can be deleted is when the Delete icon is no longer greyed out. If it remains greyed out when an interface is selected, that interface still has objects referring to it, or it is a physical interface that cannot be deleted.

To delete a virtual interface - web-based manager:

1. Ensure all objects referring to this interface have been removed.
2. Select **Global > Network > Interfaces**.
3. Select the interface to delete.
4. Select the delete icon.

Adding a zone to a VDOM

Grouping interfaces and VLAN subinterfaces into zones simplifies policy creation. You can configure policies for connections to and from a zone, but not between interfaces in a zone.

Zones are VDOM-specific. A zone cannot be moved to a different VDOM. Any interfaces in a zone cannot be used in another zone. To move a zone to a new VDOM requires deleting the current zone and re-creating a zone in the new VDOM.

The following procedure will create a zone called `accounting` in the `client2` VDOM. It will not allow intra-zone traffic, and both `port3` and `port2` interfaces belong to this zone. This is a method of grouping and isolating traffic over particular interfaces—it is useful for added security and control within a larger network.

To add a zone to a VDOM - web-based manager:

1. In **Virtual Domains**, select the client2 VDOM.
2. Go to **System > Network > Interfaces**.
3. Select **Create New > Zone**.
4. Enter the following information and select **OK**:

Zone Name	accounting
Block intra-zone traffic	Select
Interface Members	port3, port2

To add a zone to a VDOM - CLI:

```
config vdom
   edit client2
      config system zone
         edit accounting
            set interface port3 port2
            set intrazone deny
         end
   end
```

Configuring VDOM routing

Routing is VDOM-specific. Each VDOM should have a default static route configured as a minimum. Within a VDOM, routing is the same as routing on your FortiGate unit without VDOMs enabled.

When configuring dynamic routing on a VDOM, other VDOMs on the FortiGate unit can be neighbors. The following topics give a brief introduction to the routing protocols, and show specific examples of how to configure dynamic routing for VDOMs. Figures are included to show the FortiGate unit configuration after the successful completion of the routing example.

This section includes:

- Default static route for a VDOM
- Dynamic Routing in VDOMs

Default static route for a VDOM

The routing you define applies only to network traffic entering non-ssl interfaces belonging to this VDOM. Set the administrative distance high enough, typically 20, so that automatically configured routes will be preferred to the default.

In the following procedure, it is assumed that a VDOM called “Client2” exists. The procedure will create a default static route for this VDOM. The route has a destination IP of 0.0.0.0, on the port3 interface. It has a gateway of 10.10.10.1, and an administrative distance of 20.

The values used in this procedure are very standard, and this procedure should be part of configuring all VDOMs.

To add a default static route for a VDOM - web-based manager:

1. In **Virtual Domains**, select the client2 VDOM.
2. Go to **Router > Static > Static Routes**.
3. Select **Create New**.
4. Enter the following information and select **OK**:

Destination IP/Mask	0.0.0.0/0.0.0.0
Device	port2
Gateway	10.10.10.1
Distance	20

To add a default static route for a VDOM - CLI:

```
config vdom
   edit client2
      config router static
         edit 4
            set device port2
            set dst 0.0.0.0 0.0.0.0
            set gateway 10.10.10.1
            set distance 20
         end
   end
```

Dynamic Routing in VDOMs

Dynamic routing is VDOM-specific, like all other routing. Dynamic routing configuration is the same with VDOMs as with your FortiGate unit without VDOMs enabled, once you are at the routing menu. If you have multiple VDOMs configured, the dynamic routing configuration between them can become quite complex.

VDOMs provide some interesting changes to dynamic routing. Each VDOM can be a neighbor to the other VDOMs. This is useful in simulating a dynamic routing area or AS or network using only your FortiGate unit.

You can separate different types of routing to different VDOMs if required. This allows for easier troubleshooting. This is very useful if your FortiGate unit is on the border of a number of different routing domains.

For more information on dynamic routing in FortiOS, see Dynamic Routing OverviewDynamic Routing Overview.

Inter-VDOM links must have IP addresses assigned to them if they are part of a dynamic routing configuration. Inter-VDOM links may or may not have IP addresses assigned to them. Without IP addresses, you need to be careful how you configure routing. While the default static route can be assigned an address of 0.0.0.0 and rely instead on the interface, dynamic routing almost always requires an IP address.

RIP

The RIP dynamic routing protocol uses hop count to determine the best route, with a hop count of 1 being directly attached to the interface and a hop count of 16 being unreachable. For example if two VDOMs on the same FortiGate unit are RIP neighbors, they have a hop count of 1.

OSPF

OSPF communicates the status of its network links to adjacent neighbor routers instead of the complete routing table. When compared to RIP, OSPF is more suitable for large networks, it is not limited by hop count, and is more complex to configure. For smaller OSPF configurations its easiest to just use the backbone area, instead of multiple areas.

BGP

BGP is an Internet gateway protocol (IGP) used to connect autonomous systems (ASes) and is used by Internet service providers (ISPs). BGP stores the full path, or path vector, to a destination and its attributes which aid in proper routing.

Configuring security policies for NAT/Route VDOMs

Security policies are VDOM-specific. This means that all firewall settings for a VDOM, such as firewall addresses and security policies, are configured within the VDOM.

In VDOMs, all firewall related objects are configured per-VDOM including addresses, service groups, security profiles, schedules, traffic shaping, and so on. If you want firewall addresses, you will have to create them on each VDOM separately. If you have many addresses, and VDOMs this can be tedious and time consuming. Consider using a FortiManager unit to manage your VDOM configuration — it can get firewall objects from a configured VDOM or FortiGate unit, and push those objects to many other VDOMs or FortiGate units. See the FortiManager Administration Guide.

You can customize the **Policy** display by including some or all columns, and customize the column order onscreen. Due to this feature, security policy screenshots may not appear the same as on your screen.

Configuring a security policy for a VDOM

Your security policies can involve only the interfaces, zones, and firewall addresses that are part of the current VDOM, and they are only visible when you are viewing the current VDOM. The security policies of this VDOM filter the network traffic on the interfaces and VLAN subinterfaces in this VDOM.

A firewall service group can be configured to group multiple services into one service group. When a descriptive name is used, service groups make it easier for an administrator to quickly determine what services are allowed by a security policy.

In the following procedure, it is assumed that a VDOM called `Client2` exists. The procedure will configure an outgoing security policy. The security policy will allow all HTTPS and SSH traffic for the `SalesLocal` address group on VLAN_200 going to all addresses on port3. This traffic will be scanned and logged.

To configure a security policy for a VDOM - web-based manager:

1. In **Virtual Domains**, select the client2 VDOM.
2. Go to **Policy > Policy**.
3. Select **Create New**.
4. Enter the following information and select **OK**:

Source Interface/Zone	VLAN_200
Source Address	SalesLocal
Destination Interface/Zone	port3
Destination Address	any
Schedule	always
Service	Multiple - HTTPS, SSH
Action	ACCEPT
Log Allowed Traffic	enable

To configure a security policy for a VDOM - CLI:

```
config vdom
   edit Client2
      config firewall policy
         edit 12
            set srcintf VLAN_200
            set srcaddr SalesLocal
            set dstintf port3(dmz)
            set dstaddr any
            set schedule always
            set service HTTPS SSH
            set action accept
            set status enable
            set logtraffic enable
         end
   end
```

Configuring security profiles for NAT/Route VDOMs

In NAT/Route VDOMs, security profiles are exactly like regular FortiGate unit operation with one exception. In VDOMs, there are no default security profiles.

If you want security profiles in VDOMs, you must create them yourself. If you have many security profiles to create in each VDOM, you should consider using a FortiManager unit. It can get existing profiles from a VDOM or FortiGate unit, and push those profiles down to multiple other VDOMs or FortiGate units. See the FortiManager Administration Guide.

When VDOMs are enabled, you only need one FortiGuard license for the physical unit, and download FortiGuard updates once for the physical unit. This can result in a large time and money savings over multiple physical units if you have many VDOMs.

Configuring VPNs for a VDOM

Virtual Private Networking (VPN) settings are VDOM-specific, and must be configured within each VDOM. Configurations for IPsec Tunnel, IPsec Interface, PPTP and SSL are VDOM-specific. However, certificates are shared by all VDOMs and are added and configured globally to the FortiGate unit.

Example NAT/Route VDOM configuration

Company A and Company B each have their own internal networks and their own ISPs. They share a FortiGate unit that is configured with two separate VDOMs, with each VDOM running in NAT/Route mode enabling separate configuration of network protection profiles. Each ISP is connected to a different interface on the FortiGate unit.

This network example was chosen to illustrate one of the most typical VDOM configurations.

This example has the following sections:

- Network topology and assumptions
- General configuration steps
- Creating the VDOMs
- Configuring the FortiGate interfaces
- Configuring the vdomA VDOM
- Configuring the vdomB VDOM
- Testing the configuration

Network topology and assumptions

Both companies have their own ISPs and their own internal interface, external interface, and VDOM on the FortiGate unit.

For easier configuration, the following IP addressing is used:

- all IP addresses on the FortiGate unit end in ".2" such as 10.11.101.2.
- all IP addresses for ISPs end in ".7", such as 172.20.201.7.
- all internal networks are 10.*.*.* networks, and sample internal addresses end in ".55".

The IP address matrix for this example is as follows.

Address	Company A	Company B
ISP	172.20.201.7	192.168.201.7
Internal network	10.11.101.0	10.12.101.0
FortiGate / VDOM	172.20.101.2 (port1) 10.11.101.2 (port4)	192.168.201.2 (port3) 10.12.101.2 (port2)

The Company A internal network is on the 10.11.101.0/255.255.255.0 subnet. The Company B internal network is on the 10.12.101.0/255.255.255.0 subnet.

There are no switches or routers required for this configuration.

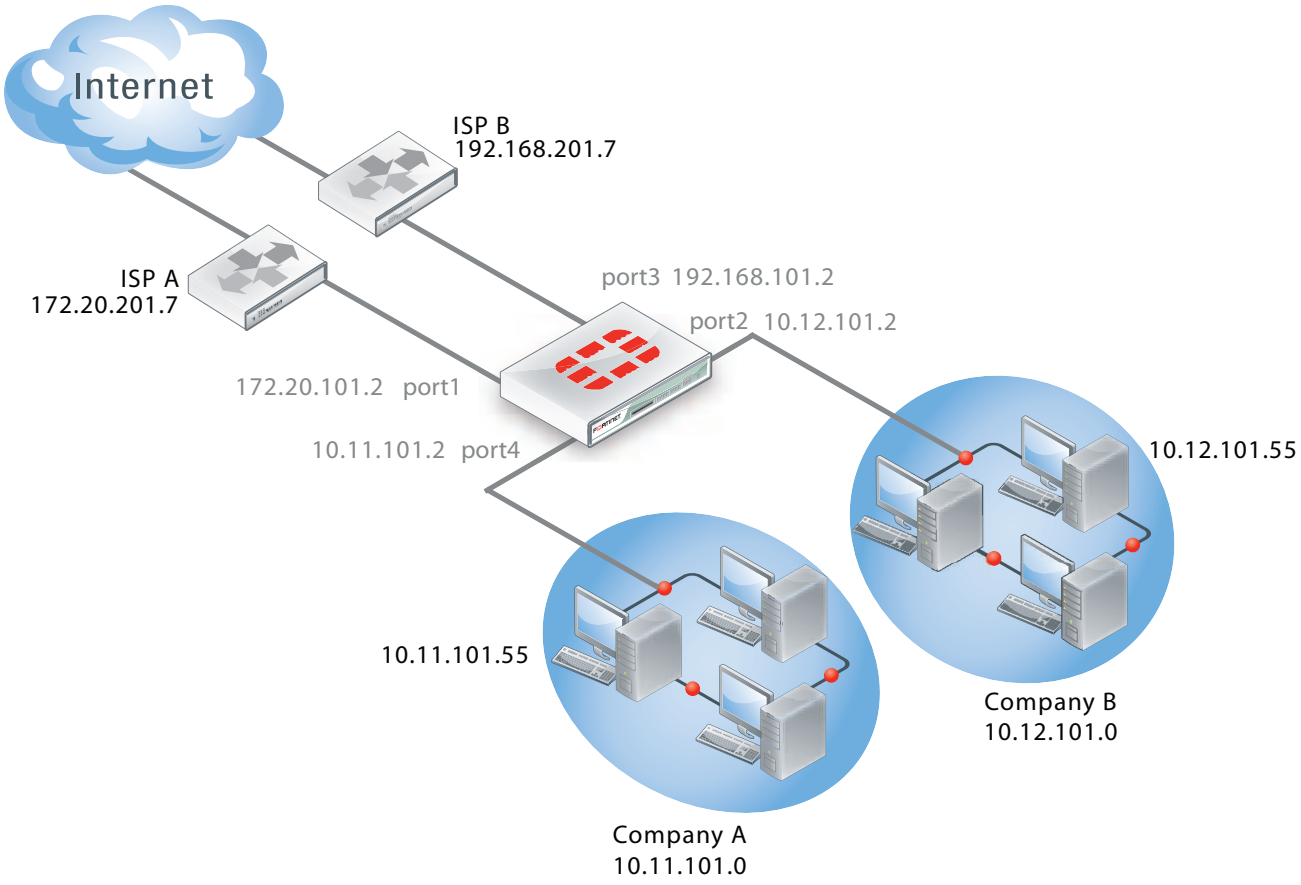
There are no VLANs in this network topology.

The interfaces used in this example are port1 through port4. Different FortiGate models may have different interface labels. port1 and port3 are used as external interfaces. port2 and port4 are internal interfaces.

The administrator is a super_admin account. If you are a using a non-super_admin account, refer to "Global and per-VDOM settings" to see which parts a non-super_admin account can also configure.

When configuring security policies in the CLI always choose a policy number that is higher than any existing policy numbers, select `services` before `profile-status`, and `profile-status` before `profile`. If these commands are not entered in that order, they may not be available to enter.

Figure 9: Example VDOM configuration



General configuration steps

For best results in this configuration, follow the procedures in the order given. Also, note that if you perform any additional actions between procedures, your configuration may have different results.

1. Creating the VDOMs
2. Configuring the FortiGate interfaces
3. Configuring the vdomA VDOM, and Configuring the vdomB VDOM
4. Testing the configuration

Creating the VDOMs

In this example, two new VDOMs are created — vdomA for Company A and vdomB for Company B. These VDOMs will keep the traffic for these two companies separate while enabling each company to access its own ISP.

To create two VDOMs - web-based manager:

1. Log in with a super_admin account.
2. Go to **Global > VDOM > VDOM**, and select **Create New**.
3. Enter `vdomA` and select **OK**.
4. Select **OK** again to return to the VDOM list.
5. Select **Create New**.
6. Enter `vdomB` and select **OK**.

To create two VDOMs - CLI:

```
config vdom
   edit vdomA
   next
   edit vdomB
end
```

Configuring the FortiGate interfaces

This section configures the interfaces that connect to the companies' internal networks, and to the companies' ISPs.

All interfaces on the FortiGate unit will be configured with an IP address ending in ".2" such as 10.11.101.2. This will simplify network administration both for the companies, and for the FortiGate unit global administrator. Also the internal addresses for each company differ in the second octet of their IP address - Company A is 10.11.*, and Company B is 10.12.*.

This section includes the following topics:

- Configuring the vdomA interfaces
- Configuring the vdomB interfaces

If you cannot change the VDOM of an network interface it is because something is referring to that interface that needs to be deleted. Once all the references are deleted the interface will be available to switch to a different VDOM. For example a common reference to the external interface is the default static route entry. See Configuring interfaces in a NAT/Route VDOM.

Configuring the vdomA interfaces

The `vdomA` VDOM includes two FortiGate unit interfaces: port1 and external.

The port4 interface connects the Company A internal network to the FortiGate unit, and shares the internal network subnet of 10.11.101.0/255.255.255.0.

The external interface connects the FortiGate unit to ISP A and the Internet. It shares the ISP A subnet of 172.20.201.0/255.255.255.0.

To configure the vdomA interfaces - web-based manager:

1. Go to **Global > Network > Interfaces**.
2. Select **Edit** on the port1 interface.
3. Enter the following information and select **OK**:

Virtual Domain	vdomA
Addressing mode	Manual
IP/Netmask	172.20.101.2/255.255.255.0

4. Select **Edit** on the port4 interface.
5. Enter the following information and select **OK**:

Virtual Domain	vdomA
Addressing mode	Manual
IP/Netmask	10.11.101.2/255.255.255.0

To configure the vdomA interfaces - CLI:

```
config global
   config system interface
      edit port1
         set vdom vdomA
         set mode static
         set ip 172.20.101.2 255.255.255.0
      next
      edit port4
         set vdom vdomA
         set mode static
         set ip 10.11.101.2 255.255.255.0
      end
```

Configuring the vdomB interfaces

The `vdomB` VDOM uses two FortiGate unit interfaces: port2 and port3.

The port2 interface connects the Company B internal network to the FortiGate unit, and shares the internal network subnet of 10.12.101.0/255.255.255.0.

The port3 interface connects the FortiGate unit to ISP B and the Internet. It shares the ISP B subnet of 192.168.201.0/255.255.255.0.

To configure the vdomB interfaces - web-based manager:

1. Go to **Global > Network > Interfaces**.
2. Select **Edit** on the port3 interface.

3. Enter the following information and select **OK**:

Virtual domain	vdomB
Addressing mode	Manual
IP/Netmask	192.168.201.2/255.255.255.0

4. Select **Edit** on the port2 interface.
5. Enter the following information and select **OK**:

Virtual domain	vdomB
Addressing mode	Manual
IP/Netmask	10.12.101.2/255.255.255.0

To configure the vdomB interfaces - CLI:

```
config global
   config system interface
      edit port3
         set vdom vdomB
         set mode static
         set ip 192.168.201.2 255.255.255.0
      next
      edit port2
         set vdom vdomB
         set mode static
         set ip 10.12.101.2 255.255.255.0
   end
```

Configuring the vdomA VDOM

With the VDOMs created and the ISPs connected, the next step is to configure the vdomA VDOM.

Configuring the vdomA includes the following:

- Adding vdomA firewall addresses
- Adding the vdomA security policy
- Adding the vdomA default route

Adding vdomA firewall addresses

You need to define the addresses used by Company A's internal network for use in security policies. This internal network is the 10.11.101.0/255.255.255.0 subnet.

The FortiGate unit provides one default address, "all", that you can use when a security policy applies to all addresses as the source or destination of a packet.

To add the vdomA firewall addresses - web-based manager:

1. In **Virtual Domains**, select **vdomA**.
2. Go to **Firewall Objects > Address > Address**.

3. Select **Create New**.
4. Enter the following information and select **OK**:

Address Name	Ainternal
Type	Subnet / IP Range
Subnet / IP Range	10.11.101.0/255.255.255.0
Interface	port4

To add the vdomA VDOM firewall addresses - CLI:

```
config vdom
   edit vdomA
      config firewall address
         edit Ainternal
            set type ipmask
            set subnet 10.11.101.0 255.255.255.0
      end
   end
```

Adding the vdomA security policy

You need to add the `vdomA` security policy to allow traffic from the internal network to reach the external network, and from the external network to internal as well. You need two policies for this domain.

To add the vdomA security policy - web-based manager:

1. In **Virtual Domains**, select **vdomA**.
2. Go to **Policy > Policy**.
3. Select **Create New**.
4. Enter the following information and select **OK**:

Source Interface/Zone	port4
Source Address	Ainternal
Destination Interface/Zone	port1
Destination Address	all
Schedule	Always
Service	ANY
Action	ACCEPT

5. Select **Create New**.
6. Enter the following information and select **OK**:

Source Interface/Zone	port1
Source Address	all
Destination Interface/Zone	port4
Destination Address	Ainternal
Schedule	Always
Service	ANY
Action	ACCEPT

To add the vdomA security policy - CLI:

```
config vdom
   edit vdomA
      config firewall policy
         edit 1
            set srcintf port4
            set srcaddr Ainternal
            set dstintf port1
            set dstaddr all
            set schedule always
            set service ANY
            set action accept
            set status enable
         next
         edit 2
            set srcintf port1
            set srcaddr all
            set dstintf port4
            set dstaddr Ainternal
            set schedule always
            set service ANY
            set action accept
            set status enable
         end
```

Adding the vdomA default route

You also need to define a default route to direct packets from the Company A internal network to ISP A. Every VDOM needs a default static route, as a minimum, to handle traffic addressed to external networks such as the Internet.

The administrative distance should be set slightly higher than other routes. Lower admin distances will get checked first, and this default route will only be used as a last resort.

To add a default route to the vdomA - web-based manager:

1. For **Virtual Domains**, select **vdomA**
2. Go to **Router > Static > Static Routes**.
3. Select **Create New**.
4. Enter the following information and select **OK**:

Destination IP/Mask	0.0.0.0/0.0.0.0
Device	port1
Gateway	172.20.201.7
Distance	20

To add a default route to the vdomA - CLI:

```
config vdom
   edit vdomA
      config router static
         edit 1
            set device port1
            set gateway 172.20.201.7
         end
```

Configuring the vdomB VDOM

In this example, the vdomB VDOM is used for Company B. Firewall and routing settings are specific to a single VDOM.

vdomB includes the FortiGate port2 interface to connect to the Company B internal network, and the FortiGate port3 interface to connect to ISP B. Security policies are needed to allow traffic from port2 to external and from external to port2 interfaces.

This section includes the following topics:

- Adding the vdomB firewall address
- Adding the vdomB security policy
- Adding a default route to the vdomB VDOM

Adding the vdomB firewall address

You need to define addresses for use in security policies. In this example, the vdomB VDOM needs an address for the port2 interface and the “all” address.

To add the vdomB firewall address - web-based manager:

1. In **Virtual Domains**, select **vdomB**.
2. Go to **Firewall Objects > Address > Address**.
3. Select **Create New**.
4. Enter the following information and select **OK**:

Address Name	Binternal
Type	Subnet / IP Range
Subnet / IP Range	10.12.101.0/255.255.255.0
Interface	port2

To add the vdomB firewall address - CLI:

```
config vdom
   edit vdomB
      config firewall address
         edit Binternal
            set type ipmask
            set subnet 10.12.101.0 255.255.255.0
         end
   end
```

Adding the vdomB security policy

You also need a security policy for the Company B domain. In this example, the security policy allows all traffic.

To add the vdomB security policy - web-based manager:

1. Log in with a super_admin account.
2. In **Virtual Domains**, select vdomB.
3. Go to **Policy > Policy**.
4. Select **Create New**.
5. Enter the following information and select **OK**:

Source Interface/Zone	port2
Source Address	Binternal
Destination Interface/Zone	port3
Destination Address	all
Schedule	Always
Service	ANY
Action	ACCEPT

6. Select **Create New**.
7. Enter the following information and select **OK**:

Source Interface/Zone	port3
Source Address	all
Destination Interface/Zone	port2
Destination Address	Binternal
Schedule	Always
Service	ANY
Action	ACCEPT

To add the vdomB security policy - CLI:

```
config vdom
   edit vdomB
      config firewall policy
         edit 1
            set srcintf port2
            set dstintf port3
            set srcaddr Binternal
            set dstaddr all
            set schedule always
            set service ANY
            set action accept
            set status enable
         edit 1
            set srcintf port3
            set dstintf port2
            set srcaddr all
            set dstaddr Binternal
            set schedule always
            set service ANY
            set action accept
            set status enable
         end
   end
```

Adding a default route to the vdomB VDOM

You need to define a default route to direct packets to ISP B.

To add a default route to the vdomB VDOM - web-based manager:

1. Log in as the super_admin administrator.
2. In **Virtual Domains**, select vdomB.
3. Go to **Router > Static > Static Routes**.
4. Select **Create New**.
5. Enter the following information and select **OK**:

Destination IP/Mask	0.0.0.0/0.0.0.0
Device	port3
Gateway	192.168.201.7
Distance	20

To add a default route to the vdomB VDOM - CLI:

```
config vdom
   edit vdomB
      config router static
         edit 1
            set dst 0.0.0.0/0
```

```
            set device external
            set gateway 192.168.201.7
        end
    end
```

Testing the configuration

Once you have completed configuration for both company VDOMs, you can use diagnostic commands, such as `tracert` in Windows, to test traffic routed through the FortiGate unit. Alternately, you can use the `traceroute` command on a Linux system with similar output.

Possible errors during the traceroute test are:

- "`* * * Request timed out`" - the trace was not able to make the next connection towards the destination fast enough
- "`Destination host unreachable`" - after a number of timed-out responses the trace will give up

Possible reasons for these errors are bad connections or configuration errors.

For additional troubleshooting, see Troubleshooting Virtual Domains.

Testing traffic from the internal network to the ISP

In this example, a route is traced from the Company A internal network to ISP A. The test was run on a Windows PC with an IP address of 10.11.101.55.

The output here indicates three hops between the source and destination, the IP address of each hop, and that the trace was successful.

From the Company A internal network, access a command prompt and enter this command:

```
C:\>tracert 172.20.201.7
Tracing route to 172.20.201.7 over a maximum of 30 hops:
  1   <10 ms   <10 ms   <10 ms  10.11.101.2
  2   <10 ms   <10 ms   <10 ms  172.20.101.2
  3   <10 ms   <10 ms   <10 ms  172.20.201.7
Trace complete.
```

Virtual Domains in Transparent mode

In Transparent mode, the FortiGate unit behaves like a layer-2 bridge but can still provide services such as antivirus scanning, web filtering, spam filtering and intrusion protection to traffic. There are some limitations in Transparent mode in that you cannot use SSL VPN, PPTP/L2TP VPN, DHCP server, or easily perform NAT on traffic. The limits in Transparent mode apply to IEEE 802.1Q VLAN trunks passing through the unit.

VDOMs can each be configured to operate either in Transparent or NAT/Route operation mode, with each VDOM behaving like a separate FortiGate unit operating in the respective mode. VLANs configured on a VDOM in Transparent mode are the same as VLANs configured on the FortiGate unit when VDOMs are disabled.

This chapter includes the following sections:

- Transparent operation mode
- Configuring VDOMs in Transparent mode
- Example of VDOMs in Transparent mode

Transparent operation mode

In transparent mode, the FortiGate unit becomes a layer-2 IP forwarding bridge. This means that Ethernet frames are forwarded based on destination MAC address, and no other routing is performed. All incoming traffic that is accepted by the firewall, is broadcast out on all interfaces.

In transparent mode the FortiGate unit is a forwarding bridge, not a switch. A switch can develop a port table and associated MAC addresses, so that it can bridge two ports to deliver the traffic instead of broadcasting to all ports. In transparent mode, the FortiGate unit does not following this switch behavior, but instead is the forwarding bridge that broadcasts all packets out over all interfaces, subject to security policies.

Features such as broadcast domains, forwarding domains, and STP apply to both FortiGate units and VDOMs in Transparent mode.

Broadcast domains

A broadcast domain is a network segment in which any network equipment can transmit data directly to another device without going through a routing device. All the devices share the same subnet. The subnets are separated by layer-3 devices, such as routers, that can forward traffic from one broadcast domain to the next.

Broadcast domains are important to transparent mode FortiGate units because the broadcast domain is the limit of where the FortiGate unit can forward packets when it is in transparent mode.

Forwarding domains

Address Resolution Protocol (ARP) packets are vital to communication on a network, and ARP support is enabled on FortiGate unit interfaces by default. Normally you want ARP packets to pass through the FortiGate unit. However, in Transparent mode ARP packets arriving on one interface are sent to all other interfaces including VLANs giving the appearance of duplicates of the same MAC address on different interfaces. Some layer-2 switches become unstable when they detect these duplicate MAC addresses. Unstable switches may become unreliable or reset and cause network traffic to slow down considerably.

When you are using VLANs in Transparent mode, the solution to the duplicate MAC address issue is to use the `forward-domain` CLI command. This command tags VLAN traffic as belonging to a particular collision group,

and only VLANs tagged as part of that collision group receive that traffic—it is like an additional set of VLANs. By default, all interfaces and VLANs are part of forward-domain collision group 0.

To assign VLAN 200 to collision group 2, VLAN 300 to collision group 3, and all other interfaces to stay in the default collision group 0 enter the following CLI commands:

```
config system interface
   edit vlan200
      set vlanid 200
      set forward_domain 2
   next
   edit vlan300
      set vlanid 300
      set forward_domain 3
   next
end
```

When using forwarding domains, you may experience connection issues with layer-2 traffic, such as ping, if your network configuration has

- packets going through the FortiGate unit in Transparent mode multiple times,
- more than one forwarding domain (such as incoming on one forwarding domain and outgoing on another)
- IPS and AV enabled.

Spanning Tree Protocol

VDOMs and FortiGate units do not participate in the Spanning Tree Protocol (STP). STP is an IEEE 802.1 protocol that ensures there are no layer-2 loops on the network. Loops are created when there is more than one route for traffic to take and that traffic is broadcast back to the original switch. This loop floods the network with traffic, quickly reducing available bandwidth to zero.

If you use your VDOM or FortiGate unit in a network topology that relies on STP for network loop protection, you need to make changes to your FortiGate configuration. Otherwise, STP recognizes your FortiGate unit as a blocked link and forwards the data to another path. By default, your FortiGate unit blocks STP as well as other non-IP protocol traffic. Using the CLI, you can enable forwarding of STP and other layer-2 protocols through the interface. In this example, layer-2 forwarding is enabled on the port2 interface:

```
config global
   config system interface
      edit port2
         set l2forward enable
         set stpforward enable
      next
   end
```

There are different CLI commands to allow other common layer-2 protocols such as IPX, PPTP or L2TP on the network. For more information, see the FortiOS CLI Reference.

Differences between NAT/Route and Transparent mode

The differences between NAT/Route mode and Transparent mode include:

Differences between NAT/Route and Transparent modes

Features	NAT/Route mode	Transparent mode
Specific Management IP address required	No	Yes
Perform Network Address Translation (NAT)	Yes	Yes
Stateful packet inspection	Yes	Yes
Layer-2 forwarding	Yes	Yes
Layer-3 routing	Yes	No
Unicast Routing / Policy Based routing	Yes	No
DHCP server	Yes	No
IPsec VPN	Yes	Yes
PPTP/L2TP VPN	Yes	No
SSL VPN	Yes	No
Security features	Yes	Yes
VLAN support	Yes	Yes - limited to VLAN trunks.
Ping servers (dead gateway detection)	Yes	No

To provide administrative access to a FortiGate unit or VDOM in Transparent mode, you must define a management IP address and a gateway. This step is not required in NAT/Route mode where you can access the FortiGate unit through the assigned IP address of any interface where administrative access is permitted.

If you incorrectly set the Transparent mode management IP address for your FortiGate unit, you will be unable to access your unit through the web-based manager. In this situation, you will need to connect to the FortiGate unit using the console cable and change the settings so you can access the unit. Alternately, if your unit has an LCD panel, you can change the operation mode and interface information through the LCD panel.

Operation mode differences in VDOMs

A VDOM, such as root, can have a maximum of 255 interfaces in Network Address Translation (NAT) mode or Transparent mode. This includes VLANs, other virtual interfaces, and physical interfaces. To have more than a total of 255 interfaces configured, you need multiple VDOMs with multiple interfaces on each.

In Transparent mode without VDOMs enabled, all interfaces on the FortiGate unit act as a bridge — all traffic coming in on one interface is sent back out on all the other interfaces. This effectively turns the FortiGate unit into a two interface unit no matter how many physical interfaces it has. When VDOMs are enabled, this allows you to

determine how many interfaces to assign to a VDOM running in Transparent mode. If there are reasons for assigning more than two interfaces based on your network topology, you are able to. However, the benefit of VDOMs in this case is that you have the functionality of Transparent mode, but you can use interfaces for NAT/Route traffic as well.

You can add more VDOMs to separate groups of VLAN subinterfaces. When using a FortiGate unit to serve multiple organizations, this configuration simplifies administration because you see only the security policies and settings for the VDOM you are configuring. For information on adding and configuring virtual domains, see Benefits of Virtual Domains.

One essential application of VDOMs is to prevent problems caused when a FortiGate unit is connected to a layer-2 switch that has a global MAC table. FortiGate units normally forward ARP requests to all interfaces, including VLAN subinterfaces. It is then possible for the switch to receive duplicate ARP packets on different VLANs. Some layer-2 switches reset when this happens. As ARP requests are only forwarded to interfaces in the same VDOM, you can solve this problem by creating a VDOM for each VLAN. For a configuration example, see Example of VDOMs in Transparent mode.

Configuring VDOMs in Transparent mode

In Transparent mode, your FortiGate unit becomes a layer-2 bridge — any traffic coming in on one port is broadcast out on all the other ports. If your FortiGate unit has many interfaces, this is not the best use of those interfaces. VDOMs can limit Transparent mode to only a few interfaces while allowing the rest of the FortiGate unit to remain in NAT/Route mode.

The essential steps to configure your FortiGate unit to work with VLANs in Transparent mode are:

- Switching to Transparent mode
- Adding VLAN subinterfaces
- Creating security policies

You can also configure the security profiles that manage antivirus scanning, web filtering and spam filtering.

In Transparent mode, you can access the FortiGate web-based manager by connecting to an interface configured for administrative access and using HTTPS to access the management IP address. On the FortiGateunit used for examples in this guide, administrative access is enabled by default on the internal interface and the default management IP address is `10.11.0.1`.

Switching to Transparent mode

A VDOM is in NAT/Route mode by default when it is created. You must switch it to Transparent mode, and add a management IP address so you can access the VDOM from your management computer.

Before applying the change to Transparent mode, ensure the VDOM has administrative access on the selected interface, and that the selected management IP address is reachable on your network.

To switch the `tpVDOM` VDOM to Transparent mode - web-based manager:

1. Go to **Global > VDOM > VDOM**.
2. Edit the **tpVDOM**.
3. Select `Transparent` for **Operation mode**.
4. Enter the management IP/Netmask.
   The IP address must be accessible to the subnet where the management computer is located. For example 10.11.0.99/255.255.255.0 will be able to access the 10.11.0.0 subnet.
5. Select **Apply**.

When you select **Apply**, the FortiGate unit will log you out. When you log back in, the VDOM will be in Transparent mode.

To switch the `tpVDOM` VDOM to Transparent mode - CLI:

```
config vdom
   edit tpVDOM
      config system settings
         set opmode transparent
         set mangeip 10.11.0.99 255.255.255.0
      end
   end
```

Adding VLAN subinterfaces

There are a few differences when adding VLANs in Transparent mode compared to NAT/Route mode.

In Transparent mode, VLAN traffic is trunked across the VDOM. That means VLAN traffic cannot be routed, changed, or inspected. For this reason when you assign a VLAN to a Transparent mode VDOM, you will see the **Addressing Mode** section of the interface configuration disappear in from the web-based manager. It is because with no routing, inspection, or any activities able to be performed on VLAN traffic the VDOM simply re-broadcasts the VLAN traffic. This requires no addressing.

Also any routing related features such as dynamic routing or Virtual Router Redundancy Protocol (VRRP) are not available in Transparent mode for any interfaces.

Creating security policies

Security policies permit communication between the FortiGate unit's network interfaces based on source and destination IP addresses. Typically you will also limit communication to desired times and services for additional security.

In Transparent mode, the FortiGate unit performs antivirus and antispam scanning on each packet as it passes through the unit. You need security policies to permit packets to pass from the VLAN interface where they enter the unit to the VLAN interface where they exit the unit. If there are no security policies configured, no packets will be allowed to pass from one interface to another. For more information, see the FortiGate Administration Guide.

Example of VDOMs in Transparent mode

In this example, the FortiGate unit provides network protection to two organizations — Company A and Company B. Each company has different policies for incoming and outgoing traffic, requiring three different security policies and protection profiles.

VDOMs are not required for this configuration, but by using VDOMs the profiles and policies can be more easily managed on a per-VDOM basis either by one central administrator or separate administrators for each company. Also future expansion is simply a matter of adding additional VDOMs, whilst not disrupt the existing VDOMs.

For this example, firewalls are only included to deal with web traffic. This is to provide an example without making configuration unnecessarily complicated.

This example includes the following sections:

- Network topology and assumptions
- General configuration steps
- Configuring common items
- Creating virtual domains
- Configuring the Company_A VDOM
- Configuring the Company_B VDOM
- Virtual Domains in Transparent mode
- Testing the configuration

Network topology and assumptions

Each organization's internal network consists of a different range of IP addresses:

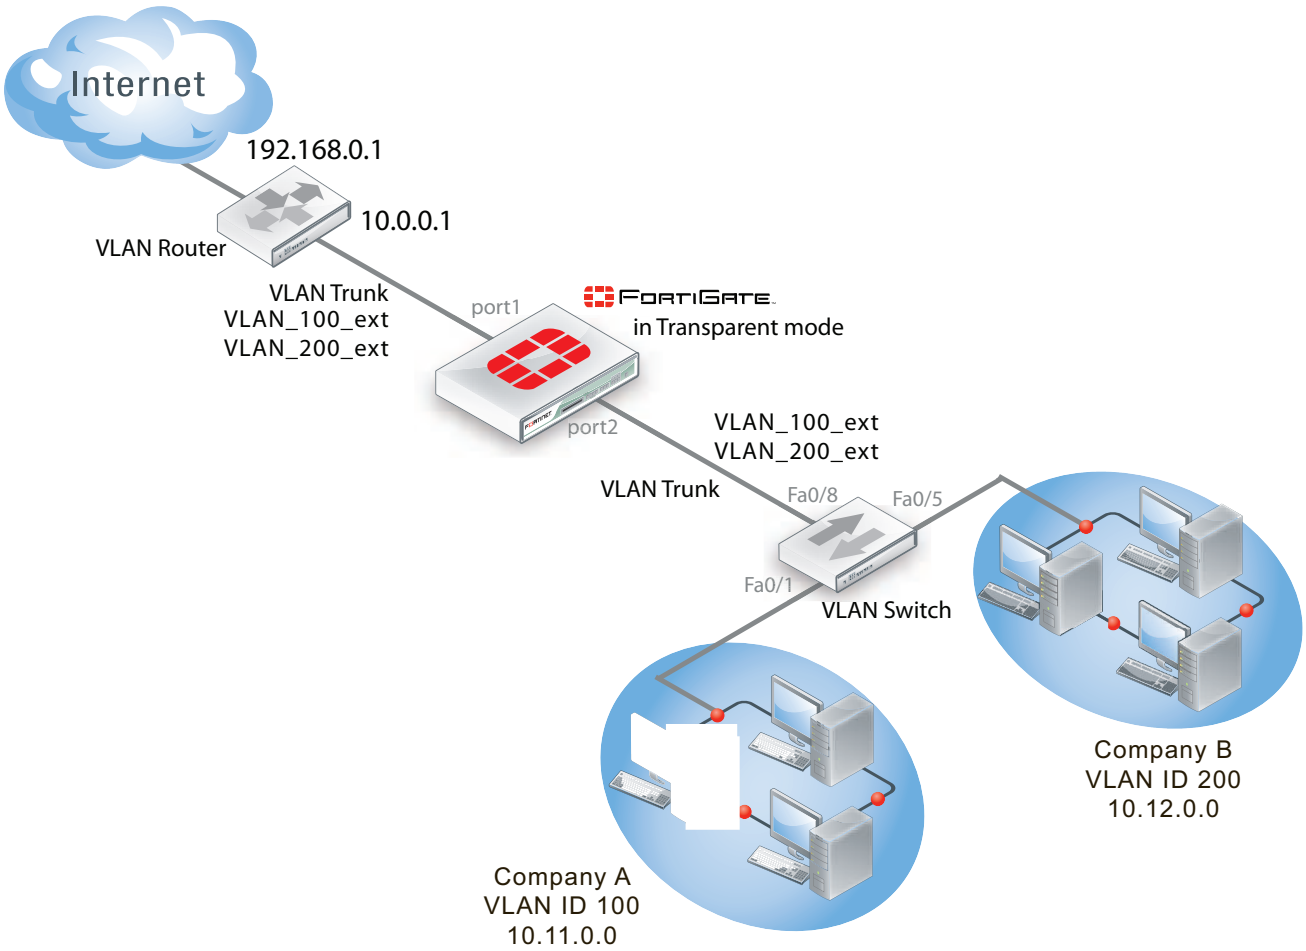
- 10.11.0.0/255.255.0.0 for Company A.
- 10.12.0.0/255.255.0.0 for Company B.

For the procedures in this section, it is assumed that you have enabled VDOM configuration on your FortiGate unit. For more information, see Enabling and accessing Virtual Domains.

The VDOM names are similar to the company names for easy recognition. The root VDOM cannot be renamed and is not used in this example.

Interfaces used in this example are port1 and port2. Some FortiGate models may not have interfaces with these names. port1 is an external interface. port2 is an internal interface.

Figure 10: VLAN and VDOM Transparent example network topology



General configuration steps

The following steps summarize the configuration for this example. For best results, follow the procedures in the order given. Also, note that if you perform any additional actions between procedures, your configuration may have different results.

1. Configuring common items
2. Creating virtual domains
3. Configuring the Company_A VDOM
4. Configuring the Company_B VDOM
5. Virtual Domains in Transparent mode
6. Testing the configuration

Configuring common items

Both VDOMs require you configure security profiles. These will be configured the same way, but need to be configured in both VDOMs.

The relaxed profile allows users to surf websites they are not allowed to visit during normal business hours. Also a quota is in place to restrict users to one hour of access to these websites to ensure employees do not take long and unproductive lunches.

To create a strict web filtering profile - web-based manager:

1. Go to the proper VDOM, and select **Security Profiles > Web Filter > Profile**.
2. Select **Create New**.
3. Enter `strict` for the **Name**.
4. Expand FortiGuard Web Filtering, and select block for all Categories except Business Oriented, and Other.
5. Block all Classifications except Cached Content, and Image Search.
6. Ensure **FortiGuard Quota** for all Categories and Classifications is Disabled.
7. Select **OK**.

To create a strict web filtering profile - CLI:

```
config vdom
   edit <vdom_name>
      config webfilter profile
         edit strict
            config ftgd-wf
               set allow g07 g08 g21 g22 c01 c03
               set deny g01 g02 g03 g04 g05 g06 c02 c04 c05 c06 c07
            end
            set web-ftgd-err-log enable
         end
```

To create a relaxed web filtering profile - web-based manager:

1. Go to the proper VDOM, and select **Security Profiles > Web Filter > Profile**.
2. Select **Create New**.
3. Enter `relaxed` for the **Name**.
4. Expand FortiGuard Web Filtering, and select block for Potentially Security Violating Category, and Spam URL Classification.
5. Enable FortiGuard Quotas to allow 1 hour for all allowed Categories and Classifications.

Creating virtual domains

The FortiGate unit supports 10 virtual domains. Root is the default VDOM. It cannot be deleted or renamed. The root VDOM is not used in this example. New VDOMs are created for Company A and Company B

To create the virtual domains - web-based manager:

1. With VDOMs enabled, select **System > VDOM > VDOM**.
2. Select **Create New**.
3. Enter `Company_A` for Name, and select **OK**.
4. Select **Create New**.
5. Enter `Company_B` for Name, and select **OK**.

To create the virtual domains - CLI:

```
config system vdom
   edit Company_A
   next
   edit Company_B
end
```

Configuring the Company_A VDOM

This section describes how to add VLAN subinterfaces and configure security policies for the Company_A VDOM.

This section includes the following topics:

- Adding VLAN subinterfaces
- Creating the Lunch schedule
- Configuring Company_A firewall addresses
- Creating Company_A security policies

Adding VLAN subinterfaces

You need to create a VLAN subinterface on the port2 interface and another one on the port1 interface, both with the same VLAN ID.

To add VLAN subinterfaces - web-based manager:

1. Go to **System > Network > Interfaces**.
2. Select **Create New**.
3. Enter the following information and select **OK**:

Name	VLAN_100_int
Interface	port2
VLAN ID	100
Virtual Domain	Company_A

4. Select **Create New**.
5. Enter the following information and select **OK**:

Name	VLAN_100_ext
Interface	port1
VLAN ID	100
Virtual Domain	Company_A

To add the VLAN subinterfaces - CLI:

```
config system interface
```

```
edit VLAN_100_int
   set interface port2
   set vlanid 100
   set vdom Company_A
next
edit VLAN_100_ext
   set interface port1
   set vlanid 100
   set vdom Company_A
end
```

Creating the Lunch schedule

Both organizations have the same lunch schedule, but only Company A has relaxed its security policy to allow employees more freedom in accessing the Internet during lunch. Lunch schedule will be Monday to Friday from 11:45am to 2:00pm (14:00).

To create a recurring schedule for lunchtime - web-based manager:

1. In Company_A VDOM, go to **Firewall Objects > Schedule > Recurring**.
2. Select **Create New**.
3. Enter `Lunch` as the name for the schedule.
4. Select **Mon**, **Tues**, **Wed**, **Thu**, and **Fri**.
5. Set the **Start** time as `11:45` and set the **Stop** time as `14:00`.
6. Select **OK**.

To create a recurring schedule for lunchtime - CLI:

```
config vdom
   edit Company_A
      config firewall schedule recurring
         edit Lunch
            set day monday tuesday wednesday thursday friday
            set start 11:45
            set end 14:00
         end
```

Configuring Company_A firewall addresses

For Company A, its networks are all on the 10.11.0.0 network, so restricting addresses to that domain provides added security.

To configure Company_A firewall addresses - web-based manager:

1. In the Company_A VDOM, go to **Firewall Objects > Address > Address**.
2. Select **Create New**.
3. Enter `CompanyA` in the **Address Name** field.
4. Type 10.11.0.0/255.255.0.0 in the **Subnet / IP Range** field.
5. Select **OK**.

To configure vdomA firewall addresses - CLI:

```
config firewall address
   edit CompanyA
      set type ipmask
      set subnet 10.11.0.0 255.255.0.0
   end
```

Creating Company_A security policies

A security policy can include varying levels of security feature protection. This example only deals with web filtering. The following security policies use the custom security `strict` and `relaxed` profiles configured earlier. See Configuring common items.

For these security policies, we assume that all protocols will be on their standard ports, such as port 80 for http traffic. If the ports are changed, such as using port 8080 for http traffic, you will have to create custom services for protocols with non-standard ports, and assign them different names.

The firewalls configured in this section are:

- internal to external — always deny all
- external to internal — always deny all
- internal to external — always allow all, security features - web filtering: strict
- internal to external — Lunch allow all, security features - web filtering:relaxed

Security policies allow packets to travel between the internal VLAN_100 interface to the external interface subject to the restrictions of the protection profile. Entering the policies in this order means the last one configured is at the top of the policy list, and will be checked first. This is important because the policies are arranged so if one does not apply the next is checked until the end of the list.

To configure Company_A security policies - web-based manager:

1. Go to **Policy > Policy**.
2. Select **Create New**.
3. Enter the following information and select **OK**:

Source Interface/Zone	VLAN_100_int
Source Address	CompanyA
Destination Interface/Zone	VLAN_100_ext
Destination Address	all
Schedule	always
Service	all
Action	DENY

This policy is a catch all for outgoing traffic to ensure that if it doesn't match any of the other policies, it will not be allowed. This is standard procedure.

4. Select **Create New**.
5. Enter the following information and select **OK**:

Source Interface/Zone	VLAN_100_ext
Source Address	all
Destination Interface/Zone	VLAN_100_int
Destination Address	CompanyA
Schedule	always
Service	all
Action	DENY

This policy is a catch all for incoming traffic to ensure that if it doesn't match any of the other policies, it will not be allowed. This is standard procedure.

6. Select **Create New**.
7. Enter the following information and select **OK**:

Source Interface/Zone	VLAN_100_int
Source Address	CompanyA
Destination Interface/Zone	VLAN_100_ext
Destination Address	all
Schedule	always
Service	all
Action	ACCEPT
Security Features	enable
Web Filtering	strict

This policy enforces strict scanning at all times, while allowing all traffic. It ensures company policies are met for network security.

8. Select **Create New**.
9. Enter the following information and select **OK**:

Source Interface/Zone	VLAN_100_int
Source Address	CompanyA
Destination Interface/Zone	VLAN_100_ext

Destination Address	all
Schedule	Lunch
Service	all
Action	ACCEPT
Security Features	enable
Web Filtering	relaxed

This policy provides relaxed protection during lunch hours — going from strict down to scan for protocol options and web filtering. AntiVirus and Email Filtering remain at strict for security — relaxing them would not provide employees additional access to the Internet and it would make the company vulnerable.

10. Verify that the policies entered appear in the list with the last policy (lunch) at the top, and the first policy (deny all) at the bottom. Otherwise traffic will not flow as expected.

To configure Company_A security policies - CLI:

```
config vdom
   edit Company_A
      config firewall policy
         edit 1
            set srcintf VLAN_100_int
            set dstintf VLAN_100_ext
            set srcaddr all
            set dstaddr all
            set action accept
            set schedule Lunch
            set webfiltering relaxed
         next
         edit 3
            set srcintf VLAN_100_int
            set dstintf VLAN_100_ext
            set srcaddr all
            set dstaddr all
            set action accept
            set schedule BusinessDay
            set service HTTP
            set profile_status enable
            set profile BusinessOnly
         end
```

Configuring the Company_B VDOM

This section describes how to add VLAN subinterfaces and configure security policies for the Company B VDOM.

This section includes the following topics:

- Adding VLAN subinterfaces
- Creating Company_B service groups

- Configuring Company_B firewall addresses
- Configuring Company_B security policies

Adding VLAN subinterfaces

You need to create a VLAN subinterface on the internal interface and another one on the external interface, both with the same VLAN ID.

To add VLAN subinterfaces - web-based manager:

1. Go to **System > Network > Interfaces**.
2. Select **Create New**.
3. Enter the following information and select **OK**:

Name	VLAN_200_int
Interface	port2
VLAN ID	200
Virtual Domain	Company_B

4. Select **Create New**.
5. Enter the following information and select **OK**:

Name	VLAN_200_ext
Interface	port1
VLAN ID	200
Virtual Domain	Company_B

To add the VLAN subinterfaces - CLI:

```
config system interface
   edit VLAN_200_int
      set interface internal
      set vlanid 200
      set vdom Company_B
   next
   edit VLAN_200_ext
      set interface external
      set vlanid 200
      set vdom Company_B
   end
```

Creating Company_B service groups

Company_B does not want its employees to use any online chat software except NetMeeting, which the company uses for net conferencing. To simplify the creation of a security policy for this purpose, you create a service group that contains all of the services you want to restrict. A security policy can manage only one service or one group.

To create a chat service group - web-based manager:

1. Go to **Firewall Objects > Service > Groups**.
2. Select **Create New**.
3. Enter `Chat` in the **Group Name** field.
4. For each of IRC, AOL, SIP-MSNmessenger and TALK, select the service in the **Available Services** list and select the right arrow to add it to the **Members** list.

If a particular service does not appear in the **Available Services** list, see the list in **Firewall Objects > Service > Services**. Some services do not appear by default unless edited.

5. Select **OK**.

To create a games and chat service group - CLI:

```
config firewall service group
   edit Chat
      set member IRC SIP-MSNmessenger AOL TALK
   end
```

Configuring Company_B firewall addresses

Company B's network is all in the 10.12.0.0 network. Security can be improved by only allowing traffic from IP addresses on that network.

To configure Company_B firewall address - web-based manager:

1. In the Company_B VDOM, go to **Firewall Objects > Address > Address.**
2. Select **Create New**.
3. Enter `new` in the **Address Name** field.
4. Type 10.12.0.0/255.255.0.0 in the **Subnet / IP Range** field.
5. Select **OK**.

To configure Company_B firewall addresses - CLI:

```
config vdom
   edit Company_B
      config firewall address
         edit all
            set type ipmask
            set subnet 10.12.0.0 255.255.0.0
         end
```

Configuring Company_B security policies

Security policies allow packets to travel between the internal and external VLAN_200 interfaces subject to the restrictions of the protection profile.

To configure Company_B security policies - web-based manager:

1. Go to **Policy > Policy**.
2. Select **Create New**.

3. Enter the following information and select **OK**:

Source Interface/Zone	VLAN_200_int
Source Address	all
Destination Interface/Zone	VLAN_200_ext
Destination Address	all
Schedule	BusinessDay
Service	games-chat
Action	DENY

This policy prevents the use of network games or chat programs (except NetMeeting) during business hours.

4. Enter the following information and select **OK**:

Source Interface/Zone	VLAN_200_int
Source Address	all
Destination Interface/Zone	VLAN_200_ext
Destination Address	all
Schedule	Lunch
Service	HTTP
Action	ACCEPT
Protection Profile	Relaxed

This policy relaxes the web category filtering during lunch hour.

5. Select **Create New**.
6. Enter the following information and select **OK**:

Source Interface/Zone	VLAN_200_int
Source Address	all
Destination Interface/Zone	VLAN_200_ext
Destination Address	all
Schedule	BusinessDay
Service	HTTP

Action	ACCEPT
Protection Profile	BusinessOnly

This policy provides rather strict web category filtering during business hours.

7. Select **Create New**.
8. Enter the following information and select **OK**:

Source Interface/Zone	VLAN_200_int
Source Address	all
Destination Interface/Zone	VLAN_200_ext
Destination Address	all
Schedule	always
Service	ANY
Action	ACCEPT
Protection Profile	Relaxed

Because it is last in the list, this policy applies to the times and services not covered in preceding policies. This means that outside of regular business hours, the Relaxed protection profile applies to email and web browsing, and online chat and games are permitted. Company B needs this policy because its employees sometimes work overtime. The other companies in this example maintain fixed hours and do not want any after-hours Internet access.

To configure Company_B security policies - CLI:

```
config firewall policy
   edit 1
      set srcintf VLAN_200_int
      set srcaddr all
      set dstintf VLAN_200_ext
      set dstaddr all
      set schedule BusinessDay
      set service Games
      set action deny
   next
   edit 2
      set srcintf VLAN_200_int
      set srcaddr all
      set dstintf VLAN_200_ext
      set dstaddr all
      set action accept
      set schedule Lunch
      set service HTTP
      set profile_status enable
      set profile Relaxed
   next
   edit 3
```

```
        set srcintf VLAN_200_int
        set srcaddr all
        set dstintf VLAN_200_ext
        set dstaddr all
        set action accept
        set schedule BusinessDay
        set service HTTP
        set profile_status enable
        set profile BusinessOnly
    next
    edit 4
        set srcintf VLAN_200_int
        set srcaddr all
        set dstintf VLAN_200_ext
        set dstaddr all
        set action accept
        set schedule always
        set service ANY
        set profile_status enable
        set profile Relaxed
    end
```

Testing the configuration

Use diagnostic commands, such as tracert, to test traffic routed through the network.

You should test traffic between the internal VLANs as well as from the internal VLANs to the Internet to ensure connectivity.

For additional troubleshooting, see Troubleshooting Virtual Domains.

This section includes the following topics:

- Testing traffic from VLAN_100 to the Internet
- Testing traffic from VLAN_100 to VLAN_200

Testing traffic from VLAN_100 to the Internet

In this example, a route is traced from VLANs to a host on the Internet. The route target is www.example.com.

From a host on VLAN_100, access a command prompt and enter this command:

```
C:\>tracert www.example.com
Tracing route to www.example.com [208.77.188.166]
over a maximum of 30 hops:
 1 <10 ms <10 ms <10 ms 10.100.0.1
...
14 172 ms 141 ms 140 ms 208.77.188.166
Trace complete.
```

The number of steps between the first and the last hop, as well as their IP addresses, will vary depending on your location and ISP. However, all successful tracerts to www.example.com will start and end with these lines.

Repeat the tracert for VLAN_200.

The tracert for each VLAN will include the gateway for that VLAN as the first step. Otherwise, the tracert should be the same for each VLAN.

Testing traffic from VLAN_100 to VLAN_200

In this example, a route is traced between two internal networks. The route target is a host on VLAN_200. The Windows traceroute command `tracert` is used.

From VLAN_100, access a Windows command prompt and enter this command:

```
C:\>tracert 10.12.0.2
Tracing route to 10.12.0.2 over a maximum of 30 hops:
1 <10 ms <10 ms <10 ms 10.100.0.1
2 <10 ms <10 ms <10 ms 10.12.0.2
Trace complete.
```

You can repeat this for different routes in the topology. In each case the IP addresses will be the gateway for the starting VLAN, and the end point at the ending VLAN.

Inter-VDOM routing

In the past, virtual domains (VDOMs) were separate from each other—there was no internal communication. Any communication between VDOMs involved traffic leaving on a physical interface belonging to one VDOM and re-entering the FortiGate unit on another physical interface belonging to another VDOM to be inspected by firewall policies in both directions.

Inter-VDOM routing changes this. With VDOM links, VDOMs can communicate internally without using additional physical interfaces.

Inter-VDOM routing is the communication between VDOMs. VDOM links are virtual interfaces that connect VDOMs. A VDOM link contains a pair of interfaces with each one connected to a VDOM, and forming either end of the inter-VDOM connection.

This chapter contains the following sections:

- Benefits of inter-VDOM routing
- Getting started with VDOM links
- Dynamic routing over inter-VDOM links
- HA virtual clusters and VDOM links
- Example of inter-VDOM routing

Benefits of inter-VDOM routing

Inter-VDOM routing has a number of advantages over independent VDOM routing. These benefits include:

- Freed-up physical interfaces
- More speed than physical interfaces
- Continued support for secure firewall policies
- Configuration flexibility

Freed-up physical interfaces

Tying up physical interfaces on the FortiGate unit presents a problem. With a limited number of interfaces available, configuration options for the old style of communication between VDOMs are very limited. VLANs can be an answer to this, but they have some limitations.

For example, the FortiGate-800 has 8 physical ethernet ports. If they are assigned 2 per VDOM (one each for external and internal traffic) there can only be 4 VDOMs at most configured, not the 10 VDOMs the license will allow. Adding even one additional interface per VDOM to be used to communicate between VDOMs leaves only 2 VDOMs for that configuration, since it would required 9 interfaces for 3 VDOMs. Even using one physical interface for both external traffic and inter-VDOM communication would severely lower the available bandwidth for external traffic on that interface.

With the introduction of inter-VDOM routing, traffic can travel between VDOMs internally, freeing up physical interfaces for external traffic. Using the above example we can use the 4 VDOM configuration and all the interfaces will have their full bandwidth.

More speed than physical interfaces

Internal interfaces are faster than physical interfaces. Their speed depends on the FortiGate unit CPU and its load. That means that an inter-VDOM link interface will be faster than a outbound physical interface connected to another inbound physical interface.

Inter-VDOM links are CPU bound, and cannot be part of an accelerated pair of interfaces.

However, while one virtual interface with normal traffic would be considerably faster than on a physical interface, the more traffic and more internal interfaces you configure, the slower they will become until they are slower than the physical interfaces. CPU load can come from other sources such as AV or content scanning. This produces the same effect—internal interfaces such as inter-VDOM links will be slower.

Continued support for secure firewall policies

VDOMs help to separate traffic based on your needs. This is an important step in satisfying regulations that require proof of secure data handling. This is especially important to health, law, accounting, and other businesses that handle sensitive data every day.

By keeping things separate, traffic has to leave the FortiGate unit and re-enter to change VDOMs. This forces traffic to go through the firewall when leaving and enter through another firewall, keeping traffic secure.

With inter-VDOM routing, the need for the physical interfaces is greatly reduced. However, firewall policies still need to be in place for traffic to pass through any interface, physical or virtual, and thus provide the same level of security both internally and externally. Configuration of firewall policies is the same for inter-VDOM links as for any other interface, and your data will continue to have the high level of security.

Configuration flexibility

A typical VDOM uses at least two interfaces, typically physical interfaces, one for internal and one for external traffic. Depending on the configuration, more interfaces may be required. This means that the maximum number of VDOMs configurable on a FortiGate unit using physical interfaces is the number of interfaces available divided by two. VLANs can increase the number by providing multiple virtual interfaces over a single physical interface, but VLANs have some limitations. Using physical interfaces for inter-VDOM communication therefore limits the number of possible configurations on your FortiGate unit.

To overcome this limitation, inter-VDOM links can be created within the FortiGate unit. Using virtual interfaces, inter-VDOM links free up the physical interfaces for external traffic. Using VDOM links on a FortiGate unit with 8 physical interfaces, you can have 4 VDOMs communicating with each other (meshed configuration) and continue to have 2 physical interfaces each for internal and external connections. This configuration would have required 20 physical interfaces without inter-VDOM routing. With inter-VDOM routing it only requires 8 physical interfaces, with the other 12 interfaces being internal VDOM links.

Inter-VDOM routing allows you to make use of Standalone VDOM configuration, Management VDOM configuration, and Meshed VDOM configuration without being limited by the number of physical interfaces on your FortiGate unit.

Getting started with VDOM links

Once VDOMs are configured on your FortiGate unit, configuring inter-VDOM routing and VDOM-links is very much like creating a VLAN interface. VDOM-links are managed through the web-based manager or CLI. In the web-based manager, VDOM link interfaces are managed in the network interface list.

This section includes the following topics:

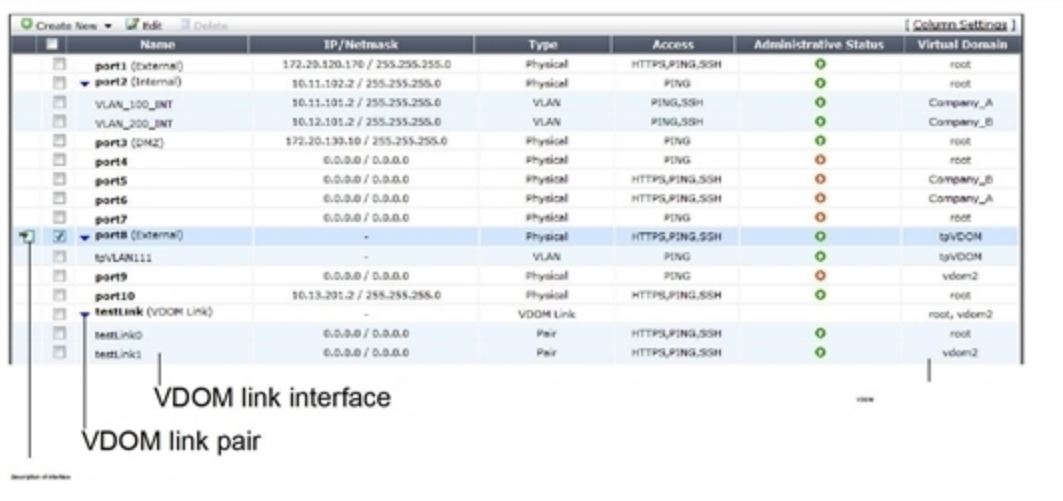
- Viewing VDOM links
- Creating VDOM links
- Deleting VDOM links
- NAT to Transparent VDOM links

Viewing VDOM links

VDOM links are displayed on the network interface list in the web-based manager. You can view VDOM links only if you are using a super_admin account and in global configuration.

To view the network interface list, in the Global menu go to **System > Network > Interfaces.**

Interface list displaying interface names and information



Create New	Select the arrow to create a new interface or VDOM link. Interface options include VLAN, Aggregate, Redundant, or loopback interfaces. For more information, see Creating VDOM links.
Edit	Select to change interface configuration for the selected interface. This option not available if no interfaces or multiple interfaces are selected.
Delete	Select to remove an interface from the list. One or more interfaces must be selected for this option to be available. You cannot delete permanent physical interfaces, or any interfaces that have configuration referring to them. See Deleting VDOM links or see Deleting an interface.
Column Settings	Select to change which information is displayed about the interfaces, and in which order the columns appear. Use to display VDOM, VLAN, and other information.
Checkbox	Select the checkbox for an interface to edit or delete that interface. Select multiple interfaces to delete those interfaces. Optionally select the check box at the top of the column to select or unselect all checkboxes.
Name	The name of the interface. The name of the VDOM link (`vlink1`) has an expand arrow to display or hide the pair of VDOM link interfaces. For more information, see Viewing VDOM links.
IP/Netmask	The IP address and netmask assigned to this interface.
Type	The type of interface such as physical, VLAN, or VDOM link pair.
Access	The protocols allowed for administrators to connect to the FortiGate unit.
Administrative Status	The status of this interface, either set to up (active) or down (disabled).
Virtual Domain	The virtual domain this interface belongs to. For more information on VDOMs, see Virtual Domains in NAT/Route mode.

Creating VDOM links

VDOM links connect VDOMs together to allow traffic to pass between VDOMs as per firewall policies. Inter-VDOM links are virtual interfaces that are very similar to VPN tunnel interfaces except inter-VDOM links do not require IP addresses. See IP addresses and inter-VDOM links.

To create a VDOM link, you first create the point-to-point interface, and then bind the two interface objects associated with it to the virtual domains.

In creating the point-to-point interface, you also create two additional interface objects by default. They are called `vlink10` and `vlink11` - the interface name you chose with a 1 or a 0 to designate the two ends of the link.

Once the interface objects are bound, they are treated like normal FortiGate interfaces and need to be configured just like regular interfaces.

The assumptions for this example are as follows:

- Your FortiGate unit has VDOMs enabled and you have 2 VDOMs called `customer1` and `customer2` already configured. For more information on configuring VDOMs see Configuring Virtual Domains.
- You are using a super_admin account

To configure an inter-VDOM link - web-based manager:

1. Go to **Global > Network > Interfaces**.
2. Select **Create New > VDOM link**, enter the following information, and select **OK**.

Name		vlink1 (The name can be up to 11 characters long. Valid characters are letters, numbers, "-", and "_". No spaces are allowed.)
Interface #0		
	Virtual Domain	customer1
	IP/Netmask	10.11.12.13/255.255.255.0
	Administrative Access	HTTPS, SSL
Interface #1		
	Virtual Domain	customer2
	IP/Netmask	172.120.100.13/255.255.255.0
	Administrative Access	HTTPS, SSL

To configure an inter-VDOM link - CLI:

```
config global
   config system vdom-link
      edit vlink1
      end
   config system interface
      edit vlink10
         set vdom customer1
      next
      edit vlink11
         set vdom customer2
      end
```

Once you have created and bound the interface ends to VDOMs, configure the appropriate firewall policies and other settings that you require. To confirm the inter-VDOM link was created, find the VDOM link pair and use the expand arrow to view the two VDOM link interfaces. You can select edit to change any information.

IP addresses and inter-VDOM links

Besides being virtual interfaces, here is one main difference between inter-VDOM links and regular interfaces—default inter-VDOM links do not require IP addresses. IP addresses are not required by default because an inter-VDOM link is an internal connection that can be referred to by the interface name in firewall policies, and other system references. This introduces three possible situations with inter-VDOM links that are:

- **unnumbered** - an inter-VDOM link with no IP addresses for either end of the tunnel
- **half numbered** - an inter-VDOM link with one IP address for one end and none for the other end
- **full numbered** - an inter-VDOM link with two IP addresses, one for each end.

Not using an IP address in the configuration can speed up and simplify configuration for you. Also you will not use up all the IP addresses in your subnets if you have many inter-VDOM links.

Half or full numbered interfaces are required if you are doing NAT, either SNAT or DNAT as you need an IP number on both ends to translate between.

You can use unnumbered interfaces in static routing, by naming the interface and using `0.0.0.0` for the gateway. Running traceroute will not show the interface in the list of hops. However you can see the interface when you are sniffing packets, which is useful for troubleshooting.

Deleting VDOM links

When you delete the VDOM link, the two link objects associated with it will also be deleted. You cannot delete the objects by themselves. The example uses a VDOM routing connection called “vlink1”. Removing vlink1 will also remove its two link objects vlink10 and vlink11.

Before deleting the VDOM link, ensure all policies, firewalls, and other configurations that include the VDOM link are deleted, removed, or changed to no longer include the VDOM link.

To remove a VDOM link - web-based manager:

1. Go to **Global > Network > Interfaces**.
2. Select **Delete** for the VDOM link **vlink1**.

To remove a VDOM link - CLI:

```
config global
   config system vdom-link
      delete vlink1
   end
```

For more information, see the FortiGate CLI Reference.

NAT to Transparent VDOM links

Inter-VDOM links can be created between VDOMs in NAT mode and VDOMs in Transparent mode, but it must be done through the CLI, as the VDOM link type must be changed from the default PPP to Ethernet for the two VDOMs to communicate. The below example assumes one vdom is in NAT mode and one is Transparent.

An IP address must be assigned to the NAT VDOM's interface, but no IP address should be assigned to the Transparent VDOM's interface.

To configure a NAT to Transparent VDOM link - CLI:

```
config global
   config system vdom-link
      edit vlink1
      set type ethernet
      end
   config system interface
      edit vlink10
         set vdom (interface 1 name)
         set ip (interface 1 ip)
      next
      edit vlink11
         set vdom (interface 2 name)
      end
```

Ethernet-type is not recommended for standard NAT to NAT inter-VDOM links, as the default PPP-type link does not require the VDOM links to have addresses, while Ethernet-type does. VDOM link addresses are explained in IP addresses and inter-VDOM links.

Inter-VDOM configurations

By using fewer physical interfaces to inter-connect VDOMs, inter-VDOM links provide you with more configuration options.

None of these configurations use VLANs to reduce the number of physical interfaces. It is generally assumed that an internal or client network will have its own internal interface and an external interface to connect to its ISP and the Internet.

These inter-VDOM configurations can use any FortiGate model with possible limitations based on the number of physical interfaces. VLANs can be used to work around these limitations.

In the following inter-VDOM diagrams, red indicates the physical FortiGate unit, grey indicate network connections external to the FortiGate unit, and black is used for inter-VDOM links and VDOMs.

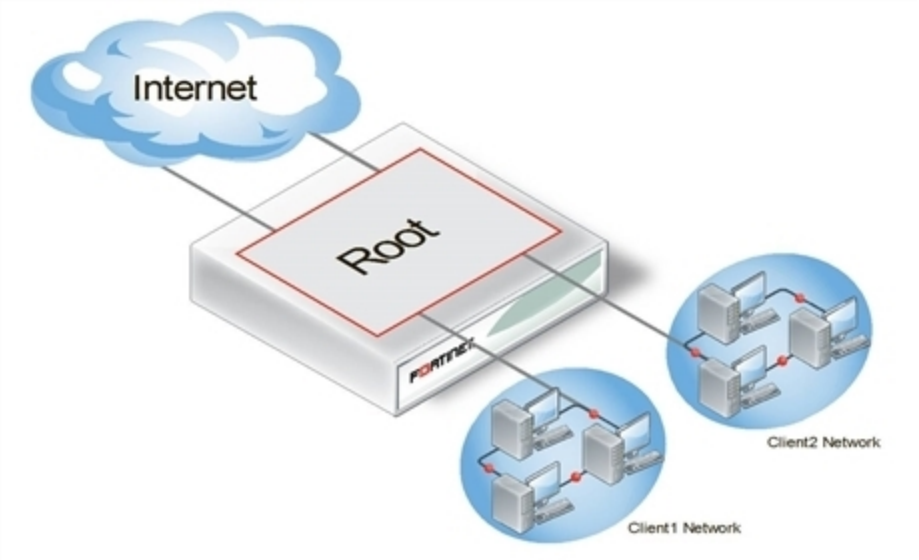
This section includes the following topics:

- Standalone VDOM configuration
- Independent VDOMs configuration
- Management VDOM configuration
- Meshed VDOM configuration

Standalone VDOM configuration

The standalone VDOM configuration uses a single VDOM on your FortiGate unit — the root VDOM that all FortiGate units have by default. This is the VDOM configuration you are likely familiar with. It is the default configuration for FortiGate units before you create additional VDOMs.

Standalone VDOM



The configuration shown above has no VDOM inter-connections and requires no special configurations or settings.

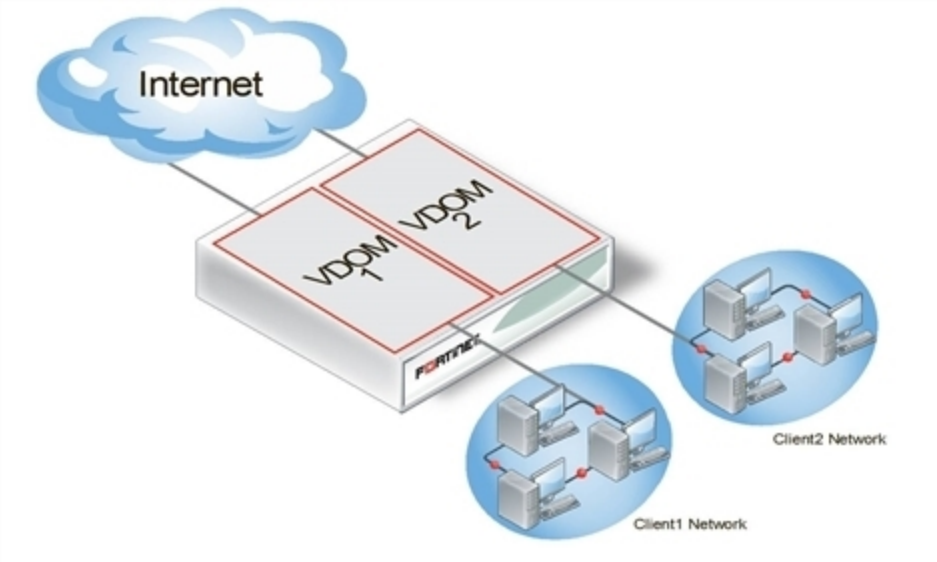
The standalone VDOM configuration can be used for simple network configurations that only have one department or one company administering the connections, firewalls and other VDOM-dependent settings.

However, with this configuration, keeping client networks separate requires many interfaces, considerable firewall design and maintenance, and can quickly become time consuming and complex. Also, configuration errors for one client network can easily affect other client networks, causing unnecessary network downtime.

Independent VDOMs configuration

The independent VDOMs configuration uses multiple VDOMs that are completely separate from each other. This is another common VDOM configuration.

Independent VDOMs



This configuration has no communication between VDOMs and apart from initially setting up each VDOM, it requires no special configurations or settings. Any communication between VDOMs is treated as if communication is between separate physical devices.

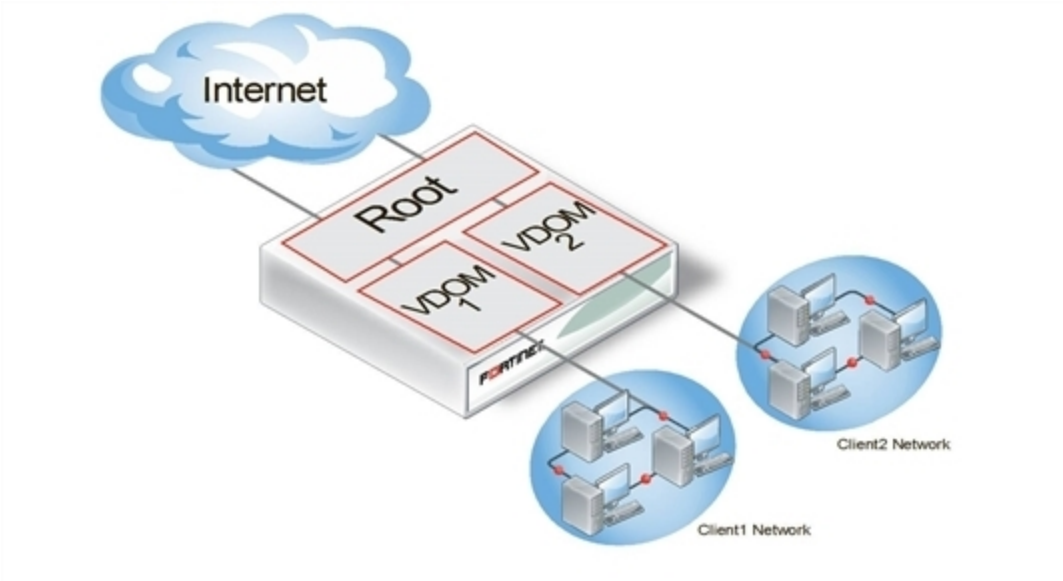
The independent inter-VDOM configuration can be used where more than one department or one company is sharing the FortiGate unit. Each can administer the connections, firewalls and other VDOM-dependent settings for only its own VDOM. To each company or department, it appears as if it has its own FortiGate unit. This configuration reduces the amount of firewall configuration and maintenance required by dividing up the work.

However, this configuration lacks a management VDOM for VDOMs 1, 2, and 3. This is illustrated in Figure 50. This management VDOM would enable an extra level of control for the FortiGate unit administrator, while still allowing each company or department to administer its own VDOM.

Management VDOM configuration

In the management VDOM configuration, the root VDOM is the management VDOM. The other VDOMs are connected to the management VDOM with inter-VDOM links. There are no other inter-VDOM connections.

Management VDOM configuration



The inter-VDOM links connect the management VDOM to the other VDOMs. This does not require any physical interfaces, and the bandwidth of inter-VDOM links can be faster than physical interfaces, depending on the CPU workload.

Only the management VDOM is connected to the Internet. The other VDOMs are connected to internal networks. All external traffic is routed through the management VDOM using inter-VDOM links and firewall policies between the management VDOM and each VDOM. This ensures the management VDOM has full control over access to the Internet, including what types of traffic are allowed in both directions. There is no communication directly between the non-root VDOMs. Security is greatly increased with only one point of entry and exit. Only the management VDOM needs to be fully managed to ensure network security in this case. Each client network can manage its own configuration without compromising security or bringing down another client network.

The management VDOM configuration is ideally suited for a service provider business. The service provider administers the management VDOM with the other VDOMs as customers. These customers do not require a dedicated IT person to manage their network. The service provider controls the traffic and can prevent the customers from using banned services and prevent Internet connections from initiating those same banned services. One example of a banned service might be Instant Messaging (IM) at a company concerned about intellectual property. Another example could be to limit bandwidth used by file-sharing applications without banning that application completely. Firewall policies control the traffic between the customer VDOM and the management VDOM and can be customized for each customer.

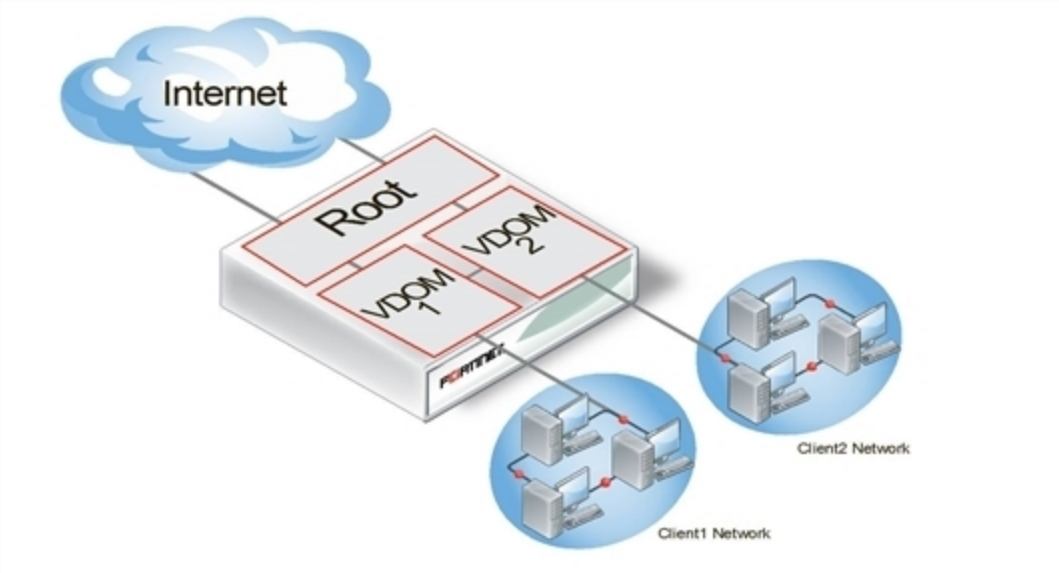
The management VDOM configuration is limited in that the customer VDOMs have no inter-connections. In many situations this limitation is ideal because it maintains proper security. However, some configurations may require customers to communicate with each other, which would be easier if the customer VDOMs were inter-connected.

Meshed VDOM configuration

The meshed VDOMs configuration, including partial and full mesh, has VDOMs inter-connected with other VDOMs. There is no special feature to accomplish this—they are just complex VDOM configurations.

Partial mesh means only some VDOMs are inter-connected. In a full mesh configuration, all VDOMs are inter-connected to all other VDOMs. This can be useful when you want to provide full access between VDOMs but handle traffic differently depending on which VDOM it originates from or is going to.

Meshed VDOMs



With full access between all VDOMs being possible, it is extra important to ensure proper security. You can achieve this level of security by establishing extensive firewall policies and ensuring secure account access for all administrators and users.

Meshed VDOM configurations can become complex very quickly, with full mesh VDOMs being the most complex. Ensure this is the proper solution for your situation before using this configuration. Generally, these configurations are seen as theoretical and are rarely deployed in the field.

Dynamic routing over inter-VDOM links

BGP is supported over inter-VDOM links. Unless otherwise indicated, routing works as expected over inter-VDOM links.

If an inter-VDOM link has no assigned IP addresses to it, it may be difficult to use that interface in dynamic routing configurations. For example BGP requires an IP address to define any BGP router added to the network.

In OSPF, you can configure a router using a router ID and not its IP address. In fact, having no IP address avoids possible confusing between which value is the router ID and which is the IP address. However for that router to become adjacent with another OSPF router it will have to share the same subnet, which is technically impossible without an IP address. For this reason, while you can configure an OSPF router using an IP-less inter-VDOM link, it will likely be of limited value to you.

In RIP the metric used is hop count. If the inter-VDOM link can reach other nodes on the network, such as through a default route, then it may be possible to configure a RIP router on an inter-VDOM link. However, once again it may be of limited value due to limitations.

As stated earlier, BGP requires an IP address to define a router — an IP-less inter-VDOM link will not work with BGP.

In Multicast, you can configure an interface without using an IP address. However that interface will be unable to become an RP candidate. This limits the roles available to such an interface.

HA virtual clusters and VDOM links

FortiGate HA is implemented by configuring two or more FortiGate units to operate as an HA cluster. To the network, the HA cluster appears to function as a single FortiGate unit, processing network traffic and providing normal security services such as firewall, VPN, IPS, virus scanning, web filtering, and spam filtering.

Virtual clustering extends HA features to provide failover protection and load balancing for a FortiGate unit operating with virtual domains. A virtual cluster consists of a cluster of two FortiGate units operating with virtual domains. Traffic on different virtual domains can be load balanced between the cluster units.

With virtual clusters (vclusters) configured, inter-VDOM links must be entirely within one vcluster. You cannot create links between vclusters, and you cannot move a VDOM that is linked into another virtual cluster. If your FortiGate units are operating in HA mode, with multiple vclusters when you create the vdom-link, the CLI command `config system vdom-link` includes an option to set which vcluster the link will be in.

What is virtual clustering?

Virtual clustering is an extension of the FGCP for FortiGate units operating with multiple VDOMS enabled. Virtual clustering operates in active-passive mode to provide failover protection between two instances of a VDOM operating on two different cluster units. You can also operate virtual clustering in active-active mode to use HA load balancing to load balance sessions between cluster units. Alternatively, by distributing VDOM processing between the two cluster units you can also configure virtual clustering to provide load balancing by distributing sessions for different VDOMs to each cluster unit.

Virtual clustering and failover protection

Virtual clustering operates on a cluster of two (and only two) FortiGate units with VDOMs enabled. Each VDOM creates a cluster between instances of the VDOMs on the two FortiGate units in the virtual cluster. All traffic to and from the VDOM stays within the VDOM and is processed by the VDOM. One cluster unit is the primary unit for each VDOM and one cluster unit is the subordinate unit for each VDOM. The primary unit processes all traffic for the VDOM. The subordinate unit does not process traffic for the VDOM. If a cluster unit fails, all traffic fails over to the cluster unit that is still operating.

Virtual clustering and heartbeat interfaces

The HA heartbeat provides the same HA services in a virtual clustering configuration as in a standard HA configuration. One set of HA heartbeat interfaces provides HA heartbeat services for all of the VDOMs in the cluster. You do not have to add a heartbeat interface for each VDOM.

Virtual clustering and HA override

For a virtual cluster configuration, override is enabled by default for both virtual clusters when you:

- Enable VDOM portioning from the web-based manager by moving virtual domains to virtual cluster 2
- Enter set vcluster2 enable from the CLI config system ha command to enable virtual cluster 2.

Usually you would enable virtual cluster 2 and expect one cluster unit to be the primary unit for virtual cluster 1 and the other cluster unit to be the primary unit for virtual cluster 2. For this distribution to occur override must be enabled for both virtual clusters. Otherwise you will need to restart the cluster to force it to renegotiate.

Virtual clustering and load balancing or VDOM partitioning

There are two ways to configure load balancing for virtual clustering. The first is to set the HA mode to active-active. The second is to configure VDOM partitioning. For virtual clustering, setting the HA Mode to active-active has the same result as active-active HA for a cluster without virtual domains. The primary unit receives all sessions and load balances them among the cluster units according to the load balancing schedule. All cluster units process traffic for all virtual domains.

Note: If override is enabled the cluster may renegotiate too often. You can choose to disable override at any time. If you decide to disable override, for best results, you should disable it for both cluster units.

In a VDOM partitioning virtual clustering configuration, the HA mode is set to active-passive. Even though virtual clustering operates in active-passive mode you can configure a form of load balancing by using VDOM partitioning to distribute traffic between both cluster units. To configure VDOM partitioning you set one cluster unit as the primary unit for some virtual domains and you set the other cluster unit as the primary unit for other virtual domains. All traffic for a virtual domain is processed by the primary unit for that virtual domain. You can control the distribution of traffic between the cluster units by adjusting which cluster unit is the primary unit for each virtual domain.

For example, you could have 4 VDOMs, two of which have a high traffic volume and two of which have a low traffic volume. You can configure each cluster unit to be the primary unit for one of the high volume VDOMs and one of the low volume VDOMs. As a result each cluster unit will be processing traffic for a high volume VDOM and a low volume VDOM, resulting in an even distribution of traffic between the cluster units. You can adjust the distribution at any time. For example, if a low volume VDOM becomes a high volume VDOM you can move it from one cluster unit to another until the best balance is achieved. From the web-based manager you configure VDOM partitioning by setting the HA mode to active-passive and distributing virtual domains between Virtual Cluster 1 and Virtual Cluster 2. You can also configure different device priorities, port monitoring, and remote link failover, for Virtual Cluster 1 and Virtual Cluster 2.

From the CLI you configure VDOM partitioning by setting the HA mode to a-p. Then you configure device priority, port monitoring, and remote link failover and specify the VDOMs to include in virtual cluster 1. You do the same for virtual cluster 2 by entering the config secondary-vcluster command.

Failover protection does not change. If one cluster unit fails, all sessions are processed by the remaining cluster unit. No traffic interruption occurs for the virtual domains for which the still functioning cluster unit was the primary unit. Traffic may be interrupted temporarily for virtual domains for which the failed unit was the primary unit while processing fails over to the still functioning cluster unit. If the failed cluster unit restarts and rejoins the virtual cluster, VDOM partitioning load balancing is restored.

Example of inter-VDOM routing

This example shows how to configure a FortiGate unit to use inter-VDOM routing.

This section contains the follow topics:

- Network topology and assumptions
- Creating the VDOMs
- Configuring the physical interfaces
- Configuring the VDOM links
- Configuring the firewall and Security Profile settings
- Testing the configuration

Network topology and assumptions

Two departments of a company, Accounting and Sales, are connected to one FortiGate-800 unit. To do its work, the Sales department receives a lot of email from advertising companies that would appear to be spam if the Accounting department received it. For this reason, each department has its own VDOM to keep firewall policies and other configurations separate. A management VDOM makes sense to ensure company policies are followed for traffic content.

The traffic between Accounting and Sales will be email and HTTPS only. It could use a VDOM link for a meshed configuration, but we will keep from getting too complex. With the configuration, inter-VDOM traffic will have a slightly longer path to follow than normal—from one department VDOM, through the management VDOM, and back to the other department VDOM. Since inter-VDOM links are faster than physical interfaces, this longer path should not be noticed.

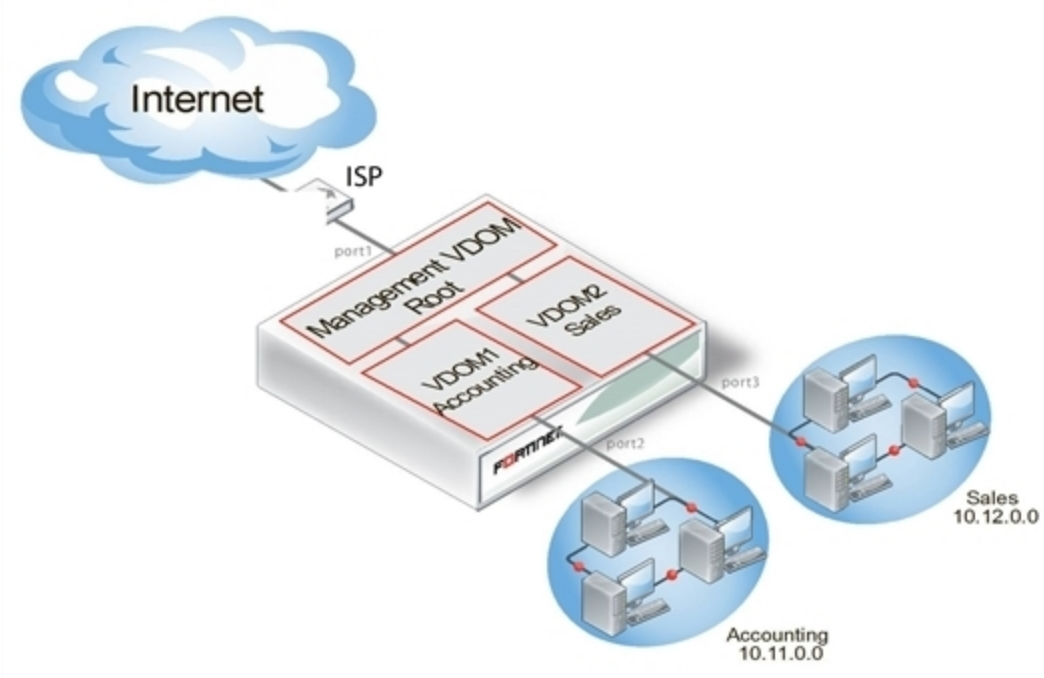
Firewall policies will be in place. For added security, firewall policies will allow only valid office services such as email, web browsing, and FTP between either department and the Internet. Any additional services that are required can be added in the future.

The company uses a single ISP to connect to the Internet. The ISP uses DHCP to provide an IP address to the FortiGate unit. Both departments use the same ISP to reach the Internet.

Other assumptions for this example are as follows:

- Your FortiGate unit has interfaces labelled port1 through port4 and VDOMs are not enabled.
- You are using the super_admin account.
- You have the FortiClient application installed.
- You are familiar with configuring interfaces, firewalls, and other common features on your FortiGate unit.

Management VDOM for two departments



General configuration steps

This example includes the following general steps. For best results, follow the steps in the order given. Also, note that if you perform any additional actions between procedures, your configuration may have different results.

1. Creating the VDOMs
2. Configuring the physical interfaces
3. Configuring the VDOM links
4. Configuring the firewall and Security Profile settings
5. Testing the configuration

Creating the VDOMs

This procedure enables VDOMs and creates the Sales and Accounting VDOMs.

To create the VDOMs - web-based manager:

1. Log in as the super_admin administrator.
2. Go to **System > Dashboard > Status > System Information > Virtual Domain**, and select **Enable**.
3. Log in again.
4. Go to **System > VDOM > VDOM**.
5. Select **Create New**, enter `Accounting` for the VDOM Name, and select **OK**.
6. Select **Create New**, enter `Sales` for the VDOM Name, and select **OK**.

To create the VDOMs - CLI:

```
config system global
   set vdom enable
end
config system vdom
   edit Accounting
   next
   edit Sales
   next
end
```

Configuring the physical interfaces

Next, the physical interfaces must be configured. This example uses three interfaces on the FortiGate unit - port2 (internal), port3(dmz), and port1(external). port2 and port3 interfaces each have a department's network connected. port1 is for all traffic to or from the Internet and will use DHCP to configure its IP address, which is common with many ISPs.

To configure the physical interfaces - web-based manager:

1. Go to **Global > Network** > Interfaces.
2. Select **Edit** for the port2 interface, enter the following information, and select **OK.**

Alias	AccountingLocal

Virtual Domain	Accounting
Addressing mode	Manual
IP/Netmask	172.100.1.1/255.255.0.0
Administrative Access	HTTPS, PING, SSH
Description	This is the accounting department internal interface.

3. Select **Edit** for the port3 interface, enter the following information, and select **OK**.

Alias	SalesLocal
Virtual Domain	Sales
Addressing mode	Manual
IP/Netmask	192.168.1.1/255.255.0.0
Administrative Access	HTTPS, PING, SSH
Description	This is the sales department internal interface.

4. Select **Edit** for the port1 interface, enter the following information, and select **OK**.

Alias	ManagementExternal
Virtual Domain	root
Addressing Mode	DHCP
Distance	5
Retrieve default gateway from server	Enable
Override internal DNS	Enable
Administrative Access	HTTPS, SSH, SNMP
Description	This is the accounting department internal interface.

When the mode is set to DHCP or PPoE on an interface you can set the distance field. This is the administrative distance for any routes learned through the gateway for this interface. The gateway is added to the static route table with these values. A lower distance indicates a preferred route.

To configure the physical interfaces - CLI:

```
config global
   config system interface
      edit port2
         set alias AccountingLocal
```

```
    set vdom Accounting
    set mode static
    set ip 172.100.1.1 255.255.0.0
    set allowaccess https ping ssh
    set description "The accounting dept internal interface"
next
edit port3
    set alias SalesLocal
    set vdom Sales
    set mode static
    set ip 192.168.1.1 255.255.0.0
    set allowaccess https ping ssh
    set description "The sales dept. internal interface"
next
edit port1
    set alias ManagementExternal
    set vdom root
    set mode DHCP
    set distance 5
    set gwdetect enable
    set dns-server-override enable
    set allowaccess https ssh snmp
    set description "The systemwide management interface."
end
```

Configuring the VDOM links

To complete the connection between each VDOM and the management VDOM, you need to add the two VDOM links; one pair is the Accounting - management link and the other is for Sales - management link.

When configuring inter-VDOM links, you do not have to assign IP addresses to the links unless you are using advanced features such as dynamic routing that require them. Not assigning IP addresses results in faster configuration, and more available IP addresses on your networks.

If you require them, or if you simply want to assign IP addresses for clarity can do so.

To configure the Accounting and management VDOM link - web-based manager:

1. Go to **Global > Network > Interfaces**.
2. Select the expand arrow to select **Create New > VDOM link**.
3. Enter the following information, and select **OK**.

Name		AccountVlnk
Interface #0		
	Virtual Domain	Accounting
	IP/Netmask	0.0.0.0/0.0.0.0
	Administrative Access	HTTPS, PING, SSH
	Description	The Accounting VDOM side of the link.

Interface #1		
	Virtual Domain	root
	IP/Netmask	0.0.0.0/0.0.0.0
	Administrative Access	HTTPS, PING, SSH
	Description	The Management VDOM side of the link.

To configure the Accounting and management VDOM link - CLI:

```
config global
   config system vdom-link
      edit AccountVlnk
      next
   end
   config system interface
      edit AccountVlnk0
         set vdom Accounting
         set ip 0.0.0.0 0.0.0.0
         set allowaccess https ping ssh
         set description "Accounting side of the VDOM link"
      next
      edit AccountVlnk1
         set vdom root
         set ip 0.0.0.0 0.0.0.0
         set allowaccess https ping ssh
         set description "Management side of the VDOM link"
      end
```

To configure the Sales and management VDOM link - web-based manager:

1. Go to **Global > Network** > Interfaces.
2. Select the expand arrow and select **Create New > VDOM link**.
3. Enter the following information, and select **OK**.

Name		SalesVlnk
Interface #0		
	Virtual Domain	Sales
	IP/Netmask	0.0.0.0/0.0.0.0
	Administrative Access	HTTPS, PING, SSH
	Description	The Sales VDOM side of the link.
Interface #1		

Virtual Domain	root
IP/Netmask	0.0.0.0/0.0.0.0
Administrative Access	HTTPS, PING, SSH
Description	The Management VDOM side of the link.

To configure the Sales and management VDOM link - CLI:

```
config global
   config system vdom-link
      edit SalesVlnk
   end
   config system interface
      edit SalesVlnk0
         set vdom Accounting
         set ip 0.0.0.0 0.0.0.0
         set allowaccess https ping ssh
         set description "Sales side of the VDOM link"
      next
      edit SalesVlnk1
         set vdom root
         set ip 0.0.0.0 0.0.0.0
         set allowaccess https ping ssh
         set description "Management side of the VDOM link"
      end
   end
```

Configuring the firewall and Security Profile settings

With the VDOMs, physical interfaces, and VDOM links configured the firewall must now be configured to allow the proper traffic. Firewalls are configured per-VDOM, and firewall objects must be created for each VDOM separately.

For this example, the firewall group of services allowed between the internal networks and the Internet are the basic services for web browsing, file transfer, and email. These include: HTTP, HTTPS, SSL, FTP, DNS, NTP, POP3, and SMTP.

The only services allowed between Sales and Accounting are secure web browsing (HTTPS) and email (POP3 and SMTP).

The limited number of services ensures security between departments. The list of services can be expanded in the future if needed.

Security profile settings will block all non-essential business websites while logging all web traffic, scan and file filter all web and email protocols, and block game and peer-to-peer applications using application control.

For added security, FortiClient is required on internal computers with AntiVirus scanning configured. This is enforced by **Endpoint NAC** in firewall policies.

Using firewall addresses makes the firewall policies easier to read. Also if any changes need to be made in the future, you can simply update the addresses without changing the firewall policies. The addresses required are:

- `AccountingLocal` - all traffic from the internal accounting network
- `AccountingVlnk` - all traffic from the VDOM link between accounting and management VDOMs
- `SalesLocal` - all traffic from the internal sales network
- `SalesVlnk` - all traffic from the VDOM link between sales and management VDOM.

The Accounting VDOM requires `AccountingLocal`, `AccountingVlnk`, and `SalesLocal`. The Sales VDOM requires `SalesLocal`, `SalesVlnk`, and `AccountingLocal`.

The firewall policies required on the Accounting VDOM are:

- AccountingLocal to Internet
- Internet to AccountingLocal
- SalesLocal to AccountingLocal
- AccountingLocal to SalesLocal

The firewall policies required on the Sales VDOM are:

- SalesLocal to Internet
- Internet to SalesLocal
- SalesLocal to AccountingLocal
- AccountingLocal to SalesLocal

This section includes the following topics:

- Configuring firewall service groups
- Configuring Security Profile settings for the Accounting VDOM
- Configuring firewall settings for the Accounting VDOM
- Configuring Security Profile settings for the Sales VDOM
- Configuring firewall settings for the Sales VDOM
- Configuring firewall settings between the Accounting and Sales VDOMs

Configuring firewall service groups

Service groups are an easy way to manage multiple services, especially if the same services are used on different networks.

The two service groups used here are intended for normal office traffic to the Internet, and for restricted traffic between departments. In both cases network traffic will be limited to the services listed to prevent any potential security risks or bandwidth-robbing applications.

These service groups can be changed as needed to either include additional valid services that are being used on the network, or to exclude services that are not required. Also, custom services can be created as needed for applications that are not listed.

To configure two firewall service groups - web-based manager:

1. Open the **Accounting** VDOM.
2. Go to **Firewall Objects > Service > Group.**
3. Select **Create New**, enter the following information, and select **OK.**

Group Name	OfficeServices
Members	HTTP, HTTPS, SSL, FTP, DNS, NTP, POP3, PING, SMTP

4. Select **Create New**, enter the following information, and select **OK**.

Group Name	AccountingSalesServices
Members	HTTPS, POP3, PING, SMTP

To configure two firewall service groups - CLI:

```
config vdom
   edit Accounting
      config firewall service group
         edit OfficeServices
            set member HTTP HTTPS SSH FTP DNS NTP POP3 PING SMTP
         next
         edit AccountingSalesServices
            set member HTTPS POP3 PING SMTP
         end
   end
```

Configuring Security Profile settings for the Accounting VDOM

Security Profile settings include web filtering, antivirus, application control, and other features. This example just uses those three features to ensure that

- the business environment is free from viruses
- employees do not surf grossly inappropriate websites, and
- employees do not use games or peer-to-peer applications at work.

To configure web filtering for the Accounting VDOM - web-based manager:

1. Open the **Accounting** VDOM.
2. Go to **Security Profiles > Web Filter > Profile**.
3. Select **Create New**.
4. Enter `webStrict` for the **Name**.
5. Select the arrow to expand the **FortiGuard Web Filtering** section.
6. Block all **Categories** except Business Oriented, Other, and Unrated.
7. Block all **Classifications** except Image Search..
8. Log all **Categories** and **Classifications**.
9. Select **OK**.

To configure AntiVirus for the Accounting VDOM - web-based manager:

1. Open the **Accounting** VDOM.
2. Go to **Security Profiles > AntiVirus > Profile**.
3. Select **Create New**.
4. Enter `avStrict` for the **Name**.

5. Enable **Scan** for all protocols.
6. Enable **File filter** for all protocols, and select `built-in-patterns` for **Option**.
7. Enable logging for both **Scan** and **File Filter**.
8. Select **OK**.

To configure application control for the Accounting VDOM - web-based manager:

1. Open the **Accounting** VDOM.
2. Go to **Security Profiles > Application Control > Application Sensor.**
3. Select **Create New** (+ button at top right of page).
4. Enter `appStrict` for **Name** and select OK.
5. Select **Create New**.
6. In **Filters**, set **Category** to **game**.
7. In **Applications/Settings**, enter the following, and select **OK**.

Action	Block
Packet Logging	Enable

8. Select **Create New**.
9. In **Filters**, set **Category** to **p2p**.
10. In **Applications/Settings**, enter the following, and select **OK**.

Action	Block
Packet Logging	Enable

11. Select **Apply**.

To configure application control for the Accounting VDOM - CLI:

```
config vdom
   edit Accounting
      config application list
         edit appStrict
            config entries
               edit 1
                  set category 2
               next
               edit 2
                  set category 8
               end
         end
   end
```

Configuring firewall settings for the Accounting VDOM

This configuration includes two firewall addresses and two firewall policies for the Accounting VDOM - one for the internal network, and one for the VDOM link with the management VDOM (root).

For added security, all traffic allowed will be scanned. Only valid office traffic will be allowed using the service group `OfficeServices`. The FortiClient application must be used to ensure additional protection for the sensitive accounting information.

All sales and accounting computers have the FortiClient application installed, so the firewall policies check that FortiClient is installed and that antivirus scanning is enabled.

Note the spelling of `AccountVlnk` which is due to the eleven character limit on VDOM link names.

To configure firewall addresses - web-based manager:

1. Open the **Accounting** VDOM.
2. Select **Firewall Objects > Address > Address**
3. Select **Create New**, enter the following information, and select **OK**.

Address Name	AccountingLocal
Type	Subnet/ IP Range
Subnet / IP Range	172.100.0.0
Interface	port1

4. Select **Create New**, enter the following information, and select **OK**.

Address Name	AccountManagement
Type	Subnet/ IP Range
Subnet / IP Range	10.0.1.0
Interface	AccountVlnk

To configure firewall addresses - CLI:

```
config vdom
   edit Accounting
      config firewall address
         edit AccountingLocal
            set type iprange
            set subnet 172.100.0.0
            set associated-interface port1
         next
         edit AccountManagement
            set type iprange
            set subnet 10.0.1.0
            set associated-interface AccountVlnk
         end
      end
```

To configure protocol options for Accounting VDOM - web-based manager:

1. Open the **Accounting** VDOM.
2. Select **Policy > Policy > Protocol Options.**

3. Select **Create New**.
4. Enter `default` for the **Name**.
5. Select **OK**.

To configure the firewall policies from AccountingLocal to the Internet - web-based manager:

1. Open the **Accounting** VDOM.
2. Go to **Policy > Policy**.
3. Select **Create New**, enter the following information, and then select **OK**.

Source Interface/Zone		port2
Source Address		AccountingLocal
Destination Interface/Zone		AccountVlnk
Destination Address		AccountManagement
Schedule		always
Service		OfficeServices
Action		ACCEPT
Enable NAT		enable
Security Features		enabled
	Protocol Option	default
	Web Filtering	webStrict
	AntiVirus Filtering	avStrict
	Application Control	appStrict
Enable Endpoint NAC		Enforce_FortiClient_AV

4. Open the **root** VDOM.
5. Go to **Policy > Policy.**
6. Select **Create New**, enter the following information, and then select **OK**.

Source Interface/Zone	AccountVlnk
Source Address	AccountManagement
Destination Interface/Zone	port2
Destination Address	all

Schedule	always
Service	OfficeServices
Action	ACCEPT
Enable NAT	enable
Security Features	enabled
Protocol Option	default
Web Filtering	webStrict
AntiVirus Filtering	avStrict
Application Control	appStrict
Enable Endpoint NAC	disabled

To configure the firewall policies from AccountingLocal to Internet - CLI:

```
config vdom
   edit Accounting
      config firewall policy
         edit 1
            set srcintf "port2"
            set dstintf "AccountVlnk"
            set srcaddr "AccountingLocal"
            set dstaddr "AccountManagement"
            set action accept
            set schedule "always"
            set service "OfficeServices"
            set nat enable
            set av-profile avStrict
            set webfilter-profile webStrict
            set application-list appStrict
            set profile-protocol-options default
            set endpoint-check enable
            set endpoint-profile "FortiClient_installed"
         end
   end
config vdom
   edit root
      config firewall policy
         edit 2
            set srcintf AccountVlnk
            set dstintf port1
            set srcaddr AccountManagement
            set dstaddr all
            set action accept
            set schedule always
            set service OfficeServices
            set nat enable
            set av-profile "scan"
```

```
            set webfilter-profile "scan"
            set application-list "AppControlList"
            set profile-protocol-options default
            set endpoint-check disable
        end
    end
```

To configure the firewall policies from Internet to AccountingLocal - web-based manager:

1. Open the **root** VDOM.
2. Go to **Policy > Policy**.
3. Select **Create New**, enter the following information, and select **OK**.

Source Interface/Zone	port1
Source Address	all
Destination Interface/Zone	AccountVlnk
Destination Address	AccountManagement
Schedule	always
Service	OfficeServices
Action	ACCEPT
Enable NAT	enable
Security Features	enabled
Protocol Option	default
Web Filtering	webStrict
AntiVirus Filtering	avStrict
Application Control	appStrict
Enable Endpoint NAC	disabled

4. Open the **Accounting** VDOM.
5. Go to **Policy > Policy.**
6. Select **Create New**, enter the following information, and select **OK**.

Source Interface/Zone	AccountVlnk
Source Address	AccountManagement
Destination Interface/Zone	port2

Destination Address	AccountingLocal
Schedule	always
Service	OfficeServices
Action	ACCEPT
Enable NAT	enable
Security Features	enabled
Protocol Option	default
Web Filtering	webStrict
AntiVirus Filtering	avStrict
Application Control	appStrict
Enable Endpoint NAC	disabled

To configure the firewall policies from Internet to AccountingLocal - CLI:

```
config vdom
   edit root
      config firewall policy
         edit 3
            set srcintf port1
            set dstintf AccountVlnk
            set srcaddr all
            set dstaddr AccountManagement
            set action accept
            set schedule always
            set service OfficeServices
            set nat enable
            set av-profile avStrict
            set webfilter-profile webStrict
            set application-list appstrict
            set profile-protocol-options default
            set endpoint-check disable
         end
   end
config vdom
   edit Accounting
      config firewall policy
         edit 4
            set srcintf AccountVlnk
            set dstintf port2
            set srcaddr AccountManagement
            set dstaddr AccountingLocal
            set action accept
            set schedule always
            set service OfficeServices
            set nat enable
```

```
            set av-profile avStrict
            set webfilter-profile webStrict
            set application-list appstrict
            set profile-protocol-options default
            set endpoint-check disable
        end
    end
```

Configuring Security Profile settings for the Sales VDOM

Security profile settings include web filtering, antivirus, application control, and other features. This example just uses those three features to ensure that

- the business environment is free from viruses
- employees do not surf grossly inappropriate websites, and
- employees do not use games or peer-to-peer applications at work.

Note that Sales web traffic is different from Accounting, and web filtering is different to account for this.

To configure web filtering for the Sales VDOM - web-based manager:

1. Open the **Sales** VDOM.
2. Go to **Security Profiles > Web Filter > Profile**.
3. Select **Create New**.
4. Enter `webStrict` for the **Name**.
5. In **FortiGuard Categories**, select all of the categories except **Bandwidth Consuming**, **General Interest - Business** and **Unrated**.
6. In **Change Action for Selected Categories** select **Block**.
7. Select **Apply**.

To configure web filtering for the Sales VDOM - CLI:

```
config vdom
   edit Sales
      config webfilter profile
         edit webStrict
            config ftgd-wf
               set allow g07 g08 g21 g22 c01 c03
               set deny g01 g02 g03 g04 g05 g06 c02 c04 c05 c06 c07
            end
            set web-ftgd-err-log enable
         end
   end
```

To configure AntiVirus for the Sales VDOM - web-based manager:

1. Open the **Sales** VDOM.
2. Go to **Security Profiles > AntiVirus > Profile**.
3. Select **Create New**.
4. Enter `avStrict` for the **Name**.
5. Enable virus scan for all protocols.
6. Select **Apply**.

To configure AntiVirus for the Sales VDOM - CLI:

```
config vdom
   edit Sales
      config antivirus profile
         edit "avStrict"
            config http
               set options scan file-filter
            end
            config ftp
               set options scan file-filter
            end
            config imap
               set options scan file-filter
            end
            config pop3
               set options scan file-filter
            end
            config smtp
               set options scan file-filter
            end
            config nntp
               set options scan file-filter
            end
            config im
               set options scan file-filter
            end
            set filepattable 1
            set av-virus-log enable
            set av-block-log enable
         end
   end
```

To configure application control for the Sales VDOM - web-based manager:

1. Open the **Accounting** VDOM.
2. Go to **Security Profiles > Application Control > Application Sensor.**
3. Select **Create New** (+ button at top right of page).
4. Enter `appStrict` for **Name** and select OK.
5. Select **Create New**.
6. In **Filters**, set **Category** to **game**.
7. In **Applications/Settings**, enter the following, and select **OK**.

Action	Block
Packet Logging	Enable

8. Select **Create New**.
9. In **Filters**, set **Category** to **p2p**.
10. In **Applications/Settings**, enter the following, and select **OK**.

Action	Block
Packet Logging	Enable

11. Select **Apply**.

To configure application control for the Sales VDOM - CLI:

```
config vdom
   edit Sales
      config application list
         edit "appStrict"
            config entries
               edit 1
                  set category 2
               next
               edit 2
                  set category 8
               end
         end
   end
```

Configuring firewall settings for the Sales VDOM

Like the Accounting firewall settings, this configuration includes two firewall addresses and two firewall policies for the sales VDOM: one for the internal network, and one for the VDOM link with the management VDOM.

When entering the CLI commands, the number of the firewall policies must be high enough to be a new policy. Depending on the number of firewall policies on your FortiGate unit, this may require starting at a higher number than the 6 required for the default configuration. This number is added automatically when you configure firewall policies using the web manager interface.

The FortiClient application must be used on Sales network computers to ensure additional protection for the sensitive information and for protection against spam.

To configure firewall addresses - web-based manager:

1. Open the **Sales** VDOM.
2. Go to **Firewall Objects > Address > Address.**
3. Select **Create New,** enter the following information, and select **OK**.

Address Name	SalesLocal
Type	Subnet / IP Range
Subnet / IP Range	172.100.0.0
Interface	port3

4. Go to **Firewall Objects > Addresses.**
5. Select **Create New**, enter the following information, and select **OK**.

Address Name	SalesManagement
Type	Subnet / IP Range
Subnet / IP Range	10.0.1.0
Interface	SalesVlnk

To configure the firewall addresses - CLI:

```
config vdom
   edit Sales
      config fireall address
         edit SalesLocal
            set type iprange
            set subnet 172.100.0.0
            set associated-interface port2
         next
         edit SalesManagement
            set type iprange
            set subnet 10.0.1.0
            set associated-interface SalesVlnk
         end
   end
```

To configure the firewall policies from SalesLocal to the Internet - web-based manager:

1. Open the **Sales** VDOM.
2. Go to **Policy > Policy.**
3. Select **Create New**, enter the following information, and select **OK**.

Source Interface/Zone	port3
Source Address	SalesLocal
Destination Interface/Zone	SalesVlnk
Destination Address	SalesManagement
Schedule	always
Service	OfficeServices
Action	ACCEPT
Log Allowed Traffic	enabled
Enable Endpoint Control Check	disabled
Redirect Non-conforming Clients to Download Portal	enabled

4. Open the **root** VDOM.
5. Go to **Policy > Policy.**

6. Select **Create New**, enter the following information, and select **OK**.

Source Interface/Zone	SalesVlnk
Source Address	SalesManagement
Destination Interface/Zone	external
Destination Address	all
Schedule	always
Service	OfficeServices
Action	ACCEPT
Protection Profile	scan
Log Allowed Traffic	enabled
Enable Endpoint Control Check	disabled

To configure the firewall policies from SalesLocal to the Internet - CLI:

```
config vdom
   edit root
      config firewall policy
         edit 6
            set srcintf port2
            set srcaddr SalesLocal
            set dstintf SalesVlnk
            set dstaddr SalesManagement
            set schedule always
            set service OfficeServices
            set action accept
            set profile-status enable
            set profile scan
            set logtraffic enable
            set endpoint-check enable
            set endpoint-redir-portal enable
         end
   end
config vdom
   edit Sales
      config firewall policy
         edit 7
            set srcintf SalesVlnk
            set srcaddr SalesManagement
            set dstintf external
            set dstaddr all
            set schedule always
            set service OfficeServices
            set action accept
            set profile-status enable
            set profile scan
            set logtraffic enable
```

```
            set endpoint-check enable
        end
    end
```

To configure the firewall policies from the Internet to SalesLocal - web-based manager:

1. Open the **root** VDOM.
2. Go to **Policy > Policy.**
3. Select **Create New**, enter the following information, and select **OK**.

Source Interface/Zone	external
Source Address	all
Destination Interface/Zone	SalesVlnk
Destination Address	SalesManagement
Schedule	always
Service	OfficeServices
Action	ACCEPT
Protection Profile	scan
Log Allowed Traffic	enabled
Enable Endpoint Control Check	disabled

4. Open the **Sales** VDOM.
5. Go to **Policy > Policy.**
6. Select **Create New**, enter the following information, and select **OK**.

Source Interface/Zone	SalesVlnk
Source Address	SalesManagement
Destination Interface/Zone	port2
Destination Address	SalesLocal
Schedule	always
Service	OfficeServices
Action	ACCEPT
Protection Profile	scan
Log Allowed Traffic	enabled

Enable Endpoint Control Check	disabled
Redirect Non-conforming Clients to Download Portal	enabled

To configure the firewall policies from the Internet to SalesLocal - CLI:

```
config vdom
   edit root
      config firewall policy
         edit 8
            set srcintf external
            set srcaddr all
            set dstintf SalesVlnk
            set dstaddr SalesManagement
            set schedule always
            set service OfficeServices
            set action accept
            set profile-status enable
            set profile scan
            set logtraffic enable
            set endpoint-check enable
            set endpoint-redir-portal enable
         end
   end
config vdom
   edit Sales
      config firewall policy
         edit 9
            set srcintf SalesVlnk
            set srcaddr SalesManagement
            set dstintf port2
            set dstaddr SalesLocal
            set schedule always
            set service OfficeServices
            set action accept
            set profile-status enable
            set profile scan
            set logtraffic enable
            set endpoint-check enable
            set endpoint-redir-portal enable
         end
   end
```

Configuring firewall settings between the Accounting and Sales VDOMs

Firewall policies are required for any communication between each internal network and the Internet. Policies are also required for the two internal networks to communicate with each other through the management VDOM.

The more limited AccountingSalesServices group of services will be used between Sales and Accounting to ensure the traffic is necessary business traffic only. These policies will result in a partially meshed VDOM configuration. The FortiClient application must be used to ensure additional protection for the sensitive accounting information.

Two firewall policies are required to allow traffic in both directions between Sales and Accounting.

To configure the firewall policy between Sales and Accounting on the management VDOM - web-based manager:

1. Open the **root** VDOM.
2. Go to **Policy > Policy.**
3. Select **Create New**, enter the following information, and select **OK**.

Source Interface/Zone	SalesVlnk
Source Address	SalesManagement
Destination Interface/Zone	AccountVlnk
Destination Address	AccountingManagement
Schedule	always
Service	AccountingSalesServices
Action	ACCEPT
Protection Profile	scan
Log Allowed Traffic	enabled
Enable Endpoint Control Check	disabled
Redirect Non-conforming Clients to Download Portal	enabled

4. Go to **Policy > Policy.**
5. Select **Create New**, enter the following information, and select **OK**.

Source Interface/Zone	AccountVlnk
Source Address	AccountingManagement
Destination Interface/Zone	SalesVlnk
Destination Address	SalesManagement
Schedule	always
Service	AccountingSalesServices
Action	ACCEPT
Protection Profile	scan
Log Allowed Traffic	enabled

Enable Endpoint Control Check	disabled
Redirect Non-conforming Clients to Download Portal	enabled

To configure the firewall policy between Sales and Accounting on the management VDOM - CLI:

```
config vdom
   edit root
      config system firewall policy
         edit 9
            set srcintf SalesVlnk
            set srcaddr SalesManagement
            set dstintf AccountVlnk
            set dstaddr AccountManagement
            set schedule always
            set service AccountingSalesServices
            set action accept
            set profile-status enable
            set profile scan
            set logtraffic enable
            set endpoint-check enable
            set endpoint-redir-portal enable
         next
         edit 10
            set srcintf AccountVlnk
            set srcaddr AccountManagement
            set dstintf SalesVlnk
            set dstaddr SalesManagement
            set schedule always
            set service AccountingSalesServices
            set action accept
            set profile-status enable
            set profile scan
            set logtraffic enable
            set endpoint-check enable
            set endpoint-redir-portal enable
         end
   end
```

Testing the configuration

Once the inter-VDOM routing has been configured, tests must be conducted to confirm proper operation. If there are any problems, use the troubleshooting tips to resolve them.

This section includes the following topics:

- Testing connectivity
- Troubleshooting Tips

Testing connectivity

Testing connectivity ensures that physical networking connections as well as FortiGate unit interface configurations, including firewall policies, are properly configured.

The easiest way to test connectivity is to use the `ping` and `traceroute` commands to confirm the connectivity of different routes on the network. Include testing:

- from AccountingLocal to Internet
- from Internet to AccountingLocal
- from SalesLocal to Internet
- from Internet to SalesLocal
- from AccountingLocal to SalesLocal.

When using the commands on a Windows computer, go to a command line prompt and enter either `ping <IP address>` or `tracert <IP address>`.

When using the commands on a FortiGate unit, go to the CLI and enter either `exec ping <IP address>` or `exec traceroute <IP address>`.

Troubleshooting Tips

When there are problems with connectivity, the following troubleshooting tips will help resolve the issues.

- If a multiple hop test, such as traceroute, is not successful then reduce it to a single hop to simplify the test. Test each link of the path to see which hop is down. If all hops are up, check the FortiGate unit policies to ensure they allow basic traffic to flow as expected.
- If ping does not work, confirm that the FortiGate unit interfaces have Ping enabled and also ensure Ping is enabled in the firewall policies. Otherwise the Ping traffic will be blocked.
- If one protocol does not work but others do work, check the FortiGate unit firewall policies for that one protocol to ensure it is allowed.
- If there are unexplained connectivity problems, check the local computer to ensure it does not have a software firewall running that may be blocking traffic. MS Windows computers have a firewall running by default that can cause problems.

For additional troubleshooting, see Troubleshooting Virtual Domains.

Troubleshooting Virtual Domains

When you are configuring VDOMs you may run into some issues, with your VDOM configuration, your network configuration, or your device setup. This section addresses common problems and specific concerns that an administrator of a VDOM network may have.

This section includes:

- VDOM admin having problems gaining access
- FortiGate unit running very slowly
- General VDOM tips and troubleshooting

VDOM admin having problems gaining access

With VDOMs configured, administrators have an extra layer of permissions and may have problems accessing their information.

Confirm the admin's VDOM

Each administrator account, other than the super_admin account, is tied to one specific VDOM. That administrator is not able to access any other VDOM. It may be possible they are trying to access the wrong VDOM.

Confirm the VDOM's interfaces

An administrator can only access their VDOM through interfaces that are assigned to that VDOM. If interfaces on that VDOM are disabled or unavailable there will be no method of accessing that VDOM by its local administrator. The super_admin will be required to either bring up the interfaces, fix the interfaces, or move another interface to that VDOM to restore access.

Confirm the VDOMs admin access

As with all FortiGate units, administration access on the VDOM's interfaces must be enabled for that VDOM's administrators to gain access. For example if SSH is not enabled, that is not available to administrators.

To enable admin access, the super_admin will go to the **Global > Network > Interfaces** page, and for the interface in question enable the admin access.

FortiGate unit running very slowly

You may experience a number of problems resulting from your FortiGate unit being overloaded. These problems may appear as:

- CPU and memory threshold limits exceeded on a continual basis
- AV failopen happening on a regular basis
- dropped traffic or sessions due to lack of resources

These problems are caused by a lack of system resources. There are a number of possible reasons for this.

Too many VDOMs

If you have configured many VDOMs on your system, past the default ten VDOMs, this could easily be your problem.

Each VDOM you create on your FortiGate unit requires system resources to function - CPU cycles, memory, and disk space. When there are too many VDOMs configured there are not enough resources for operation. This may be a lack of memory in the session table, or no CPU cycles for processing incoming IPS traffic, or even a full disk drive.

Go to **System > VDOM** and see the number of configured VDOMs on your system. If you are running 500 or more VDOMs, you must have a FortiGate 5000 chassis. Otherwise you need to reduce the number of VDOMs on your system to fix the problem. Even if you have the proper hardware, you may encounter noticeably slow throughput if you are using advanced features such as security profiles or deep content inspection with many configured VDOMs.

One or more VDOMs are consuming all the resources

If you have sufficient hardware to support the number of VDOMs you are running, check the global resources on your FortiGate unit. At a glance it will tell you if you are running out of a particular resource such as sessions, or users. If this is the case, you can then check your VDOMs to see if one particular VDOM is using more than its share of resources. If that is the case you can change the resource settings to allow that VDOM (or those VDOMs) fewer resources and in turn allow the other VDOMs access to those resources.

Too many Security Features in use

It is likely that reducing the Security Features in use regardless of number of VDOMs will greatly improve overall system performance and should be considered as an option.

Finally it is possible that your FortiGate unit configuration is incorrect in some other area, which is using up all your resources. For example, forgetting that you are running a network sniffer on an interface will create significant amounts of traffic that may prevent normal operation.

General VDOM tips and troubleshooting

Besides ping and traceroute, there are additional tools for troubleshooting your VDOM configurations. These include packet sniffing and debugging the packet flow.

Perform a sniffer trace

When troubleshooting networks, it helps to look inside the headers of packets to determine if they are traveling along the route you expect that they are. Packet sniffing can also be called a network tap, packet capture, or logic analyzing.

If your FortiGate unit has NP interfaces that are offloading traffic, this will change the sniffer trace. Before performing a trace on any NP interfaces, you should disable off-loading on those interfaces.

What sniffing packets can tell you

If you are running a constant traffic application such as ping, packet sniffing can tell you if the traffic is reaching the destination, what the port of entry is on the FortiGate unit, if the ARP resolution is correct, and if the traffic is being sent back to the source as expected.

Sniffing packets can also tell you if the Fortigate unit is silently dropping packets for reasons such as RPF (Reverse Path Forwarding), also called Anti Spoofing, which prevents an IP packet from being forwarded if its Source IP does not either belong to a locally attached subnet (local interface), or be part of the routing between the FortiGate and another source (static route, RIP, OSPF, BGP). Note that RPF can be disabled by turning on asymmetric routing in the CLI (`config system setting, set asymmetric enable`), however this will disable stateful inspection on the FortiGate unit and cause many features to be turned off.

If you configure virtual IP addresses on your Fortigate unit, it will use those addresses in preference to the physical IP addresses. You will notice this when you are sniffing packets because all the traffic will be using the virtual IP addresses. This is due to the ARP update that is sent out when the VIP address is configured.

How to sniff packets

When you are using VDOMs, you must be in a VDOM to access the `diag sniffer` command. At the global level, the command is not available. This is limit the packets only to the ones on your VDOM, and protects the privacy of other VDOM clients.

The general form of the internal FortiOS packet sniffer command is:

```
diag sniffer packet <interface_name> <'filter'> <verbose> <count>
```

To stop the sniffer, type `CTRL+C`.

<interface_name>	The name of the interface to sniff, such as “port1” or “internal”. This can also be “any” to sniff all interfaces.
<‘filter’>	What to look for in the information the sniffer reads. “none” indicates no filtering, and all packets will be displayed as the other arguments indicate. The filter must be inside single quotes (‘).
<verbose>	The level of verbosity as one of: **1 -** print header of packets **2 -** print header and data from IP of packets **3 -** print header and data from Ethernet of packets
<count>	The number of packets the sniffer reads before stopping. If you don’t put a number here, the sniffer will run forever unit you stop it with <CTRL C>.

For a simple sniffing example, enter the CLI command `diag sniffer packet port1 none 1 3`. This will display the next 3 packets on the port1 interface using no filtering, and using verbose level 1. At this verbosity level you can see the source IP and port, the destination IP and port, action (such as ack), and sequence numbers.

In the output below, port 443 indicates these are HTTPS packets, and 172.20.120.17 is both sending and receiving traffic.

```
Head_Office_620b # diag sniffer packet port1 none 1 3
interfaces=[port1]
filters=[none]
0.545306 172.20.120.17.52989 -> 172.20.120.141.443: psh 3177924955 ack 1854307757

0.545963 172.20.120.141.443 -> 172.20.120.17.52989: psh 1854307757 ack 3177925808

0.562409 172.20.120.17.52988 -> 172.20.120.141.443: psh 4225311614 ack 3314279933
```

For a more advanced example of packet sniffing, the following commands will report packets on any interface travelling between a computer with the host name of `PC1` and the computer with the host name of `PC2`. With verbosity 4 and above, the sniffer trace will display the interface names where traffic enters or leaves the FortiGate unit. Remember to stop the sniffer, type `CTRL+C`. Note that `PC1` and `PC2` may be VDOMs.

```
FGT# diagnose sniffer packet any "host <PC1> or host <PC2>" 4
```

or

```
FGT# diagnose sniffer packet any "(host <PC1> or host <PC2>) and icmp" 4
```

The following sniffer CLI command includes the ARP protocol in the filter which may be useful to troubleshoot a failure in the ARP resolution (for instance PC2 may be down and not responding to the FortiGate ARP requests).

```
FGT# diagnose sniffer packet any "host <PC1> or host <PC2> or arp" 4
```

Debugging the packet flow

Traffic should come in and leave the VDOM. If you have determined that network traffic is not entering and leaving the VDOM as expected, debug the packet flow.

Debugging can only be performed using CLI commands. Debugging the packet flow requires a number of debug commands to be entered as each one configures part of the debug action, with the final command starting the debug.

If your FortiGate unit has NP interfaces that are offloading traffic, this will change the packet flow. Before performing the debug on any NP interfaces, you should disable offloading on those interfaces.

The following configuration assumes that `PC1` is connected to the internal interface of the FortiGate unit and has an IP address of `10.11.101.200`. `PC1` is the host name of the computer.

To debug the packet flow in the CLI, enter the following commands:

```
FGT# diag debug enable
FGT# diag debug flow filter add <PC1>
FGT# diag debug flow show console enable
FGT# diag debug flow trace start 100
FGT# diag debug enable
```

The `start 100` argument in the above list of commands will limit the output to 100 packets from the flow. This is useful for looking at the flow without flooding your log or your display with too much information.

To stop all other debug activities, enter the command:

```
FGT# diag debug flow trace stop
```

The following is an example of debug flow output for traffic that has no matching Firewall Policy, and is in turn blocked by the FortiGate unit. The denied message indicates the traffic was blocked. Note that even with VDOMs not enabled, vd-root is still shown.

```
id=20085 trace_id=319 func=resolve_ip_tuple_fast line=2825 msg="vd-root received a
    packet(proto=6, 192.168.129.136:2854->192.168.96.153:1863) from port3."

id=20085 trace_id=319 func=resolve_ip_tuple line=2924 msg="allocate a new session-
    013004ac"

id=20085 trace_id=319 func=vf_ip4_route_input line=1597 msg="find a route: gw-
    192.168.150.129 via port1"

id=20085 trace_id=319 func=fw_forward_handler line=248 msg=" Denied by forward policy
    check"
```

Chapter 28 - VM Installation

This document describes how to deploy a FortiGate virtual appliance in several virtualization server environments. This includes how to configure the virtual hardware settings of the virtual appliance.

This document assumes:

- you have already successfully installed the virtualization server on the physical machine,
- you have installed appropriate VM management software on either the physical server or a computer to be used for VM management.

This document does not cover configuration and operation of the virtual appliance after it has been successfully installed and started. For these issues, see the FortiGate 5.2 Handbook.

This document includes the following sections:

- FortiGate VM Overview
- Deployment example – VMware
- Deployment example – MS Hyper-V
- Deployment example – KVM
- Deployment example – OpenXen
- Deployment example – Citrix XenServer

FortiGate VM Overview

The following topics are included in this section:

FortiGate VM models and licensing
Registering FortiGate VM with Customer Service & Support
Downloading the FortiGate VM deployment package
Deployment package contents
Deploying the FortiGate VM appliance

FortiGate VM models and licensing

Fortinet offers the FortiGate VM in five virtual appliance models determined by license. When configuring your FortiGate VM, be sure to configure hardware settings within the ranges outlined below. Contact your Fortinet Authorized Reseller for more information.

FortiGate VM model information

Technical Specification	FG-VM00	FG-VM01	FG-VM02	FG-VM04	FG-VM08
Virtual CPUs (min / max)	1 / 1	1 / 1	1 / 2	1 / 4	1 / 8
Virtual Network Interfaces (min / max)			2 / 10		
Virtual Memory (min / max)	1GB / 1GB	1GB / 2GB	1GB / 4GB	1GB / 6GB	1GB /12GB
Virtual Storage (min / max)			32GB / 2TB		
Managed Wireless APs (tunnel mode / global)	32 / 32	32 / 64	256 / 512	256 / 512	1024 / 4096
Virtual Domains (default / max)	1 / 1	10 / 10	10 / 25	10 / 50	10 / 250

After placing an order for FortiGate VM, a license registration code is sent to the email address used on the order form. Use the registration number provided to register the FortiGate VM with Customer Service & Support and then download the license file. Once the license file is uploaded to the FortiGate VM and validated, your FortiGate VM appliance is fully functional.

FortiGate VM evaluation license

FortiGate VM includes a limited embedded 15-day trial license that supports:

- 1 CPU maximum
- 1024 MB memory maximum
- low encryption only (no HTTPS administrative access)
- all features except FortiGuard updates

You cannot upgrade the firmware, doing so will lock the Web-based Manager until a license is uploaded. Technical support is not included. The trial period begins the first time you start FortiGate VM. After the trial license expires, functionality is disabled until you upload a license file.

Registering FortiGate VM with Customer Service & Support

To obtain the FortiGate VM license file you must first register your FortiGate VM with Customer Service & Support.

To register your FortiGate VM:

1. Log in to the Customer Service & Support portal using an existing support account or select **Sign Up** to create a new account.
2. In the main page, under **Asset**, select **Register/Renew**.

   The **Registration** page opens.
3. Enter the registration code that was emailed to you and select **Register**. A registration form will display.
4. After completing the form, a registration acknowledgement page will appear.
5. Select the **License File Download** link.
6. You will be prompted to save the license file (`.lic`) to your local computer. See "Upload the license file" for instructions on uploading the license file to your FortiGate VM via the Web-based Manager.

Downloading the FortiGate VM deployment package

FortiGate VM deployment packages are included with FortiGate firmware images on the Customer Service & Support site. First, see the following table to determine the appropriate VM deployment package for your VM platform.

Selecting the correct FortiGate VM deployment package for your VM platform

VM Platform	FortiGate VM Deployment File
Citrix XenServer v5.6sp2, 6.0 and later	FGT_VM64-v500-buildnnnn-FORTINET.out.CitrixXen.zip
OpenXen v3.4.3, 4.1	FGT_VM64-v500-buildnnnn-FORTINET.out.OpenXen.zip
Microsoft Hyper-V Server 2008R2 and 2012	FGT_VM64-v500-buildnnnn-FORTINET.out.hyperv.zip
KVM (qemu 0.12.1)	FGT_VM64-v500-buildnnnn-FORTINET.out.kvm.zip
VMware ESX 4.0, 4.1 ESXi 4.0/4.1/5.0/5.1/5.5	FGT_VM32-v500-buildnnnn-FORTINET.out.ovf.zip (32-bit) FGT_VM64-v500-buildnnnn-FORTINET.out.ovf.zip

For more information see the FortiGate product datasheet available on the Fortinet web site, http://www.fortinet.com/products/fortigate/virtualappliances.html.

The firmware images FTP directory is organized by firmware version, major release, and patch release. The firmware images in the directories follow a specific naming convention and each firmware image is specific to the device model. For example, the FGT_VM32-v500-build0151-FORTINET.out.ovf.zip image found in the v5.0 Patch Release 2 directory is specific to the FortiGate VM 32-bit environment.

You can also download the FortiOS Release Notes, FORTINET-FORTIGATE MIB file, FSSO images, and SSL VPN client in this directory. The Fortinet Core MIB file is located in the main FortiGate v5.00 directory.

To download the FortiGate VM deployment package:

1. In the main page of the Customer Service & Support site, select **Download** > **Firmware Images**.

   The **Firmware Images** page opens.
2. In the **Firmware Images** page, select **FortiGate**.
3. Browse to the appropriate directory on the FTP site for the version that you would like to download.
4. Download the appropriate `.zip` file for your VM server platform.

   You can also download the FortiGate Release Notes.
5. Extract the contents of the deployment package to a new file folder.

Deployment package contents

Citrix XenServer

The FORTINET.out.CitrixXen.zip file contains:

- fortios.vhd: the FortiGate VM system hard disk in VHD format
- fortios.xva: binary file containing virtual hardware configuration settings
- in the ovf folder:
  - FortiGate-VM64.ovf: Open Virtualization Format (OVF) template file, containing virtual hardware settings for Xen
  - fortios.vmdk: the FortiGate VM system hard disk in VMDK format
  - datadrive.vmdk: the FortiGate VM log disk in VMDK format

The ovf folder and its contents is an alternative method of installation to the .xva and VHD disk image.

OpenXEN

The FORTINET.out.OpenXen.zip file contains only fortios.qcow2, the FortiGate VM system hard disk in qcow2 format. You will need to manually:

- create a 32GB log disk
- specify the virtual hardware settings

Microsoft Hyper-V

The FORTINET.out.hyperv.zip file contains:

- in the Virtual Hard Disks folder:
  - fortios.vhd: the FortiGate VM system hard disk in VHD format
  - DATADRIVE.vhd: the FortiGate VM log disk in VHD format
- In the Virtual Machines folder:
  - fortios.xml: XML file containing virtual hardware configuration settings for Hyper-V. This is compatible with Windows Server 2012.
- Snapshots folder: optionally, Hyper-V stores snapshots of the FortiGate VM state here

KVM

The FORTINET.out.kvm.zip contains only fortios.qcow2, the FortiGate VM system hard disk in qcow2 format. You will need to manually:

- create a 32GB log disk
- specify the virtual hardware settings

VMware ESX/ESXi

You will need to create a 32GB log disk.

The FORTINET.out.ovf.zip file contains:

- fortios.vmdk: the FortiGate VM system hard disk in VMDK format
- datadrive.vmdk: the FortiGate VM log disk in VMDK format
- Open Virtualization Format (OVF) template files:
  - FortiGate-VM64.ovf: OVF template based on Intel e1000 NIC driver
  - FortiGate-VM64.hw04.ovf: OVF template file for older (v3.5) VMware ESX server
  - FortiGate-VMxx.hw07_vmxnet2.ovf: OVF template file for VMware vmxnet2 driver
  - FortiGate-VMxx.hw07_vmxnet3.ovf: OVF template file for VMware vmxnet3 driver

Use the VMXNET3 interface (FortiGate-VMxx.hw07_vmxnet3.ovf template) if the virtual appliance will distribute workload to multiple processor cores.

Deploying the FortiGate VM appliance

Prior to deploying the FortiGate VM appliance, the VM platform must be installed and configured so that it is ready to create virtual machines. The installation instructions for FortiGate VM assume that

- You are familiar with the management software and terminology of your VM platform.
- An Internet connection is available for FortiGate VM to contact FortiGuard to validate its license or, for closed environments, a FortiManager can be contacted to validate the FortiGate VM license. See "Validate the FortiGate VM license with FortiManager".

For assistance in deploying FortiGate VM, refer to the deployment chapter in this guide that corresponds to your VMware environment. You might also need to refer to the documentation provided with your VM server. The deployment chapters are presented as examples because for any particular VM server there are multiple ways to create a virtual machine. There are command line tools, APIs, and even alternative graphical user interface tools.

Before you start your FortiGate VM appliance for the first time, you might need to adjust virtual disk sizes and networking settings. The first time you start FortiGate VM, you will have access only through the console window of your VM server environment. After you configure one FortiGate network interface with an IP address and administrative access, you can access the FortiGate VM web-based manager.

After deployment and license validation, you can upgrade your FortiGate VM appliance's firmware by downloading either FGT_VM32-v500-buildnnnn-FORTINET.out (32-bit) or FGT_VM64-v500-buildnnnn-FORTINET.out (64-bit) firmware. Firmware upgrading on a VM is very similar to upgrading firmware on a hardware FortiGate unit.

Deployment example – VMware

Once you have downloaded the FGT_VMxx-v5-build0xxx-FORTINET.out.ovf.zip file from http://support.fortinet.com and extracted the package contents to a folder on your local computer, you can use the vSphere client to create the virtual machine from the deployment package OVF template.

The following topics are included in this section:

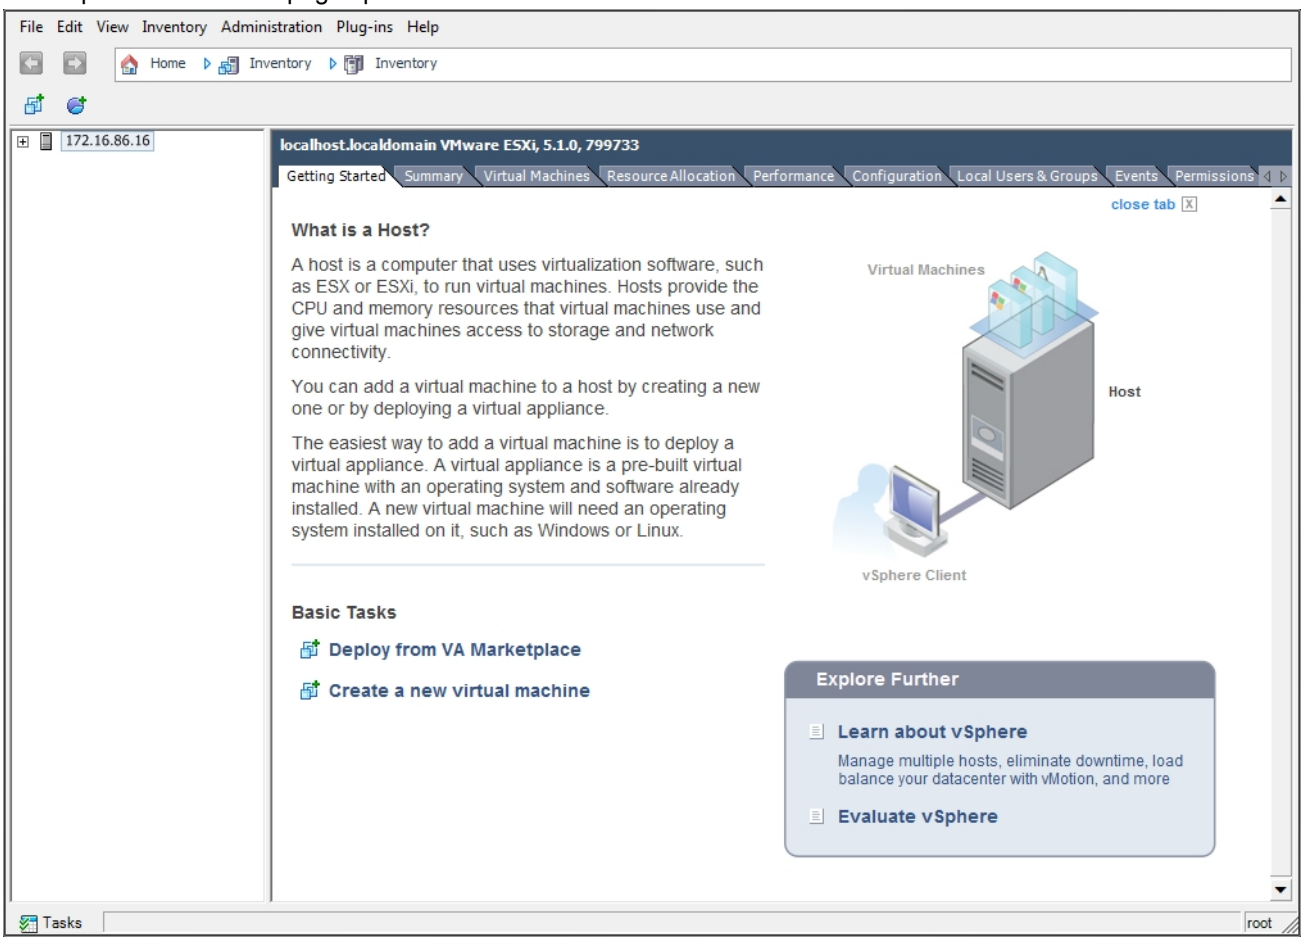
Open the FortiGate VM OVF file with the vSphere client
Configure FortiGate VM hardware settings
Transparent mode VMware configuration
High Availability VMware configuration
Power on your FortiGate VM

Open the FortiGate VM OVF file with the vSphere client

To deploy the FortiGate VM OVF template:

1. Launch the VMware vSphere client, enter the IP address or host name of your server, enter your user name and password and select **Login**.

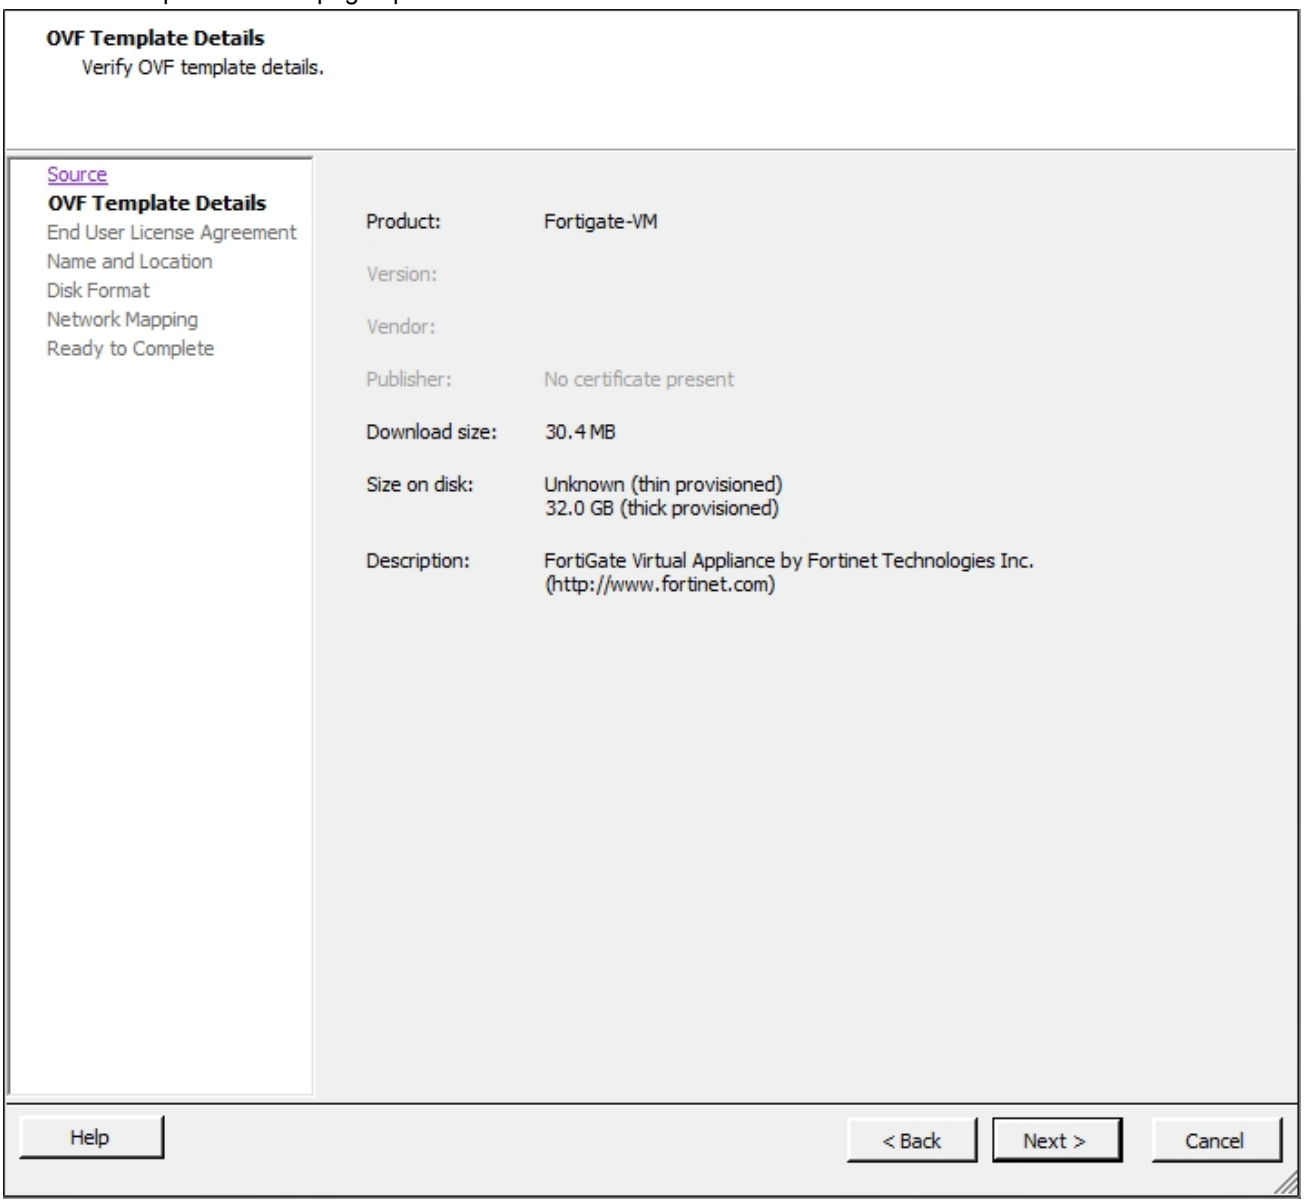
The vSphere client home page opens.



2. Select **File > Deploy OVF Template** to launch the OVF Template wizard.

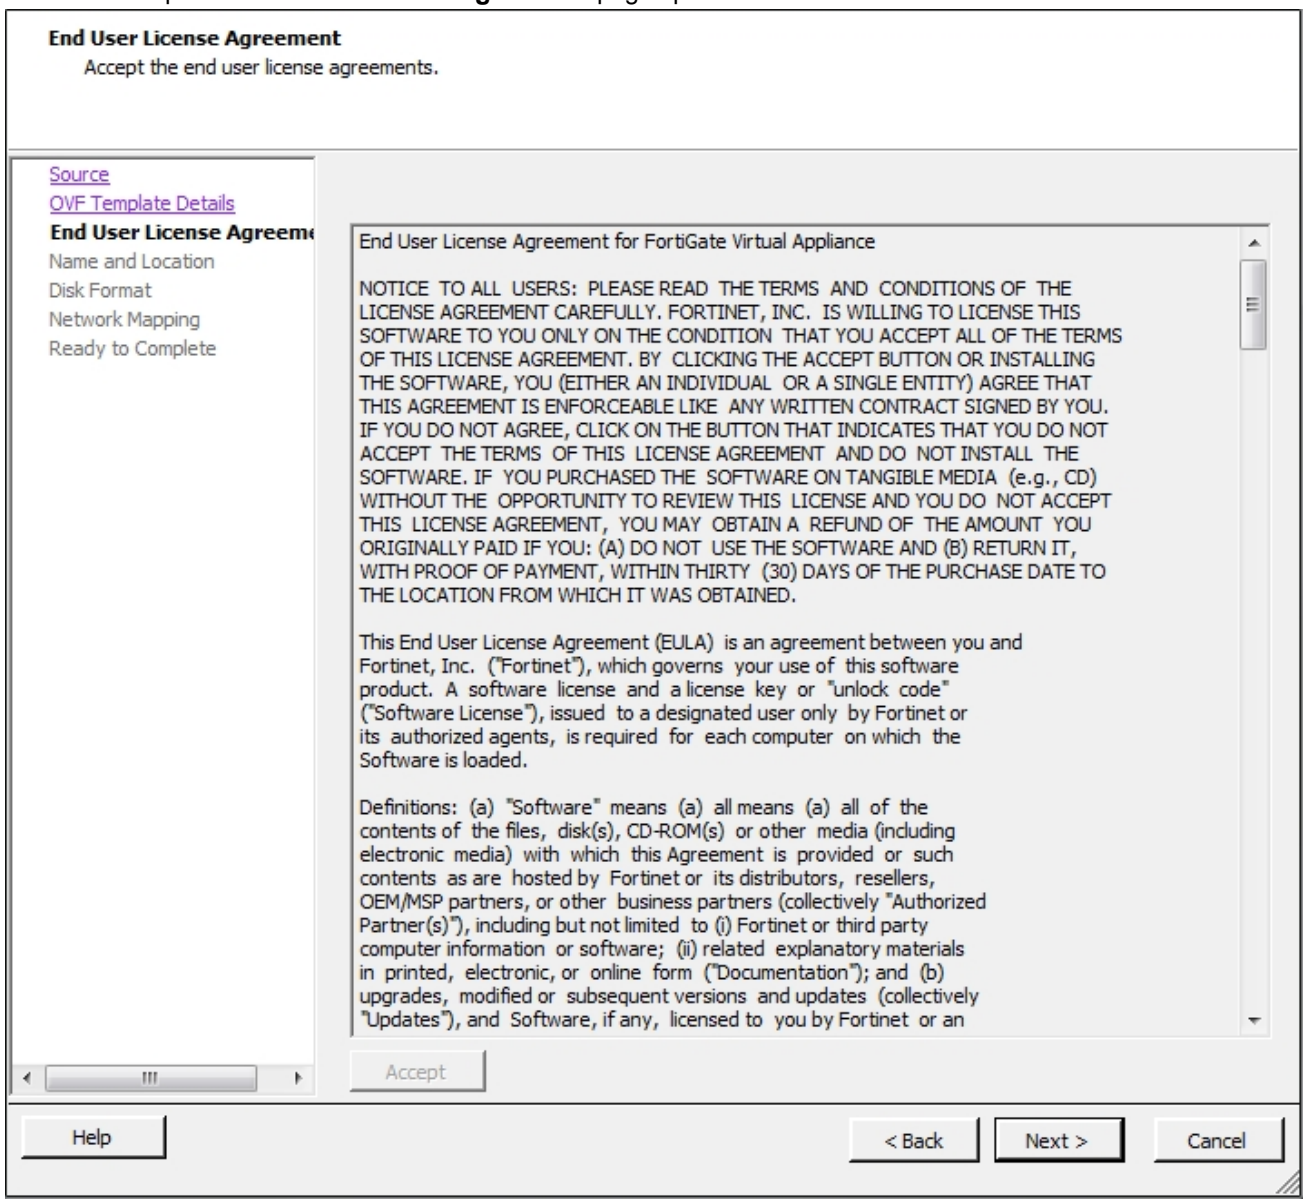
   The OVF Template **Source** page opens.
3. Select the source location of the OVF file. Select **Browse** and locate the OVF file on your computer. Select **Next** to continue.

The OVF Template **Details** page opens.



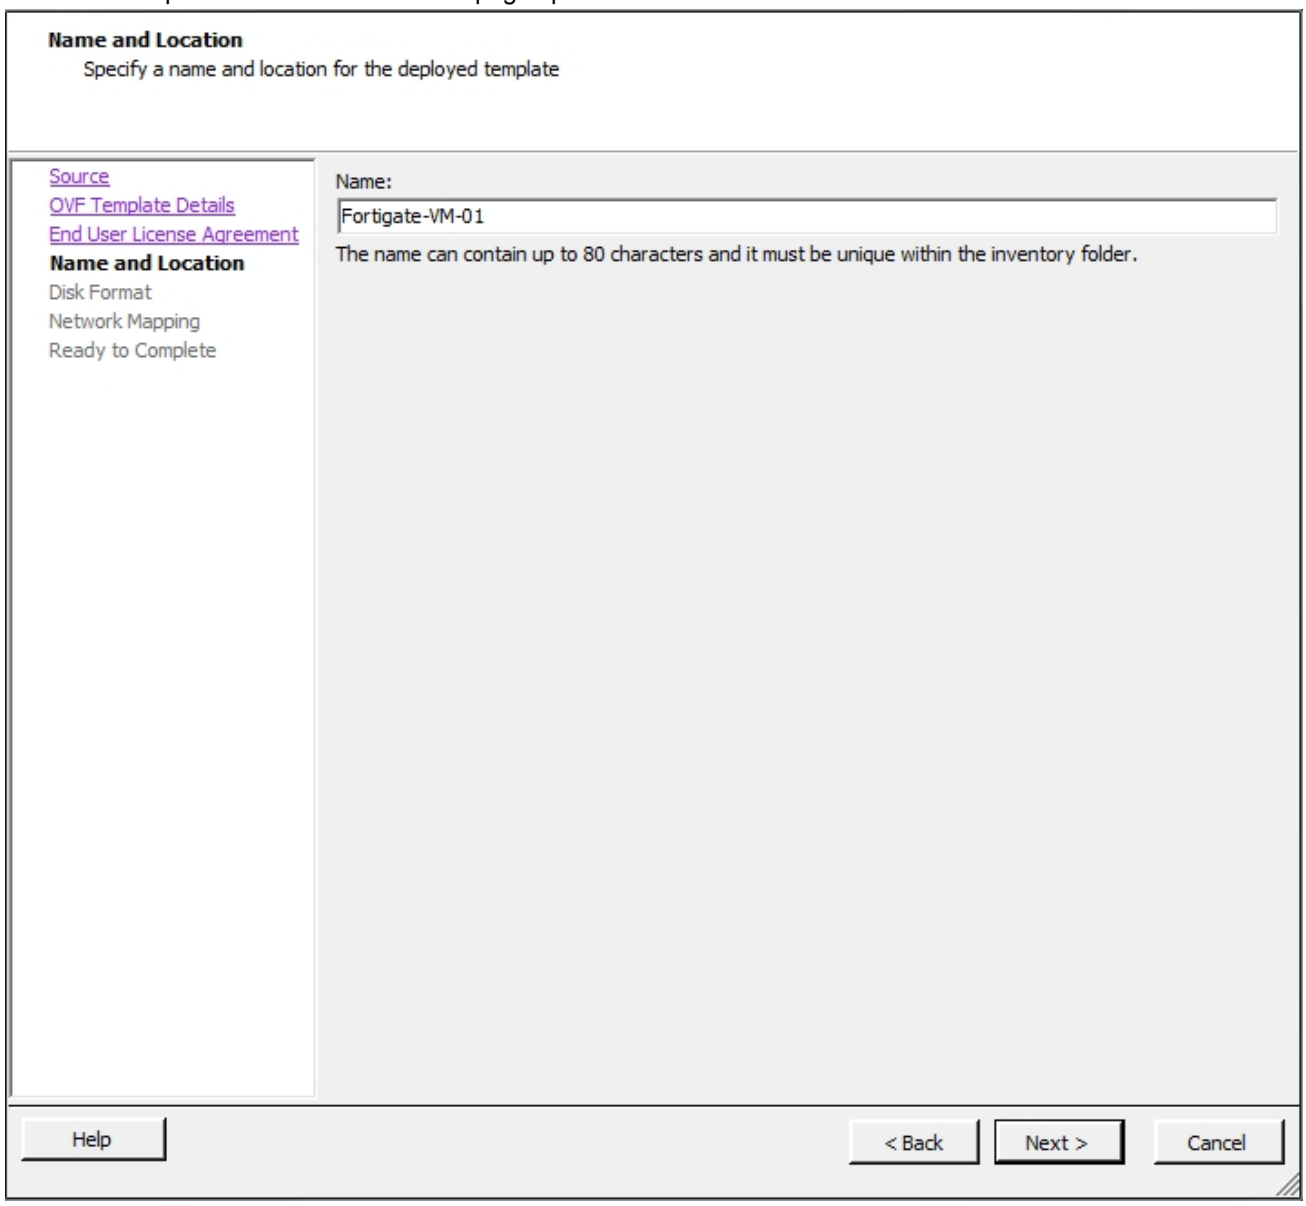
4. Verify the OVF template details. This page details the product name, download size, size on disk, and description. Select **Next** to continue.

The OVF Template **End User License Agreement** page opens.



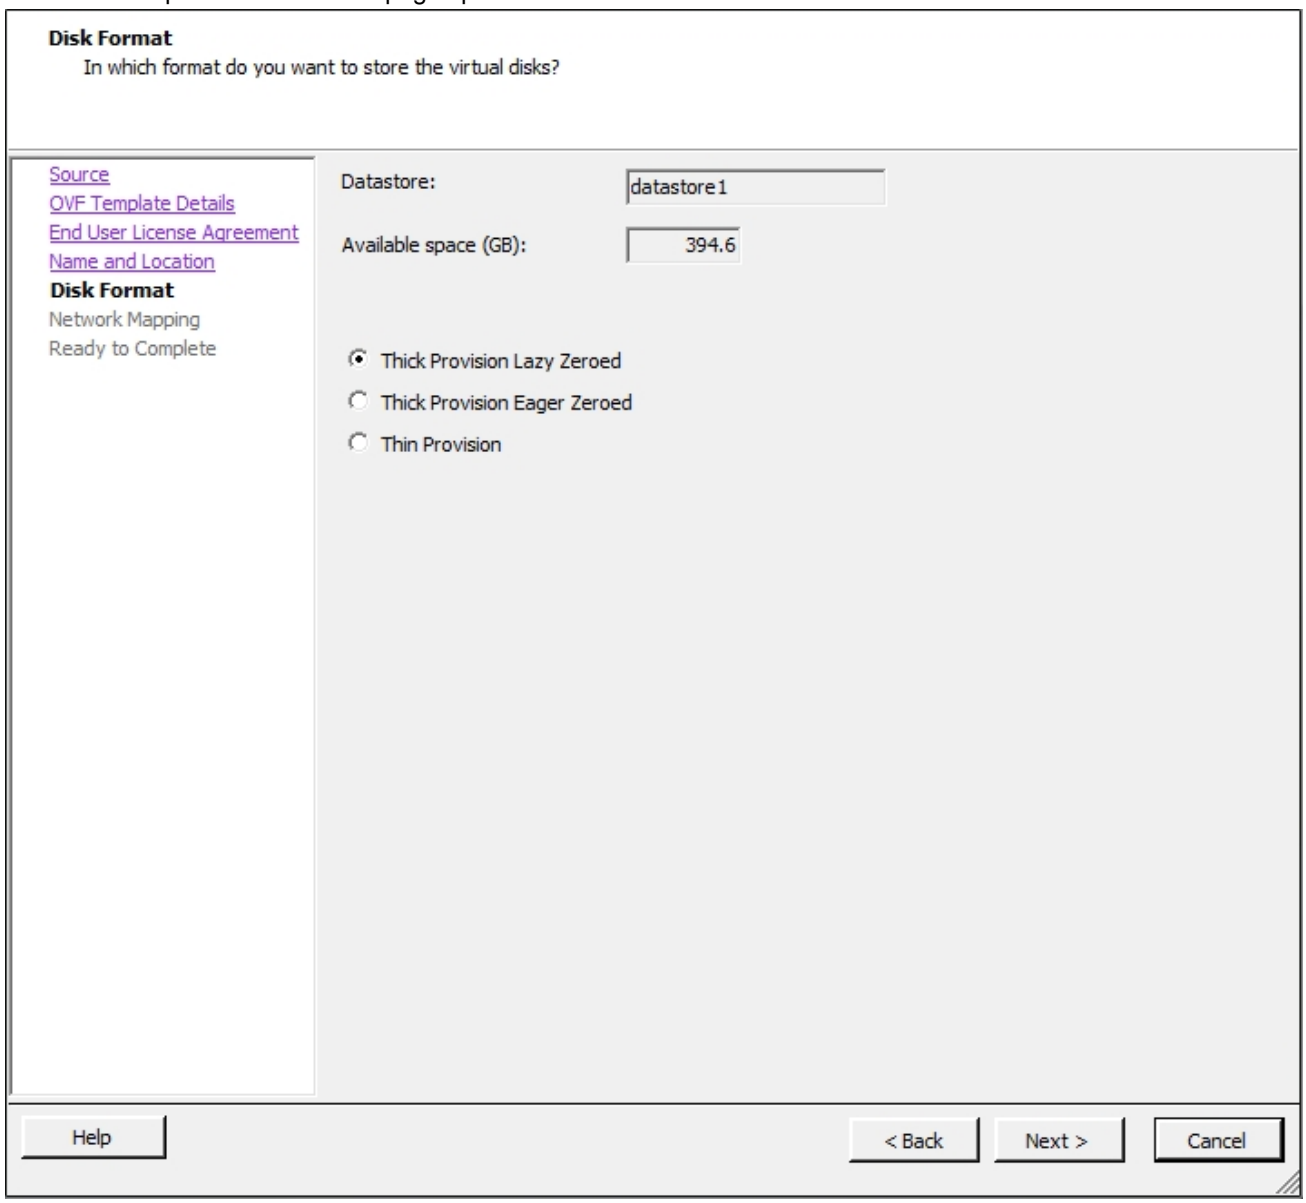
5. Read the end user license agreement for FortiGate VM. Select **Accept** and then select **Next** to continue.

The OVF Template **Name and Location** page opens.



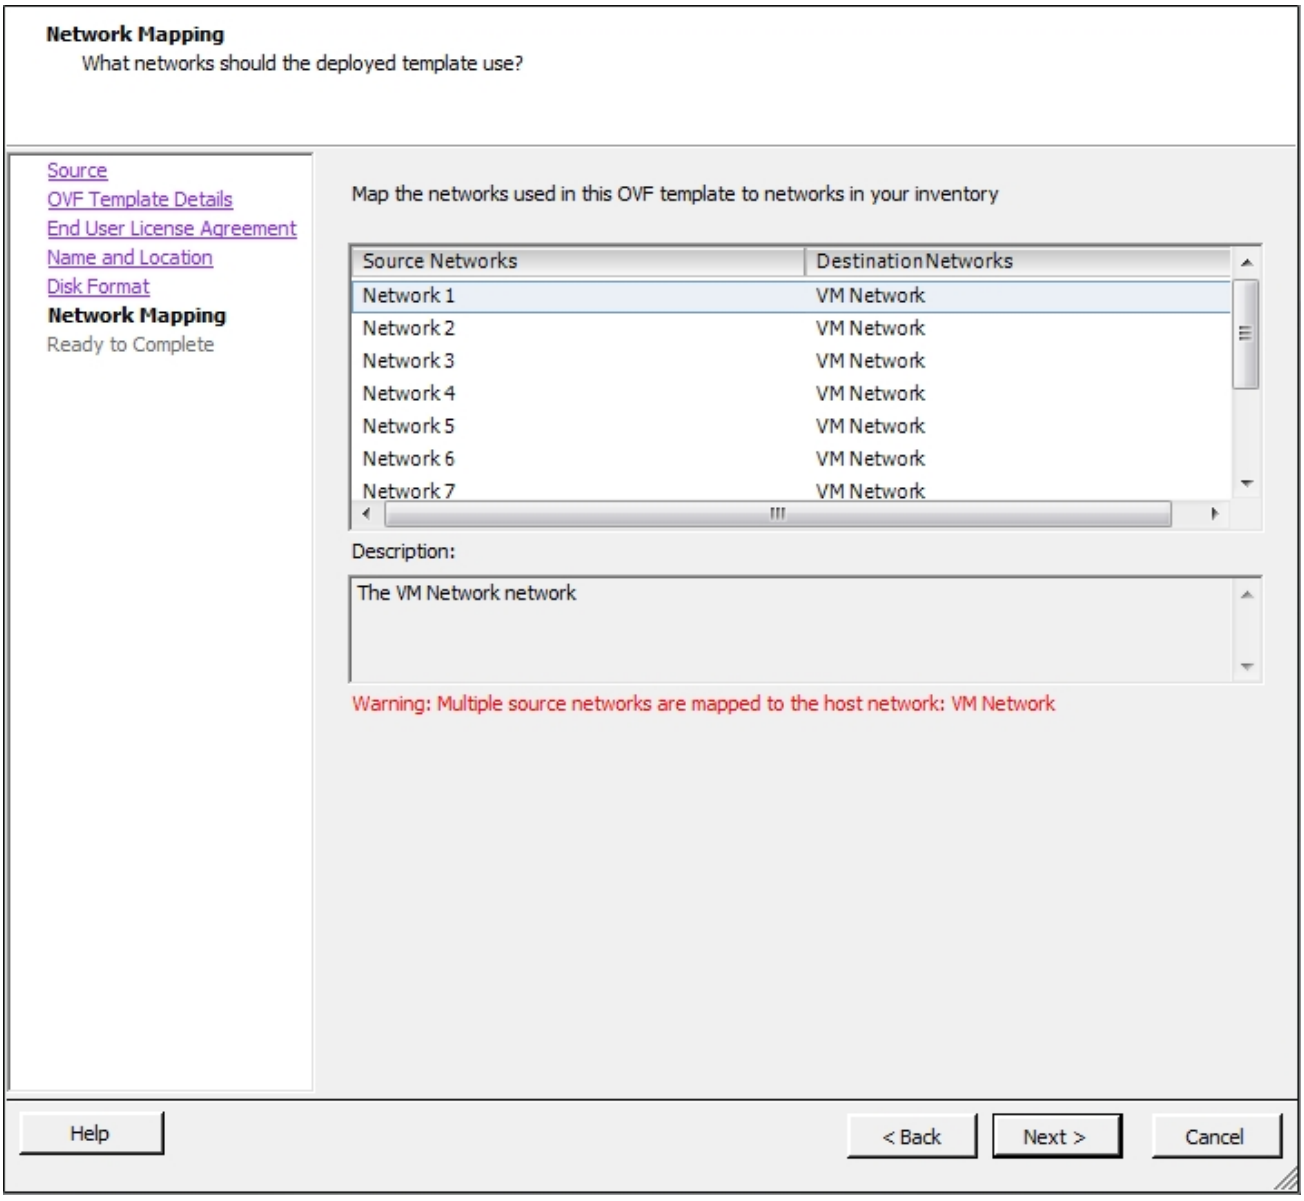
6. Enter a name for this OVF template. The name can contain up to 80 characters and it must be unique within the inventory folder. Select **Next** to continue.

The OVF Template **Disk Format** page opens.



7. Select one of the following:
   - **Thick Provision Lazy Zeroed**: Allocates the disk space statically (no other volumes can take the space), but does not write zeros to the blocks until the first write takes place to that block during runtime (which includes a full disk format).
   - **Thick Provision Eager Zeroed**: Allocates the disk space statically (no other volumes can take the space), and writes zeros to all the blocks.
   - **Thin Provision**: Allocates the disk space only when a write occurs to a block, but the total volume size is reported by VMFS to the OS. Other volumes can take the remaining space. This allows you to float space between your servers, and expand your storage when your size monitoring indicates there is a problem. Note that once a Thin Provisioned block is allocated, it remains on the volume regardless if you have deleted data, etc.
8. Select **Next** to continue.

   The OVF Template **Network Mapping** page opens.

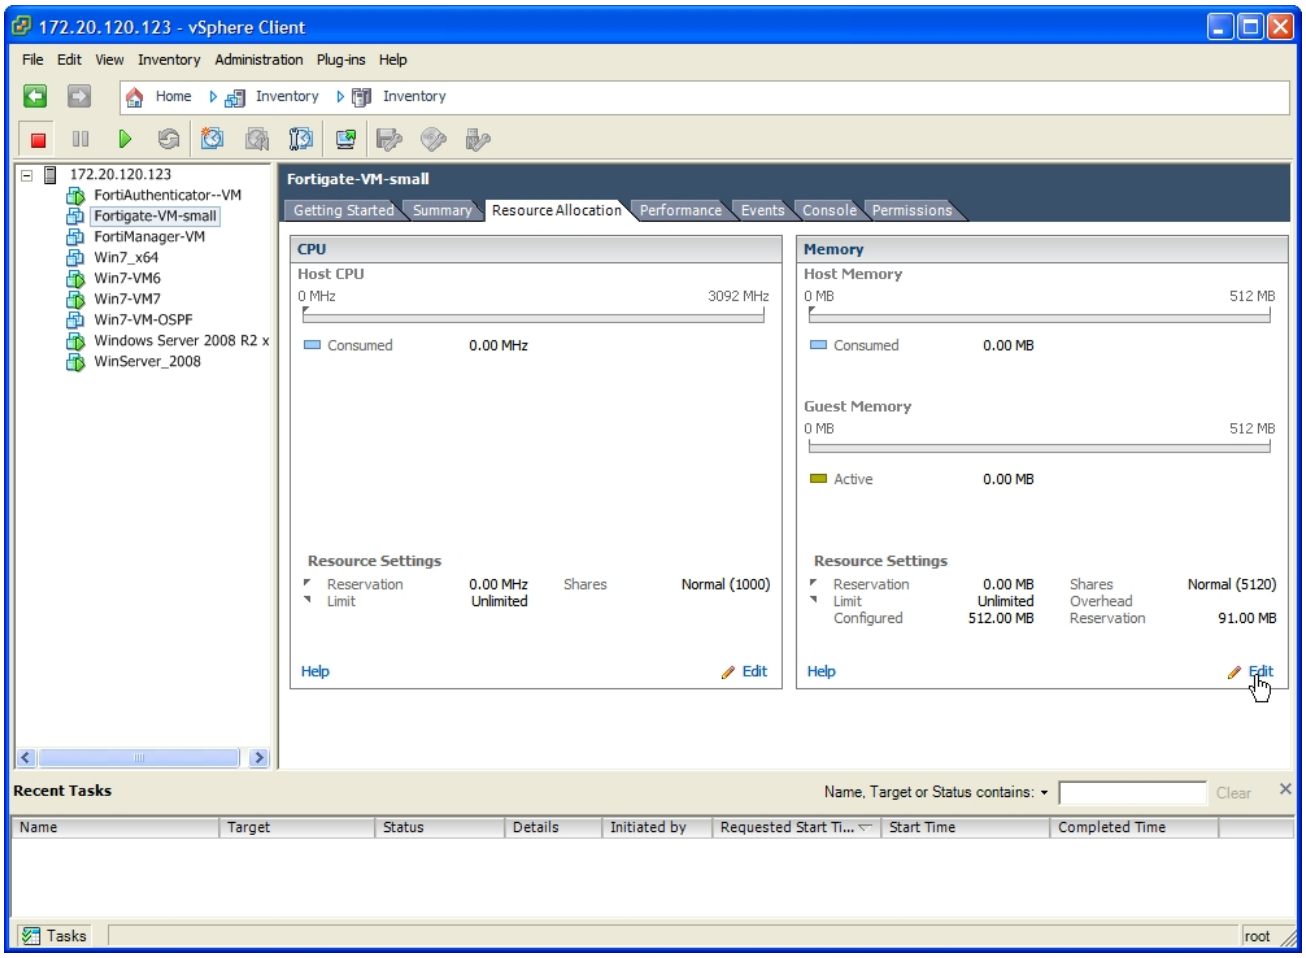


9. Map the networks used in this OVF template to networks in your inventory. Network 1 maps to port1 of the FortiGate VM. You must set the destination network for this entry to access the device console. Select **Next** to continue.

   The OVF Template **Ready to Complete** page opens.
10. Review the template configuration. Make sure that **Power on after deployment** is not enabled. You might need to configure the FortiGate VM hardware settings prior to powering on the FortiGate VM.
11. Select **Finish** to deploy the OVF template. You will receive a **Deployment Completed Successfully** dialog box once the FortiGate VM OVF template wizard has finished.

Configure FortiGate VM hardware settings

Before powering on your FortiGate VM you must configure the virtual memory, virtual CPU, and virtual disk configuration to match your FortiGate VM license.



Transparent mode VMware configuration

If you want to use your FortiGate-VM in transparent mode, your VMware server's virtual switches must operate in promiscuous mode. This permits these interfaces to receive traffic that will pass through the FortiGate unit but was not addressed to the FortiGate unit.

In VMware, promiscuous mode must be explicitly enabled:

1. In the vSphere client, select your VMware server in the left pane and then select the **Configuration** tab in the right pane.
2. In **Hardware**, select **Networking**.
3. Select **Properties** of vSwitch0.
4. In the **Properties** window left pane, select **vSwitch** and then select **Edit**.
5. Select the **Security** tab, set **Promiscuous Mode** to **Accept**, then select **OK**.
6. Select **Close**.
7. Repeat steps 3 through 6 for other vSwitches that your transparent mode FortiGate-VM uses.

High Availability VMware configuration

If you want to combine two or more FortiGate-VM instances into a FortiGate Clustering Protocol (FGCP) High Availability (HA) cluster the VMware server's virtual switches used to connect the heartbeat interfaces must operate in promiscuous mode. This permits HA heartbeat communication between the heartbeat interfaces. HA heartbeat packets are non-TCP packets that use Ethertype values 0x8890, 0x8891, and 0x8890. The FGCP uses link-local IP4 addresses in the 169.254.0.x range for HA heartbeat interface IP addresses.

To enable promiscuous mode in VMware:

1. In the vSphere client, select your VMware server in the left pane and then select the **Configuration** tab in the right pane.
2. In **Hardware**, select **Networking**.
3. Select **Properties** of a virtual switch used to connect heartbeat interfaces.
4. In the **Properties** window left pane, select **vSwitch** and then select **Edit**.
5. Select the **Security** tab, set **Promiscuous Mode** to **Accept**, then select **OK**.
6. Select **Close**.

You must also set the virtual switches connected to other FortiGate interfaces to allow MAC address changes and to accept forged transmits. This is required because the FGCP sets virtual MAC addresses for all FortiGate interfaces and the same interfaces on the different VM instances in the cluster will have the same virtual MAC addresses.

To make the required changes in VMware:

1. In the vSphere client, select your VMware server in the left pane and then select the **Configuration** tab in the right pane.
2. In **Hardware**, select **Networking**.
3. Select **Properties** of a virtual switch used to connect FortiGate VM interfaces.
4. Set **MAC Address Changes**to**Accept**.
5. Set **Forged Transmits** to **Accept**.

Power on your FortiGate VM

You can now proceed to power on your FortiGate VM. There are several ways to do this:

- Select the name of the FortiGate VM you deployed in the inventory list and select **Power on the virtual machine** in the **Getting Started** tab.
- In the inventory list, right-click the name of the FortiGate VM you deployed, and select **Power > Power On**.
- Select the name of the FortiGate VM you deployed in the inventory list. Click the **Power On** button on the toolbar.

Select the Console tab to view the console. To enter text, you must click in the console pane. The mouse is then captured and cannot leave the console screen. As the FortiGate console is text-only, no mouse pointer is visible. To release the mouse, press Ctrl-Alt.

Deployment example – MS Hyper-V

Once you have downloaded the FGT_VMxx_HV-v5-build0xxx-FORTINET.out.hyperv.zip file and extracted the package contents to a folder on your Microsoft server, you can deploy the VHD package to your Microsoft Hyper-V environment.

The following topics are included in this section:

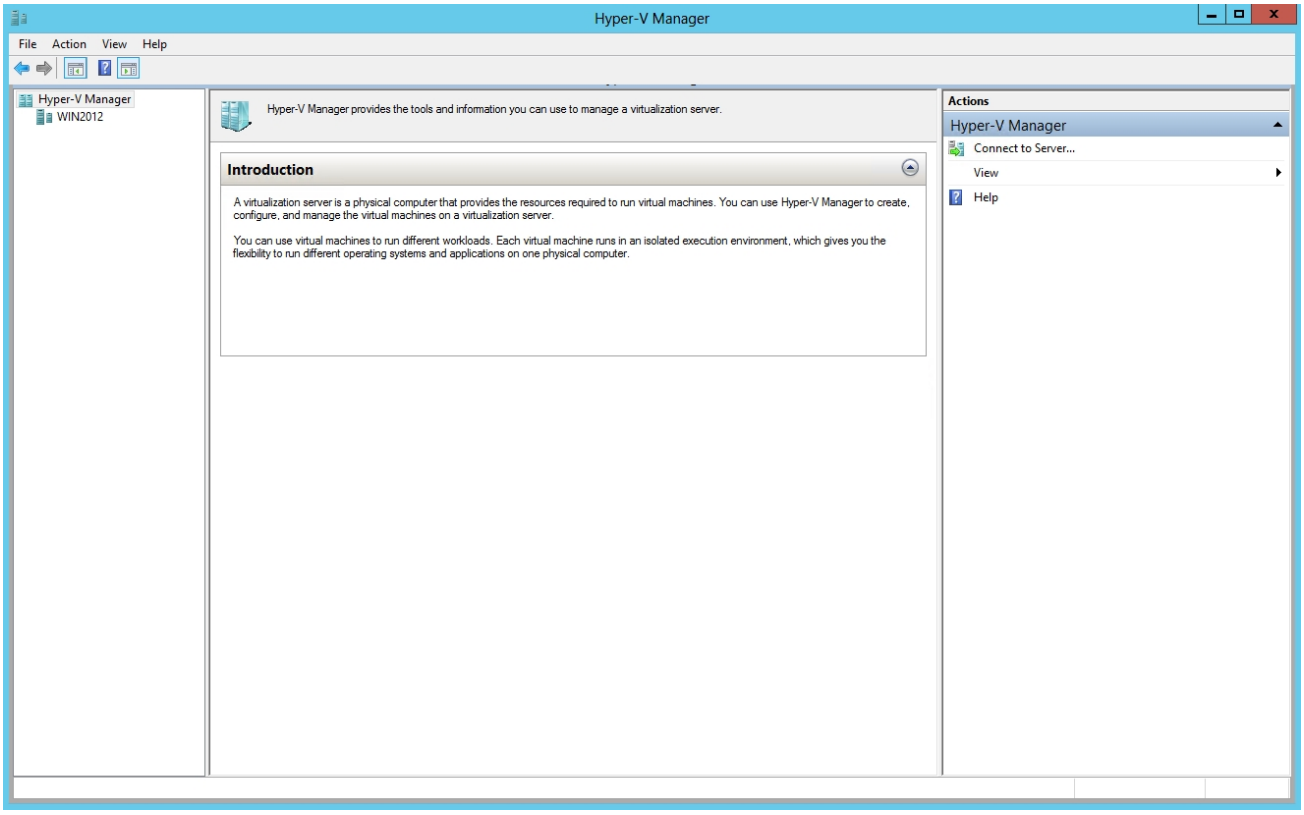
Create the FortiGate VM virtual machine
Configure FortiGate VM hardware settings
High Availability Hyper-V configuration
Start the FortiGate VM

Create the FortiGate VM virtual machine

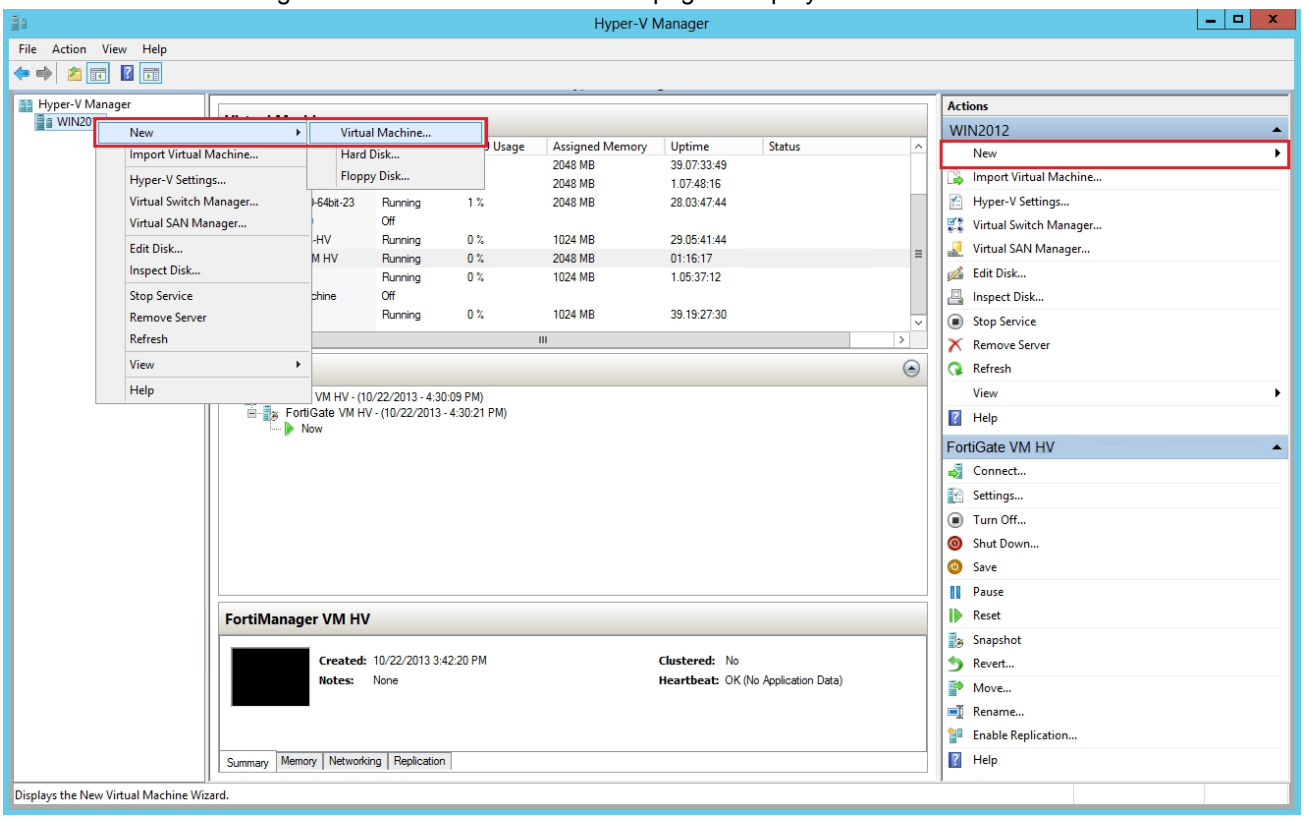
To create the FortiGate VM virtual machine:

1. Launch the Hyper-V Manager in your Microsoft server.

   The **Hyper-V Manager** home page opens.

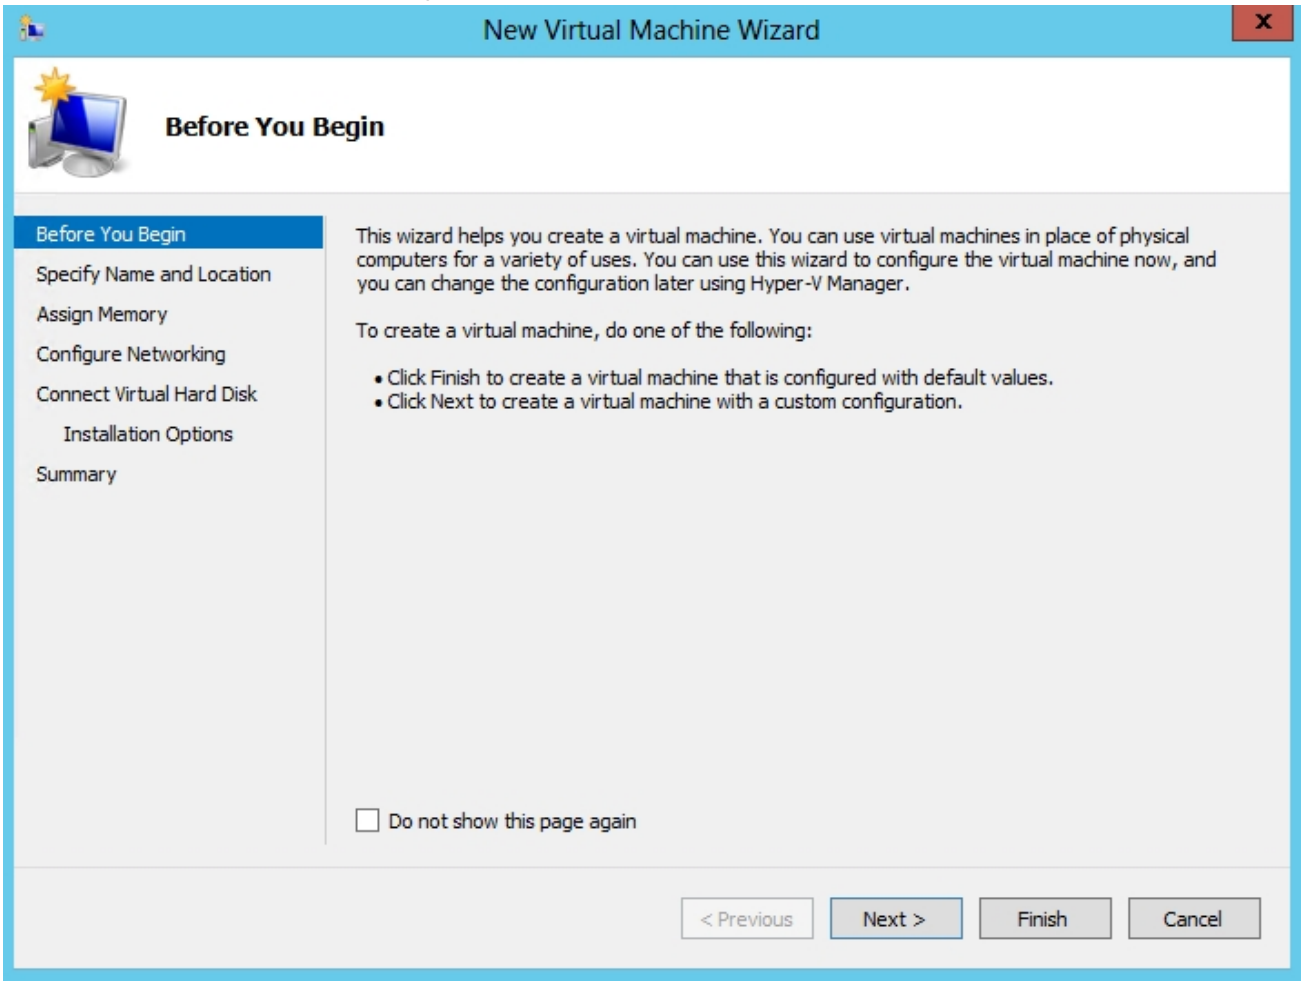


2. Select the server in the right-tree menu. The server details page is displayed.



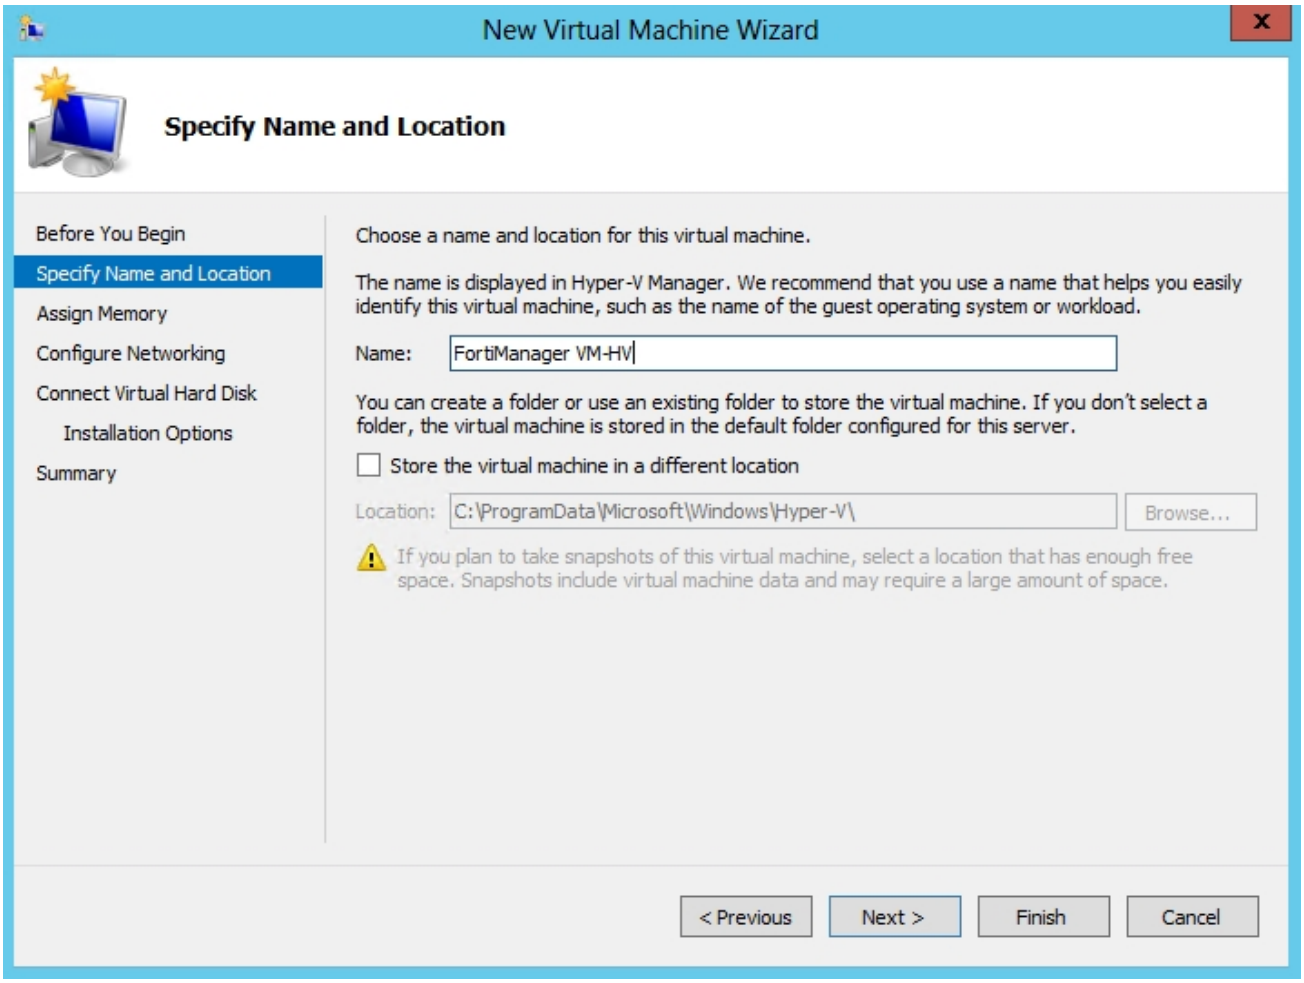
3. Right-click the server and select **New and select Virtual Machine** from the menu. Optionally, in the **Actions** menu, select **New** and select **Virtual Machine** from the menu.

The **New Virtual Machine Wizard** opens.



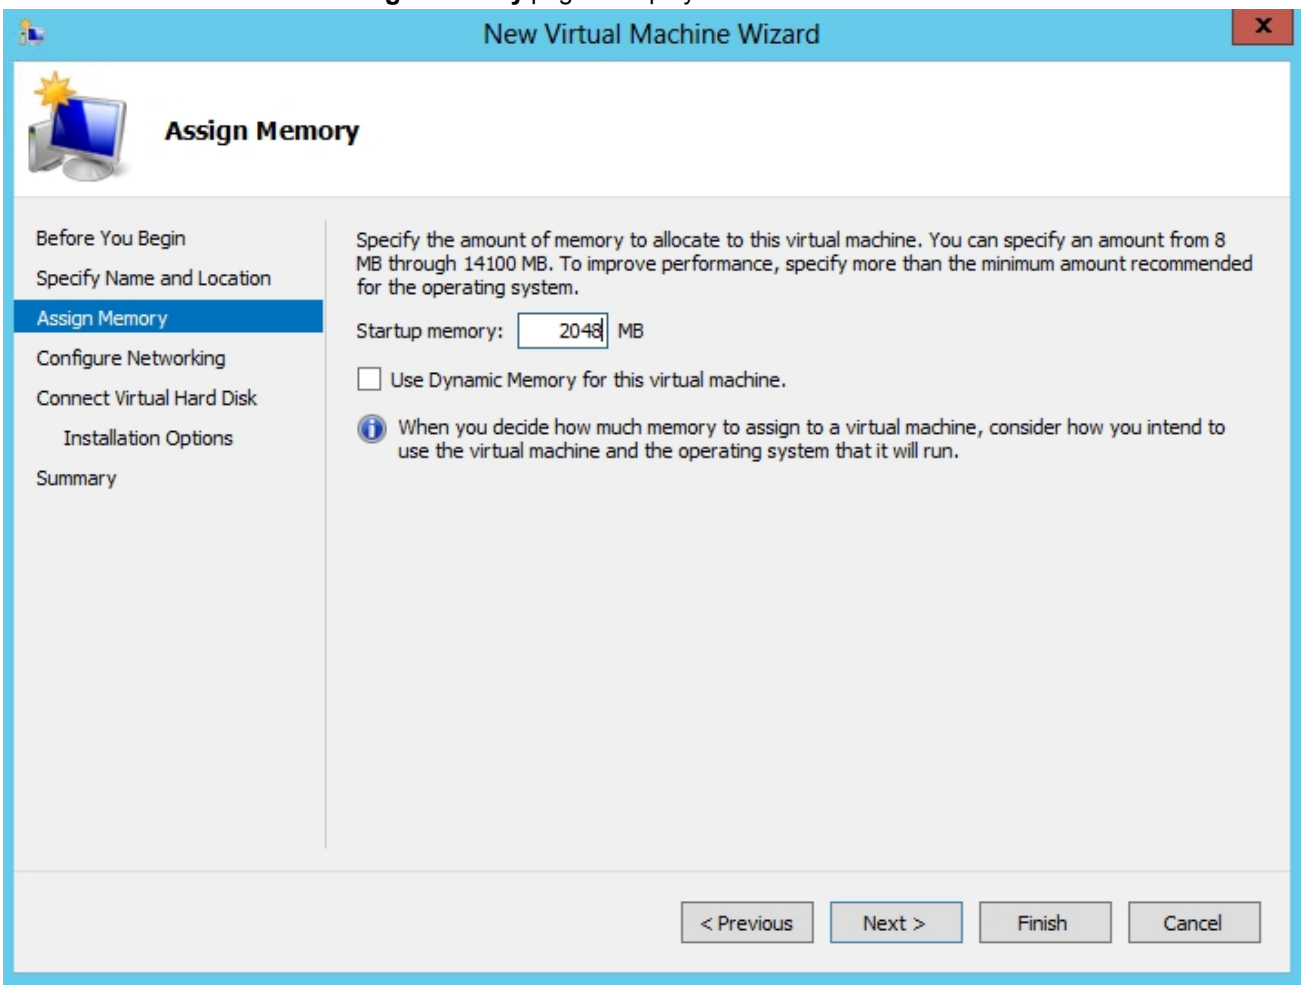
4. Select **Next** to create a virtual machine with a custom configuration.

   The **Specify Name and Location** page is displayed.



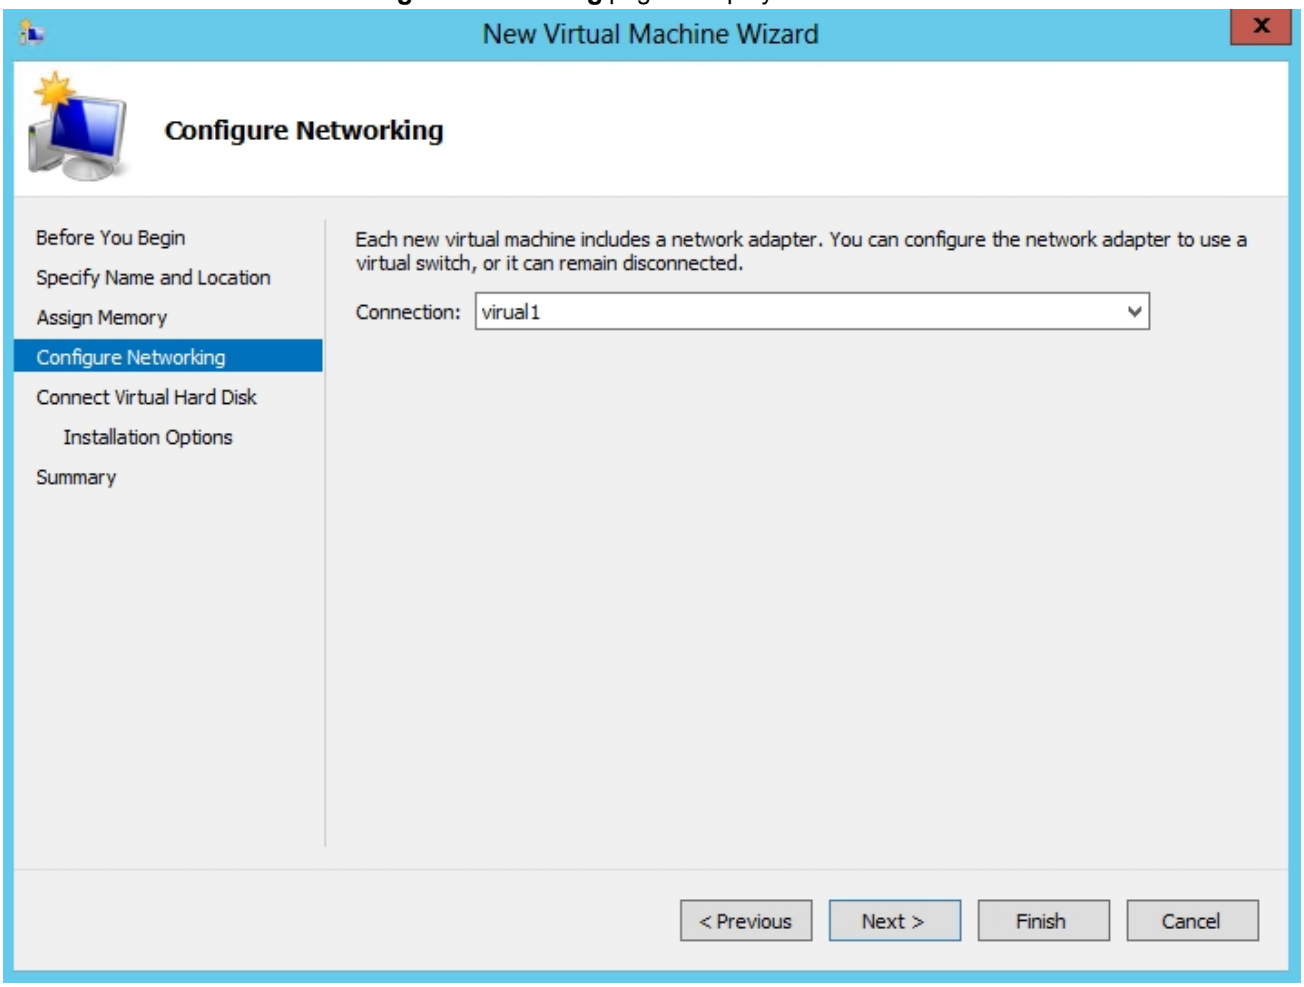
5. Enter a name for this virtual machine. The name is displayed in the Hyper-V Manager.

Select **Next** to continue. The **Assign Memory** page is displayed.



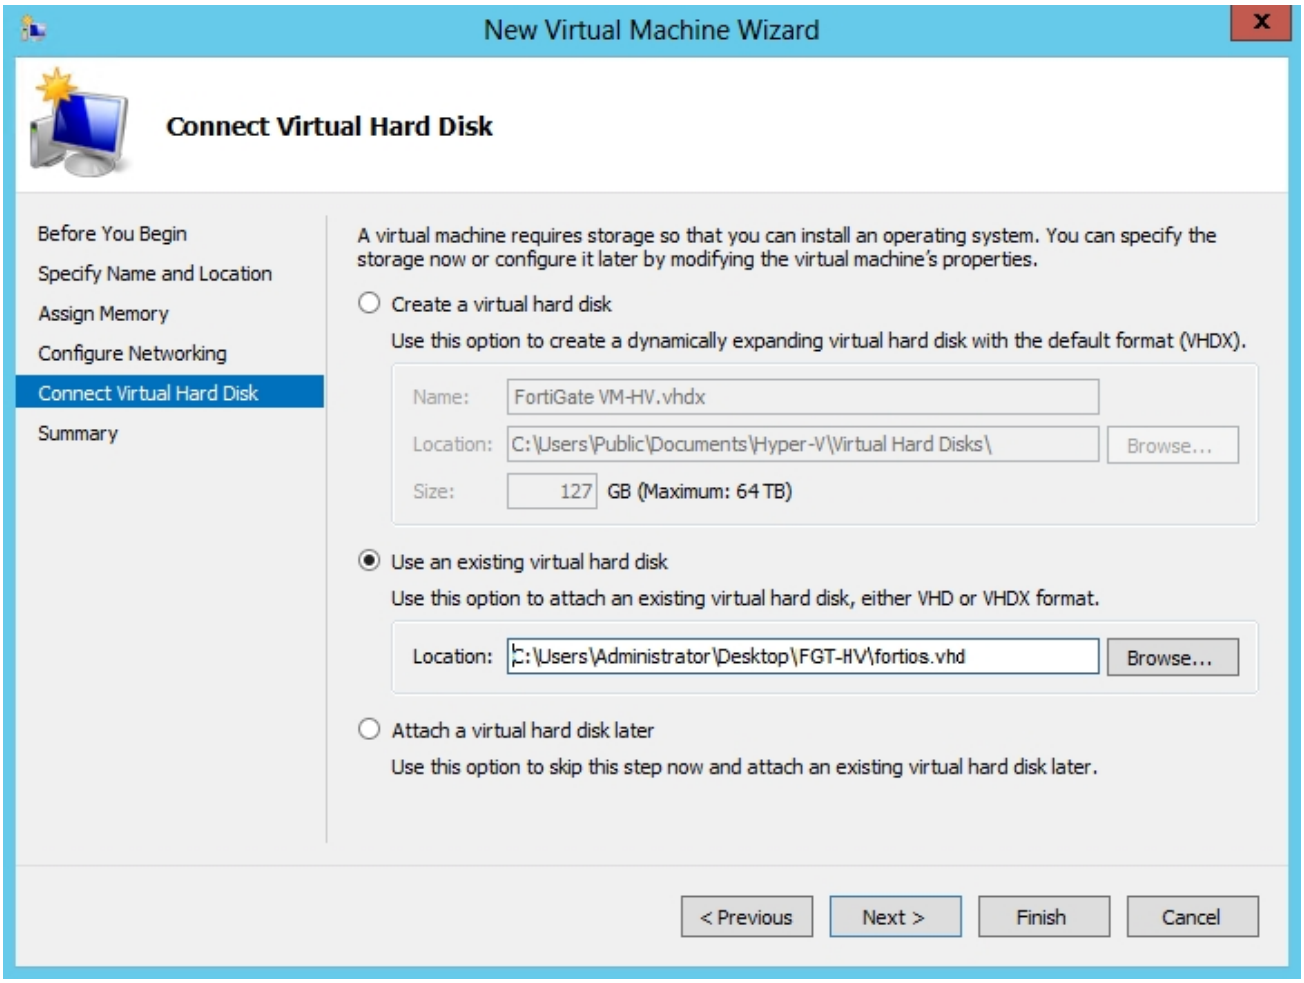
6. Specify the amount of memory to allocate to this virtual machine. The default memory for FortiGate VM is 1GB (1024MB).

Select **Next** to continue. The **Configure Networking** page is displayed.



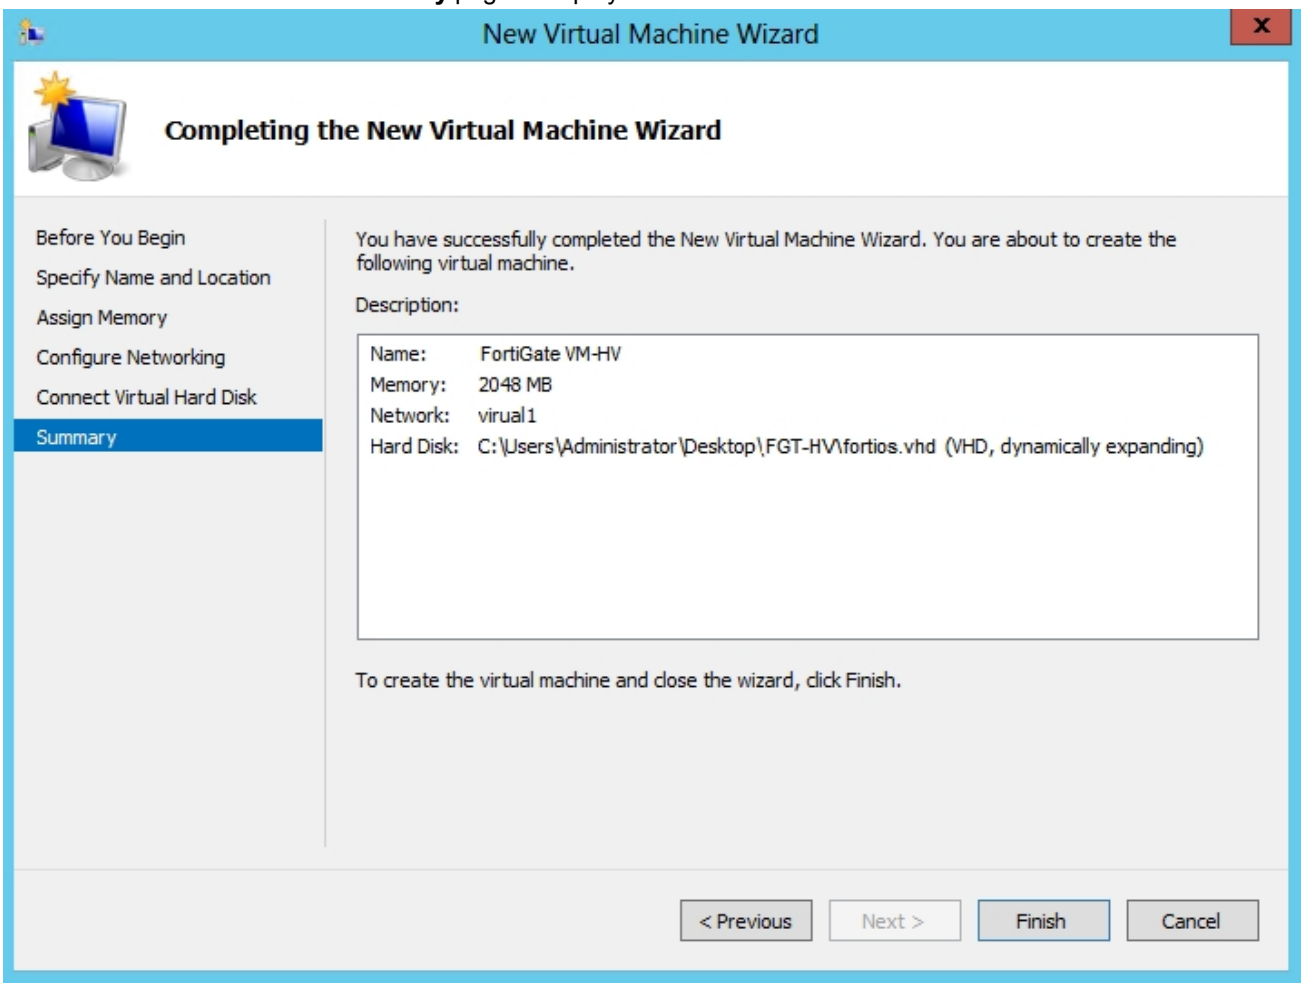
7. Each new virtual machine includes a network adapter. You can configure the network adapter to use a virtual switch, or it can remain disconnected. FortiGate VM requires four network adapters. You must configure network adapters in the **Settings** page.

   Select **Next** to continue. The **Connect Virtual Hard Disk** page is displayed.



8. Select to use an existing virtual hard disk and browse for the `fortios.vhd` file that you downloaded from the Fortinet Customer Service & Support portal.

Select **Next** to continue. The **Summary** page is displayed.



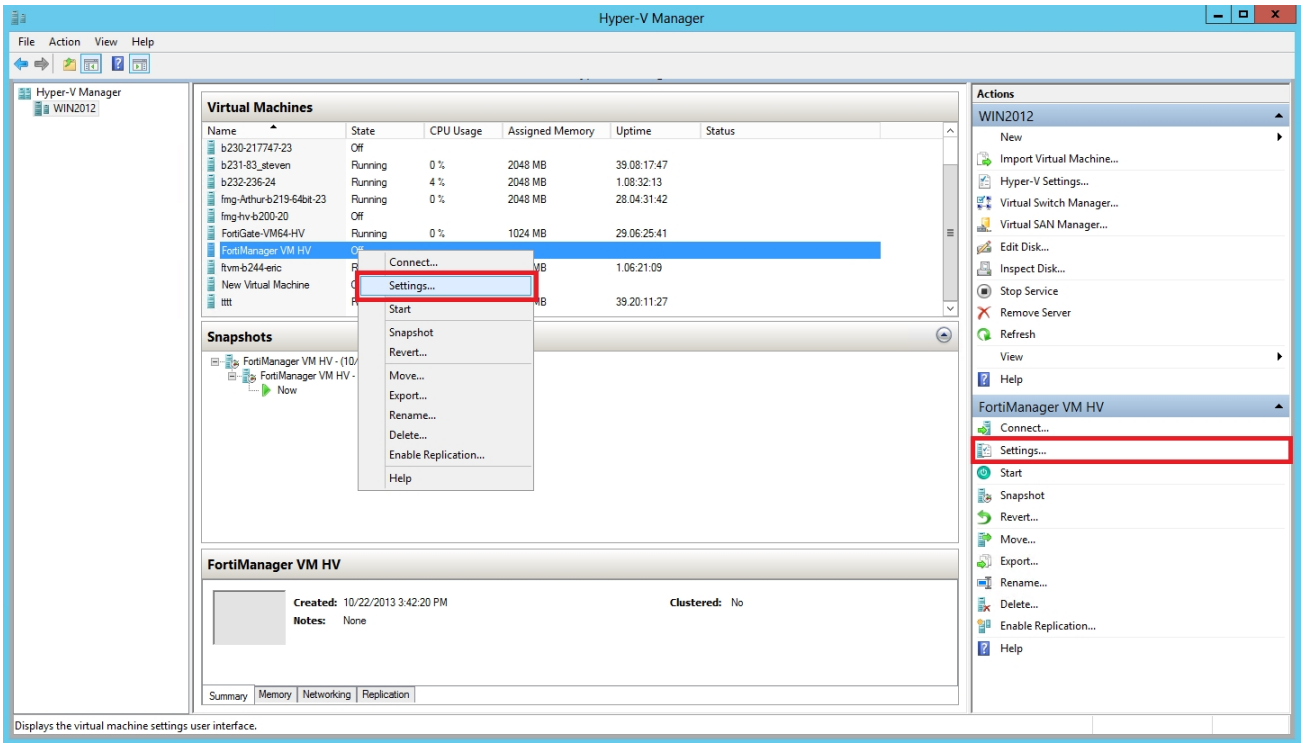
9. To create the virtual machine and close the wizard, select **Finish**.

Configure FortiGate VM hardware settings

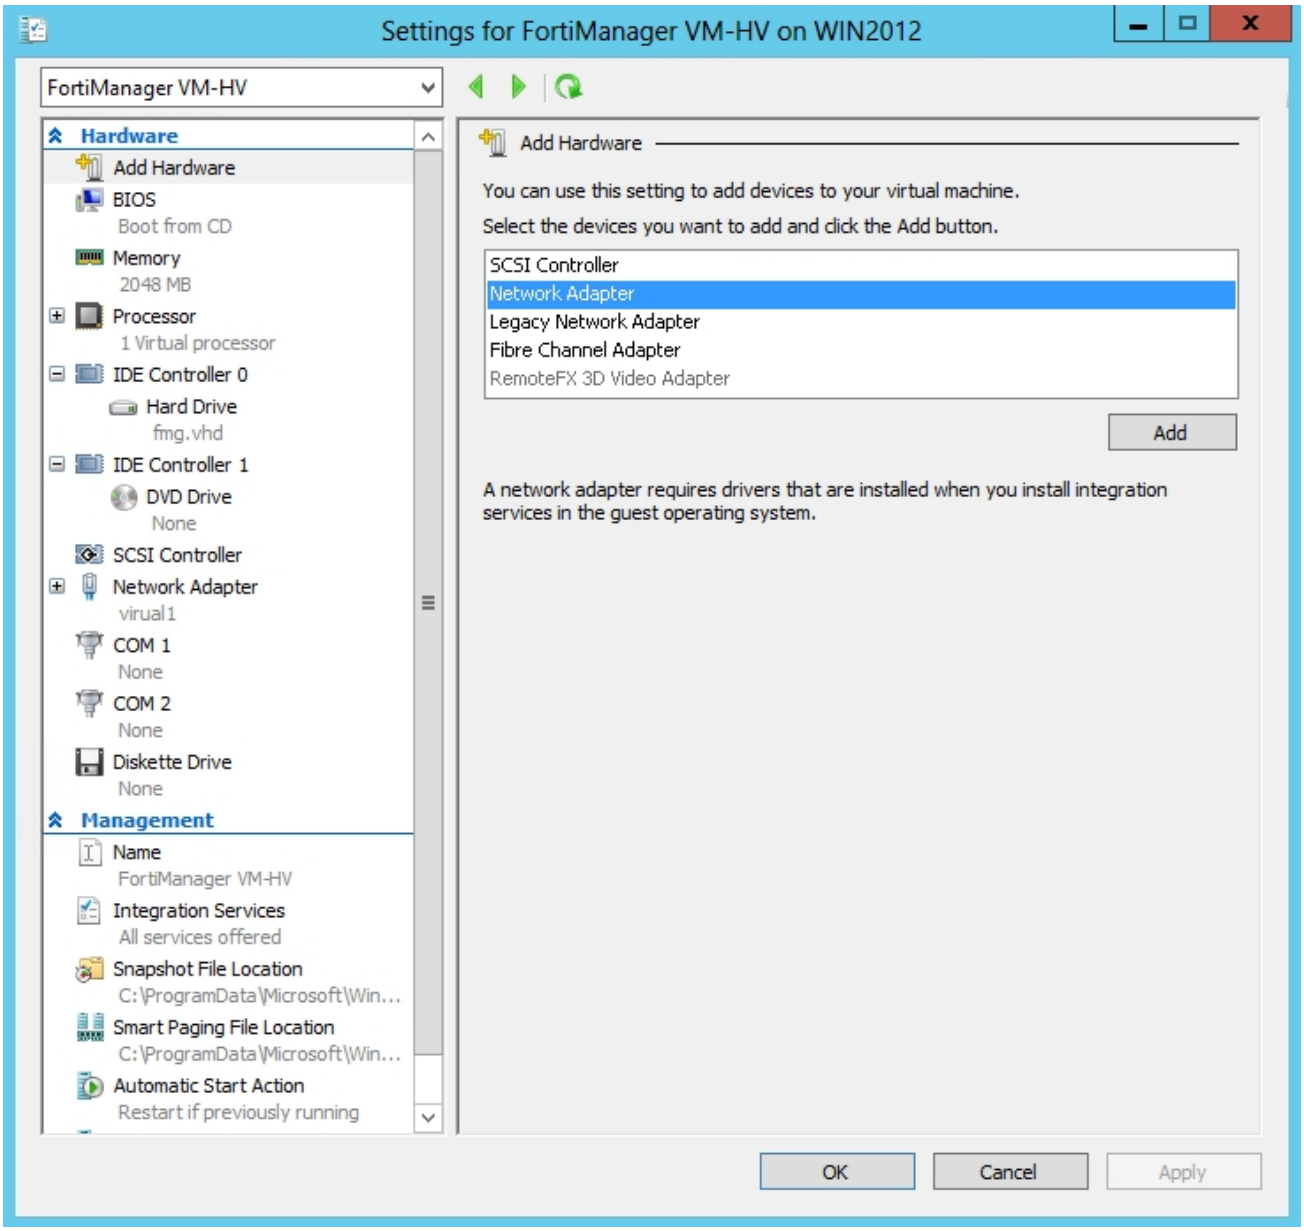
Before powering on your FortiGate VM you must configure the virtual memory, virtual CPU, and virtual disk configuration to match your FortiGate VM license.

To configure settings for FortiGate VM on the server:

1. In the Hyper-V Manager, locate the name of the virtual machine, right-click the entry, and select **Settings** from the menu. Optionally, you can select the virtual machine and select **Settings** in the **Actions** menu.



The **Settings** page is displayed.



2. Configure virtual processors, network adapters, and virtual hard drive settings.
3. Select **Apply** to save the settings and then select **OK** to close the settings page.

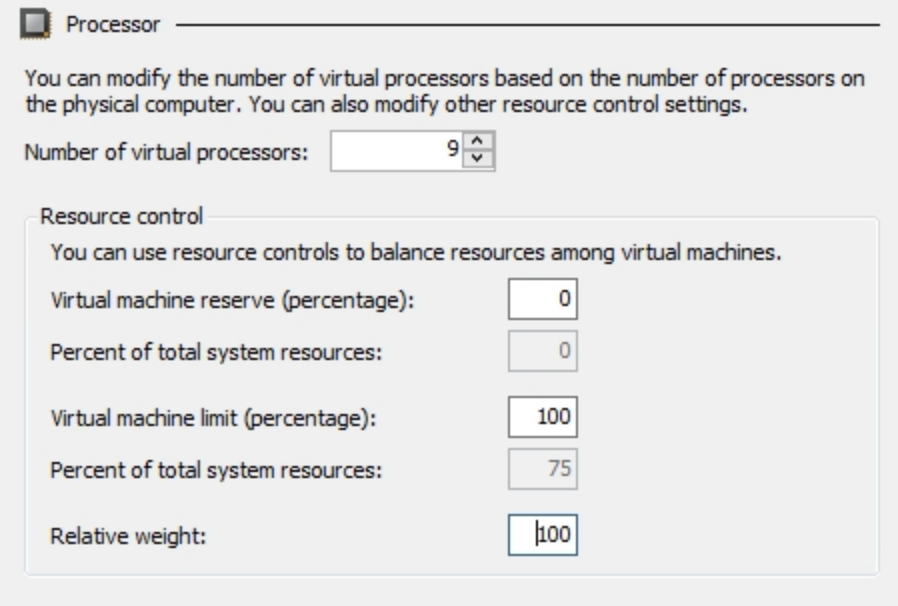
FortiGate VM virtual processors

You must configure FortiGate VM virtual processors in the server settings page. The number of processors is dependent on your server environment.

Configure FortiGate VM virtual processors:

1. In the **Settings** page, select **Processor** from the **Hardware** menu.

   The **Processor** page is displayed.



2. Configure the number of virtual processors for the FortiGate VM virtual machine. Optionally, you can use resource controls to balance resources among virtual machines.
3. Select **Apply** to save the settings.

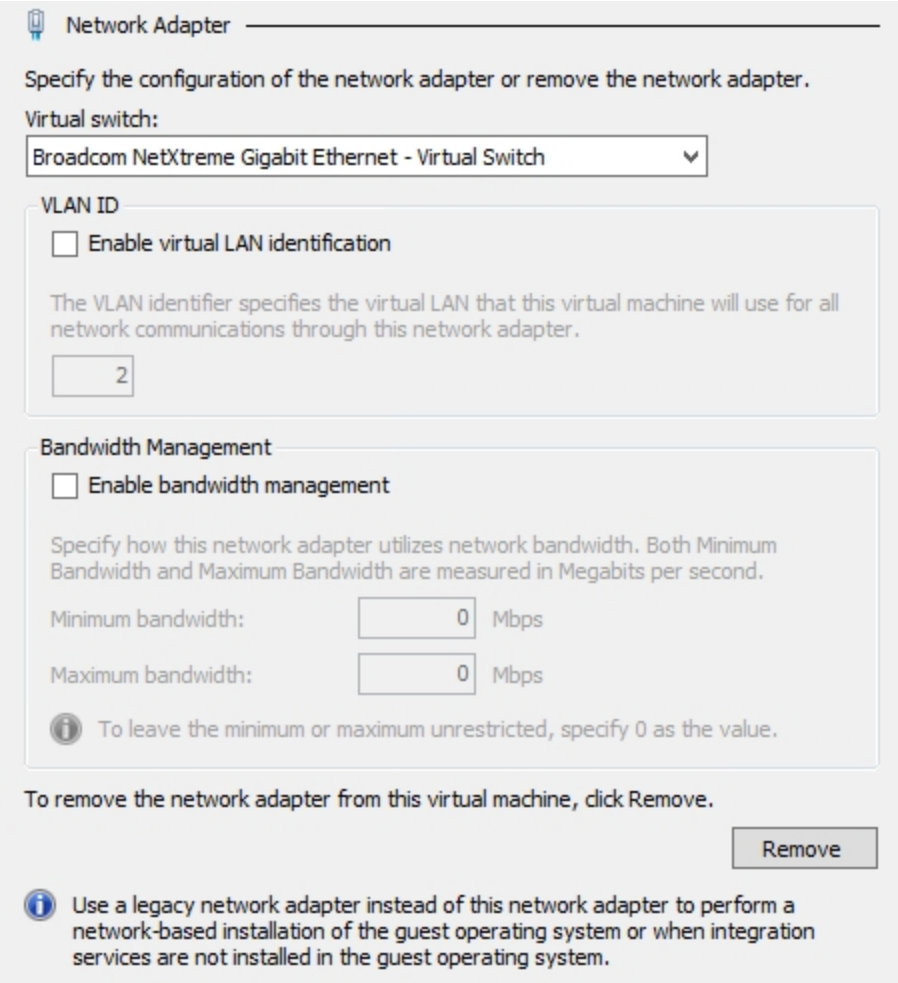
FortiGate VM network adapters

You must configure FortiGate VM network adapters in the server settings page. FortiGate VM supports four network adapters.

Configure FortiGate VM network adapters:

1. In the **Settings** page, select **Add Hardware** from the **Hardware** menu, select **Network Adapter** in the device list, and select the **Add** button.

The **Network Adapter** page is displayed.



1. You must manually configure four network adapters for FortiGate VM in the settings page. For each network adapter, select the virtual switch from the drop-down list.
2. Select **Apply** to save the settings.

FortiGate VM virtual hard disk

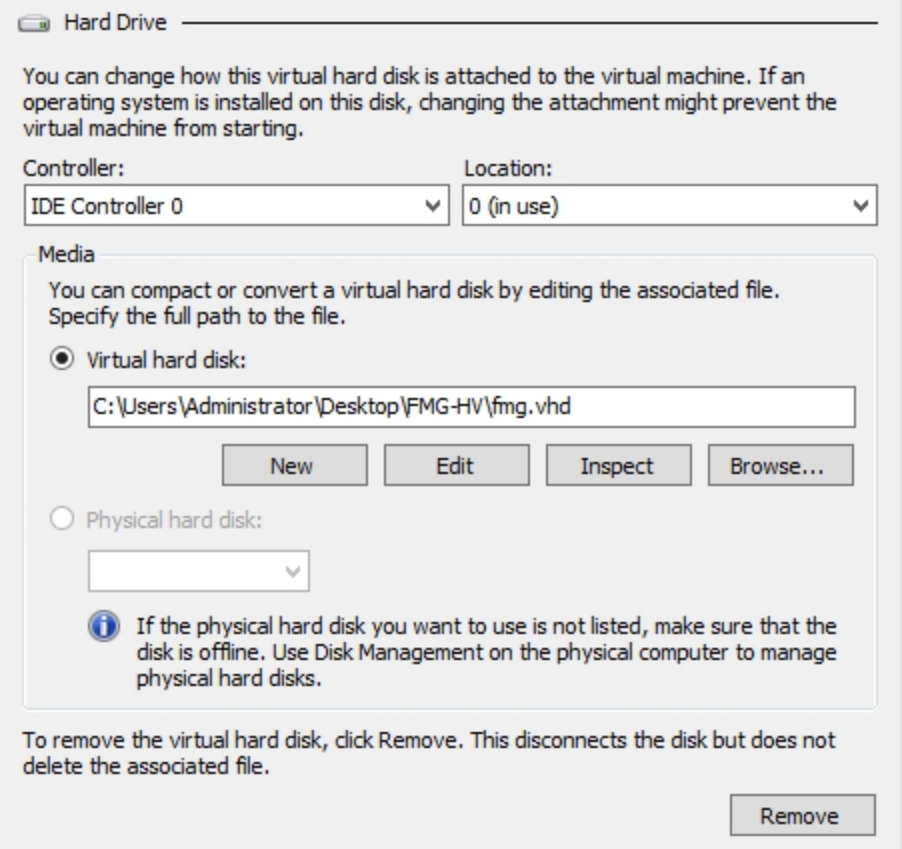
You must configure the FortiGate VM virtual hard disk in the server settings page.

If you know your environment will expand in the future, it is recommended to increase the hard disk size beyond 30GB. The VM license limit is 2TB.

Configure a FortiGate VM virtual hard drive:

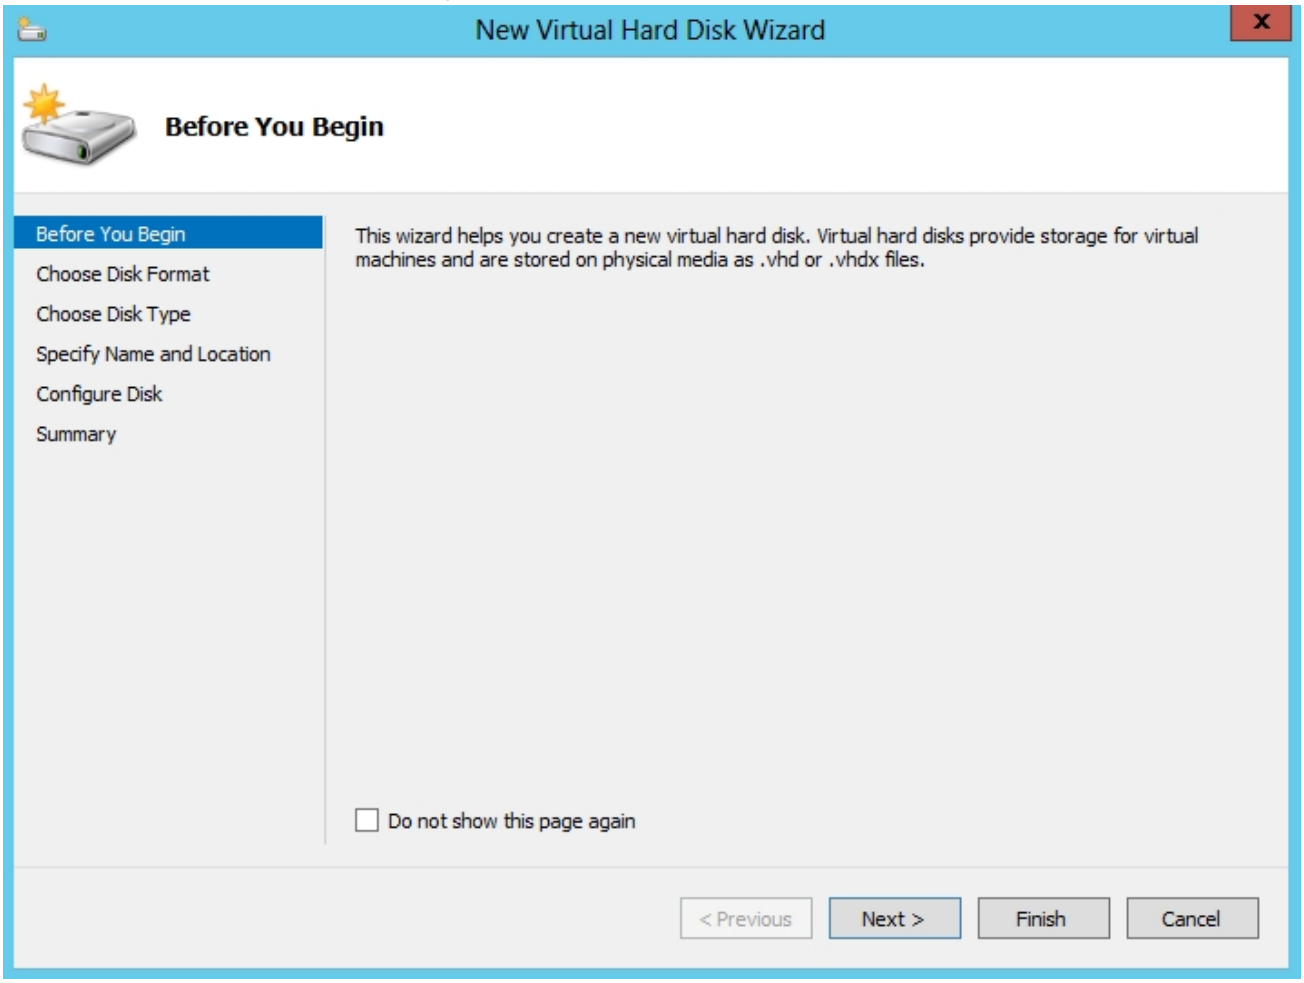
1. In the **Settings** page, select **IDE Controller 0 > Hard Drive** from the **Hardware** menu.

   The **Hard Drive** page is displayed.



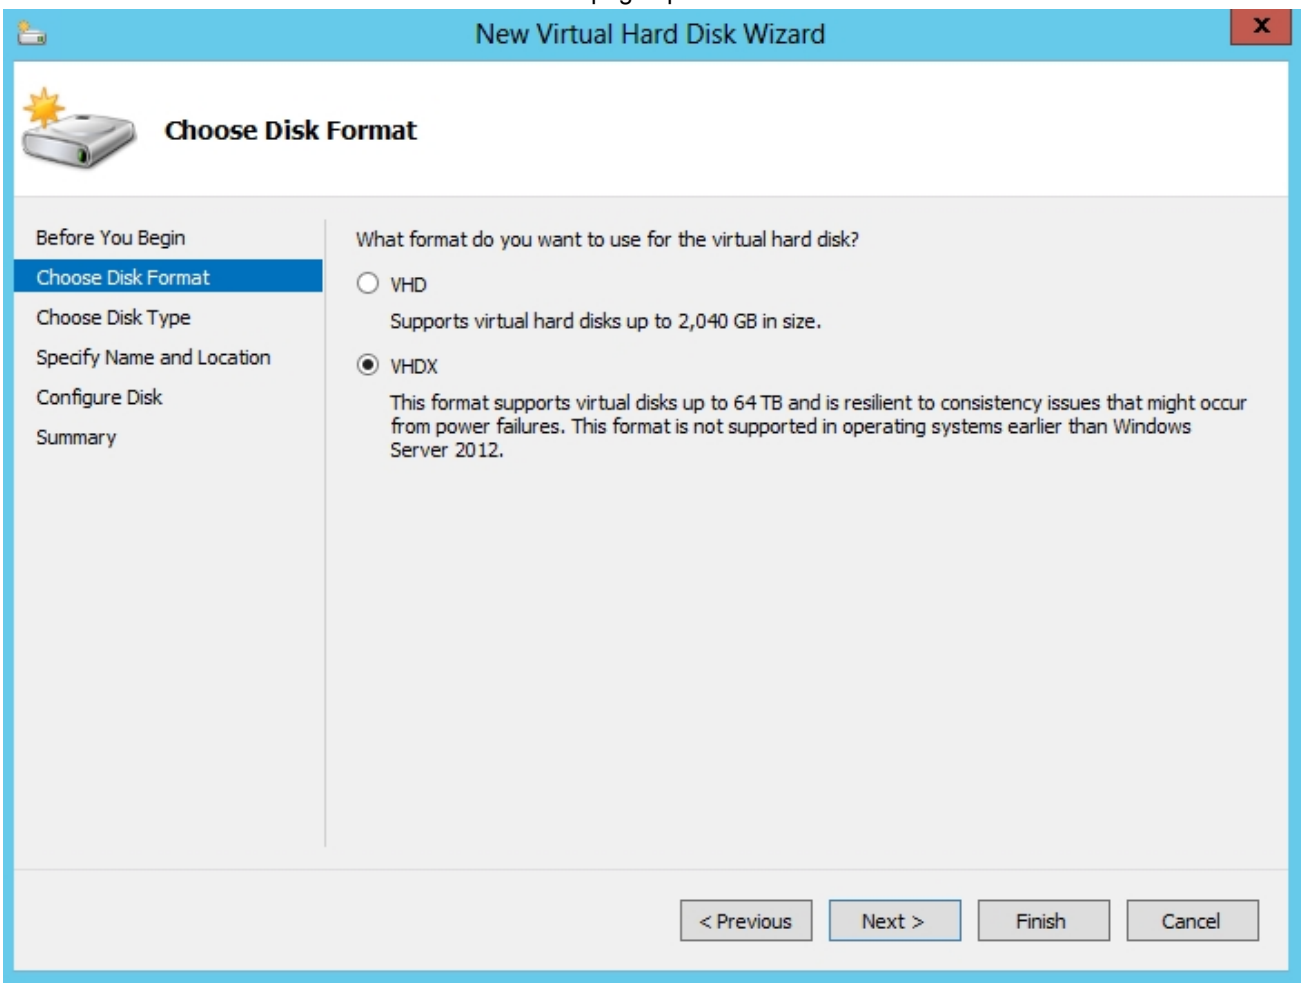
2. Select **New** to create a new virtual hard disk.

The **New Virtual Hard Disk Wizard** opens.



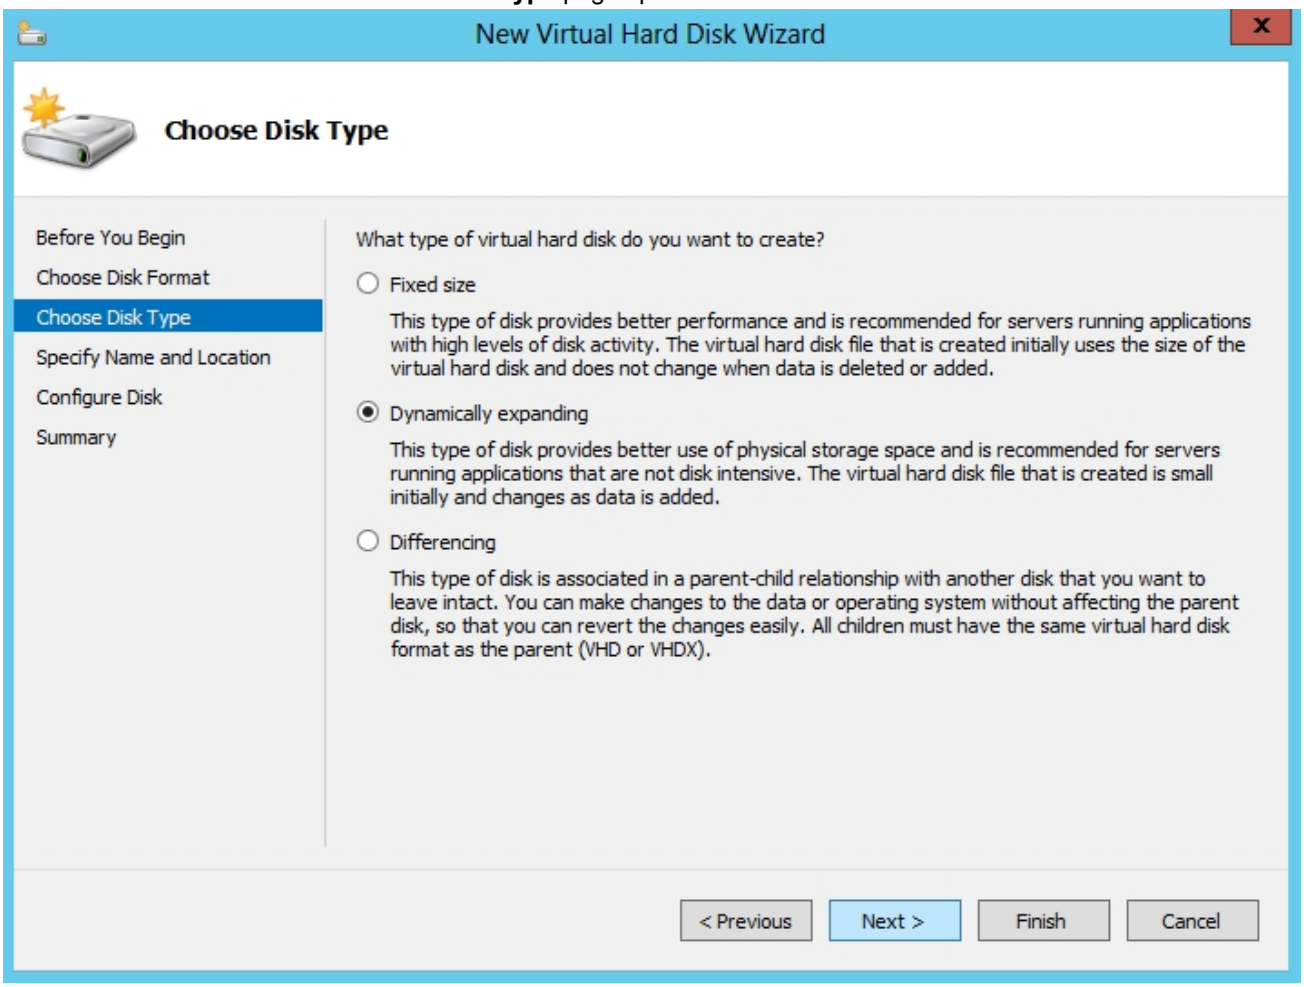
3. This wizard helps you to create a new virtual hard disk.

Select **Next** to continue. The **Choose Disk Format** page opens.



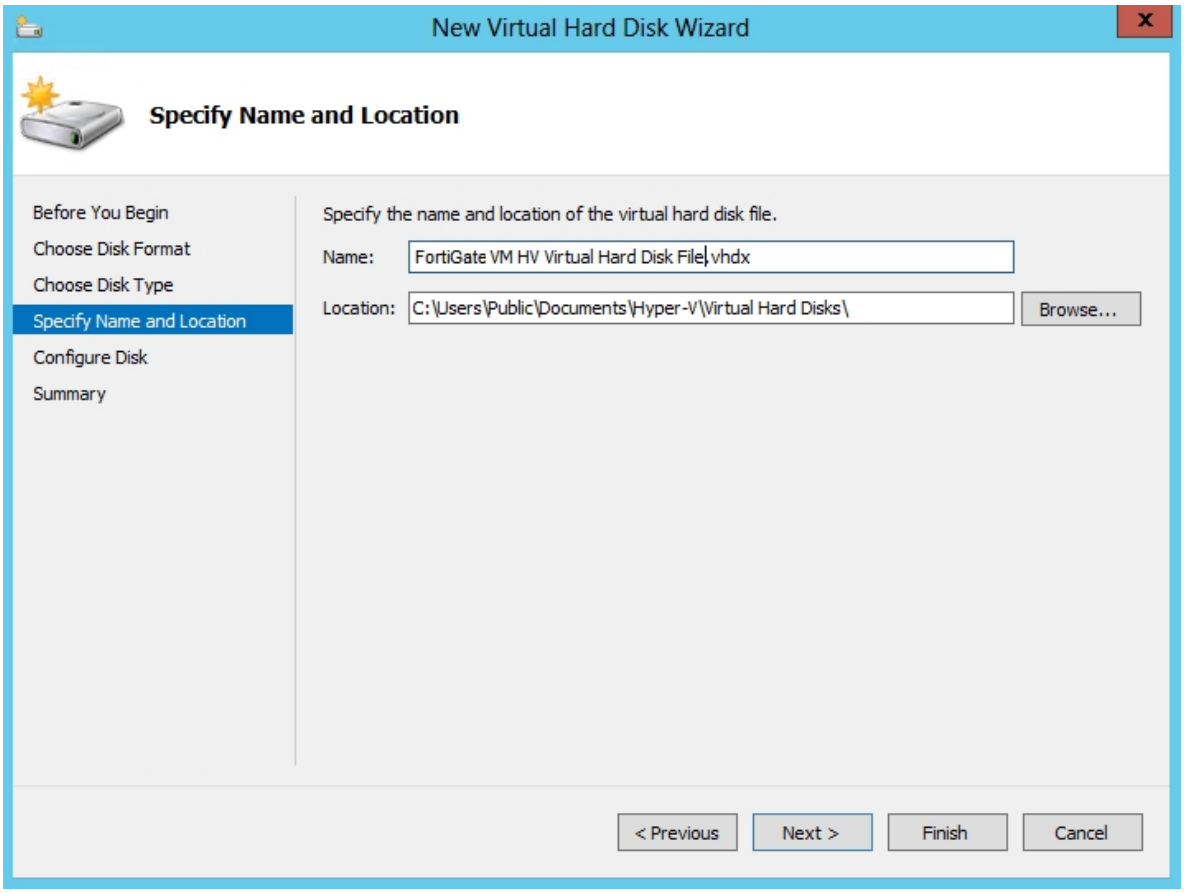
4. Select to use VHDX format virtual hard disks. This format supports virtual disks up to 64TB and is resilient to consistency issues that might occur from power failures. This format is not supported in operating systems earlier than Windows Server 2012. Note that FortiGate-VM does not support hard disks larger than 2TB.

Select **Next** to continue. The **Choose Disk Type** page opens.



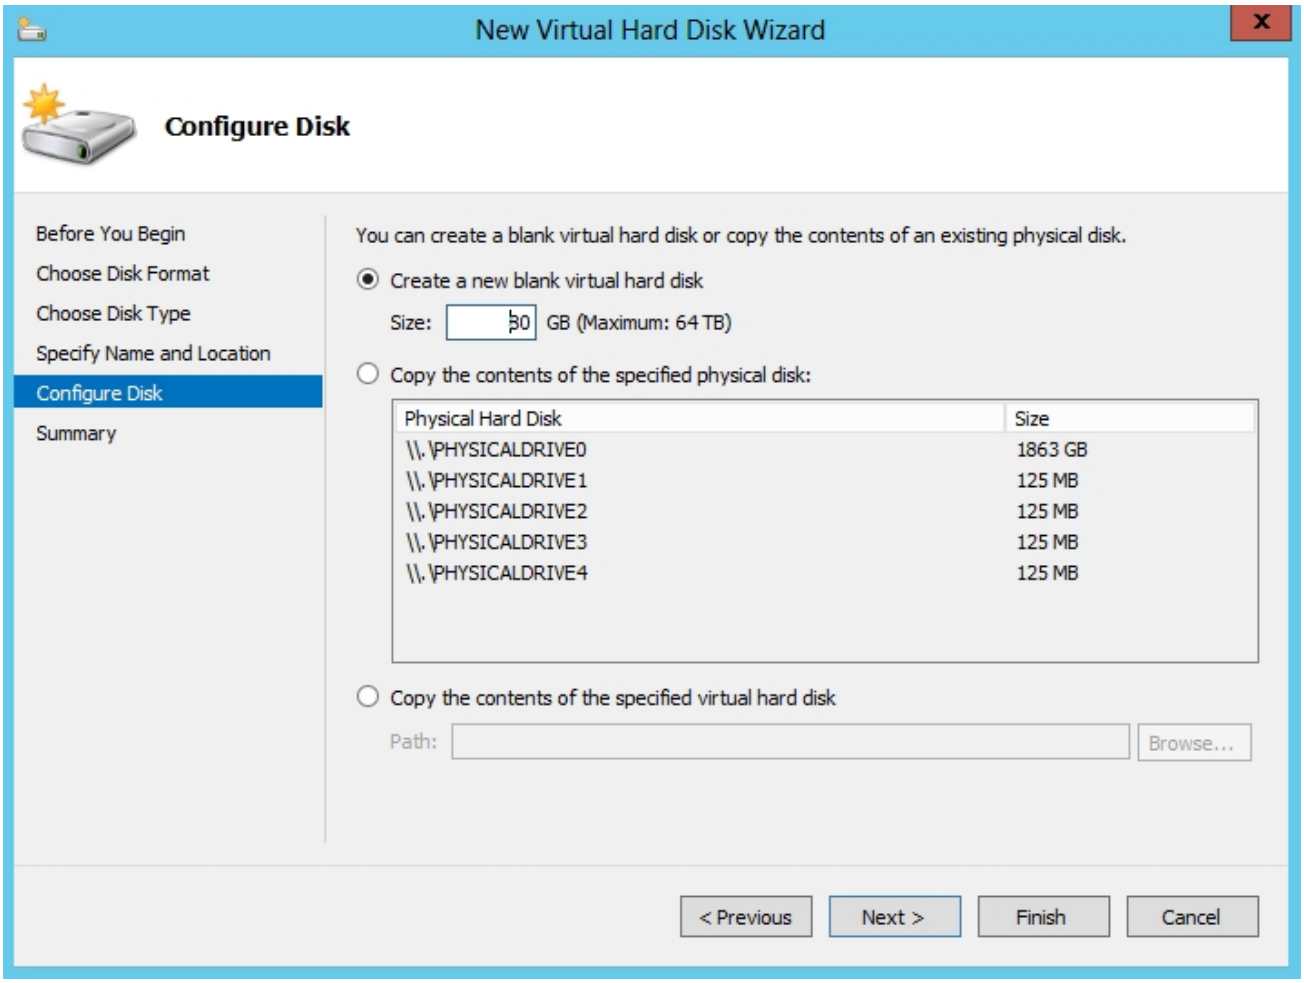
5. Select the type of virtual disk you want to use. Select one of the following disk types:
   - Fixed size: This type of disk provides better performance and is recommended for servers running applications with high levels of disk activity. The virtual hard disk file that is created initially uses the size of the virtual hard disk and does not change when data is deleted or added.
   - Dynamic expanding: This type of disk provides better use of physical storage space and is recommended for servers running applications that are not disk intensive. The virtual disk file that is created is small initially and changes as data is added.
   - Differencing: This type of disk is associated in a parent-child relationship with another disk that you want to leave intact. You can make changes to the data or operating system without affecting the parent disk, so that you can revert the changes easily. All children must have the same virtual hard disk format as the parent (VHD or VHDX).

   Select **Next** to continue. The **Specify Name and Location** page opens.



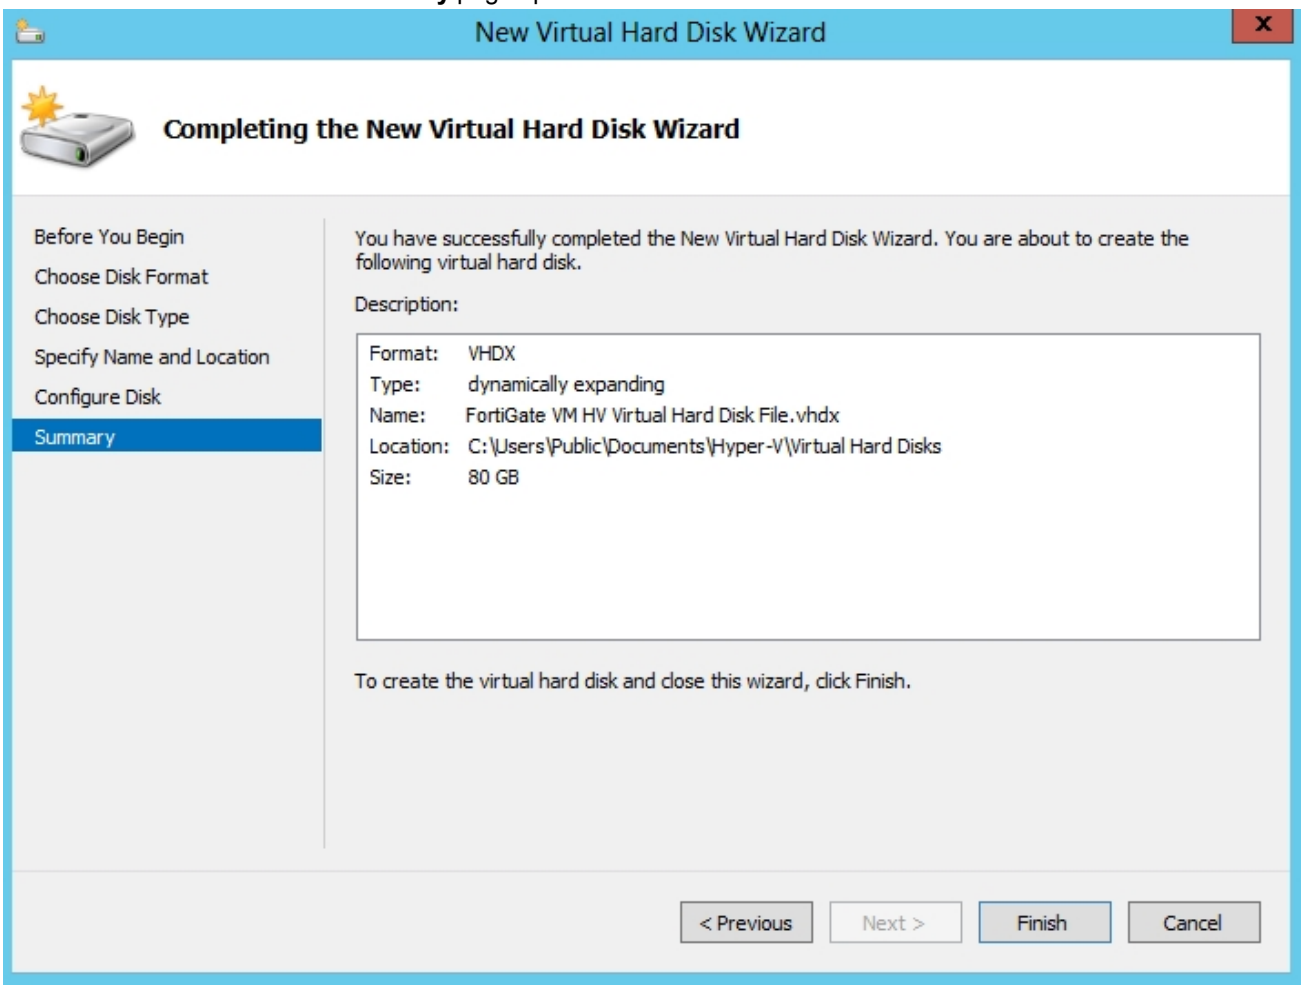
6. Specify the name and location of the virtual hard disk file. Use the **Browse** button to select a specific file folder on your server.

   Select **Next** to continue. The **Configure Disk** page opens.



7. Select to **Create a new blank virtual hard disk** and enter the size of the disk in GB. The maximum size is dependent on your server environment.

Select **Next** to continue. The **Summary** page opens.



8. The summary page provides details of the virtual hard disk. Select **Finish** to create the virtual hard disk.
9. Select **Apply** to save the settings and select **OK** to exit the settings page.

High Availability Hyper-V configuration

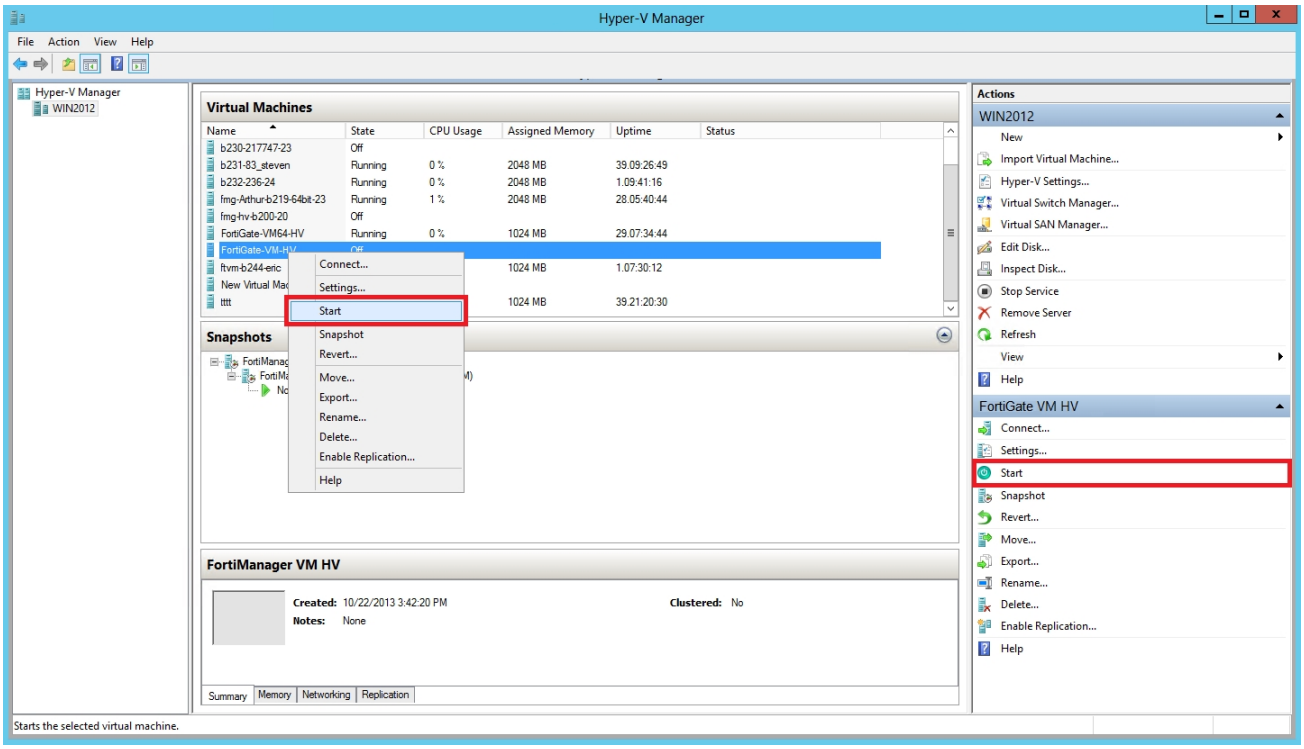
Promiscuous mode and support for MAC address spoofing is required for FortiGate-VM for Hyper-V to support FortiGate Clustering Protocol (FGCP) high availability (HA). By default the FortiGate-VM for Hyper-V has promiscuous mode enabled in the XML configuration file in the FortiGate-VM Hyper-V image. If you have problems with HA mode, confirm that this is still enabled.

In addition, because the FGCP applies virtual MAC addresses to FortiGate data interfaces and because these virtual MAC addresses mean that matching interfaces of different FortiGate-VM instances will have the same virtual MAC addresses you have to configure Hyper-V to allow MAC spoofing. But you should only enable MAC spoofing for FortiGate-VM data interfaces. You should not enable MAC spoofing for FortiGate HA heartbeat interfaces.

With promiscuous mode enabled and the correct MAC spoofing settings you should be able to configure HA between two or more FortiGate-VM for Hyper-V instances.

Start the FortiGate VM

You can now proceed to power on your FortiGate VM. Select the name of the FortiGate VM in the list of virtual machines, right-click, and select **Start** in the menu. Optionally, you can select the name of the FortiGate VM in the list of virtual machines and select **Start** in the **Actions** menu.



Deployment example – KVM

Once you have downloaded the FORTINET.out.kvm.zip file and extracted virtual hard drive image file fortios.qcow2, you can create the virtual machine in your KVM environment.

The following topics are included in this section:

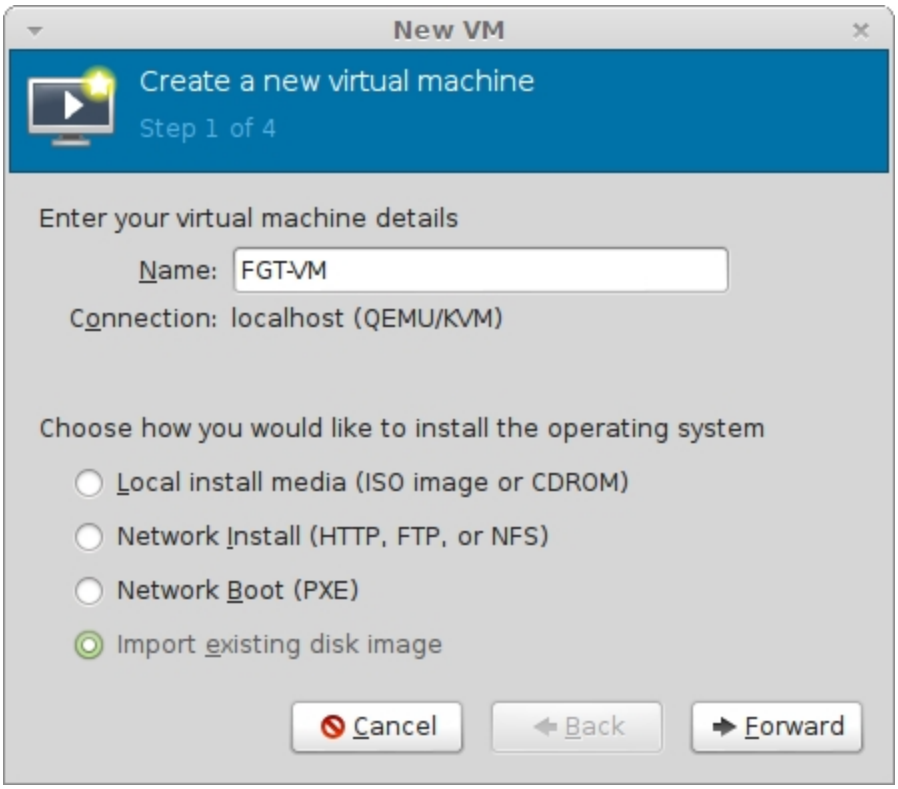
Create the FortiGate VM virtual machine
Configure FortiGate VM hardware settings
Start the FortiGate VM

Create the FortiGate VM virtual machine

To create the FortiGate VM virtual machine:

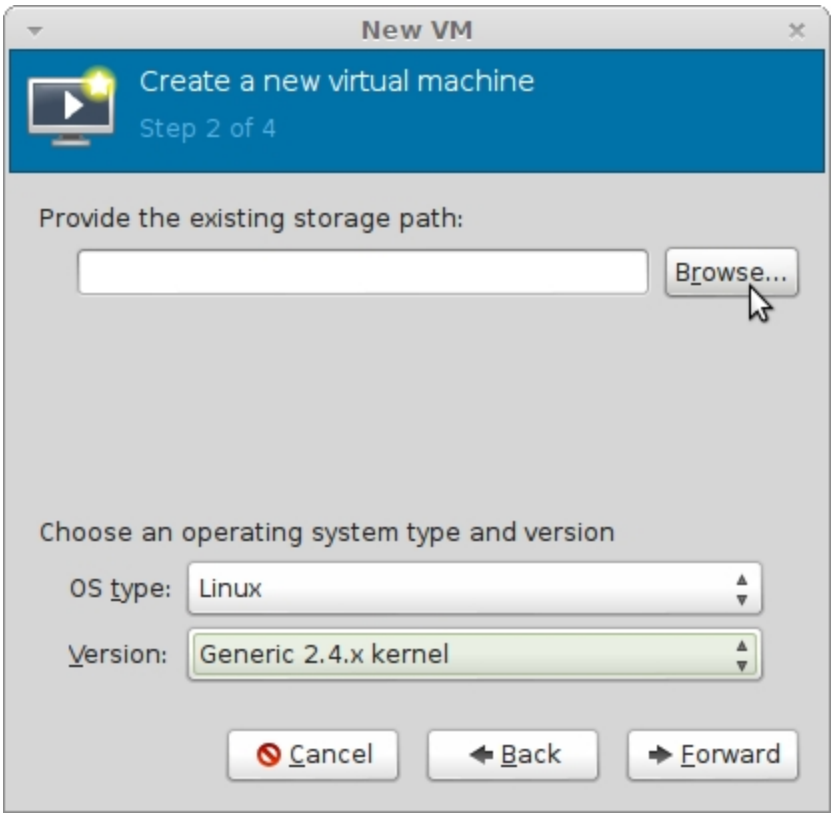
1. Launch Virtual Machine Manager (virt-manager) on your KVM host server.

   The **Virtual Machine Manager** home page opens.
2. In the toolbar, select **Create a new virtual machine**.



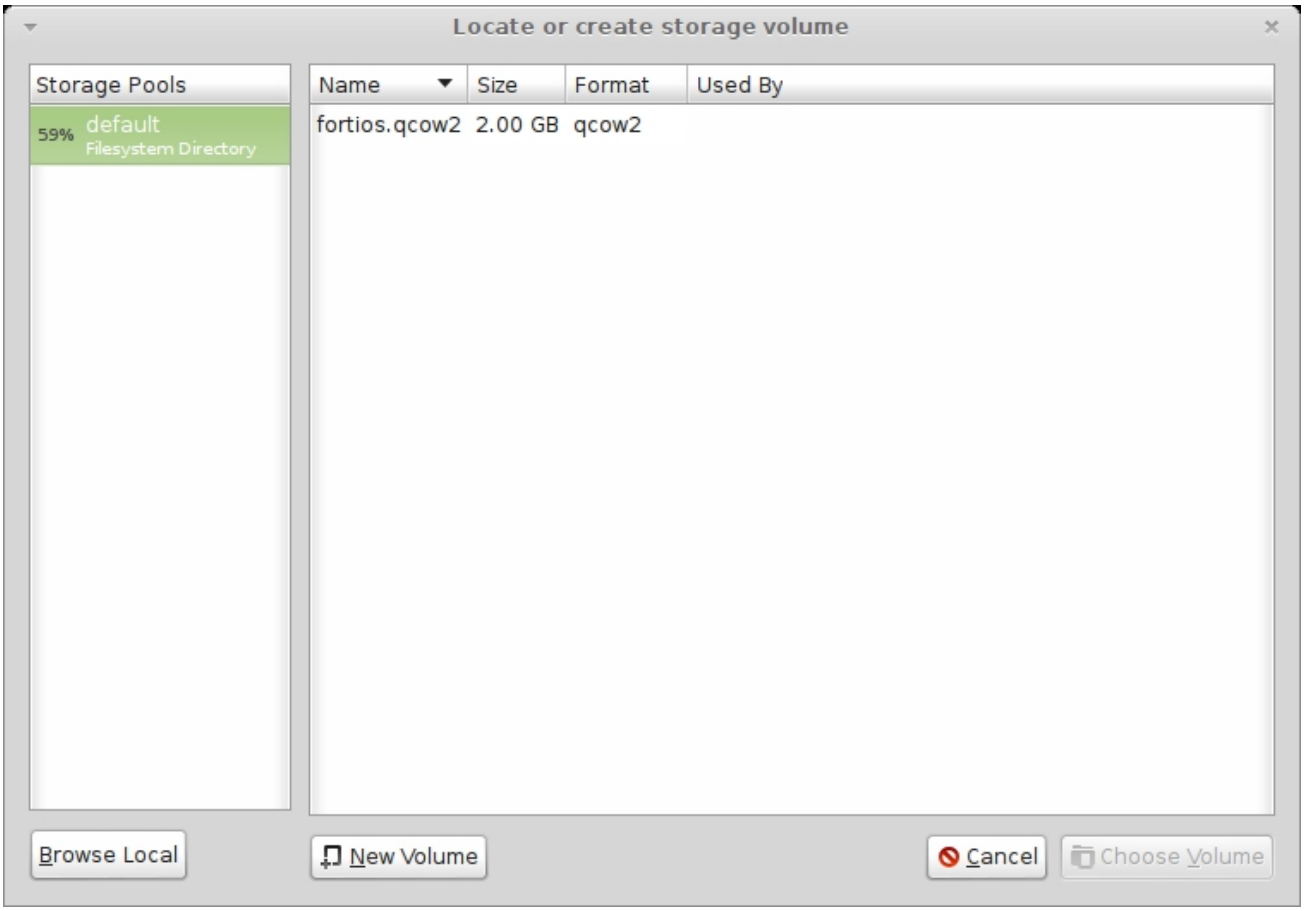
3. Enter a **Name** for the VM, FGT-VM for example.
4. Ensure that **Connection** is localhost. (This is the default.)
5. Select **Import existing disk image**.

6. Select **Forward**.



7. In **OS Type** select **Linux**.
8. In **Version**, select **Generic 2.4.x.kernel**.

9. Select **Browse**.



10. If you copied the fortios.qcow2 file to `/var/lib/libvirt/images`, it will be visible on the right. If you saved it somewhere else on your server, select Browse Local and find it.
11. Choose **Choose Volume**.
12. Select **Forward**.
13. Specify the amount of memory and number of CPUs to allocate to this virtual machine. The amounts must not exceed your license limits. See FortiGate VM Overview on page 2658.
14. Select **Forward**.
15. Expand **Advanced options**. A new virtual machine includes one network adapter by default. Select a network adapter on the host computer. Optionally, set a specific MAC address for the virtual network interface. Set **Virt Type** to **virtio** and **Architecture** to **qcow2**.
16. Select **Finish**.

Configure FortiGate VM hardware settings

Before powering on your FortiGate VM you must add the log disk and configure the virtual hardware of your FortiGate VM.

To configure settings for FortiGate VM on the server:

1. In the Virtual Machine Manager, locate the name of the virtual machine and then select Open from the toolbar.
2. Select **Add Hardware**. In the **Add Hardware** window select **Storage**.

3. Select **Create a disk image on the computer's harddrive** and set the size to 30GB.

   If you know your environment will expand in the future, it is recommended to increase the hard disk size beyond 30GB. The VM license limit is 2TB.

4. Enter:

Device type	Virtio disk
Cache mode	Default
Storage format	raw

   Even though raw is the storage format listed, the qcow2 format is also supported.

5. Select **Network** to configure add more the network interfaces. The **Device type** must be **Virtio**.

   A new virtual machine includes one network adapter by default. You can add more through the Add Hardware window. FortiGate VM requires four network adapters. You can configure network adapters to connect to a virtual switch or to network adapters on the host computer.
6. Select **Finish**.

Start the FortiGate VM

You can now proceed to power on your FortiGate VM. Select the name of the FortiGate VM in the list of virtual machines. In the toolbar, select **Console** and then select **Start**.

Deployment example – OpenXen

Once you have downloaded the FORTINET.out.OpenXen.zip file and extracted virtual hard drive image file fortios.qcow2, you can create the virtual machine in your OpenXen environment.

The following topics are included in this section:

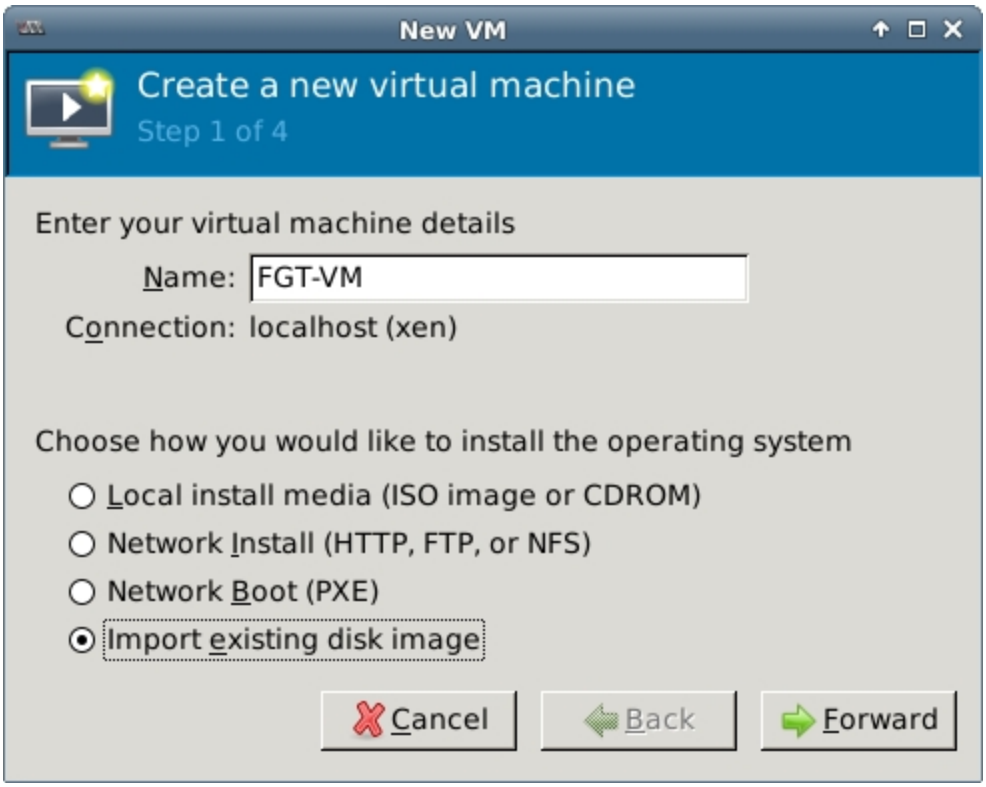
Create the FortiGate VM virtual machine (VMM)

Create the FortiGate VM virtual machine (VMM)

To create the FortiGate VM virtual machine:

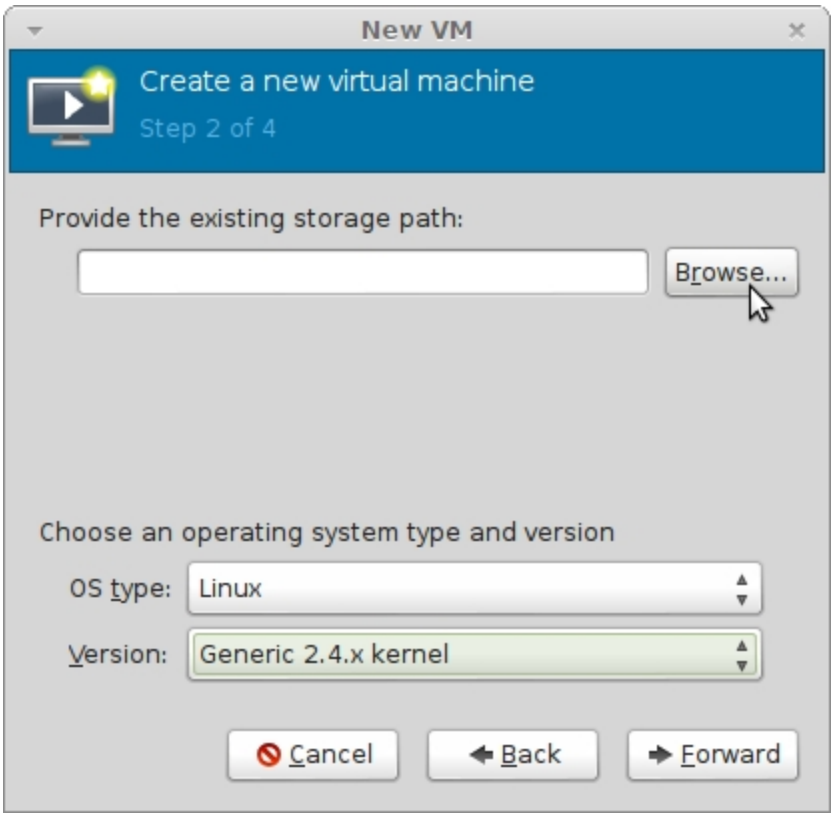
1. Launch Virtual Machine Manager (virt-manager) on your OpenXen host server.

   The **Virtual Machine Manager** home page opens.
2. In the toolbar, select **Create a new virtual machine**.



3. Enter a **Name** for the VM, FGT-VM for example.
4. Ensure that **Connection** is localhost. (This is the default.)
5. Select **Import existing disk image**.

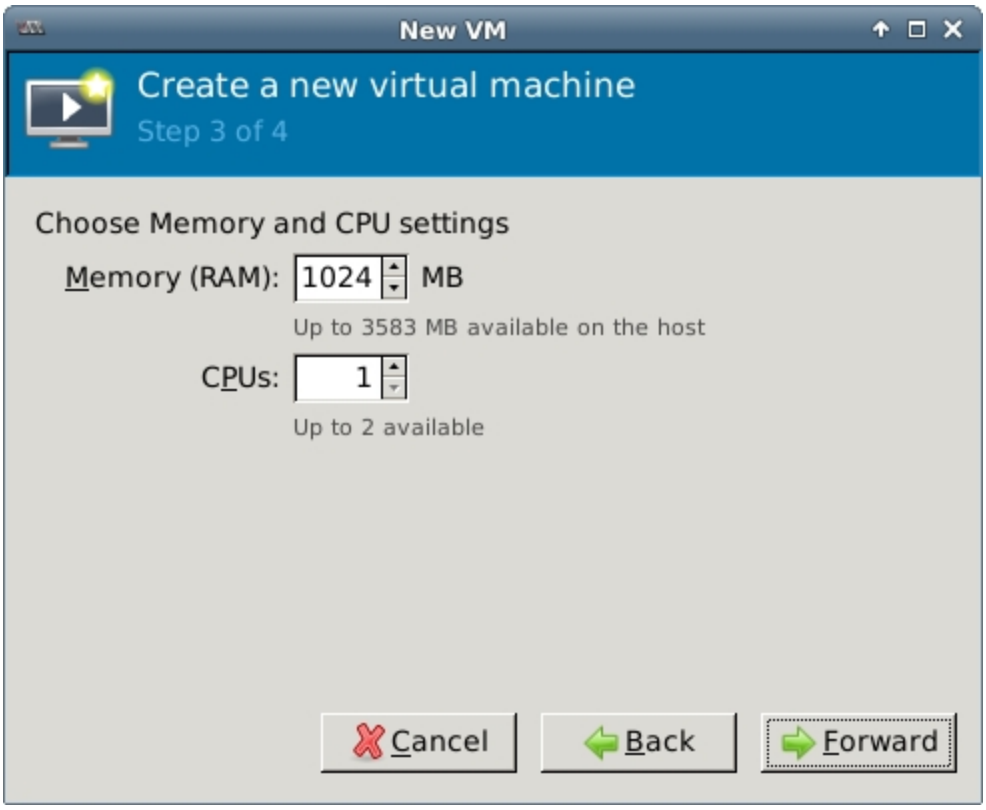
6. Select **Forward**.



7. In **OS Type** select **Linux**.
8. In **Version**, select **Generic 2.4.x.kernel**.
9. Select **Browse**.

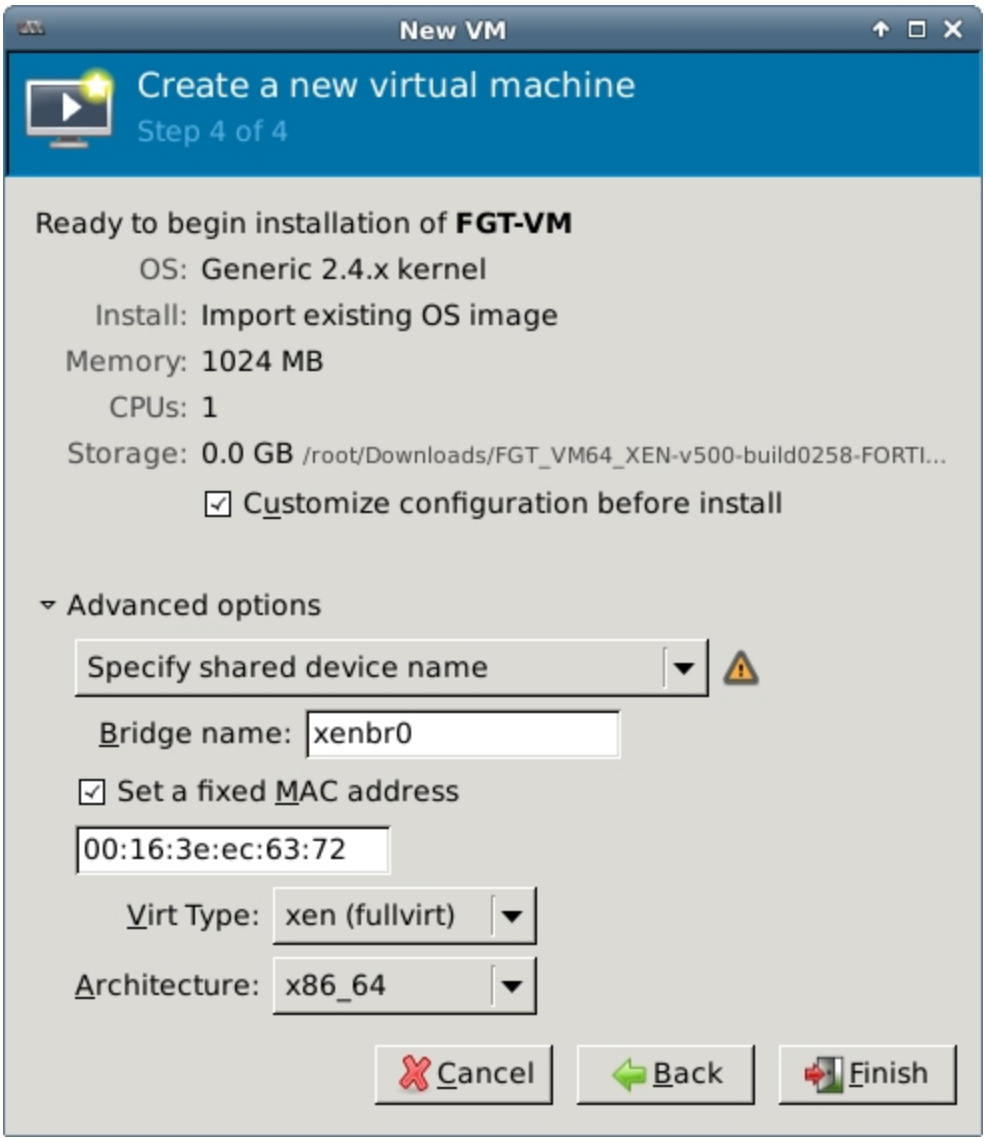
   The **Locate or create storage volume** window opens.
10. Select **Browse Local,** find the fortios.qcow2 disk image file.
11. Select fortios.qcow2 and select **Choose Volume**.

12. Select **Forward**.



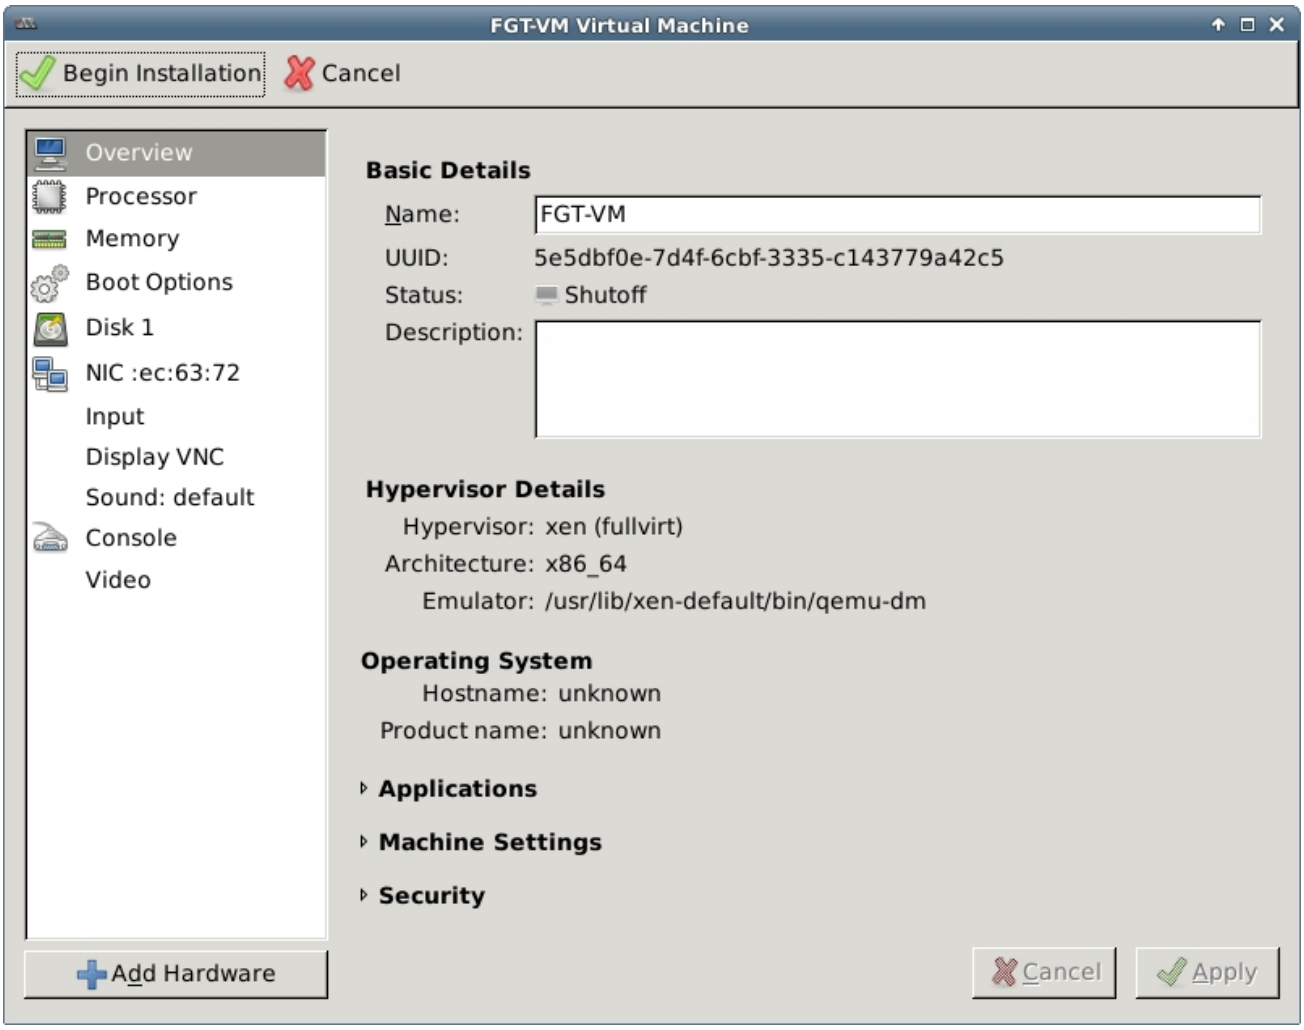
13. Specify the amount of memory and number of CPUs to allocate to this virtual machine. The amounts must not exceed your license limits.

14. Select **Forward**.



15. Select **Customize configuration before install**. This enables you to make some hardware configuration changes before VM creation is started.
16. Expand **Advanced options**. A new virtual machine includes one network adapter by default. Select **Specify shared device name** and enter the name of the bridge interface on the OpenXen host. Optionally, set a specific MAC address for the virtual network interface. **Virt Type** and **Architecture** are set by default and should be correct.
17. Select **Finish**.

    The virtual machine hardware configuration window opens.



You can use this window to add hardware such as network interfaces and disk drives.

18. Select **Add Hardware**. In the **Add Hardware** window select **Storage**.
19. Select **Create a disk image on the computer's harddrive** and set the size to 30GB.

If you know your environment will expand in the future, it is recommended to increase the hard disk size beyond 30GB. The VM license limit is 2TB.

20. Enter:

Device type	Virtio disk
Cache mode	Default
Storage format	raw

21. Select **Network** to configure add more the network interfaces. The **Device type** must be **Virtio**.

A new virtual machine includes one network adapter by default. You can add more through the Add Hardware

window. FortiGate VM requires four network adapters. You can configure network adapters to connect to a virtual switch or to network adapters on the host computer.

22. Select **Finish**.
23. Select **Begin Installation**. After the installation completes successfully, the VM starts and the console window opens.

Deployment example – Citrix XenServer

Once you have downloaded the FORTINET.out.CitrixXen.zip file and extracted the files, you can create the virtual machine in your Citrix Xen environment.

The following topics are included in this section:

Create the FortiGate VM virtual machine (XenCenter)
Configure virtual hardware

Create the FortiGate VM virtual machine (XenCenter)

To create the FortiGate VM virtual machine from the OVF file

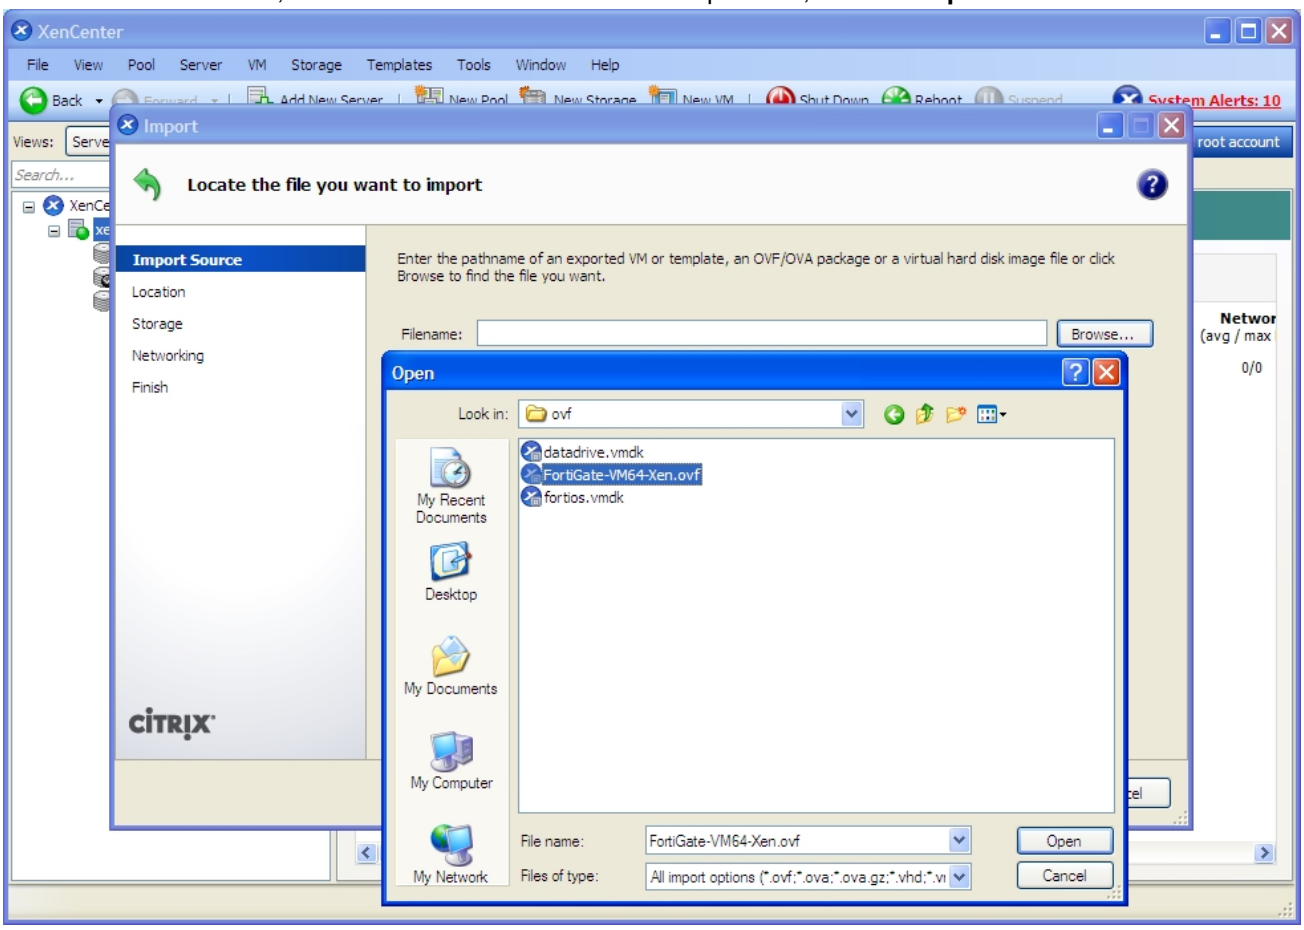
1. Launch XenCenter on your management computer.

   The management computer can be any computer that can run Citrix XenCenter, a Windows application.
2. If you have not already done so, select **ADD a server**. Enter your Citrix XenServer IP address and the root logon credentials required to manage that server.

   Your Citrix XenServer is added to the list in the left pane.

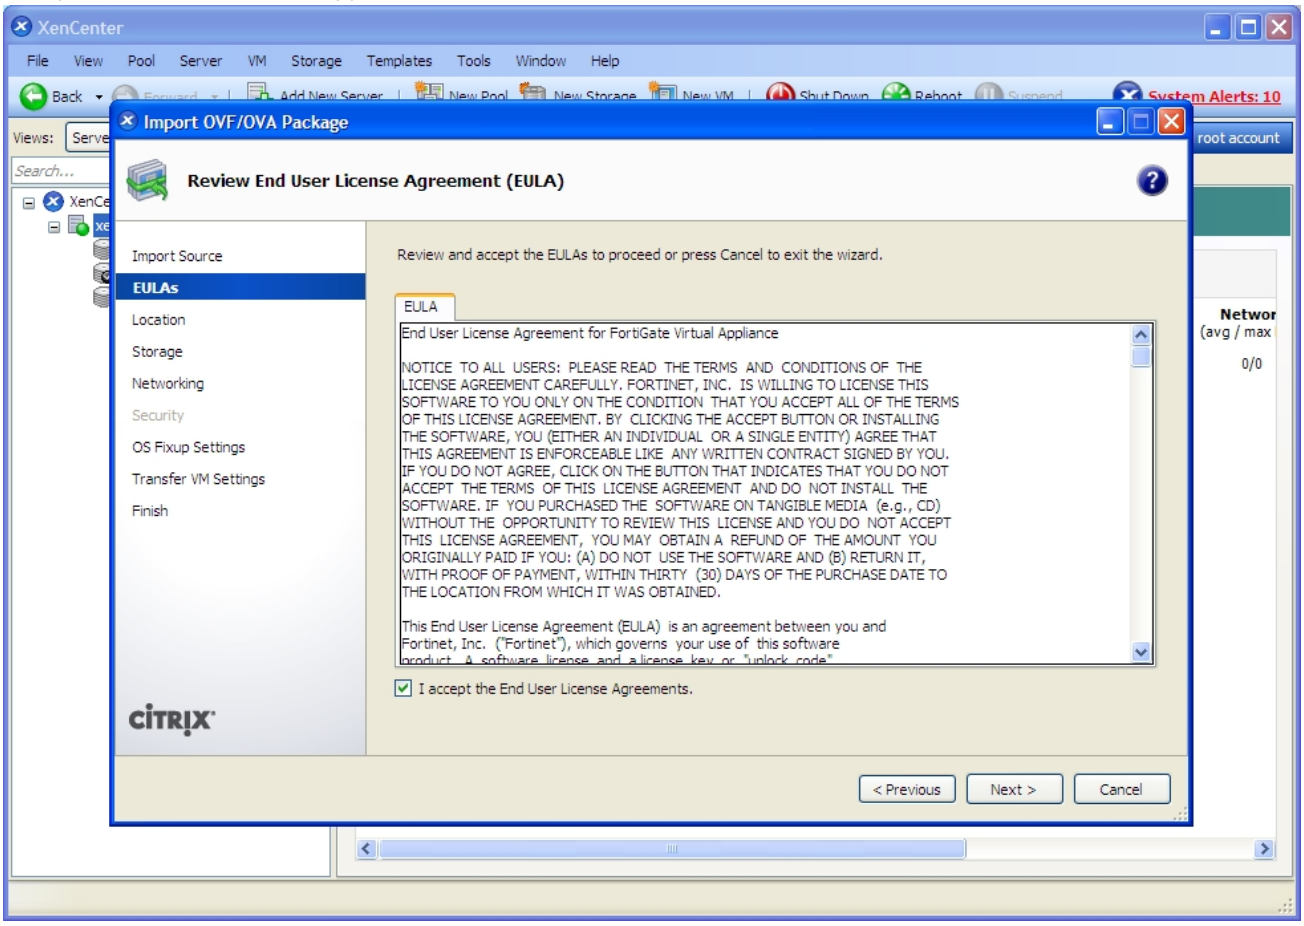
   The **Virtual Machine Manager** home page opens.
3. Go to **File > Import**. An import dialog will appear.

4. Click the **Browse** button, find the FortiGate-VM64-Xen.ovf template file, then click **Open**.



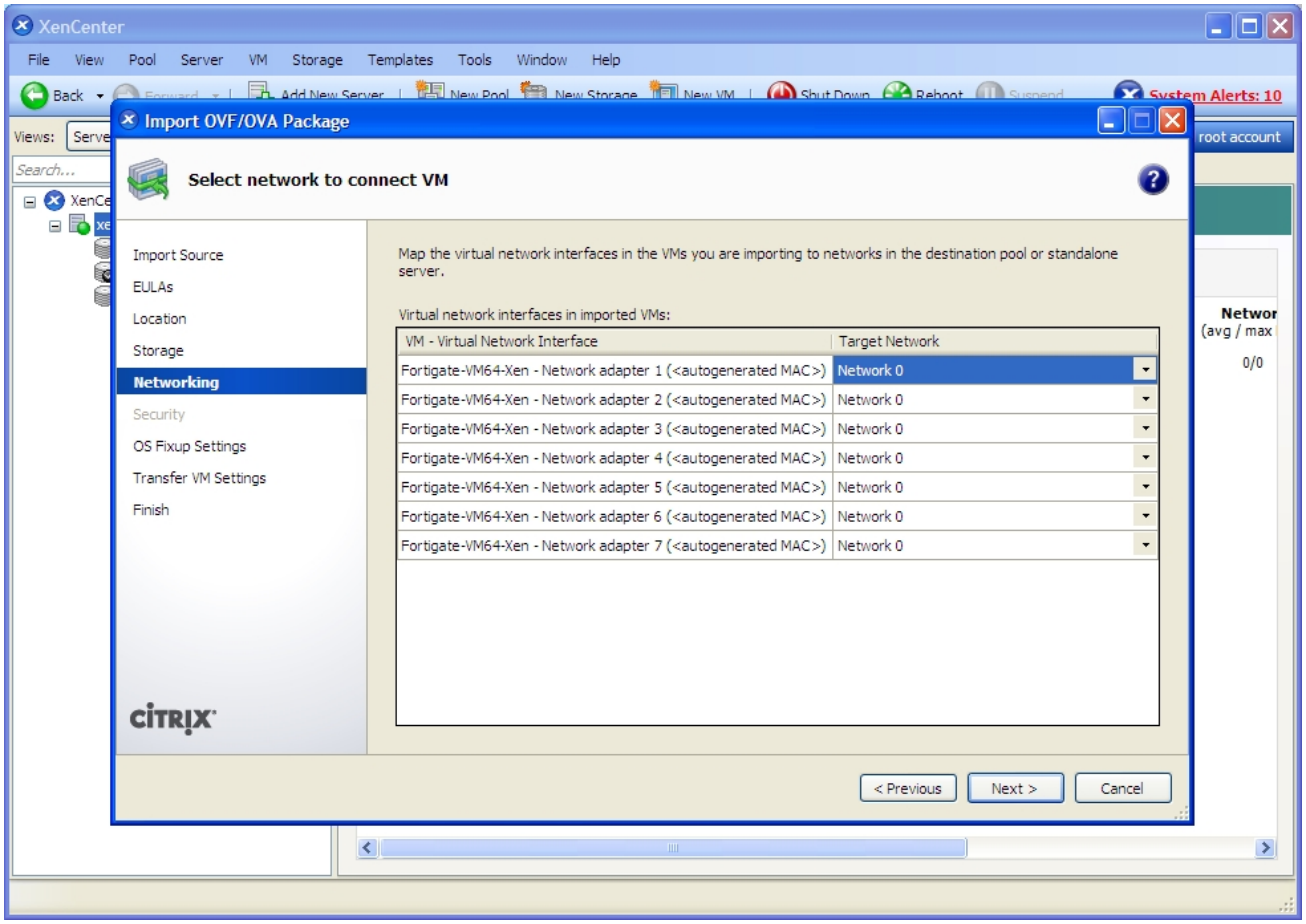
5. Select **Next**.

6. Accept the FortiGate Virtual Appliance EULA, then select **Next**.



7. Choose the pool or standalone server that will host the VM, then select **Next**.
8. Select the storage location for FortiGate VM disk drives or accept the default. Select **Next**.

9. Configure how each vNIC (virtual network adapter) in FortiGate VM will be mapped to each vNetwork on the Citrix XenServer, then click **Next**.



10. Click **Next** to skip OS fixup.
11. Select **Next** to use the default network settings for transferring the VM to the host.
12. Select **Finish**.

The Citrix XenServer imports the FortiGate VM files and configures the VM as specified in the OVF template. Depending on your computer's hardware speed and resource load, and also on the file size and speed of the network connection, this might take several minutes to complete.

When VM import is complete, the XenCenter left pane includes the FortiGate VM in the list of deployed VMs for your Citrix XenServer.

Configure virtual hardware

Before you start your FortiGate-VM for the first time, you need to adjust your virtual machine's virtual hardware settings to meet your network requirements.

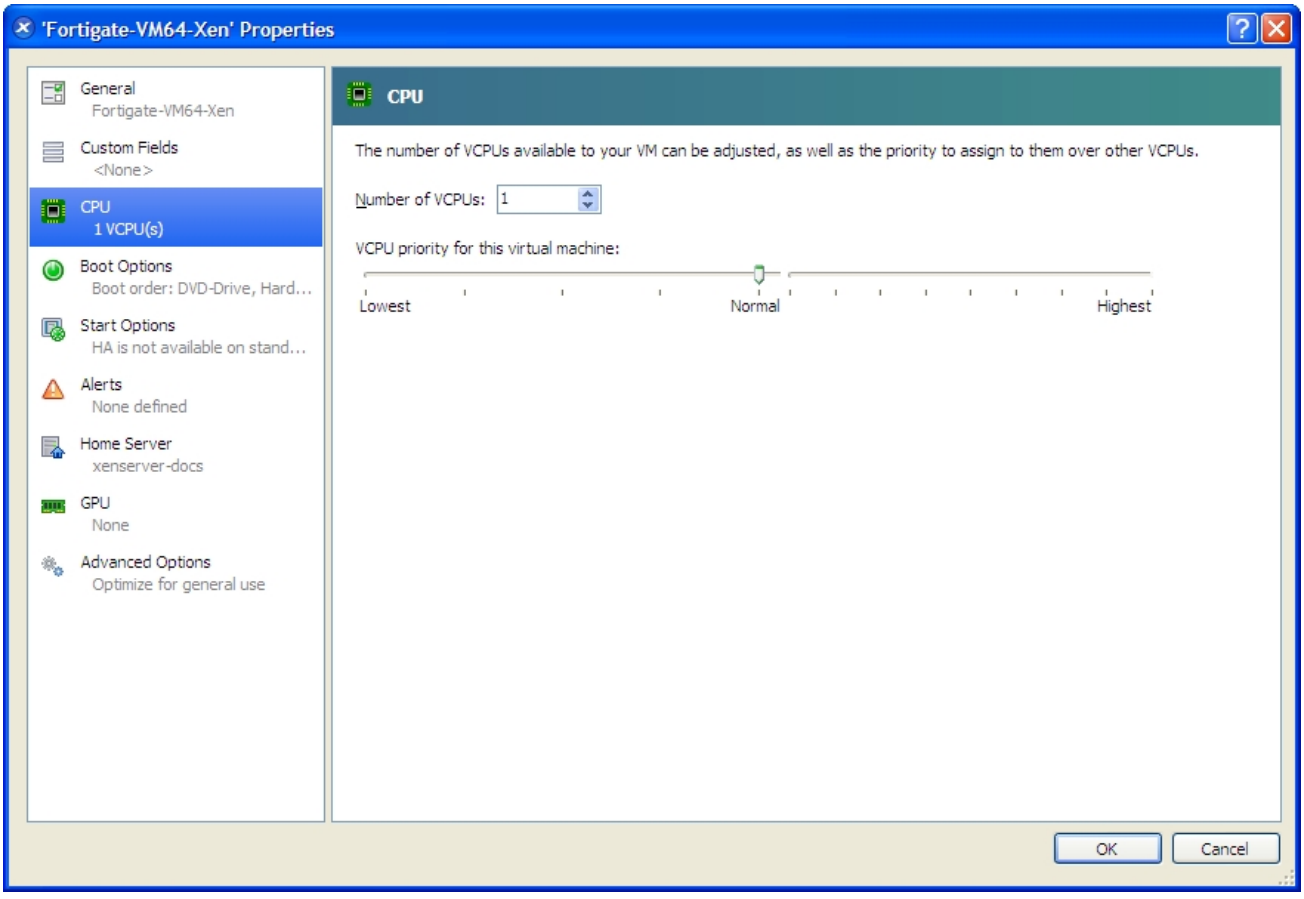
Configuring number of CPUs and memory size

Your FortiGate-VM license limits the number CPUs and amount of memory that you can use. The amounts you allocate must not exceed your license limits.

To access virtual machine settings

1. Open XenCenter.
2. Select your FortiGate VM in the left pane.
   The tabs in the right pane provide access to the virtual hardware configuration. The Console tab provides access to the FortiGate console.

1. To set the number of CPUs
2. In the XenCenter left pane, right-click the FortiGate VM and select Properties.
   The Properties window opens.
3. In the left pane, select CPU.

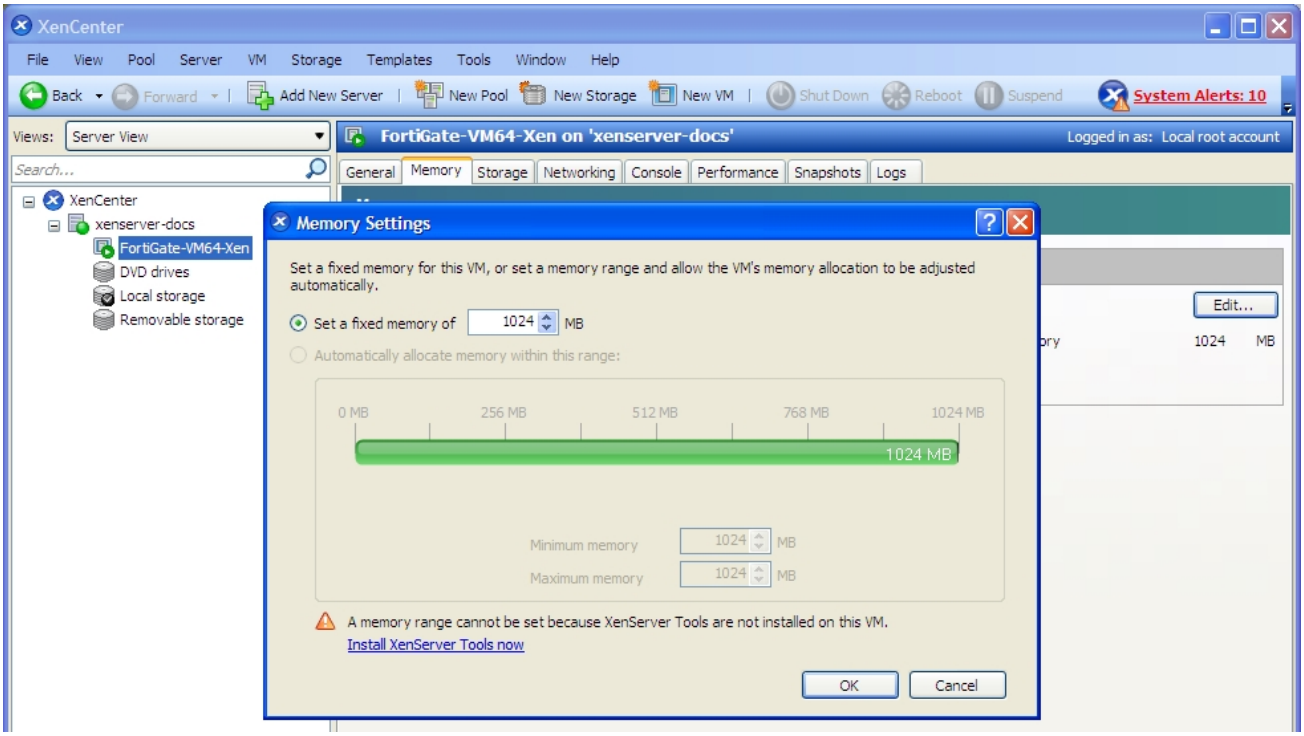


4. Adjust **Number of CPUs** and then select **OK**.

XenCenter will warn if you select more CPUs than the Xen host computer contains. Such a configuration might reduce performance.

To set memory size

1. In the XenCenter left pane, select the FortiGate VM.
2. In the right pane, select the **Memory** tab.
3. Select **Edit**, modify the value in the **Set a fixed memory of** field and select **OK**.



Configuring disk storage

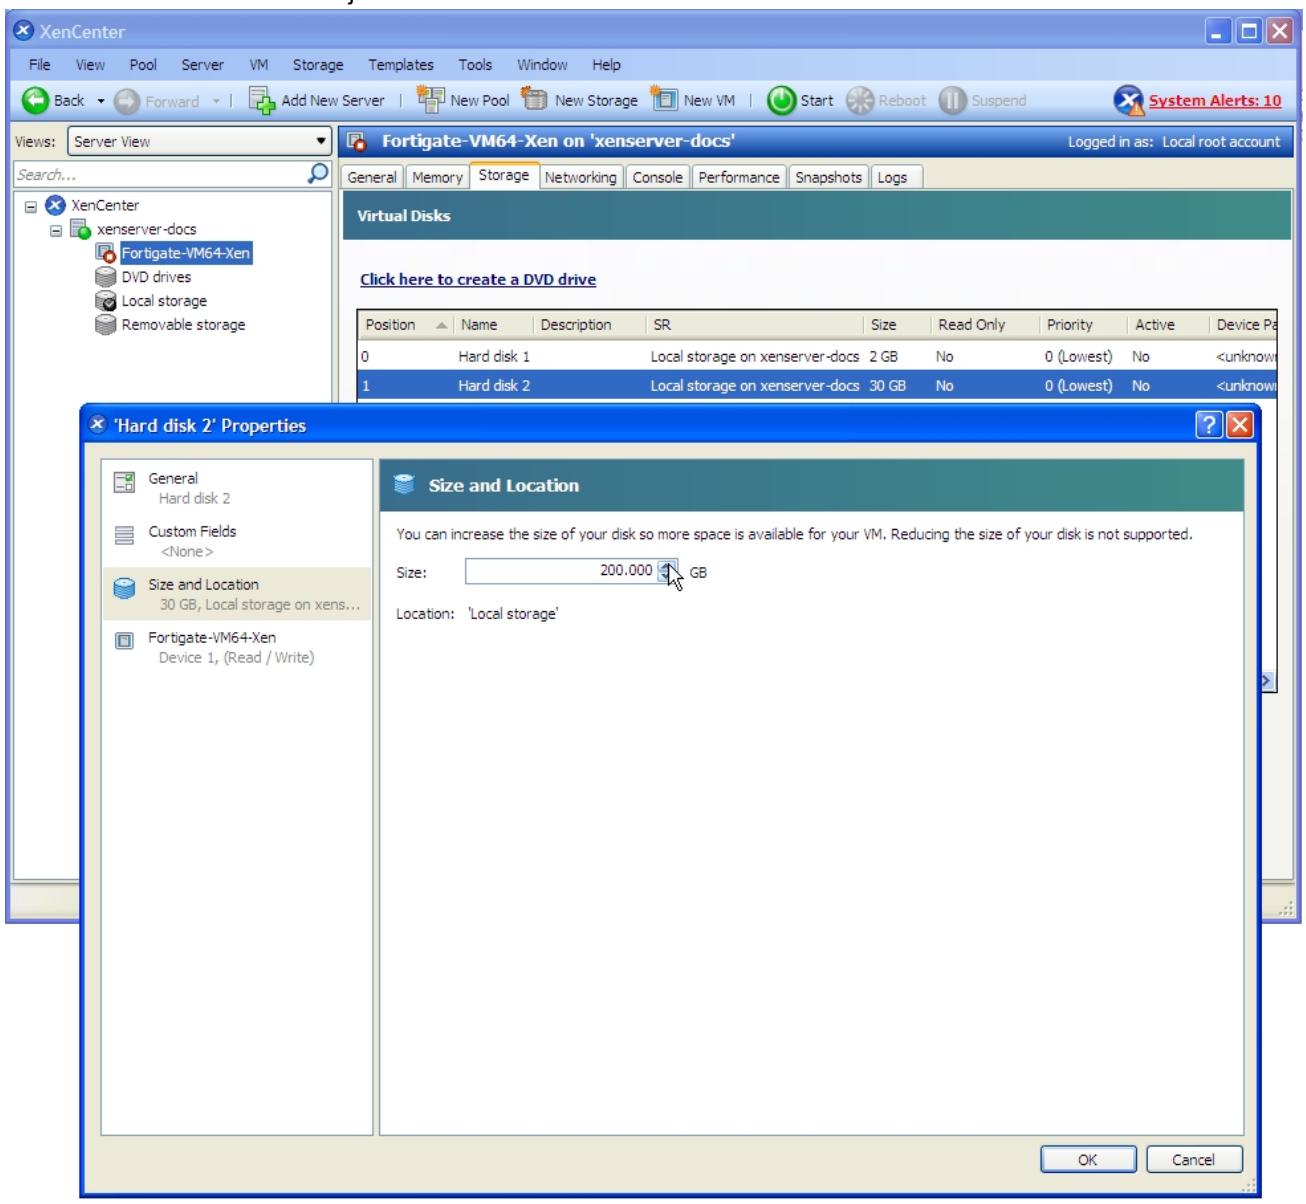
By default the FortiGate VM data disk 30GB. You will probably want to increase this. Disk resizing must be done before you start the VM for the first time.

To resize the FortiGate data disk

1. In the XenCenter left pane, select the FortiGate VM.
2. Select the **Storage** tab. Select **Hard disk 2** (the 30GB drive), then select **Properties**.

   The **'Hard disk 2' Properties** window opens.

3. Select **Size and Location**. Adjust **Size** and select **OK**.



FortiGate VM Initial Configuration

Before you can connect to the FortiGate VM web-based manager you must configure a network interface in the FortiGate VM console. Once an interface with administrative access is configured, you can connect to the FortiGate VM web-based Manager and upload the FortiGate VM license file that you downloaded from the Customer Service & Support website.

The following topics are included in this section:

Set FortiGate VM port1 IP address
Connect to the FortiGate VM Web-based Manager
Upload the FortiGate VM license file
Validate the FortiGate VM license with FortiManager
Configure your FortiGate VM

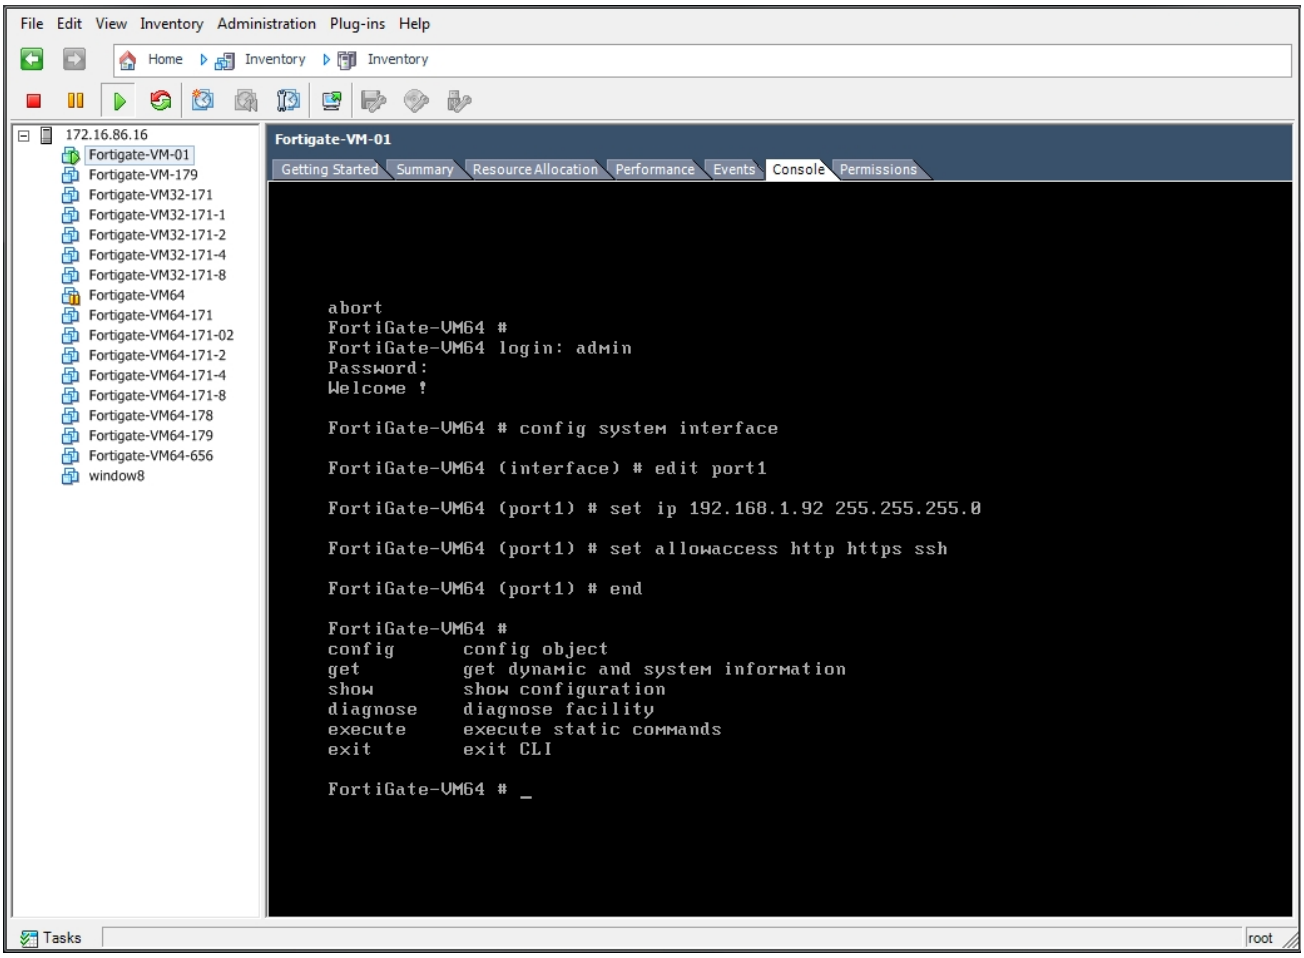
Set FortiGate VM port1 IP address

Hypervisor management environments include a guest console window. On the FortiGate VM, this provides access to the FortiGate console, equivalent to the console port on a hardware FortiGate unit. Before you can access the Web-based manager, you must configure FortiGate VM port1 with an IP address and administrative access.

To configure the port1 IP address:

1. In your hypervisor manager, start the FortiGate VM and access the console window.
   You might need to press Return to see a login prompt.

   Example of FortiGate VM console access:



2. At the FortiGate VM login prompt enter the username `admin`. By default there is no password. Just press Return.
3. Using CLI commands, configure the port1 IP address and netmask. Also, HTTP access must be enabled because until it is licensed the FortiGate VM supports only low-strength encryption. HTTPS access will not work.

   For example:

```
config system interface
   edit port1
      set ip 192.168.0.100 255.255.255.0
      append allowaccess http
   end
```

You can also use the `append allowaccess` CLI command to enable other access protocols, such as `auto-ipsec`, `http`, `probe-response`, `radius-acct`, `snmp`, and `telnet`. The `ping`, `https`, `ssh`, and `fgfm` protocols are enabled on the `port1` interface by default.

4. To configure the default gateway, enter the following CLI commands:

```
config router static
   edit 1
      set device port1
      set gateway <class_ip>
end
```

You must configure the default gateway with an IPv4 address. FortiGate VM needs to access the Internet to contact the FortiGuard Distribution Network (FDN) to validate its license.

5. To configure your DNS servers, enter the following CLI commands:

```
config system dns
   set primary <Primary DNS server>
   set secondary <Secondary DNS server>
end
```

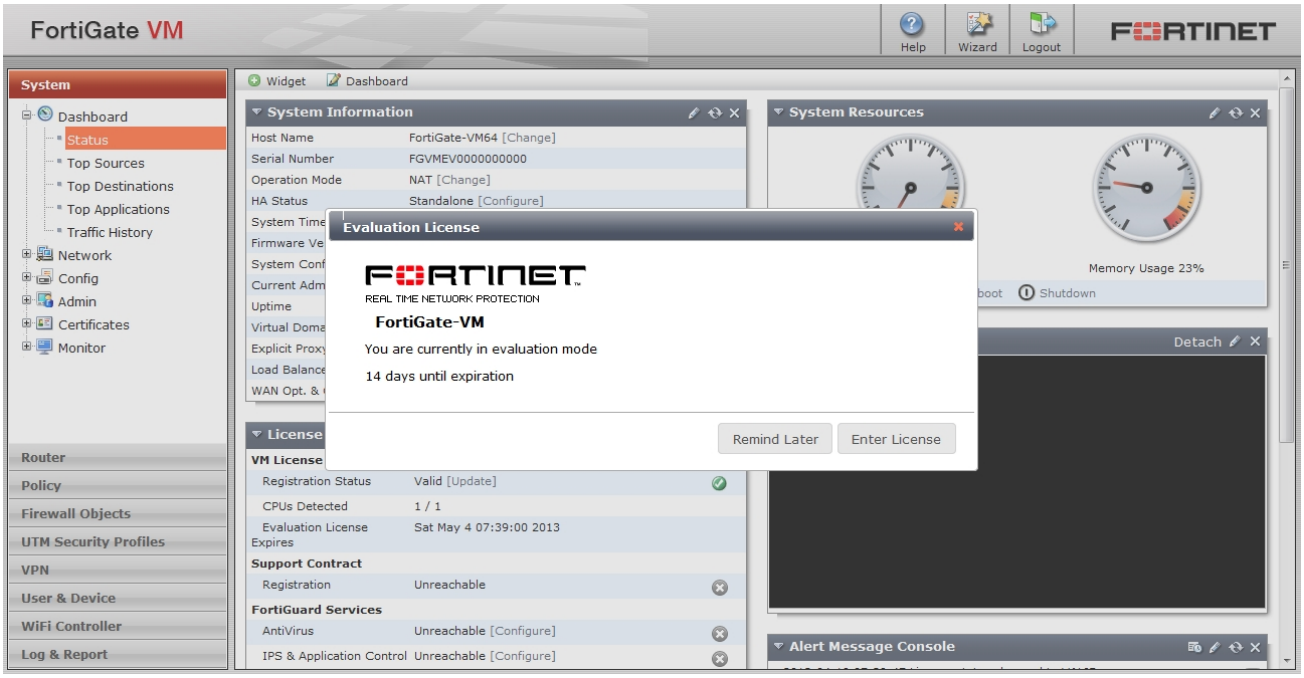
The default DNS servers are `208.91.112.53` and `208.91.112.52`.

6. To upload the FortiGate VM license from an FTP or TFTP server, use the following CLI command:

```
execute restore vmlicense {ftp | tftp} <VM license file name> <Server IP or FQDN>
    [:server port]
```

You can also upload the license in the FortiGate VM Web-based Manager. See Set FortiGate VM port1 IP address on page 2709.

Web-based Manager and Evaluation License dialog box



Connect to the FortiGate VM Web-based Manager

When you have configured the port1 IP address and netmask, launch a web browser and enter the IP address that you configured for port1. At the login page, enter the username `admin` and password field and select **Login**. The default password is no password. The Web-based Manager will appear with an **Evaluation License** dialog box.

Upload the FortiGate VM license file

Every Fortinet VM includes a 15-day trial license. During this time the FortiGate VM operates in evaluation mode. Before using the FortiGate VM you must enter the license file that you downloaded from the Customer Service & Support website upon registration.

To upload the FortiGate VM licence file:

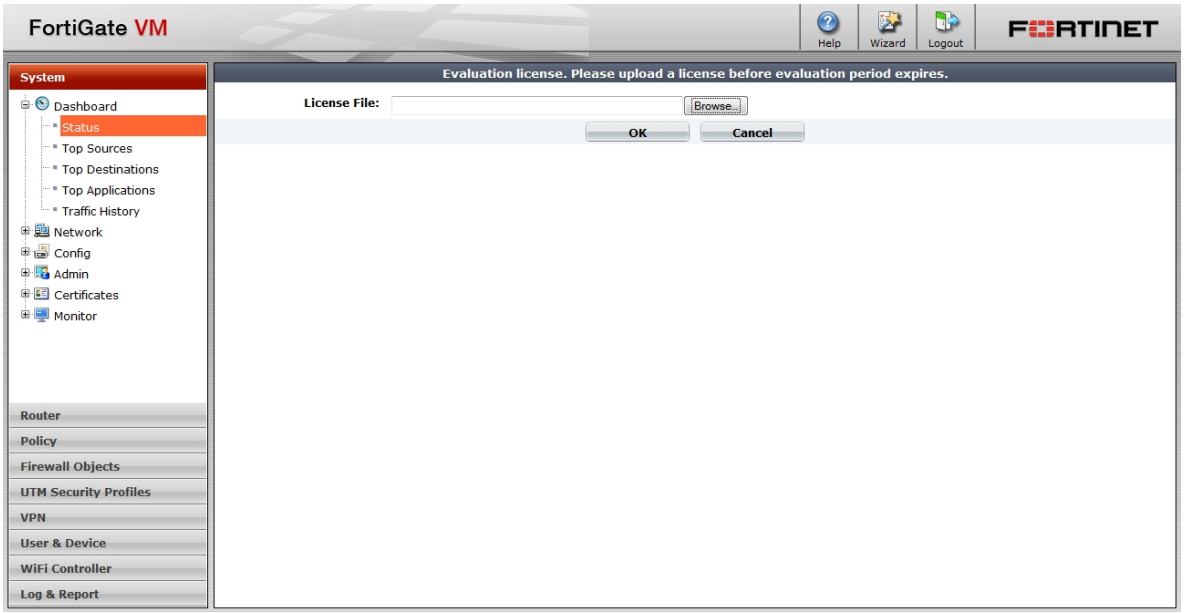
1. In the **Evaluation License** dialog box, select **Enter License**.

You can also upload the license file via the CLI using the following CLI command:

```
execute restore vmlicense [ftp | tftp] <filenmame string>
<ftp server>[:ftp port]
```

The license upload page opens.

License upload page:



2. Select **Browse** and locate the license file (`.lic`) on your computer. Select **OK** to upload the license file.
3. Refresh the browser to login.
4. Enter `admin` in the Name field and select **Login**. The VM registration status appears as valid in the License Information widget once the license has been validated by the FortiGuard Distribution Network (FDN) or FortiManager for closed networks.

Validate the FortiGate VM license with FortiManager

You can validate your FortiGate VM license with some models of FortiManager. To determine whether your FortiManager unit has the VM Activation feature, see Features section of the FortiManager Product Data sheet.

To validate your FortiGate VM with your FortiManager:

1. To configure your FortiManager as a closed network, enter the following CLI command on your FortiManager:

```
config fmupdate publicnetwork
   set status disable
end
```

2. To configure FortiGate VM to use FortiManager as its override server, enter the following CLI commands on your FortiGate VM:

```
config system central-management
   set mode normal
   set type fortimanager
   set include-default-servers disable
   set vdom <Enter the name of the VDOM to use when communicating with the FortiManager
       device>
   config server-list
      edit 1
         set server-type update rating
         set server-address <your FMG IP>
      next
   end
end
```

3. Load the FortiGate VM license file in the Web-based Manager.
   - Go to **System > Dashboard > Status**.
   - In the **License Information** widget, in the **Registration Status** field, select **Update**. Browse for the `.lic` license file and select **OK**.
4. To activate the FortiGate VM license, enter the following CLI command on your FortiGate VM:

```
execute update-now
```

5. To check the FortiGate VM license status, enter the following CLI commands on your FortiGate VM:

```
get system status
```

   The following output is displayed:

```
Version: Fortigate-VM v5.0,build0099,120910 (Interim)
Virus-DB: 15.00361(2011-08-24 17:17)
Extended DB: 15.00000(2011-08-24 17:09)
Extreme DB: 14.00000(2011-08-24 17:10)
IPS-DB: 3.00224(2011-10-28 16:39)
FortiClient application signature package: 1.456(2012-01-17 18:27)
Serial-Number: FGVM02Q105060000
License Status: Valid
BIOS version: 04000002
Log hard disk: Available
Hostname: Fortigate-VM
Operation Mode: NAT
Current virtual domain: root
Max number of virtual domains: 10
```

```
Virtual domains status: 1 in NAT mode, 0 in TP mode
Virtual domain configuration: disable
FIPS-CC mode: disable
Current HA mode: standalone
Distribution: International
Branch point: 511
Release Version Information: MR3 Patch 4
System time: Wed Jan 18 11:24:34 2012

diagnose hardware sysinfo vm full
```

The following output is displayed:

```
UUID: 564db33a29519f6b1025bf8539a41e92
valid: 1
status: 1
code: 200 (If the license is a duplicate, code 401 will be displayed)
warn: 0
copy: 0
received: 45438
warning: 0
recv: 201201201918
dup:
```

Licensing timeout

In closed environments without Internet access, it is mandatory to perform offline licensing of the virtual FortiGate using a FortiManager as a license server. If the FortiGate-VM cannot perform license validation within the license timeout period, which is 30 days, the FortiGate will discard all packets and effectively ceasing operation as a firewall. There is only a single log entry after the virtual FortiGate cannot access the license server for the license expiration period.

Configure your FortiGate VM

Once the FortiGate VM license has been validated you can begin to configure your device. You can use the **Wizard** located in the top toolbar for basic configuration including enabling central management, setting the admin password, setting the time zone, and port configuration.

For more information on configuring your FortiGate VM see the FortiOS Handbook at http://docs.fortinet.com.

Chapter 29 - VoIP Solutions: SIP

This FortiOS Handbook chapter contains the following sections:

FortiGate VoIP solutions–SIP describes FortiGate SIP support.

FortiGate VoIP solutions–SIP

The Session Initiation Protocol (SIP) is an IETF application layer signaling protocol used for establishing, conducting, and terminating multiuser multimedia sessions over TCP/IP networks using any media. SIP is often used for Voice over IP (VoIP) calls but can be used for establishing streaming communication between end points.

SIP employs a request and response transaction model similar to HTTP for communicating between endpoints. SIP sessions being with a SIP client sending a SIP request message to another client to initiate a multimedia session. The other client responds with a SIP response message. Using these request and response messages, the clients engage in a SIP dialog to negotiate how to communicate and then start, maintain, and end the communication session.

SIP commonly uses TCP or UDP port 5060 and/or 5061. Port 5060 is used for non-encrypted SIP signaling sessions and port 5061 is typically used for SIP sessions encrypted with SSL or TLS.

Devices involved in SIP communications are called SIP User Agents (UAs) (also sometimes called a User Element (UE)). UAs include User Agent Clients (UACs) that communicate with each other and User Agent Servers (UASs) that facilitate communication between UACs. For a VoIP application, an example of a UAC would be a SIP phone and an example of a UAS would be a SIP proxy server.

A SIP message contain headers that include client and server names and addresses required for the communication sessions. The body of a SIP message contains Session Description Protocol (SDP) statements that establish the media communication (port numbers, protocols and codecs) that the SIP UAs use. SIP VoIP most commonly uses the Real Time Protocol (RTP) and the Real Time Control Protocol (RTCP) for voice communication. Once the SIP dialog establishes the SIP call the VoIP stream can run independently, although SIP messages can affect the VoIP stream by changing port numbers or addresses and by ending it.

Once SIP communication and media settings are established, the UAs communicate with each using the established media settings. When the communication session is completed, one of the UAs ends the session by sending a final SIP request message and the other UA sends a SIP response message and both UAs end the SIP call and stop the media stream.

FortiGate units provide security for SIP communications using the SIP session helper and the SIP ALG:

- The SIP session-helper provides basic high-performance support for SIP calls passing through the FortiGate unit by opening SIP and RTP pinholes and performing source and destination IP address and port translation for SIP and RTP packets and for the IP addresses and port numbers in the SIP headers and the SDP body of the SIP messages. For more about the SIP session helper, see The SIP session helper on page 2738.
- The SIP Application Layer Gateway (ALG) provides the same features as the session helper plus additional advanced features such as deep SIP message inspection, SIP logging, SIP IPv6 support, SIP message checking, HA failover of SIP sessions, and SIP rate limiting. For more about the SIP ALG, see The SIP ALG on page 2744.

All SIP traffic is processed by the SIP ALG by default. You can change the default setting using the following command:

```
config system settings
   set default-voip-alg-mode {proxy-based | kernel-helper-based}
end
```

The default is `proxy-based`, which means the SIP ALG is used. If set to `kernel-helper-based`, the SIP session helper is used. If a SIP session is accepted by a firewall policy with a VoIP profile, the session is processed using the SIP ALG even if `default-voip-alg-mode` is set to `kernel-helper-based`.

If a SIP session is accepted by a firewall policy that does not include a VoIP profile:

- If `default-voip-alg-mode` is set to `proxy-based`, SIP traffic is processed by the SIP ALG using the default VoIP profile.
- If `default-voip-alg-mode` is set to `kernel-helper-based`, SIP traffic is processed by the SIP session helper. If the SIP session help has been removed, then no SIP processing takes place.

On a FortiGate unit with multiple VDOMs, whether to use the ALG or the session helper is set per-VDOM.

There are a large number of SIP-related Internet Engineering Task Force (IETF) documents (Request for Comments) that define behavior of SIP and related applications. FortiGate units provide complete support of RFC 3261 for SIP, RFC 4566 for SDP and RFC 3262 for Provisional Response Acknowledgment (PRACK). FortiGate units also provide support for other SIP and SIP-related RFCs and performs Deep SIP message inspection on page 2792 for SIP statements defined in other SIP RFCs.

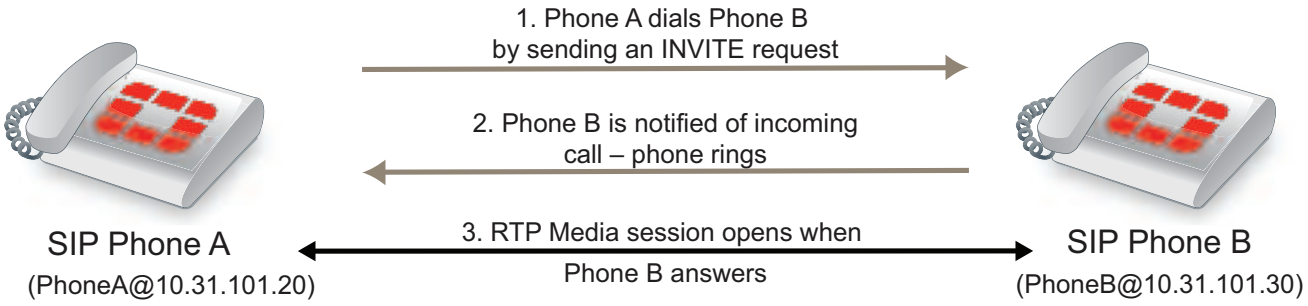
Common SIP VoIP configurations

This section describes some common SIP VoIP configurations and simplified SIP dialogs for these configurations. This section also shows some examples of how adding a FortiGate unit affects SIP processing.

Peer to peer configuration

In the peer to peer configuration shown below, two SIP phones (in the example, FortiFones) communicate directly with each other. The phones send SIP request and response messages back and forth between each other to establish the SIP session.

SIP peer to peer configuration

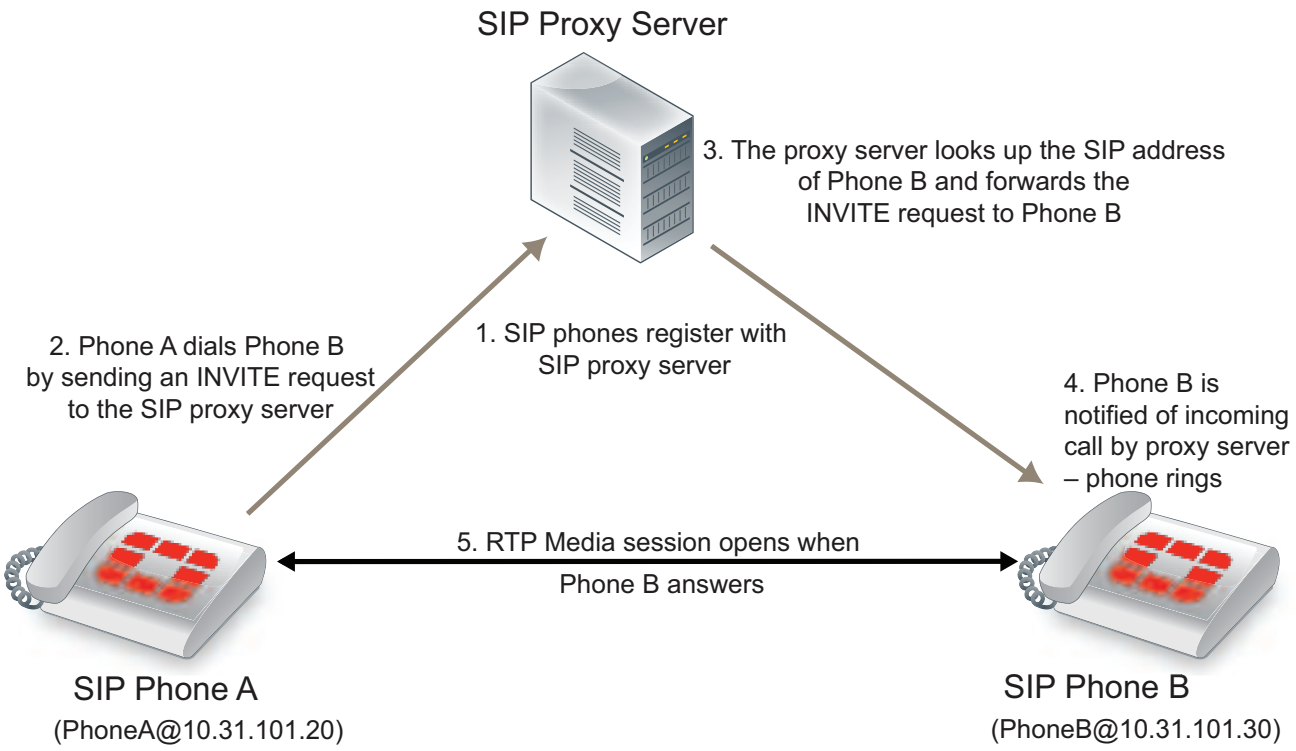


Peer to peer configurations are not very common because they require the SIP phones to keep track of the names and addresses of all of the other SIP phones that they can communicate with. In most cases a SIP proxy or re-direct server maintains addresses of a large number of SIP phones and a SIP phone starts a call by contacting the SIP proxy server.

SIP proxy server configuration

A SIP proxy server act as intermediary between SIP phones and between SIP phones (for example, two FortiFones) and other SIP servers. As shown below, SIP phones send request and response messages the SIP proxy server. The proxy server forwards the messages to other clients or to other SIP proxy servers. Proxy servers can hide SIP phones by proxying the signaling messages. To the other users on the VoIP network, the signaling invitations look as if they come from the SIP proxy server.

SIP in proxy mode

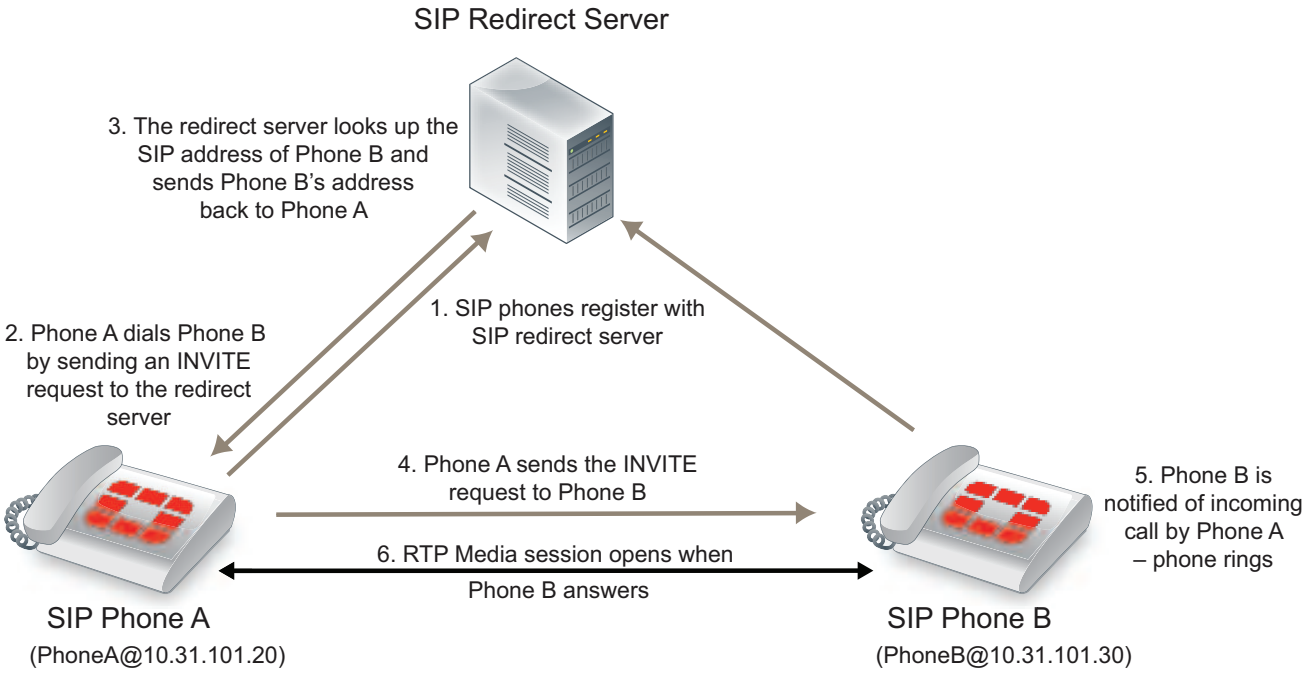


A common SIP configuration would include multiple networks of SIP phones. Each of the networks would have its own SIP server. Each SIP server would proxy the communication between phones on its own network and between phones in different networks.

SIP redirect server configuration

A SIP redirect server accepts SIP requests, maps the addresses in the request into zero or more new addresses and returns those addresses to the client. The redirect server does not initiate SIP requests or accept calls. As shown below, SIP clients send INVITE requests to the redirect server, which then looks up the destination address. The redirect server returns the destination address to the client. The client uses this address to send the INVITE request directly to the destination SIP client.

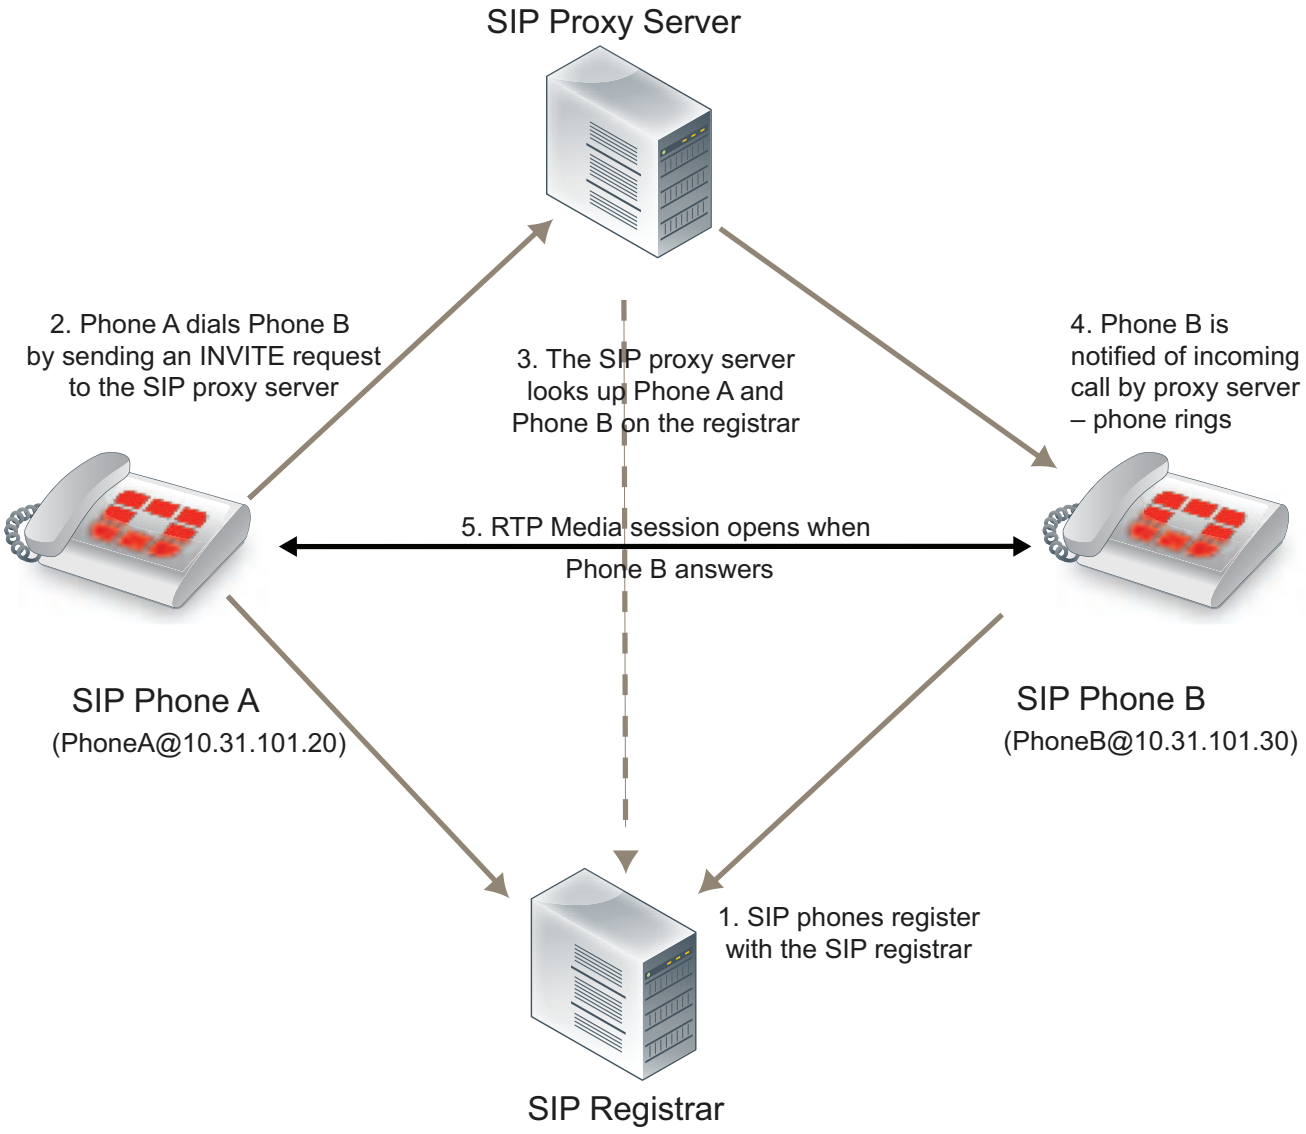
SIP in redirect model



SIP registrar configuration

A SIP registrar accepts SIP REGISTER requests from SIP phones for the purpose of updating a location database with this contact information. This database can then become a SIP location service that can be used by SIP proxy severs and redirect servers to locate SIP clients. As shown below, SIP clients send REGISTER requests to the SIP registrar.

SIP registrar and proxy servers

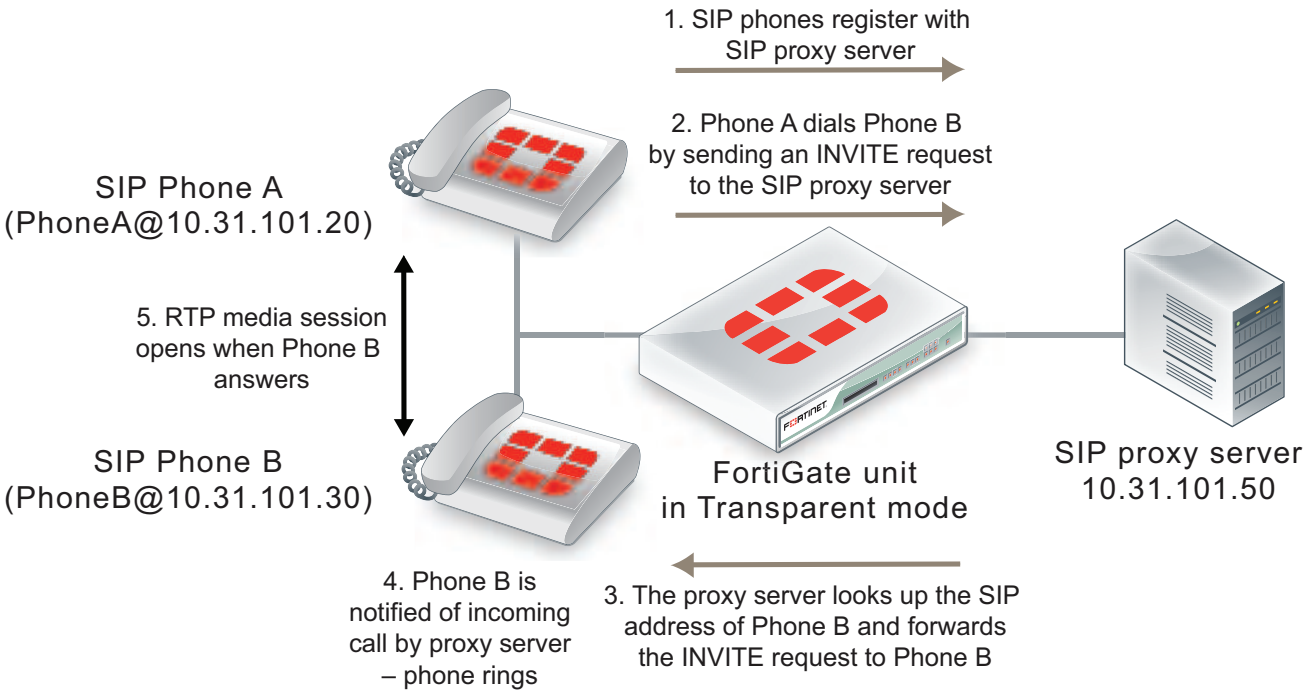


SIP with a FortiGate unit

Depending on your security requirements and network configuration FortiGate units may be in many different places in a SIP configuration. This section shows a few examples.

The diagram below shows a FortiGate unit installed between a SIP proxy server and SIP phones on the same network. The FortiGate unit is operating in Transparent mode so both the proxy server and the phones are on the same subnet. In this configuration, called SIP inspection without address translation, the FortiGate unit could be protecting the SIP proxy server on the private network by implementing SIP security features for SIP sessions between the SIP phones and the SIP proxy server.

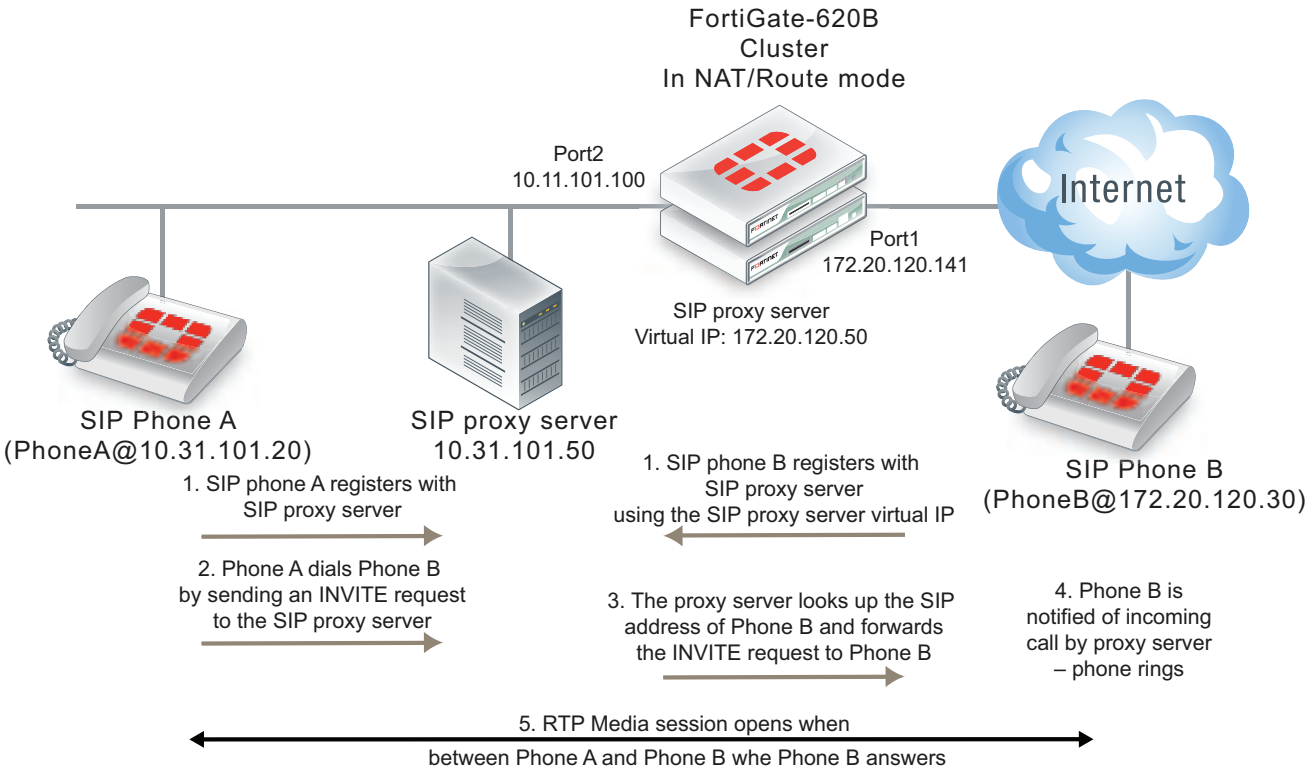
SIP network with FortiGate unit in Transparent mode



The phones and server use the same SIP dialogs as they would if the FortiGate unit was not present. However, the FortiGate unit can be configured to control which devices on the network can connect to the SIP proxy server and can also protect the SIP proxy server from SIP vulnerabilities.

The following diagram shows a FortiGate unit operating in NAT/Route mode and installed between a private network and the Internet. Some SIP phones and the SIP proxy server are connected to the private network and some SIP phones are connected to the Internet. The SIP phones on the Internet can connect to the SIP proxy server through the FortiGate unit and communication between SIP phones on the private network and SIP phones on the Internet must pass through the FortiGate unit.

SIP network with FortiGate unit in NAT/Route mode



The phones and server use the same SIP dialog as they would if the FortiGate unit was not present. However, the FortiGate unit can be configured to control which devices on the network can connect to the SIP proxy server and can also protect the SIP proxy server from SIP vulnerabilities. In addition, the FortiGate unit has a firewall virtual IP that forwards packets sent to the SIP proxy server Internet IP address (172.20.120.50) to the SIP proxy server internal network IP address (10.31.101.30).

Since the FortiGate unit is operating in NAT/Route mode it must translate packet source and destination IP addresses (and optionally ports) as the sessions pass through the FortiGate unit. Also, the FortiGate unit must translate the addresses contained in the SIP headers and SDP body of the SIP messages. As well the FortiGate unit must open SIP and RTP pinholes through the FortiGate unit. SIP pinholes allow SIP signalling sessions to pass through the FortiGate between phones and between phones and SIP servers. RTP pinholes allow direct RTP communication between the SIP phones once the SIP dialog has established the SIP call. Pinholes are opened automatically by the FortiGate unit. Administrators do not add security policies for pinholes or for RTP sessions. All that is required is a security policy that accepts SIP traffic.

Opening an RTP pinhole means opening a port on a FortiGate interface to allow RTP traffic to use that port to pass through the FortiGate unit between the SIP phones on the Internet and SIP phones on the internal network. A pinhole only accepts packets from one RTP session. Since a SIP call involves at least two media streams (one from Phone A to Phone B and one from Phone B to Phone A) the FortiGate unit opens two RTP pinholes. Phone A sends RTP packets through a pinhole in port2 and Phone B sends RTP packets through a pinhole in port1. The FortiGate unit opens the pinholes when required by the SIP dialog and closes the pinholes when the SIP call is completed. The FortiGate unit opens new pinholes for each SIP call.

Each RTP pinhole actually includes two port numbers. The RTP port number as defined in the SIP message and an RTCP port number, which is the RTP port number plus 1. For example, if the SIP call used RTP port 3346 the FortiGate unit would create a pinhole for ports 3346 and 3347.

SIP messages and media protocols

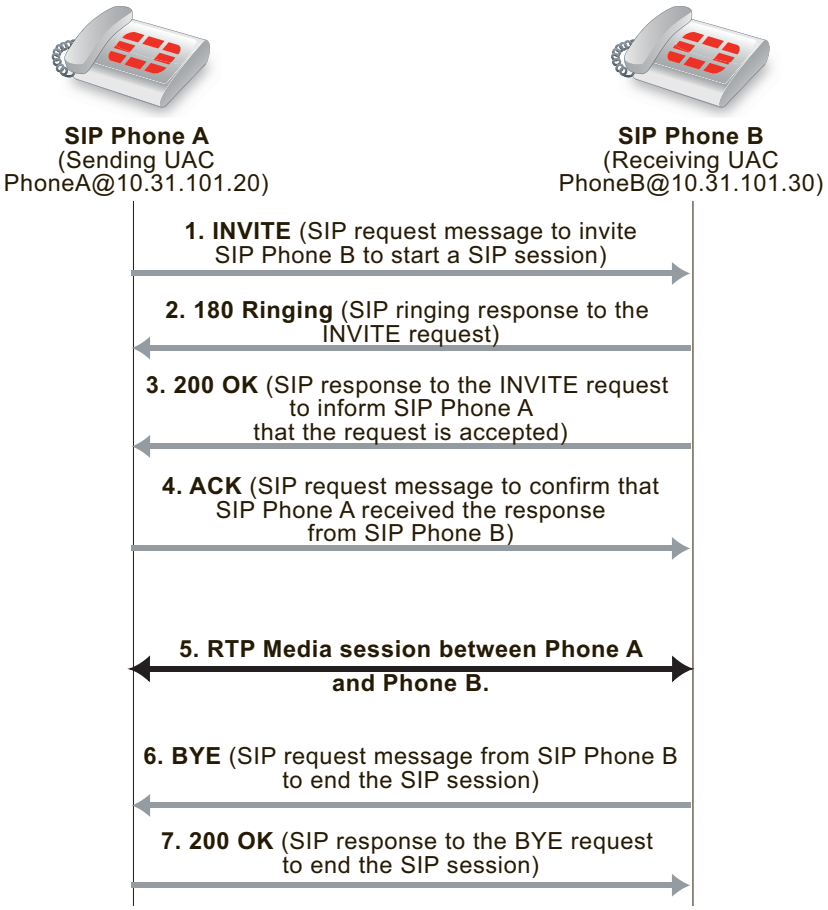
This section provides an overview of SIP messages and how they communicate information about SIP sessions and how SDP, RTP, and RTCP fits in with SIP communications.

SIP uses clear text messages to start, maintain, and end media sessions between SIP user agent clients (UACs) and user agent servers (UASs). These messages form a SIP dialog. A typical SIP dialog begins with an INVITE request message sent from a UAC to another UAC or to a UAS. The first INVITE request message attempts to start a SIP call and includes information about the sending UAC and the receiving UAC as well as information about the communication session.

If only two UACs are involved as shown below, the receiving UAC (Phone B) responds with a 180 Ringing and then a 200 OK SIP response message that informs Phone A that Phone B received and accepted the request. Phone A then sends an ACK message to notify Phone B that the SIP response was received. Phone A and Phone B can then participate in the RTP media session set up by the SIP messages.

When the phone call is complete, one of the UACs (in the example Phone B) hangs up sending a BYE request message to Phone A. Phone A then sends a 200 OK response to Phone B acknowledging that the session has ended.

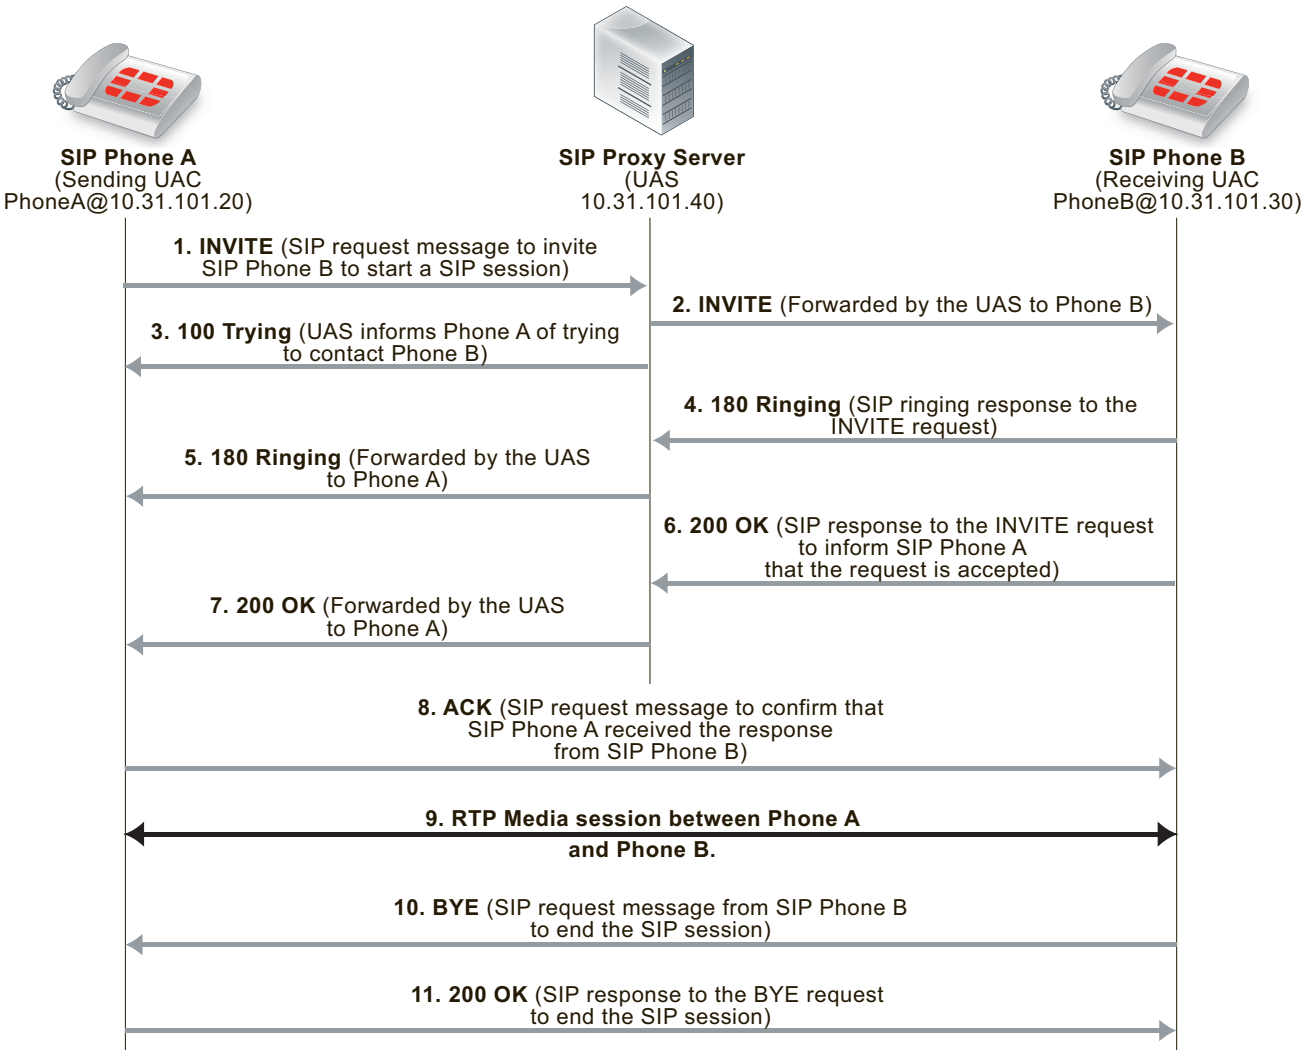
Basic SIP dialog between two UACs



If a UAS in the form of a SIP proxy server is involved, similar messages are sent and received, but the proxy server participates as an intermediary in the initial call setup. In the example below the SIP proxy server receives the INVITE request from Phone A and forwards it to Phone B. The proxy server then sends a 100 Trying response to Phone A. Phone B receives the INVITE request and responds with a 180 Ringing and then a 200 OK SIP response message. These messages are received by the proxy server and forwarded to Phone A to notify Phone A that Phone B received and accepted the request. Phone A then sends an ACK message to notify Phone B that the SIP response was received. This response is received by the proxy server and forwarded to Phone B. Phone A and Phone B can then participate in the media session independently of the proxy server.

When the phone call is complete Phone B hangs up sending a BYE request message to Phone A. Phone A then sends a 200 OK response to Phone B acknowledging that the session has ended.

Basic SIP dialog between UACs with a SIP proxy server UAS



The SIP messages include SIP headers that contain names and addresses of Phone A, Phone B and the proxy server. This addressing information is used by the UACs and the proxy server during the call set up.

The SIP message body includes Session Description Protocol (SDP) statements that Phone A and Phone B use to establish the media session. The SDP statements specify the type of media stream to use for the session (for example, audio for SIP phone calls) and the protocol to use for the media stream (usually the Real Time Protocol (RTP) media streaming protocol).

Phone A includes the media session settings that it would like to use for the session in the INVITE message. Phone B includes its response to these media settings in the 200 OK response. Phone A's ACK response confirms the settings that Phone A and Phone B then use for the media session.

Hardware accelerated RTP processing

FortiGate units can offload RTP packet processing to network processor (NP) interfaces. This acceleration greatly enhance the overall throughput and resulting in near speed RTP performance.

SIP request messages

SIP sessions always start with a SIP request message (also just called a SIP request). SIP request messages also establish, maintain, and terminate SIP communication sessions. The following table lists some common SIP request message types.

Common SIP request message types

Message Type	Description
INVITE	A client sends an INVITE request to invite another client to participate in a multimedia session. The INVITE request body usually contains the description of the session.
ACK	The originator of an INVITE message sends an ACK request to confirm that the final response to an INVITE request was received. If the INVITE request did not contain the session description, it must be included in the ACK request.
PRACK	In some cases, SIP uses provisional response messages to report on the progress of the response to a SIP request message. The provisional response messages are sent before the final SIP response message. Similar to an ACK request message, a PRACK request message is sent to acknowledge that a provisional response message has been received.
OPTIONS	The UA uses OPTIONS messages to get information about the capabilities of a SIP proxy. The SIP proxy server replies with a description of the SIP methods, session description protocols, and message encoding that are supported.
BYE	A client sends a BYE request to end a session. A BYE request from either end of the SIP session terminates the session.
CANCEL	A client sends a CANCEL request to cancel a previous INVITE request. A CANCEL request has no effect if the SIP server processing the INVITE sends a final response to the INVITE before receiving the CANCEL.
REGISTER	A client sends a REGISTER request to a SIP registrar server with information about the current location (IP address and so on) of the client. A SIP registrar server saves the information it receives in REGISTER requests and makes this information available to any SIP client or server attempting to locate the client.
Info	For distributing mid-session signaling information along the signaling path for a SIP call. I
Subscribe	For requesting the current state and state updates of a remote node.
Notify	Informs clients and servers of changes in state in the SIP network.
Refer	Refers the recipient (identified by the Request-URI) to a third party according to the contact information in the request.
Update	Opens a pinhole for new or updated SDP information.
Response codes (1xx, 202, 2xx, 3xx, 4xx, 5xx, 6xx)	Indicates the status of a transaction. For example: 200 OK, 202 Accepted, or 400 Bad Request.

SIP response messages

SIP response messages (often just called SIP responses) provide status information in response to SIP request messages. All SIP response messages include a response code and a reason phrase. There are five SIP response message classes. They are described below.

There are also two types of SIP response messages, provisional and final. Final response messages convey the result of the request processing, and are sent reliably. Provisional responses provide information on the progress of the request processing, but may not be sent reliably. Provisional response messages start with 1xx and are also called informational response messages.

Informational (or provisional)

Informational or provisional responses indicate that a request message was received and imply that the endpoint is going to process the request. Information messages may not be sent reliably and may not require an acknowledgement.

If the SIP implementation uses Provisional Response Acknowledgement (PRACK) (RFC 3262) then informational or provisional messages are sent reliably and require a PRACK message to acknowledge that they have been received.

Informational responses can contain the following reason codes and reason phrases:

```
100 Trying
180 Ringing
181 Call is being forwarded
182 Queued
183 Session progress
```

Success

Success responses indicate that a request message was received, understood, and accepted. Success responses can contain the following reason codes and reason phrases:

```
200 OK
202 Accepted
```

Redirection

Redirection responses indicate that more information is required for the endpoint to respond to a request message. Redirection responses can contain the following reason codes and reason phrases:

```
300 Multiple choices
301 Moved permanently
302 Moved temporarily
305 Use proxy
380 Alternative service
```

Client error

Client error responses indicate that a request message was received by a server that contains syntax that the server cannot understand (i.e. contains a syntax error) or cannot comply with. Client error responses include the following reason codes and reason phrases:

```
400 Bad request              401 Unauthorized
```

```
402 Payment required          403 Forbidden
404 Not found                 405 Method not allowed
406 Not acceptable            407 Proxy authentication required
408 Request time-out          409 Conflict
410 Gone                      411 Length required
413 Request entity too large  414 Request-URL too large
415 Unsupported media type    420 Bad extension
480 Temporarily not available
481 Call leg/transaction does not exist
482 Loop detected
484 Address incomplete        483 Too many hops
486 Busy here                 485 Ambiguous
488 Not acceptable here       487 Request canceled
```

Server error

Server error responses indicate that a server was unable to respond to a valid request message. Server error responses include the following reason codes and reason phrases:

```
500 Server internal error
501 Not implemented
502 Bad gateway
502 Service unavailable
504 Gateway time-out
505 SIP version not supported
```

Global failure

Global failure responses indicate that there are no servers available that can respond to a request message. Global failure responses include the following reason codes and reason phrases:

```
600 Busy everywhere
603 Decline
604 Does not exist anywhere
606 Not acceptable
```

SIP message start line

The first line in a SIP message is called the start line. The start line in a request message is called the request-line and the start line in a response message is called the status-line.

Request-line	The first line of a SIP request message. The request-line includes the SIP message type, the SIP protocol version, and a Request URI that indicates the user or service to which this request is being addressed. The following example request-line specifies the INVITE message type, the address of the sender of the message (`inviter-@example.com`), and the SIP version: `INVITE sip:inviter@example.com SIP/2.0`
Status-line	The first line of a SIP response message. The status-line includes the SIP protocol version, the response code, and the reason phrase. The example status-line includes the SIP version, the response code (`200`) and the reason phrase (`OK`). `SIP/2.0 200 OK`

SIP headers

Following the start line, SIP messages contain SIP headers (also called SIP fields) that convey message attributes and to modify message meaning. SIP headers are similar to HTTP header fields and always have the following format:

```
<header_name>:<value>
```

SIP messages can include the SIP headers listed in the following table:

SIP headers

SIP Header	Description
Allow	Lists the set of SIP methods supported by the UA generating the message. All methods, including ACK and CANCEL, understood by the UA MUST be included in the list of methods in the Allow header field, when present. For example: `Allow: INVITE, ACK, OPTIONS, CANCEL, BYE`
Call-ID	A globally unique identifier for the call, generated by the combination of a random string and the sender's host name or IP address. The combination of the To, From, and Call-ID headers completely defines a peer-to-peer SIP relationship between the sender and the receiver. This relationship is called a SIP dialog. `Call-ID: ddeg45e793@10.31.101.30`
Contact	Included in SIP request messages, the Contact header contains the SIP URI of the sender of the SIP request message. The receiver uses this URI to contact the sender. For example: `Contact: Sender <sip:sender@10.31.100.20>t`
Content-Length	The number of bytes in the message body (in bytes). `Content-Length: 126`
Content-Type	In addition to SIP headers, SIP messages include a message body that contains information about the content or communication being managed by the SIP session. The Content-Type header specifies what the content of the SIP message is. For example, if you are using SIP with SDP, the content of the SIP message is SDP code. `Content-Type: application/sdp`
CSeq	The command sequence header contains a sequence integer that is increased for each new SIP request message (but is not incremented in the response message). This header also incudes the request name found in the request message request-line. For example: `CSeq: 1 INVITE`
Expires	Gives the relative time after which the message (or content) expires. The actual time and how the header is used depends on the SIP method. For example: `Expires: 5`
From	Identifies the sender of the message. Responses to a message are sent to the address of the sender. The following example includes the sender's name (`Sender`) and the sender's SIP address (`sender@10.31.101.20.`): `From: Sender <sip:sender@10.31.101.20>`

SIP Header	Description
Max-forwards	An integer in the range 0-255 that limits the number of proxies or gateways that can forward the request message to the next downstream server. Also called the number of hops, this value is decreased every time the message is forwarded. This can also be useful when the client is attempting to trace a request chain that appears to be failing or looping in mid-chain. `For example: Max-Forwards: 30`
P-Asserted-Identity	The P-Asserted-Identity header is used among trusted SIP entities to carry the identity of the user sending a SIP message as it was verified by authentication. See RFC 3325. The header contains a SIP URI and an optional display-name, for example: `P-Asserted-Identity: "Example Person" <sip:10.31.101.50>`
RAck	Sent in a PRACK request to support reliability of information or provisional response messages. It contains two numbers and a method tag. For example: `RAck: 776656 1 INVITE`
Record-Route	Inserted into request messages by a SIP proxy to force future requests to be routed through the proxy. In the following example, the host at IP address 10.31.101.50 is a SIP proxy. The `lr` parameter indicates the URI of a SIP proxy in Record-Route headers. `Record-Route: <sip:10.31.101.50;lr>`
Route	Forces routing for a request message through one or more SIP proxies. The following example includes two SIP proxies: `Route: <sip:172.20.120.10;lr>, <sip:10.31.101.50;lr>`
RSeq	The RSeq header is used in information or provisional response messages to support reliability of informational response messages. The header contains a single numeric value. For example: `RSeq: 33456`
To	Identifies the receiver of the message. The address in this field is used to send the message to the receiver. The following example includes the receiver's name (`Receiver`) and the receiver's SIP address (`receiver@10.31.101.30`.): `To: Receiver <sip:receiver@10.31.101.30>`
Via	Indicates the SIP version and protocol to be used for the SIP session and the address to which to send the response to the message that contains the Via field. The following example Via field indicates to use SIP version 2, UDP for media communications, and to send the response to 10.31.101.20 using port 5060. `Via: SIP/2.0/UDP 10.31.101.20:5060`

The SIP message body and SDP session profiles

The SIP message body describes the session to be initiated. For example, in a SIP phone call the body usually includes audio codec types, sampling rates, server IP addresses and so on. For other types of SIP session the body could contain text or binary data of any type which relates in some way to the session. The message body is included in request and response messages.

Two possible SIP message body types:

- Session Description Protocol (SDP), most commonly used for SIP VoIP.
- Multipurpose Internet Mail Extensions (MIME)

SDP is most often used for VoIP and FortiGate units support SDP content in SIP message bodies. SDP is a text-based protocol used by SIP to control media sessions. SDP does not deliver media but provides a session profile that contains media details, transport addresses, parameter negotiation, and other session description metadata for the participants in a media session. The participants use the information in the session profile to negotiate how to communicate and to manage the media session. SDP is described by RFC 4566.

An SDP session profile always contains session information and may contain media information. Session information appears at the start of the session profile and media information (using the `m=` attribute) follows.

SDP session profiles can include the attributes listed inthe following table.

SDP session profile attributes

Attribute	Description
a=	Attributes to extend SDP in the form `a=<attribute>` or `a=<attribute>:<value>`.
b=	Contains information about the bandwidth required for the session or media in the form `b=<bandwidth_type>:<bandwidth>`.
c=	Connection data about the session including the network type (usually IN for Internet), address type (IPv4 or IPv6), the connection source address, and other optional information. For example: `c=IN IPv4 10.31.101.20`
i=	A text string that contains information about the session. For example: `i=A audio presentation about SIP`
k=	Can be used to convey encryption keys over a secure and trusted channel. For example: `k=clear:444gdduudjffdee`

m=	Media information, consisting of one or more lines all starting with `m=` and containing details about the media including the media type, the destination port or ports used by the media, the protocol used by the media, and a media format description.
	
	`m=audio 49170 RTP 0 3`
	`m-video 3345/2 udp 34`
	`m-video 2910/2 RTP/AVP 3 56`
	
	Multiple media lines are needed if SIP is managing multiple types of media in one session (for example, separate audio and video streams).
	
	Multiple ports for a media stream are indicated using a slash. `3345/2` udp means UDP ports 3345 and 3346. Usually RTP uses even-numbered ports for data with the corresponding one-higher odd ports used for the RTCP session belonging to the RTP session. So `2910/2 RTP/AVP` means ports 2910 and 2912 are used for RTP and 2911 and 2913 are used for RTCP.
	
	Media types include `udp` for an unspecified protocol that uses UDP, `RTP` or `RTP/AVP` for standard RTP and `RTP/SAVP` for secure RTP.

o=	The sender's username, a session identifier, a session version number, the network type (usually IN for Internet), the address type (for example, IPv4 or IPv6), and the sending device's IP address. The `o=` field becomes a universal identifier for this version of this session description. For example: `o=PhoneA 5462346 332134 IN IP4 10.31.101.20`

Attribute	Description
r=	Repeat times for a session. Used if a session will be repeated at one or more timed intervals. Not normally used for VoIP calls. The times can be in different formats. For example: `r=7d 1h 0 25h r=604800 3600 0 90000`
s=	Any text that describes the session or s= followed by a space. For example: `s=Call from inviter`
t=	The start and stop time of the session. Sessions with no time restrictions (most VoIP calls) have a start and stop time of 0. `t=0 0`
v=	SDP protocol version. The current SDP version is 0 so the v= field is always: `v=0`
z=	Time zone adjustments. Used for scheduling repeated sessions that span the time between changing from standard to daylight savings time. `z=2882844526 -1h 2898848070 0`

Example SIP messages

The following example SIP INVITE request message was sent by PhoneA to PhoneB. The first nine lines are the SIP headers. The SDP profile starts with v=0 and the media part of the session profile is the last line, starting with m=.

```
INVITE sip:PhoneB@172.20.120.30 SIP/2.0
Via: SIP/2.0/UDP 10.31.101.50:5060
From: PhoneA <sip:PhoneA@10.31.101.20>
To: PhoneB <sip:PhoneB@172.20.120.30>
Call-ID: 314159@10.31.101.20
CSeq: 1 INVITE
Contact: sip:PhoneA@10.31.101.20
Content-Type: application/sdp
Content-Length: 124
v=0
o=PhoneA 5462346 332134 IN IP4 10.31.101.20
s=Let's Talk
t=0 0
c=IN IP4 10.31.101.20
m=audio 49170 RTP 0 3
```

The following example shows a possible 200 OK SIP response message in response to the previous INVITE request message. The response includes `200 OK` which indicates success, followed by an echo of the original SIP INVITE request followed by PhoneB's SDP profile.

```
SIP/2.0 200 OK
Via: SIP/2.0/UDP 10.31.101.50:5060
From: PhoneA <sip:PhoneA@10.31.101.20>
```

```
To: PhoneB <sip:PhoneB@172.20.120.30>
Call-ID: 314159@10.31.101.20
CSeq: 1 INVITE
Contact: sip:PhoneB@10.31.101.30
Content-Type: application/sdp
Content-Length: 107
v=0
o=PhoneB 124333 67895 IN IP4 172.20.120.30
s=Hello!
t=0 0
c=IN IP4 172.20.120.30
m=audio 3456 RTP 0
```

SIP can support multiple media streams for a single SIP session. Each media steam will have its own c= and m= lines in the body of the message. For example, the following message includes three media streams:

```
INVITE sip:PhoneB@172.20.120.30 SIP/2.0
Via: SIP/2.0/UDP 10.31.101.20:5060
From: PhoneA <sip:PhoneA@10.31.101.20>
To: PhoneB <sip:PhoneB@172.20.120.30>
Call-ID: 314159@10.31.101.20
CSeq: 1 INVITE
Contact: sip:PhoneA@10.31.101.20
Content-Type: application/sdp
Content-Length: 124
v=0
o=PhoneA 5462346 332134 IN IP4 10.31.101.20
s=Let's Talk
t=0 0
c=IN IP4 10.31.101.20
m=audio 49170 RTP 0 3
c=IN IP4 10.31.101.20
m=audio 49172 RTP 0 3
c=IN IP4 10.31.101.20
m=audio 49174 RTP 0 3
```

The SIP session helper

The SIP session-helper is a high-performance solution that provides basic support for SIP calls passing through the FortiGate unit by opening SIP and RTP pinholes and by performing NAT of the addresses in SIP messages.

The SIP session helper:

- Understands SIP dialog messages.
- Keeps the states of the SIP transactions between SIP UAs and SIP servers.
- Translates SIP header and SDP information to account for NAT operations performed by the FortiGate unit.
- Opens up and closes dynamic SIP pinholes for SIP signalling traffic.
- Opens up and closes dynamic RTP and RTSP pinholes for RTP and RTSP media traffic.
- Provides basic SIP security as an access control device.
- Uses the intrusion protection (IPS) engine to perform basic SIP protocol checks.

SIP session helper configuration overview

By default FortiOS uses the SIP ALG for SIP traffic. If you want to use the SIP session helper you need to enter the following command:

```
config system settings
   set default-voip-alg-mode kernel-helper-based
end
```

The SIP session helper is set to listen for SIP traffic on TCP or UDP port 5060. SIP sessions using port 5060 accepted by a security policy that does not include a VoIP profile are processed by the SIP session helper.

You can enable and disable the SIP session helper, change the TCP or UDP port that the session helper listens on for SIP traffic, and enable or disable SIP NAT tracing. If the FortiGate unit is operating with multiple VDOMs, each VDOM can have a different SIP session helper configuration.

To have the SIP session helper process SIP sessions you need to add a security policy that accepts SIP sessions on the configured SIP UDP or TCP ports. The security policies can have service set to ANY, or to the SIP pre-defined firewall service, or a custom firewall service. The SIP pre-defined firewall service restricts the security policy to only accepting sessions on UDP port 5060.

If NAT is enabled for security policies that accept SIP traffic, the SIP session helper translates addresses in SIP headers and in the RDP profile and opens up pinholes as required for the SIP traffic. This includes security policies that perform source NAT and security policies that contain virtual IPs that perform destination NAT and port forwarding. No special SIP configuration is required for this address translation to occur, it is all handled automatically by the SIP session helper according to the NAT configuration of the security policy that accepts the SIP session.

To use the SIP session helper you must not add a VoIP profile to the security policy. If you add a VoIP profile, SIP traffic bypasses the SIP session helper and is processed by the SIP ALG.

In most cases you would want to use the SIP ALG since the SIP session helper provides limited functionality. However, the SIP session helper is available and can be useful for high-performance solutions where a high level of SIP security is not a requirement.

Disabling and enabling the SIP session helper

You can use the following steps to disable the SIP session helper. You might want to disable the SIP session helper if you don't want the FortiGate unit to apply NAT or other SIP session help features to SIP traffic. With the SIP session helper disabled, the FortiGate unit can still accept SIP sessions if they are allowed by a security policy, but the FortiGate unit will not be able to open pinholes or NAT the addresses in the SIP messages.

To disable the sip session helper

1. Enter the following command to find the sip session helper entry in the session-helper list:

```
show system session-helper
   .
   .
   .
edit 13
   set name sip
   set port 5060
   set protocol 17
next
   .
   .
   .
```

This command output shows that the sip session helper listens in UDP port 5060 for SIP sessions.

2. Enter the following command to delete session-helper list entry number 13 to disable the sip session helper:

```
config system session-helper
   delete 13
end
```

If you want to use the SIP session helper you can verify whether it is enabled or disabled using the `show system session-helper` command.

You do not have to disable the SIP session helper to use the SIP ALG.

If the SIP session helper has been disabled by being removed from the session-helper list you can use the following command to enable the SIP session helper by adding it back to the session helper list:

```
config system session-helper
   edit 0
      set name sip
      set port 5060
      set protocol 17
end
```

Changing the port numbers that the SIP session helper listens on

You can use the following command to change the port number that the SIP session helper listens on for SIP traffic to 5064. The SIP session helper listens on the same port number for UDP and TCP SIP sessions. In this example, the SIP session helper is session helper 13:

```
config system session-helper
   edit 13
      set port 5064
   end
```

The `config system settings` options `sip-tcp-port`, `sip-udp-port`, and `sip-ssl-port` control the ports that the SIP ALG listens on for SIP sessions. See Changing the port numbers that the SIP ALG listens on on page 2748.

Your FortiGate unit may use a different session helper number for SIP. Enter the following command to view the session helpers:

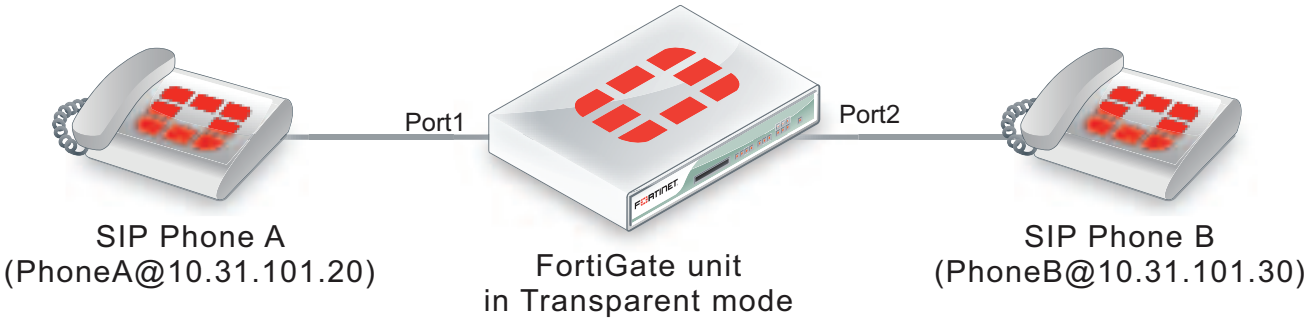
```
show system session-helper
   .
   .
   .
   edit 13
      set name sip
      set port 5060
      set protocol 17
   end
   .
   .
   .
```

Configuration example: SIP session helper in Transparent Mode

The figure below shows an example SIP network consisting of a FortiGate unit operating in Transparent mode between two SIP phones. Since the FortiGate unit is operating in Transparent mode both phones are on the same network and the FortiGate unit and the SIP session helper does not perform NAT. Even though the SIP session helper is not performing NAT you can use this configuration to apply SIP session helper security features to the SIP traffic.

The FortiGate unit requires two security policies that accept SIP packets. One to allow SIP Phone A to start a session with SIP Phone B and one to allow SIP Phone B to start a session with SIP Phone A.

SIP network with FortiGate unit in Transparent mode



General configuration steps

The following general configuration steps are required for this SIP configuration that uses the SIP session helper. This example includes security policies that specifically allow SIP sessions using UDP port 5060 from Phone A to Phone B and from Phone B to Phone A. In most cases you would have more than two phones so would use more general security policies. Also, you can set the firewall service to ANY to allow traffic other than SIP on UDP port 5060.

This example assumes that you have entered the following command to enable using the SIP session helper:

```
config system settings
   set default-voip-alg-mode kernel-helper-based
end
```

1. Add firewall addresses for Phone A and Phone B.
2. Add a security policy that accepts SIP sessions initiated by Phone A.
3. Add a security policy that accepts SIP sessions initiated by Phone B.

Configuration steps - web-based manager

To add firewall addresses for the SIP phones

1. Go to **Policy & Objects > Objects > Addresses**.
2. Select **Create New** to add the following addresses for Phone A and Phone B:

Category	Address

Name	Phone_A
Type	Subnet
Subnet / IP Range	10.31.101.20/255.255.255.255
Interface	port1

Category	Address
Name	Phone_B
Type	Subnet
Subnet / IP Range	10.31.101.30/255.255.255.255
Interface	port2

To add security policies to accept SIP sessions

1. Go to **Policy & Objects > Policy > IPv4**.
2. Select **Create New** to add a security policy.
3. Add a security policy to allow Phone A to send SIP request messages to Phone B:

Incoming Interface	port1
Source Address	Phone_A
Outgoing Interface	port2
Destination Address	Phone_B
Schedule	always
Service	SIP
Action	ACCEPT

4. Select **OK**.
5. Add a security policy to allow Phone B to send SIP request messages to Phone A:

Incoming Interface	port2
Source Address	Phone_B
Outgoing Interface	port1
Destination Address	Phone_A
Schedule	always

Service	SIP
Action	ACCEPT

6. Select **OK**.

Configuration steps - CLI

To add firewall addresses for Phone A and Phone B and security policies to accept SIP sessions

1. Enter the following command to add firewall addresses for Phone A and Phone B.

```
config firewall address
   edit Phone_A
      set associated interface port1
      set type ipmask
      set subnet 10.31.101.20 255.255.255.255
   next
   edit Phone_B
      set associated interface port2
      set type ipmask
      set subnet 10.31.101.30 255.255.255.255
   end
```

2. Enter the following command to add security policies to allow Phone A to send SIP request messages to Phone B and Phone B to send SIP request messages to Phone A.

```
config firewall policy
   edit 0
      set srcintf port1
      set dstintf port2
      set srcaddr Phone_A
      set dstaddr Phone_B
      set action accept
      set schedule always
      set service SIP
   next
   edit 0
      set srcintf port2
      set dstintf port1
      set srcaddr Phone_B
      set dstaddr Phone_A
      set action accept
      set schedule always
      set service SIP
      set utm-status enable
   end
```

SIP session helper diagnose commands

You can use the `diagnose sys sip` commands to display diagnostic information for the SIP session helper.

Use the following command to set the debug level for the SIP session helper. Different debug masks display different levels of detail about SIP session helper activity.

```
diagnose sys sip debug-mask <debug_mask_int>
```

Use the following command to display the current list of SIP dialogs being processed by the SIP session help. You can also use the `clear` option to delete all active SIP dialogs being processed by the SIP session helper.

```
diagnose sys sip dialog {clear | list}
```

Use the following command to display the current list of SIP NAT address mapping tables being used by the SIP session helper.

```
diagnose sys sip mapping list
```

Use the following command to display the current SIP session helper activity including information about the SIP dialogs, mappings, and other SIP session help counts. This command can be useful to get an overview of what the SIP session helper is currently doing.

```
diagnose sys sip status
```

The SIP ALG

In most cases you should use the SIP Application Layer Gateway (ALG) for processing SIP sessions. The SIP ALG provides the same basic SIP support as the SIP session helper. Additionally, the SIP ALG provides a wide range of features that protect your network from SIP attacks, can apply rate limiting to SIP sessions, can check the syntax of SIP and SDP content of SIP messages, and provide detailed logging and reporting of SIP activity.

By default all SIP traffic is processed by the SIP ALG. If the policy that accepts the SIP traffic includes a VoIP profile the SIP traffic is processed by that profile. If the policy does not include a SIP profile the SIP traffic is processed by the SIP ALG using the default VoIP profile.

If a FortiGate unit or a VDOM has been configured to use the SIP session helper, you can change this behavior to the default configuration of using the SIP ALG with the following command:

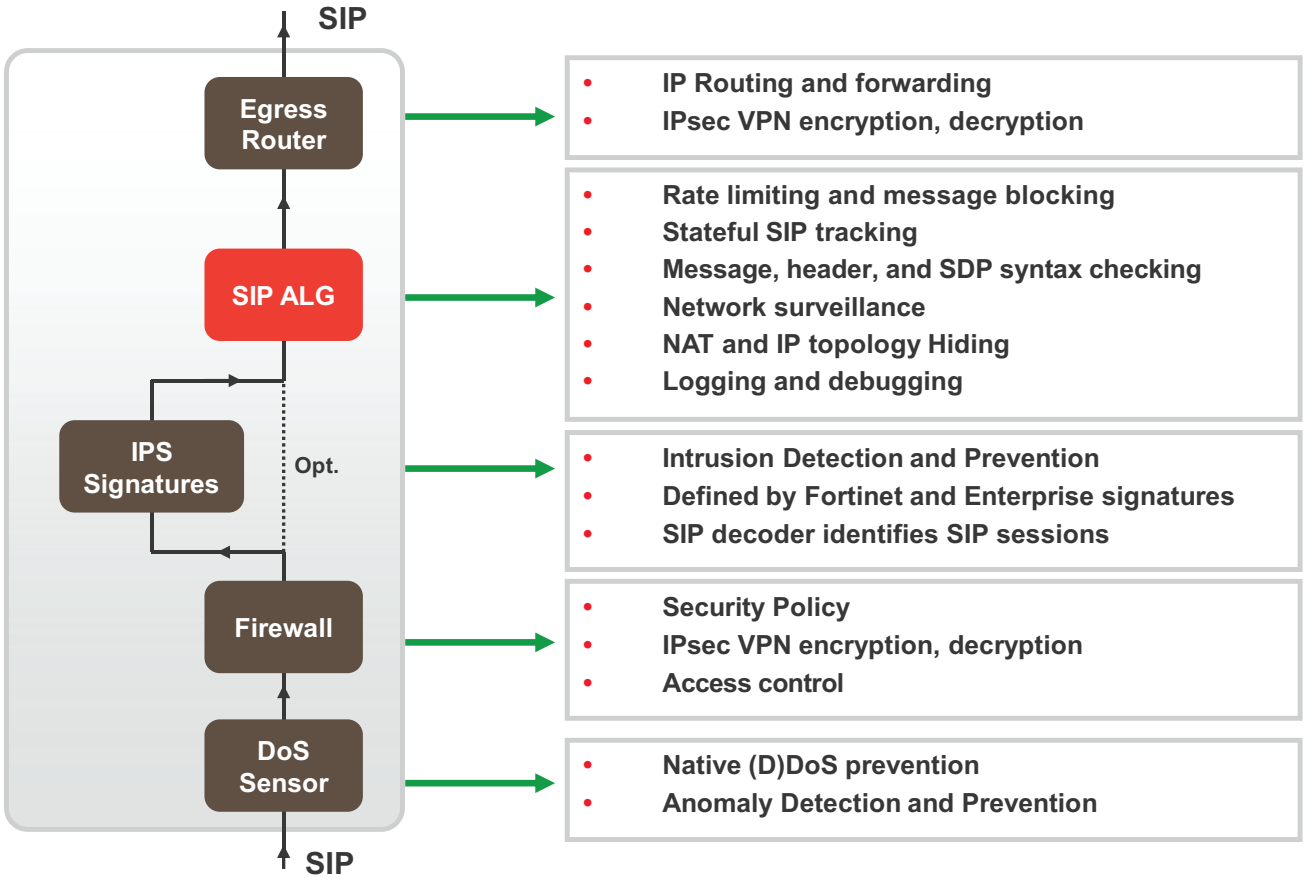
```
config system settings
   set default-voip-alg-mode proxy-based
end
```

As shown in the figure below, the FortiGate SIP ALG intercepts SIP packets after they have been routed by the routing module, accepted by a security policy and passed through DoS and IPS Sensors (if DoS and IPS are enabled). The ALG raises SIP packets to the application layer, analyzes the SIP and SDP addressing information in the SIP messages, makes adjustments (for example, NAT) to this addressing if required, and then sends the packets out the egress interface to their destination.

The SIP ALG provides:

- All the same features as the SIP session helper including NAT and SIP and RTP Pinholes.
- In addition for the ALG you can enable or disable RTP pinholing, SIP register pinholing and SIP contact pinholing. In a signalling only environment where the RTP stream bypasses the FortiGate unit, you can disable RTP pinholing to improve performance.
- SIP TCP and UDP support
- SIP Message order checking
- Configurable Header line length maximums

The SIP ALG works at the application level after ingress packets are accepted by a security policy



- Message fragment assembly (TCP)
- If SIP messages are fragmented across multiple packets, the FortiGate unit assembles the fragments, does inspection and pass the message in its entirety to the SIP server as one packet. This offloads the server from doing all the TCP processing of fragments.
- L4 Protocol Translation
- Message Flood Protection
- Protects a SIP server from intentional or unintentional DoS of flooding INVITE, REGISTER, and other SIP methods by allowing control of the rate that these massages pass through the FortiGate unit.
- SIP message type filtering
- The FortiGate unit can prevent specified SIP message types from passing through the FortiGate unit to a SIP server. For example In a voice only SIP implementation, there may be no need to permit a SUBSCRIBE message to ever make it's way to the SIP call processor. Also, if a SIP server cannot process some SIP message types you can use SIP message type filtering to block them. For example, a SIP server could have a bug that prevents it from processing certain SIP messages. In this case you can temporarily block these message types until problem with the SIP server has been fixed.
- SIP statistics and logging
- SIP over IPv6
- SIP over SSL/TLS

- Deep SIP message syntax checking (also called deep SIP header inspection or SIP fuzzing protection). Prevents attacks that use malformed SIP messages. Can check many SIP headers and SDP statements. Configurable bypass and modification options.
- Hosted NAT traversal, Resolves IP address issue in SIP and SDP lines due to NAT-PT in far end firewall. Important feature for VoIP access networks.
- SIP High Availability (HA), including active-passive clustering and session pickup (session failover) for SIP sessions.
- Geographical Redundancy. In an HA configuration, if the active SIP server fails (missing SIP heartbeat messages or SIP traffic) SIP sessions can be redirected to a secondary SIP server in another location.
- SIP per request method message rate limitation with configurable threshold for SIP message rates per request method. Protects SIP servers from SIP overload and DoS attacks.
- RTP Bypass, Supports configurations with and without RTP pinholing. May inspect and protect SIP signaling only.
- SIP NAT with IP address conservation. Performs SIP and RTP aware IP Network Address translation. Preserves the lost IP address information in the SDP profile i= line for later processing/debugging in the SIP server. See NAT with IP address conservation on page 2778.
- IP topology hiding
- The IP topology of a network can be hidden through NAT and NAPT manipulation of IP and SIP level addressing. For example, see SIP NAT scenario: destination address translation (destination NAT) on page 2766.
- SIP inspection without address translation
- The SIP ALG inspects SIP messages but addresses in the messages are not translated. This feature can be applied to a FortiGate unit operating in Transparent mode or in NAT/Route mode. In Transparent mode you add normal Transparent mode security policies that enable the SIP ALG and include a VoIP profile that causes the SIP ALG to inspect SIP traffic as required. For an example configuration, see Configuration example: SIP in Transparent Mode on page 2754.
- For a FortiGate unit operating in NAT/Route mode, if SIP traffic can pass between different networks without requiring NAT because is supported by the routing configuration, you can add security policies that accept SIP traffic without enabling NAT. In the VoIP profile you can configure the SIP ALG to inspect SIP traffic as required.

SIP ALG configuration overview

To apply the SIP ALG, you add a SIP VoIP profile to a security policy that accepts SIP sessions. All SIP sessions accepted by the security policy will be processed by the SIP ALG using the settings in the VoIP profile. The VoIP profile contains settings that are applied to SIP, Session Initiation Protocol for Instant Messaging and Presence Leveraging Extensions (SIMPLE) and Skinny Call Control Protocol (SCCP) sessions. All SCCP sessions accepted by the security policy are also processed byt the ALG. You configure SIP and SCCP settings separately. SIP settings also apply to SIMPLE sessions.

Enabling VoIP support on the web-based manager

Before you begin to configure VoIP security options, including SIP, from the web-based manager you should go to **System > Config > Features** and turn on VoIP. To find VoIP select the Show More button.

From the CLI you can also enter the following command enable VoIP support on the GUI:

```
config system global
   set gui-voip-profile enable
end
```

VoIP profiles

You can customize the default VoIP profile or add new VoIP profiles.

To add a new VoIP profile from the web-based manager go to **Security Profiles > VoIP** and select **Create New** (the + button).

For SIP, from the web-based manager you can configure the VoIP profile to limit the number of SIP REGISTER and INVITE requests. Many additional options for configuring how the ALG processes SIP sessions are available from the CLI.

For SCCP you can limit the call setup time. Additional SCCP options are available from the CLI.

Use the following command to add a VoIP profile named VoIP_Pro_1 from the CLI:

```
config voip profile
   edit VoIP_Pro_1
end
```

FortiGate units include two pre-defined VoIP profiles. On the web-based manager these profiles look identical. However, the CLI-only settings result in the following functionality.

default	The most commonly used VoIP profile. This profile enables both SIP and SCCP and places the minimum restrictions on what calls will be allowed to negotiate. This profile allows normal SCCP, SIP and RTP sessions and enables the following security settings: • `block-long-lines` to block SIP messages with lines that exceed maximum line lengths. • `block-unknown` to block unrecognized SIP request messages. • `open-record-route-pinhole` to open pinholes for Record-Route messages. • `log-violations` to write log messages that record SIP violations. • `log-call-summary` to write log messages that record SIP call progress (similar to DLP archiving). • `nat-trace` (see NAT with IP address conservation on page 2778). • `contact-fixup` perform NAT on the IP addresses and port numbers in SIP headers in SIP CONTACT messages even if they don't match the session's IP address and port numbers. • `ips-rtp` to enable IPS in security policies that also accept SIP sessions to protect the SIP traffic from SIP-based attacks.
strict	This profile is available for users who want to validate SIP messages and to only allow SIP sessions that are compliant with RFC 3261. In addition to the settings in the default VoIP profile, the strict profile sets all SIP deep message inspection header checking options to `discard`. So the strict profile blocks and drops SIP messages that contain malformed SIP or SDP lines that can be detected by the ALG. For more information about SIP deep header inspection, see Deep SIP message inspection on page 2792.

Neither of the default profiles applies SIP rate limiting. To apply more ALG features to SIP sessions you can clone (copy) the pre-defined VoIP profiles and make your own modifications to them. For example, to clone the default profile and configure the limit for SIP NOTIFY request messages to 1000 messages per second per security policy and block SIP INFO request messages.

```
config voip profile
   clone default to my_voip_pro
   edit my_voip_pro
      config sip
         set notify-rate 1000
         set block-info enable
      end
   end
```

Changing the port numbers that the SIP ALG listens on

Most SIP configurations use TCP or UDP port 5060 for SIP sessions and port 5061 for SIP SSL sessions. If your SIP network uses different ports for SIP sessions you can use the following command to configure the SIP ALG to listen on a different TCP, UDP, or SSL ports. For example, to change the TCP port to 5064, the UDP port to 5065, and the SSL port to 5066.

```
config system settings
   set sip-tcp-port 5064
   set sip-udp-port 5065
   set sip-ssl-port 5066
end
```

You also configure the SIP ALG to listen in two different TCP ports and two different UDP ports for SIP sessions. For example, if you receive SIP TCP traffic on port 5060 and 5064 and UDP traffic on ports 5061 and 5065 you can enter the following command to receive the SIP traffic on all of these ports:

```
config system settings
   set sip-tcp-port 5060 5064
   set sip-udp-port 5061 5065
end
```

Disabling the SIP ALG in a VoIP profile

SIP is enabled by default in a VoIP profile. If you are just using the VoIP profile for SCCP you can use the following command to disable SIP in the VoIP profile.

```
config voip profile
edit VoIP_Pro_2
  config sip
    set status disable
  end
   end
```

SIP ALG get and diagnose commands

You can use the following commands to display diagnostic information for the SIP ALG.

Use the following command to list all active SIP calls being processed by the SIP ALG. You can also use the `clear` option to delete all active SIP calls being processed by the SIP ALG.

```
diagnose sys sip-proxy calls {clear | list}
```

Use the following commands to use filters to display specific information about the SIP ALG and the session that it is processing.

```
diagnose sys sip-proxy filter <filter_options>
diagnose sys sip-proxy log-filter <filter_options>
```

Use the following command to display the active SIP rate limiting meters and their current settings.

```
diagnose sys sip-proxy meters list
```

Use the following command to display status information about the SIP sessions being processed by the SIP ALG. You can also clear all SIP ALG statistics.

```
diagnose sys sip-proxy stats {clear | list}
```

Conflicts between the SIP ALG and the session helper

If you suspect that the SIP session helper is being used instead of the ALG, you can use the `diagnose sys sip` command to determine if the SIP session helper is processing SIP sessions. For example, the following command displays the overall status of the SIP sessions being processed by the SIP session helper:

The `diagnose sys sip` commands only display current status information. To see activity the SIP session helper has to actually be processing SIP sessions when you enter the command. For example, if the SIP session helper had been used for processing calls that ended 5 minutes ago, the command output would show no SIP session helper activity.

```
diagnose sys sip status
dialogs: max=32768, used=0
mappings: used=0
dialog hash by ID: size=2048, used=0, depth=0
dialog hash by RTP: size=2048, used=0, depth=0
mapping hash: size=2048, used=0, depth=0
count0: 0
count1: 0
count2: 0
count3: 0
count4: 0
```

This command output shows that the session helper is not processing SIP sessions because all of the used and count fields are 0. If any of these fields contains non-zero values then the SIP session helper may be processing SIP sessions.

Also, you can check to see if some ALG-only features are not being applied to all SIP sessions. For example, FortiView pages displays statistics for SIP and SCCP calls processed by the ALG but not for calls processed by the session helper. So if you see fewer calls than expected the session helper may be processing some of them.

Finally, you can check the policy usage and session information dashboard widgets to see if SIP sessions are being accepted by the wrong security policies.

Stateful SIP tracking, call termination, and session inactivity timeout

The SIP ALG tracks SIP dialogs over their lifespan between the first INVITE message and the Final 200 OK and ACK messages. For every SIP dialog, stateful SIP tracking reviews every SIP message and makes adjustment to SIP tracking tables as required. These adjustments include source and destination IP addresses, address translation, dialog expiration information, and media stream port changes. Such changes can also result in dynamically opening and closing pinholes. You can use the `diagnose sys sip-proxy stats list` and the `diagnose sys sip-proxy filter` command to view the SIP call data being tracked by the SIP ALG.

The SIP ALG uses the SIP Expires header line to time out a SIP dialog if the dialog is idle and a Re-INVITE or UPDATE message is not received. The SIP ALG gets the Session-Expires value, if present, from the 200 OK response to the INVITE message. If the SIP ALG receives an INVITE before the session times out, all timeout values are reset to the settings in the new INVITE message or to default values. As a precautionary measure, the

SIP ALG uses hard timeout values to set the maximum amount of time a call can exist. This ensures that the FortiGate unit is protected if a call ends prematurely.

When a SIP dialog ends normally, the SIP ALG deletes the SIP call information and closes open pinholes. A SIP call can also end abnormally due to an unexpected signaling or transport event that cuts off the call. When a call ends abnormally the SIP messages to end the call may not be sent or received. A call can end abnormally for the following reasons:

- Phones or servers crash during a call and a BYE message is not received.
- To attack a SIP system, a malicious user never send a BYE message.
- Poor implementations of SIP fail to process Record-Route messages and never send a BYE message.
- Network failures prevent a BYE message from being received.

Any phone or server in a SIP call can cancel the call by sending a CANCEL message. When a CANCEL message is received by the FortiGate unit, the SIP ALG closes open pinholes. Before terminating the call, the ALG waits for the final 200 OK message.

The SIP ALG can be configured to terminate SIP calls if the SIP dialog message flow or the call RTP (media) stream is interrupted and does not recover. You can use the following commands to configure terminating inactive SIP sessions and to set timers or counters to control when the call is terminated by the SIP ALG.

Adding a media stream timeout for SIP calls

Use the following command in a VoIP profile to terminate SIP calls accepted by a security policy containing the VoIP profile when the RTP media stream is idle for 100 seconds.

```
config voip profile
   edit VoIP_Pro_Name
      config sip
         set call-keepalive 100
      end
   end
```

You can adjust this setting between 1 and 10,080 seconds. The default call keepalive setting of 0 disables terminating a call if the media stream is interrupted. Set call keepalive higher if your network has latency problems that could temporarily interrupt media streams. If you have configured call keepalive and the FortiGate unit terminates calls unexpectedly you can increase the call keepalive time to resolve the problem.

Call keep alive should be used with caution because enabling this feature results in extra FortiGate CPU overhead and can cause delay/jitter for the VoIP call. Also, the FortiGate unit terminates the call without sending SIP messages to end the call. And if the SIP endpoints send SIP messages to terminate the call they will be blocked by the FortiGate unit if they are sent after the FortiGate unit terminates the call.

Adding an idle dialog setting for SIP calls

Use the following command in a VoIP profile to terminate SIP calls when for a single security policy, when the configured number of SIP calls (or dialogs) has stopped receiving SIP messages or has not received legitimate SIP messages. Using this command you can configure how many dialogs that have been accepted by a security policy that the VoIP profile is added to become idle before the SIP ALG deletes the oldest ones. The following command sets the maximum number of idle dialogs to 200:

```
config voip profile
   edit VoIP_Pro_Name
      config sip
         set max-idle-dialogs 200
```

```
        end
    end
```

Idle dialogs would usually be dialogs that have been interrupted because of errors or problems or as the result of a SIP attack that opens a large number of SIP dialogs without closing them. This command provides a way to remove these dialogs from the dialog table and recover memory and resources being used by these open and idle dialogs.

You can adjust this setting between 1 and a very high number. The default maximum idle dialogs setting of 0 disables this feature. Set maximum dialogs higher if your network has latency problems that could temporarily interrupt SIP messaging. If you have configured max idle dialogs and the FortiGate unit terminates calls unexpectedly you can increase the max idle dialogs number to resolve the problem.

Changing how long to wait for call setup to complete

In some cases and some configurations your SIP system may experience delays during call setup. If this happens, some SIP ALG timers may expire before call setup is complete and drop the call. In some cases you may also want to reduce the amount of time the SIP ALG allows for call setup to complete.

You can use the `provisional-invite-expiry-time` SIP VoIP profile option to control how long the SIP ALG waits for provisional INVITE messages before assuming that the call setup has been interrupted and the SIP call should be dropped. The default value for this timer is 210 seconds. You can change it to between 10 and 3600 seconds.

Use the following command to change the expiry time to 100 seconds.

```
config voip profile
   edit Profile_name
      config sip
         set provisional-invite-expiry-time 100
      end
end
```

SIP and RTP/RTCP

FortiGate units support the Real Time Protocol (RTP) application layer protocol for the VoIP call audio stream. RTP uses dynamically assigned port numbers that can change during a call. SIP control messages that start a call and that are sent during the call inform callers of the port number to use and of port number changes during the call.

During a call, each RTP session will usually have a corresponding Real Time Control Protocol (RTCP) session. By default, the RTCP session port number is one higher than the RTP port number.

The RTP port number is included in the `m=` part of the SDP profile. In the example above, the SIP INVITE message includes RTP port number is 49170 so the RTCP port number would be 49171. In the SIP response message the RTP port number is 3456 so the RTCP port number would be 3457.

How the SIP ALG creates RTP pinholes

The SIP ALG requires the following information to create a pinhole. The SIP ALG finds this information in SIP messages and some is provided by the SIP ALG:

Protocol	UDP (Extracted from SIP messages by the SIP ALG.)
Source IP	Any
Source port	Any
Destination IP	The SIP ALG extracts the destination IP address from the c= line in the SDP profile. The c= line can appear in either the session or media part of the SDP profile. The SIP ALG uses the IP address in the c= line of the media part of the SDP profile first. If the media part does not contain a c= line, the SIP ALG checks the c= line in the session part of the SDP profile. If the session part of the profile doesn't contain a c= line the packet is dropped. Pinholes for RTP and RTCP sessions share the same destination IP address.
Destination port	The SIP ALG extracts the destination port number for RTP from the m= field and adds 1 to this number to get the RTCP port number.
Lifetime	The length of time during which the pinhole will be open. When the lifetime ends, the SIP ALG removes the pinhole.

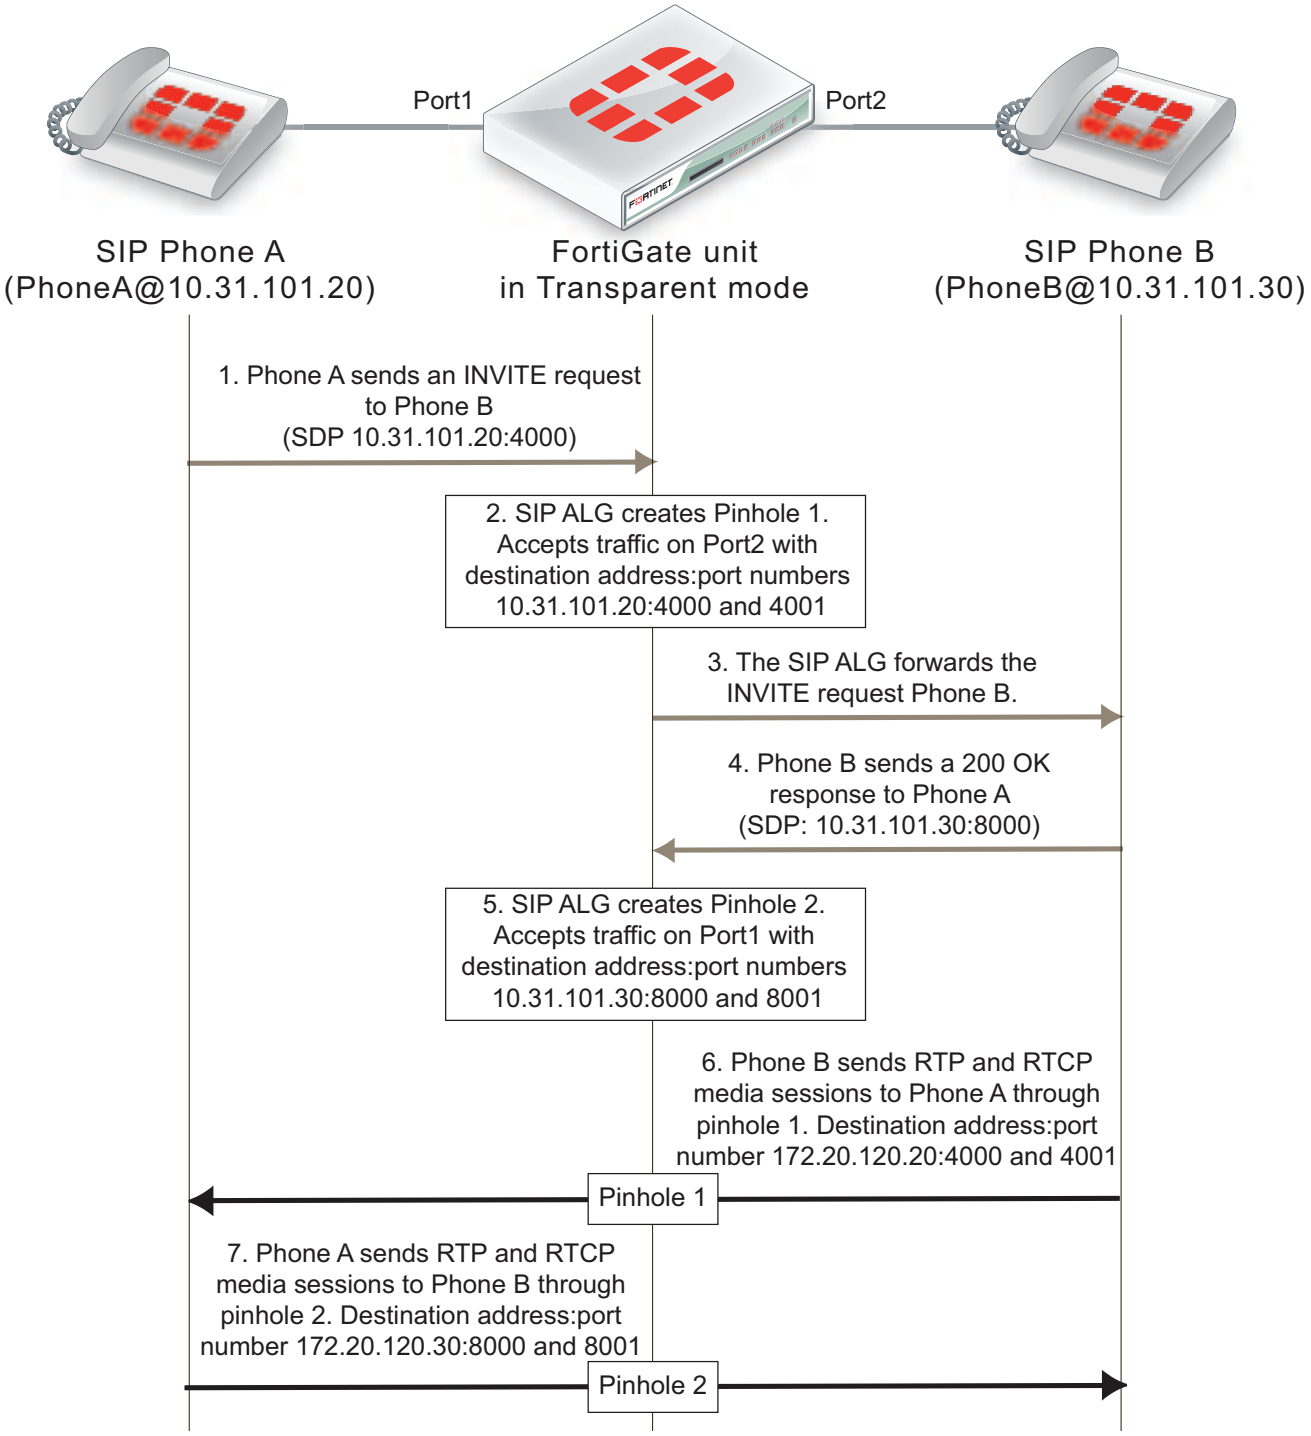
The SIP ALG keeps RTP pinholes open as long as the SIP session is alive. When the associated SIP session is terminated by the SIP ALG or the SIP phones or servers participating in the call, the RTP pinhole is closed.

The figure below shows a simplified call setup sequence that shows how the SIP ALG opens pinholes. Phone A and Phone B are installed on either side of a FortiGate unit operating in Transparent mode. Phone A and Phone B are on the same subnet. The FortiGate unit includes a security policy that accepts SIP sessions from port1 to port2 and from port2 to port1. The FortiGate unit does not require an RTP security policy, just the SIP policy.

You can see from this diagram that the SDP profile in the INVITE request from Phone A indicates that Phone A is expecting to receive a media stream sent to its IP address using port 4000 for RTP and port 4001 for RTCP. The SIP ALG creates pinhole 1 to allow this media traffic to pass through the FortiGate unit. Pinhole 1 is opened on the Port2 interface and will accept media traffic sent from Phone B to Phone A.

When Phone B receives the INVITE request from Phone A, Phone B will know to send media streams to Phone A using destination IP address 10.31.101.20 and ports 4000 and 4001. The 200 OK response sent from Phone B indicates that Phone B is expecting to receive a media stream sent to its IP address using ports 8000 and 8001. The SIP ALG creates pinhole 2 to allow this media traffic to pass through the FortiGate unit. Pinhole 2 is opened on the Port1 interface and will accept media traffic sent from Phone A to Phone B.

SIP call setup with a FortiGate unit in Transparent mode

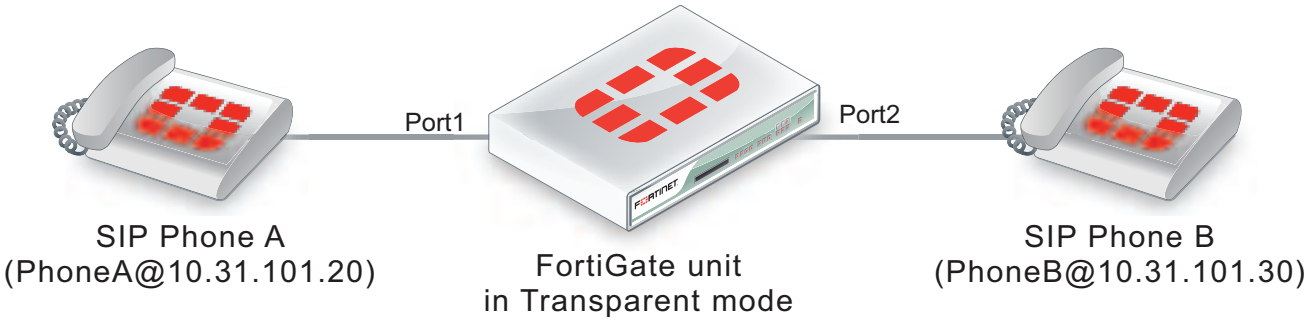


Configuration example: SIP in Transparent Mode

The figure below hows an example SIP network consisting of a FortiGate unit operating in Transparent mode between two SIP phones. Since the FortiGate unit is operating in Transparent mode both phones are on the same network and the FortiGate unit and the SIP ALG does not perform NAT. Even though the SIP ALG is not performing NAT you can use this configuration to apply SIP security features to the SIP traffic.

The FortiGate unit requires two security policies that accept SIP packets. One to allow SIP Phone A to start a session with SIP Phone B and one to allow SIP Phone B to start a session with SIP Phone A.

SIP network with FortiGate unit in Transparent mode



General configuration steps

The following general configuration steps are required for this SIP configuration. This example uses the default VoIP profile. The example also includes security policies that specifically allow SIP sessions using UDP port 5060 from Phone A to Phone B and from Phone B to Phone A. In most cases you would have more than two phones so would use more general security policies. Also, you can set the security service to ANY to allow traffic other than SIP on UDP port 5060.

1. Add firewall addresses for Phone A and Phone B.
2. Add a security policy that accepts SIP sessions initiated by Phone A and includes the default VoIP profile.
3. Add a security policy that accepts SIP sessions initiated by Phone B and includes the default VoIP profile.

Configuration steps - web-based manage

Before you begin this procedure you may have to go to **System > Config > Features** and turn on VoIP. To find VoIP select the Show More button.

To add firewall addresses for the SIP phones

1. Go to **Policy & Objects > Objects > Addresses**.
2. Add the following addresses for Phone A and Phone B:

Category	Address

Name	Phone_A
Type	Subnet
Subnet / IP Range	10.31.101.20/255.255.255.255
Interface	port1

Category	Address
Name	Phone_B
Type	Subnet
Subnet / IP Range	10.31.101.30/255.255.255.255
Interface	port2

To add security policies to apply the SIP ALG to SIP sessions

1. Go to **Policy & Objects > Policy > IPv4**.
2. Select **Create New** to add a security policy.
3. Add a security policy to allow Phone A to send SIP request messages to Phone B:

Incoming Interface	port1
Source Address	Phone_A
Outgoing Interface	port2
Destination Address	Phone_B
Schedule	always
Service	SIP
Action	ACCEPT

4. Turn on **VoIP** and select the **default** VoIP profile.
5. Select **OK**.
6. Add a security policy to allow Phone B to send SIP request messages to Phone A:

Incoming Interface	port2
Source Address	Phone_B
Outgoing Interface	port1
Destination Address	Phone_A

Schedule	always
Service	SIP
Action	ACCEPT

7. Turn on **VoIP** and select the **default** VoIP profile.
8. Select **OK**.

Configuration steps - CLI

To add firewall addresses for Phone A and Phone B and security policies to apply the SIP ALG to SIP sessions

1. Enter the following command to add firewall addresses for Phone A and Phone B.

```
config firewall address
   edit Phone_A
      set associated interface port1
      set type ipmask
      set subnet 10.31.101.20 255.255.255.255
   next
   edit Phone_B
      set associated interface port2
      set type ipmask
      set subnet 10.31.101.30 255.255.255.255
   end
```

2. Enter the following command to add security policies to allow Phone A to send SIP request messages to Phone B and Phone B to send SIP request messages to Phone A.

```
config firewall policy
   edit 0
      set srcintf port1
      set dstintf port2
      set srcaddr Phone_A
      set dstaddr Phone_B
      set action accept
      set schedule always
      set service SIP
      set utm-status enable
      set voip-profile default
   next
   edit 0
      set srcintf port2
      set dstintf port1
      set srcaddr Phone_B
      set dstaddr Phone_A
      set action accept
      set schedule always
      set service SIP
      set utm-status enable
      set voip-profile default
   end
```

RTP enable/disable (RTP bypass)

You can configure the SIP ALG to stop from opening RTP pinholes. Called RTP bypass, this configuration can be used when you want to apply SIP ALG features to SIP signalling messages but do not want the RTP media streams to pass through the FortiGate unit. The FortiGate unit only acts as a signalling firewall and RTP media session bypass the FortiGate unit and no pinholes need to be created.

Enter the following command to enable RTP bypass in a VoIP profile by disabling opening RTP pinholes:

```
config voip profile
   edit VoIP_Pro_1
      config sip
         set rtp disable
      end
end
```

Opening and closing SIP register, contact, via and record-route pinholes

You can use the `open-register-pinhole`, `open-contact-pinhole`, `open-via-port`, and `open-record-route-pinhole` VoIP profile CLI options to control whether the FortiGate unit opens various pinholes.

If `open-register-pinhole` is enabled (the default setting) the FortiGate unit opens pinholes for SIP Register request messages. You can disable `open-register-pinhole` so that the FortiGate unit does not open pinholes for SIP Register request messages.

If `open-contact-pinhole` is enabled (the default setting) the FortiGate unit opens pinholes for non-Register SIP request messages. You can disable `open-contact-pinhole` so that the FortiGate unit does not open pinholes for non-register requests. Non-register pinholes are usually opened for SIP INVITE requests.

If `open-via-pinhole` is disabled (the default setting) the FortiGate unit does not open pinholes for Via messages. You can enable `open-via-pinhole` so that the FortiGate unit opens pinholes for Via messages.

If `open-record-route-pinhole` is enabled (the default setting) the FortiGate unit opens pinholes for Record-Route messages. You can disable `open-record-route-pinhole` so that the FortiGate unit does not open pinholes for Record-Route messages.

Usually you would want to open these pinholes. Keeping them closed may prevent SIP from functioning properly through the FortiGate unit. They can be disabled, however, for interconnect scenarios (where all SIP traffic is between proxies and traveling over a single session). In some cases these settings can also be disabled in access scenarios if it is known that all users will be registering regularly so that their contact information can be learned from the register request.

You might want to prevent pinholes from being opened to avoid creating a pinhole for every register or non-register request. Each pinhole uses additional system memory, which can affect system performance if there are hundreds or thousands of users, and requires refreshing which can take a relatively long amount of time if there are thousands of active calls.

To configure a VoIP profile to prevent opening register and non-register pinholes:

```
config voip profile
   edit VoIP_Pro_1
      config sip
         set open-register-pinhole disable
         set open-contact-pinhole disable
```

```
        end
    end
```

In some cases you may not want to open pinholes for the port numbers specified in SIP Contact headers. For example, in an interconnect scenario when a FortiGate unit is installed between two SIP servers and the only SIP traffic through the FortiGate unit is between these SIP servers pinholes may not need to be opened for the port numbers specified in the Contact header lines.

If you disable `open-register-pinhole` then pinholes are not opened for ports in Contact header lines in SIP Register messages. If you disable `open-contact-pinhole` then pinholes are not opened for ports in Contact header lines in all SIP messages except SIP Register messages.

Accepting SIP register responses

You can enable the VoIP profile `open-via-pinhole` options to accept a SIP Register response message from a SIP server even if the source port of the Register response message is different from the destination port.

Most SIP servers use 5060 as the source port in the SIP register response. Some SIP servers, however, may use a different source port. If your SIP server uses a different source port, you can enable `open-via-pinhole` and the SIP ALG will create a temporary pinhole when the Register request from a SIP client includes a different source port. The FortiGate unit will accept a SIP Register response with any source port number from the SIP server.

Enter the following command to enable accepting any source port from a SIP server:

```
config voip profile
   edit VoIP_Pro_1
      config sip
         set open-via-pinhole enable
      end
end
```

How the SIP ALG performs NAT

In most Network Address Translation (NAT) configurations, multiple hosts in a private network share a single public IP address to access the Internet. For sessions originating on the private network for the Internet, NAT replaces the private IP address of the PC in the private subnet with the public IP address of the NAT device. The NAT device converts the public IP address for responses from the Internet back into the private address before sending the response over the private network to the originator of the session.

Using NAT with SIP is more complex because of the IP addresses and media stream port numbers used in SIP message headers and bodies. When a caller on the private network sends a SIP message to a phone or SIP server on the Internet, the SIP ALG must translate the private network addresses in the SIP message to IP addresses and port numbers that are valid on the Internet. When the response message is sent back to the caller, the SIP ALG must translate these addresses back to valid private network addresses.

In addition, the media streams generated by the SIP session are independent of the SIP message sessions and use varying port numbers that can also change during the media session. The SIP ALG opens pinholes to accept these media sessions, using the information in the SIP messages to determine the pinholes to open. The ALG may also perform port translation on the media sessions.

When an INVITE message is received by the SIP ALG, the FortiGate unit extracts addressing and port number information from the message header and stores it in a SIP dialog table. Similar to an IP session table the data in the dialog table is used to translate addresses in subsequent SIP messages that are part of the same SIP call.

When the SIP ALG receives a response to the INVITE message arrives, (for example, an ACK or 200 OK), the SIP ALG compares the addresses in the message fields against the entries in the SIP dialog table to identify the call context of the message. The SIP ALG then translates addresses in the SIP message before forwarding them to their destination.

The addressing and port number information in SDP fields is used by the ALG to reserve ports for the media session and create a NAT mapping between them and the ports in the SDP fields. Because SDP uses sequential ports for the RTP and RTCP channels, the ALG provides consecutive even-odd ports.

Source address translation

When a SIP call is started by a phone on a private network destined for a phone on the Internet, only source address translation is required. The phone on the private network attempts to contact the actual IP address of the phone on the Internet. However, the source address of the phone on the private network is not routable on the Internet so the SIP ALG must translate all private IP addresses in the SIP message into public IP addresses.

To configure the FortiGate for source address translation you add security policy that accepts sessions from the internal network destined for the Internet. You must enable NAT for the security policy and add a VoIP profile.

When a SIP request is received from the internal to the external network, the SIP ALG replaces the private network IP addresses and port numbers in the SIP message with the IP address of the FortiGate interface connected to the Internet. Depending on the content of the message, the ALG translates addresses in the Via:, Contact:, Route:, and Record-Route: SIP header fields. The message is then forwarded to the destination (either a VoIP phone or a SIP server on the Internet).

The VoIP phone or server in the Internet sends responses to these SIP messages to the external interface of the FortiGate unit. The addresses in the response messages are translated back into private network addresses and the response is forwarded to the originator of the request.

For the RTP communication between the SIP phones, the SIP ALG opens pinholes to allow media through the FortiGate unit on the dynamically assigned ports negotiated based on information in the SDP and the Via:, Contact:, and Record-Route: header fields. The pinholes also allow incoming packets to reach the Contact:, Via:, and Record-Route: IP addresses and ports. When processing return traffic, the SIP ALG inserts the original Contact:, Via:, Route:, and Record-Route: SIP fields back into the packets.

Destination address translation

Incoming calls are directed from a SIP phone on the Internet to the interface of the FortiGate unit connected to the Internet. To receive these calls you must add a security policy to accept SIP sessions from the Internet. The security policy requires a firewall virtual IP. SIP INVITE messages from the Internet connect to the external IP address of the virtual IP. The SIP ALG uses the destination address translation defined in the virtual IP to translated the addresses in the SIP message to addresses on the private network.

When a 200 OK response message arrives from the private network, the SIP ALG translates the addresses in the message to Internet addresses and opens pinholes for media sessions from the private network to the Internet.

When the ACK message is received for the 200 OK, it is also intercepted by the SIP ALG. If the ACK message contains SDP information, the SIP ALG checks to determine if the IP addresses and port numbers are not changed from the previous INVITE. If they are, the SIP ALG deletes pinholes and creates new ones as required. The ALG also monitors the Via:, Contact:, and Record-Route: SIP fields and opens new pinholes as required.

Call Re-invite messages

SIP Re-INVITE messages can dynamically add and remove media sessions during a call. When new media sessions are added to a call the SIP ALG opens new pinholes and update SIP dialog data. When media sessions are ended, the SIP ALG closes pinholes that are no longer needed and removes SIP dialog data.

How the SIP ALG translates IP addresses in SIP headers

The SIP ALG applies NAT to SIP sessions by translating the IP addresses contained in SIP headers. For example, the following SIP message contains most of the SIP fields that contain addresses that need to be translated:

```
INVITE PhoneB@172.20.120.30 SIP/2.0
Via: SIP/2.0/UDP 172.20.120.50:5434
From: PhoneA@10.31.101.20
To: PhoneB@172.20.120.30
Call-ID: a12abcde@172.20.120.50
Contact: PhoneA@10.31.101.20:5434
Route: <sip:example@172.20.120.50:5060>
Record-Route: <sip:example@172.20.120.50:5060>
```

How IP address translation is performed depends on whether source NAT or destination NAT is applied to the session containing the message:

Source NAT translation of IP addresses in SIP messages

Source NAT translation occurs for SIP messages sent from a phone or server on a private network to a phone or server on the Internet. The source addresses in the SIP header fields of the message are typically set to IP addresses on the private network. The SIP ALG translates these addresses to the address the FortiGate unit interface connected to the Internet.

Source NAT translation of IP addresses in SIP request messages

SIP header	NAT action
To:	None
From:	Replace private network address with IP address of FortiGate unit interface connected to the Internet.
Call-ID:	Replace private network address with IP address of FortiGate unit interface connected to the Internet.
Via:	Replace private network address with IP address of FortiGate unit interface connected to the Internet.
Request-URI:	None
Contact:	Replace private network address with IP address of FortiGate unit interface connected to the Internet.
Record-Route:	Replace private network address with IP address of FortiGate unit interface connected to the Internet.
Route:	Replace private network address with IP address of FortiGate unit interface connected to the Internet.

Response messages from phones or servers on the Internet are sent to the FortiGate unit interface connected to the Internet where the destination addresses are translated back to addresses on the private network before forwarding the SIP response message to the private network.

Source NAT translation of IP addresses in SIP response messages

SIP header	NAT action
To:	None
From:	Replace IP address of FortiGate unit interface connected to the Internet with private network address.
Call-ID:	Replace IP address of FortiGate unit interface connected to the Internet with private network address.
Via:	Replace IP address of FortiGate unit interface connected to the Internet with private network address.
Request-URI:	N/A
Contact:	None
Record-Route:	Replace IP address of FortiGate unit interface connected to the Internet with private network address.
Route:	Replace IP address of FortiGate unit interface connected to the Internet with private network address.

Destination NAT translation of IP addresses in SIP messages

Destination NAT translation occurs for SIP messages sent from a phone or server on the Internet to a firewall virtual IP address. The destination addresses in the SIP header fields of the message are typically set to the virtual IP address. The SIP ALG translates these addresses to the address of a SIP server or phone on the private network on the other side of the FortiGate unit.

Destination NAT translation of IP addresses in SIP request messages

SIP header	NAT action
To:	Replace VIP address with address on the private network as defined in the firewall virtual IP.
From:	None
Call-ID:	None
Via:	None
Request-URI:	Replace VIP address with address on the private network as defined in the firewall virtual IP.
Contact:	None
Record-Route:	None
Route:	None

SIP response messages sent in response to the destination NAT translated messages are sent from a server or a phone on the private network back to the originator of the request messages on the Internet. These reply messages are accepted by the same security policy that accepted the initial request messages, The firewall VIP in the original security policy contains the information that the SIP ALG uses to translate the private network source addresses in the SIP headers into the firewall virtual IP address.

Destination NAT translation of IP addresses in SIP response messages

SIP header	NAT action
To:	None
From:	Replace private network address with firewall VIP address.
Call-ID:	None
Via:	None
Request-URI:	N/A
Contact:	Replace private network address with firewall VIP address.
Record-Route:	Replace private network address with firewall VIP address.
Route:	None

How the SIP ALG translates IP addresses in the SIP body

The SDP session profile attributes in the SIP body include IP addresses and port numbers that the SIP ALG uses to create pinholes for the media stream.

The SIP ALG translates IP addresses and port numbers in the o=, c=, and m= SDP lines. For example, in the following lines the ALG could translate the IP addresses in the o= and c= lines and the port number (49170) in the m= line.

```
o=PhoneA 5462346 332134 IN IP4 10.31.101.20
c=IN IP4 10.31.101.20
m=audio 49170 RTP 0 3
```

If the SDP session profile includes multiple RTP media streams, the SIP ALG opens pinholes and performs the required address translation for each one.

The two most important SDP attributes for the SIP ALG are c= and m=. The c= attribute is the connection information attribute. This field can appear at the session or media level. The syntax of the connection attribute is:

```
c=IN {IPV4 | IPV6} <destination_ip_address>
```

Where

- `IN` is the network type. FortiGate units support the `IN` or Internet network type.
- `{IPV4 | IPV6}` is the address type. FortiGate units support IPv4 or IPv6 addresses in SDP statements. However, FortiGate units do not support all types of IPv6 address translation. See "SIP over IPv6".
- `<destination_IP_address>` is the unicast numeric destination IP address or domain name of the connection in either IPv4 or IPv6 format.

The syntax of the media attribute is:

```
m=audio <port_number> RTP <format_list>
```

Where

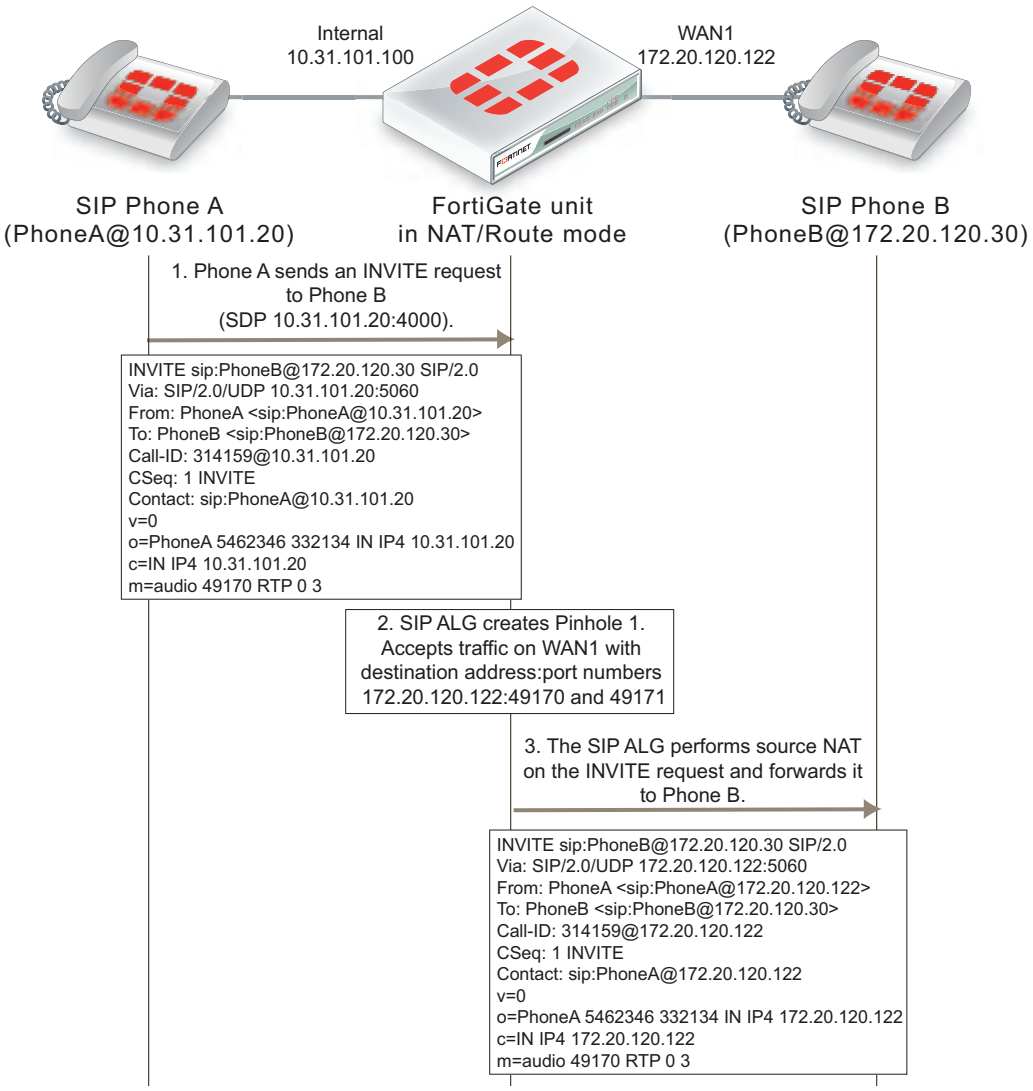
- `audio` is the media type. FortiGate units support the `audio` media type.
- `<port_number>` is the destination port number used by the media stream.
- `RTP` is the application layer transport protocol used for the media stream. FortiGate units support the Real Time Protocol (RTP) transport protocol.
- `<format_list>` is the format list that provides information about the application layer protocol that the media uses.

SIP NAT scenario: source address translation (source NAT)

The following figures show a source address translation scenario involving two SIP phones on different networks, separated by a FortiGate unit. In the scenario, SIP Phone A sends an INVITE request to SIP Phone B and SIP Phone B replies with a 200 OK response and then the two phones start media streams with each other.

To simplify the diagrams, some SIP messages are not included (for example, the Ringing and ACK response messages) and some SIP header lines and SDP profile lines have been removed from the SIP messages.

SIP source NAT scenario part 1: INVITE request sent from Phone A to Phone B



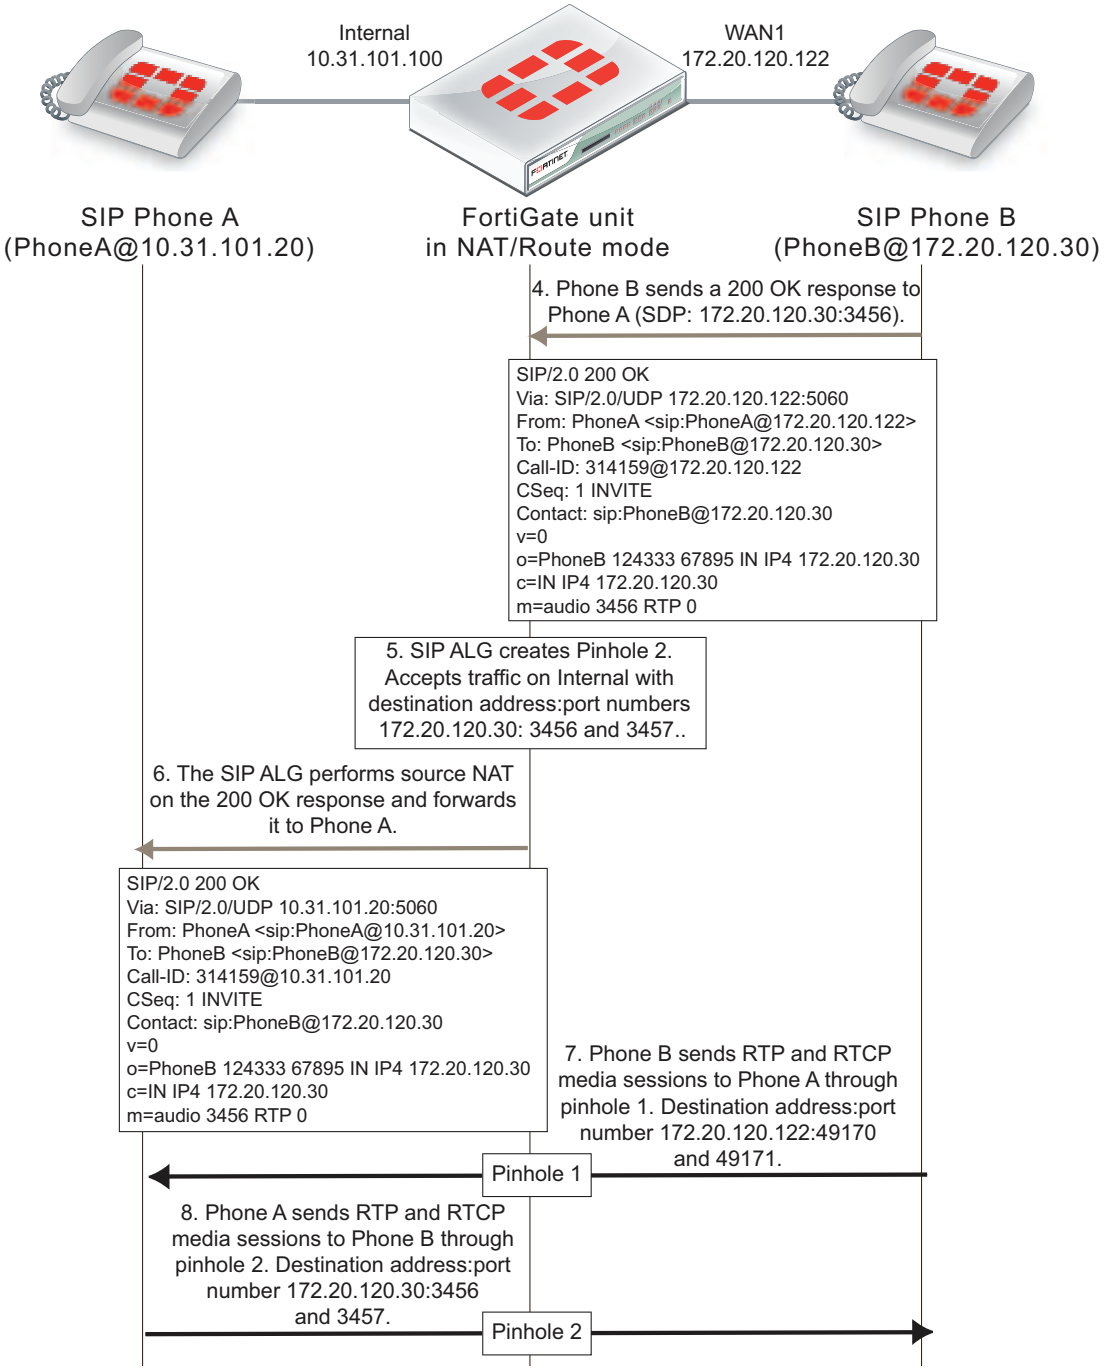
For the replies to SIP packets sent by Phone A to be routable on Phone Bs network, the FortiGate unit uses source NAT to change their source address to the address of the WAN1 interface. The SIP ALG makes similar changes the source addresses in the SIP headers and SDP profile. For example, the original INVITE request from Phone A includes the address of Phone A (10.31.101.20) in the from header line. After the INVITE request passes through the FortiGate unit, the address of Phone A in the From SIP header line is translated to 172.20.120.122, the address of the FortiGate unit WAN1 interface. As a result, Phone B will reply to SIP messages from Phone A using the WAN1 interface IP address.

The FortiGate unit also opens a pinhole so that it can accept media sessions sent to the WAN1 IP address using the port number in the m= line of the INVITE request and forward them to Phone A after translating the destination address to the IP address of Phone A.

Phone B sends the 200 OK response to the INVITE message to the WAN1 interface. The SDP profile includes the port number that Phone B wants to use for its media stream. The FortiGate unit forwards 200 OK response to Phone A after translating the addresses in the SIP and SDP lines back to the IP address of Phone A. The SIP ALG

also opens a pinhole on the Internal interface that accepts media stream sessions from Phone A with destination address set to the IP address of Phone B and using the port that Phone B added to the SDP m= line.

SIP source NAT scenario part 2: 200 OK returned and media streams established

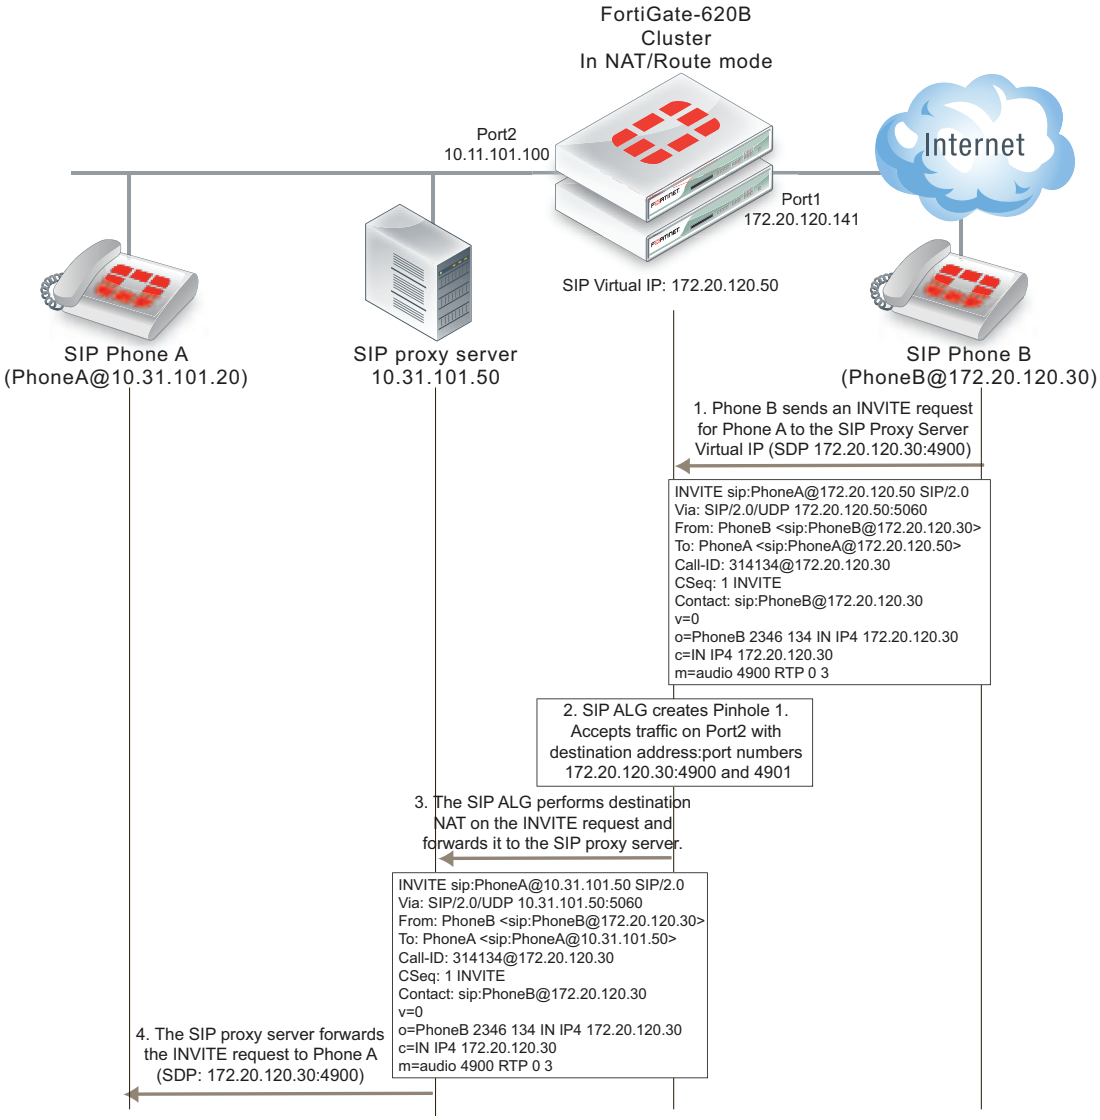


SIP NAT scenario: destination address translation (destination NAT)

The following figures show how the SIP ALG translates addresses in a SIP INVITE message sent from SIP Phone B on the Internet to SIP Phone A on a private network using the SIP proxy server. Because the addresses on the

private network are not visible from the Internet, the security policy on the FortiGate unit that accepts SIP sessions includes a virtual IP. Phone A sends SIP the INVITE message to the virtual IP address. The FortiGate unit accepts the INVITE message packets and using the virtual IP, translates the destination address of the packet to the IP address of the SIP proxy server and forwards the SIP message to it.

SIP destination NAT scenario part 1: INVITE request sent from Phone B to Phone A



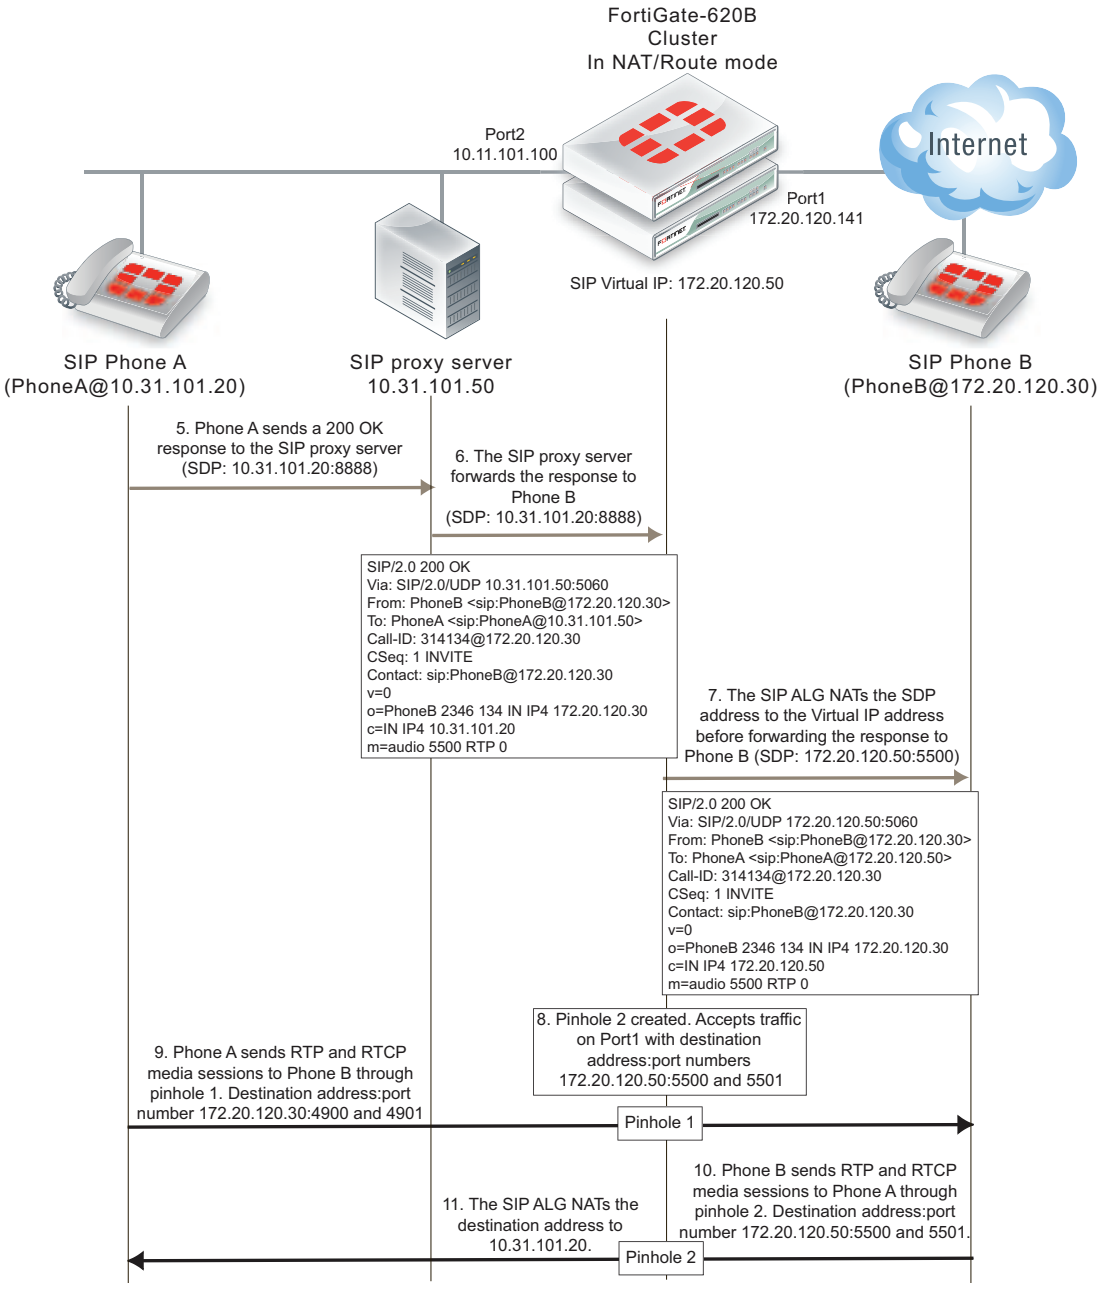
To simplify the diagrams, some SIP messages are not included (for example, the Ringing and ACK response messages) and some SIP header lines and SDP profile lines have been removed from the SIP messages.

The SIP ALG also translates the destination addresses in the SIP message from the virtual IP address (172.20.120.50) to the SIP proxy server address (10.31.101.50). For this configuration to work, the SIP proxy server must be able to change the destination addresses for Phone A in the SIP message from the address of the SIP proxy server to the actual address of Phone A.

The SIP ALG also opens a pinhole on the Port2 interface that accepts media sessions from the private network to SIP Phone B using ports 4900 and 4901.

Phone A sends a 200 OK response back to the SIP proxy server. The SIP proxy server forwards the response to Phone B. The FortiGate unit accepts the 100 OK response. The SIP ALG translates the Phone A addresses back to the SIP proxy server virtual IP address before forwarding the response back to Phone B. The SIP ALG also opens a pinhole using the SIP proxy server virtual IP which is the address in the o= line of the SDP profile and the port number in the m= line of the SDP code.

SIP destination NAT scenario part 2: 200 OK returned to Phone B and media streams established

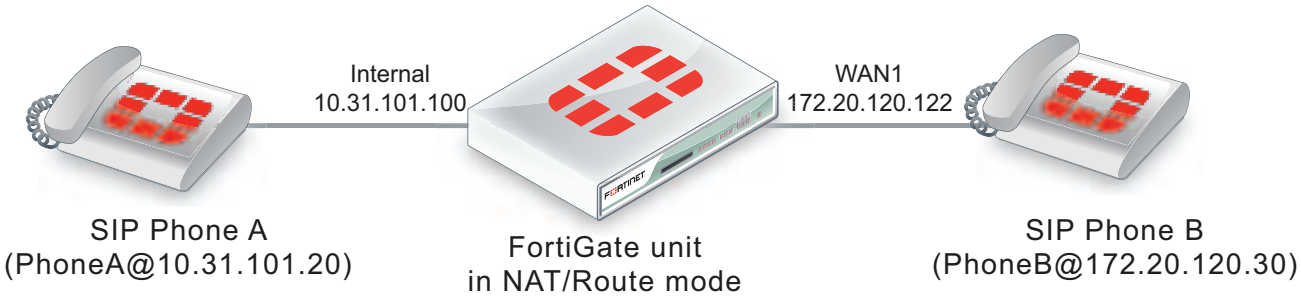


The media stream from Phone A is accepted by pinhole one and forwarded to Phone B. The source address of this media stream is changed to the SIP proxy server virtual IP address. The media stream from Phone B is accepted by pinhole 2 and forwarded to Phone B. The destination address of this media stream is changed to the IP address of Phone A.

SIP NAT configuration example: source address translation (source NAT)

This configuration example shows how to configure the FortiGate unit to support the source address translation scenario shownbelow. The FortiGate unit requires two security policies that accept SIP packets. One to allow SIP Phone A to start a session with SIP Phone B and one to allow SIP Phone B to start a session with SIP Phone A. Both of these policies must include source NAT. In this example the networks are not hidden from each other so destination NAT is not required.

SIP source NAT configuration



General configuration steps

The following general configuration steps are required for this SIP configuration. This example uses the default VoIP profile. The example also includes security policies that specifically allow SIP sessions using UDP port 5060 from Phone A to Phone B and from Phone B to Phone A. In most cases you would have more than two phones so would use more general security policies. Also, you can set the firewall service to ANY to allow traffic other than SIP on UDP port 5060.

1. Add firewall addresses for Phone A and Phone B.
2. Add a security policy that accepts SIP sessions initiated by Phone A and includes the default VoIP profile.
3. Add a security policy that accepts SIP sessions initiated by Phone B and includes the default VoIP profile.

Configuration steps - web-based manager

To add firewall addresses for the SIP phones

1. Go to **Policy & Objects > Objects > Addresses**.
2. Add the following addresses for Phone A and Phone B:

Category	Address
Name	Phone_A
Type	Subnet
Subnet / IP Range	10.31.101.20/255.255.255.255
Interface	Internal

Category	Address
Name	Phone_B
Type	Subnet
Subnet / IP Range	172.20.120.30/255.255.255.255
Interface	wan1

To add security policies to apply the SIP ALG to SIP sessions

1. Go to **Policy & Objects > Policy > IPv4**.
2. Select **Create New** to add a security policy.
3. Add a security policy to allow Phone A to send SIP request messages to Phone B:

Incoming Interface	internal
Source Address	Phone_A
Outgoing Interface	wan1
Destination Address	Phone_B
Schedule	always
Service	SIP
Action	ACCEPT

4. Select **Enable NAT** and select **Use Destination Interface Address**.
5. Turn on **VoIP** and select the **default** VoIP profile.
6. Select **OK**.
7. Add a security policy to allow Phone B to send SIP request messages to Phone A:

Incoming Interface	wan1
Source Address	Phone_B
Outgoing Interface	internal
Destination Address	Phone_A
Schedule	always
Service	SIP
Action	ACCEPT

8. Select **Enable NAT** and select **Use Destination Interface Address**.
9. Turn on **VoIP** and select the **default** VoIP profile.
10. Select **OK**.

Configuration steps - CLI

To add firewall addresses for Phone A and Phone B and security policies to apply the SIP ALG to SIP sessions

1. Enter the following command to add firewall addresses for Phone A and Phone B.

```
config firewall address
   edit Phone_A
      set associated interface internal
      set type ipmask
      set subnet 10.31.101.20 255.255.255.255
   next
   edit Phone_B
      set associated interface wan1
      set type ipmask
      set subnet 172.20.120.30 255.255.255.255
   end
```

2. Enter the following command to add security policies to allow Phone A to send SIP request messages to Phone B and Phone B to send SIP request messages to Phone A.

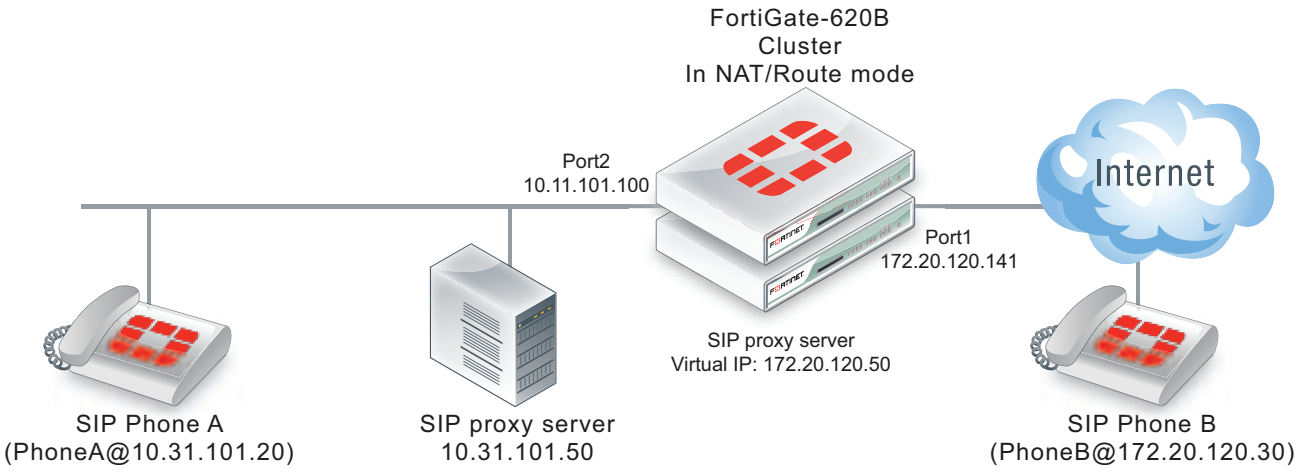
```
config firewall policy
   edit 0
      set srcintf internal
      set dstintf wan1
      set srcaddr Phone_A
      set dstaddr Phone_B
      set action accept
      set schedule always
      set service SIP
      set nat enable
      set utm-status enable
      set voip-profile default
   next
   edit 0
      set srcintf wan1
      set dstintf internal
      set srcaddr Phone_B
      set dstaddr Phone_A
      set action accept
      set schedule always
      set service SIP
      set nat enable
      set utm-status enable
      set voip-profile default
   end
```

SIP NAT configuration example: destination address translation (destination NAT)

This configuration example shows how to configure the FortiGate unit to support the destination address translation scenario shown in the figure below. The FortiGate unit requires two SIP security policies:

- A destination NAT security policy that allows SIP messages to be sent from the Internet to the private network. This policy must include destination NAT because the addresses on the private network are not routable on the Internet.
- A source NAT security policy that allows SIP messages to be sent from the private network to the Internet.

SIP destination NAT scenario part two: 200 OK returned to Phone B and media streams established



General configuration steps

The following general configuration steps are required for this destination NAT SIP configuration. This example uses the default VoIP profile.

1. Add the SIP proxy server firewall virtual IP.
2. Add a firewall address for the SIP proxy server on the private network.
3. Add a destination NAT security policy that accepts SIP sessions from the Internet destined for the SIP proxy server virtual IP and translates the destination address to the IP address of the SIP proxy server on the private network.
4. Add a security policy that accepts SIP sessions initiated by the SIP proxy server and destined for the Internet.

Configuration steps - web-based manager

To add the SIP proxy server firewall virtual IP

1. Go to **Policy & Objects > Objects > Virtual IP** and select **Create New**.
2. Add the SIP proxy server virtual IP.

VIP Type	IPv4 VIP
Name	SIP_Proxy_VIP
Interface	port1
Type	Static NAT
External IP Address/Range	172.20.120.50
Mapped IP Address/Range	10.31.101.50

To add a firewall address for the SIP proxy server

1. Go to **Firewall Objects > Address > Addresses**.
2. Add the following for the SIP proxy server:

To add the security policies

1. Go to **Policy & Objects > Policy > IPv4**.
2. Add a destination NAT security policy that includes the SIP proxy server virtual IP that allows Phone B (and other SIP phones on the Internet) to send SIP request messages to the SIP proxy server.

Incoming Interface	port1
Source Address	all
Outgoing Interface	port2
Destination Address	SIP_Proxy_VIP
Schedule	always
Service	SIP
Action	ACCEPT

3. Select **Enable NAT** and select **Use Destination Interface Address**.
4. Under **UTM Security Profiles**, select **Use Standard UTM Profiles**.
5. Turn on **VoIP** and select the **default** VoIP profile.
6. Select **OK**.
7. Add a source NAT security policy to allow the SIP proxy server to send SIP request messages to Phone B and the Internet:

Incoming Interface	port2
Source Address	SIP_Proxy_Server
Outgoing Interface	port1
Destination Address	all
Schedule	always
Service	SIP
Action	ACCEPT

8. Select **Enable NAT** and select **Use Destination Interface Address**.
9. Turn on **VoIP** and select the **default** VoIP profile.
10. Select **OK**.

Configuration steps - CLI

To add the SIP proxy server firewall virtual IP and firewall address

1. Enter the following command to add the SIP proxy server firewall virtual IP.

```
config firewall vip
  edit SIP_Proxy_VIP
```

```
      set type static-nat
      set extip 172.20.120.50
      set mappedip 10.31.101.50
      set extintf port1
   end
```

2. Enter the following command to add the SIP proxy server firewall address.

```
config firewall address
   edit SIP_Proxy_Server
      set associated interface port2
      set type ipmask
      set subnet 10.31.101.50 255.255.255.255
   end
```

To add security policies

1. Enter the following command to add a destination NAT security policy that includes the SIP proxy server virtual IP that allows Phone B (and other SIP phones on the Internet) to send SIP request messages to the SIP proxy server.

```
config firewall policy
   edit 0
      set srcintf port1
      set dstintf port2
      set srcaddr all
      set dstaddr SIP_Proxy_VIP
      set action accept
      set schedule always
      set service SIP
      set nat enable
      set utm-status enable
      set voip-profile default
   end
```

2. Enter the following command to add a source NAT security policy to allow the SIP proxy server to send SIP request messages to Phone B and the Internet:

```
config firewall policy
   edit 0
      set srcintf port2
      set dstintf port1
      set srcaddr SIP_Proxy_Server
      set dstaddr all
      set action accept
      set schedule always
      set service SIP
      set nat enable
      set utm-status enable
      set voip-profile default
   end
```

Additional SIP NAT scenarios

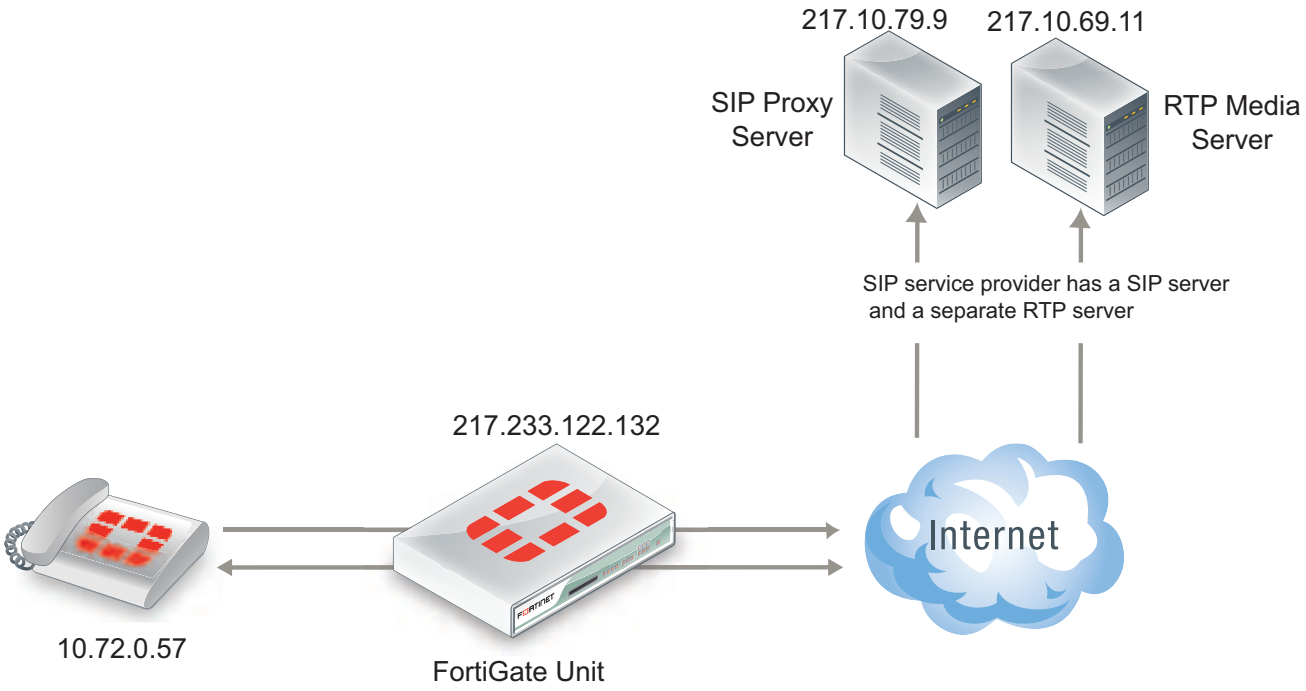
This section lists some additional SIP NAT scenarios.

Source NAT (SIP and RTP)

In the source NAT scenario shown below, a SIP phone connects to the Internet through a FortiGate unit with and IP address configured using PPPoE. The SIP ALG translates all private IPs in the SIP contact header into public IPs.

You need to configure an internal to external SIP security policy with NAT selected, and include a VoIP profile with SIP enabled.

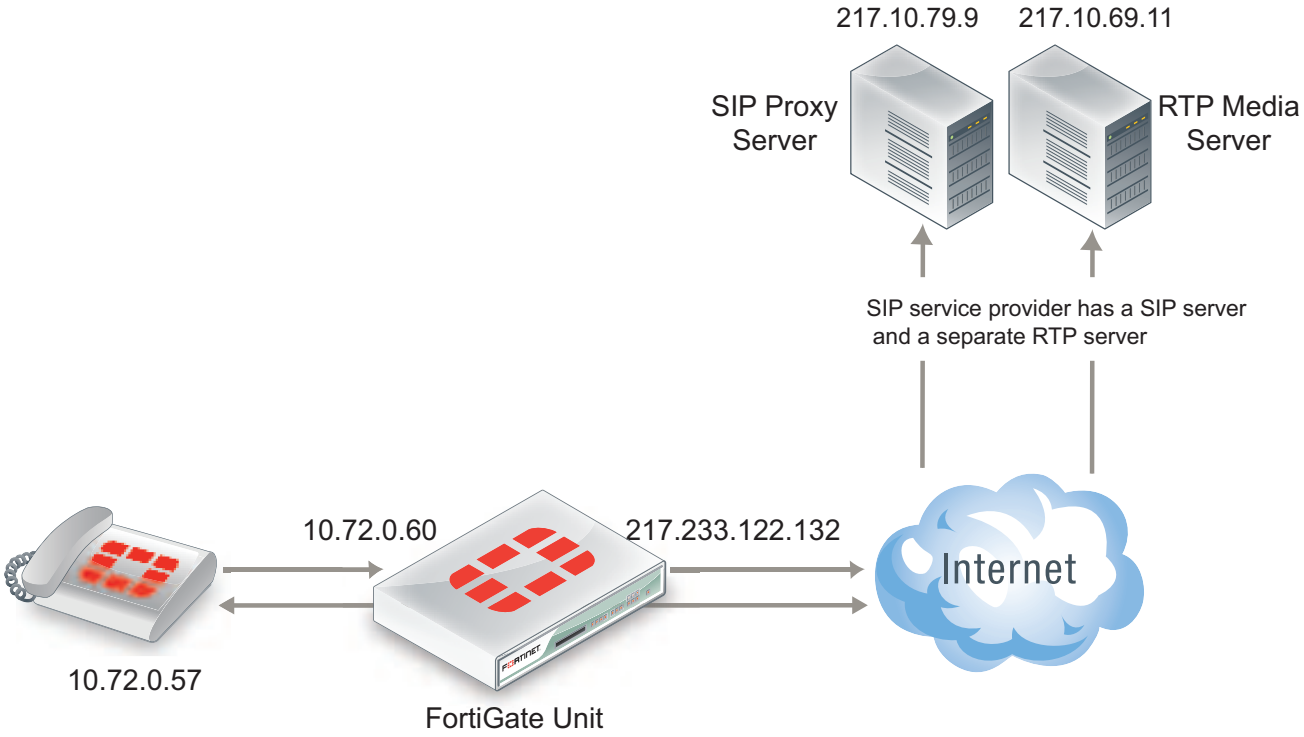
SIP source NAT



Destination NAT (SIP and RTP)

In the following destination NAT scenario, a SIP phone can connect through the FortiGate unit to private IP address using a firewall virtual IP (VIP). The SIP ALG translates the SIP contact header to the IP of the real SIP proxy server located on the Internet.

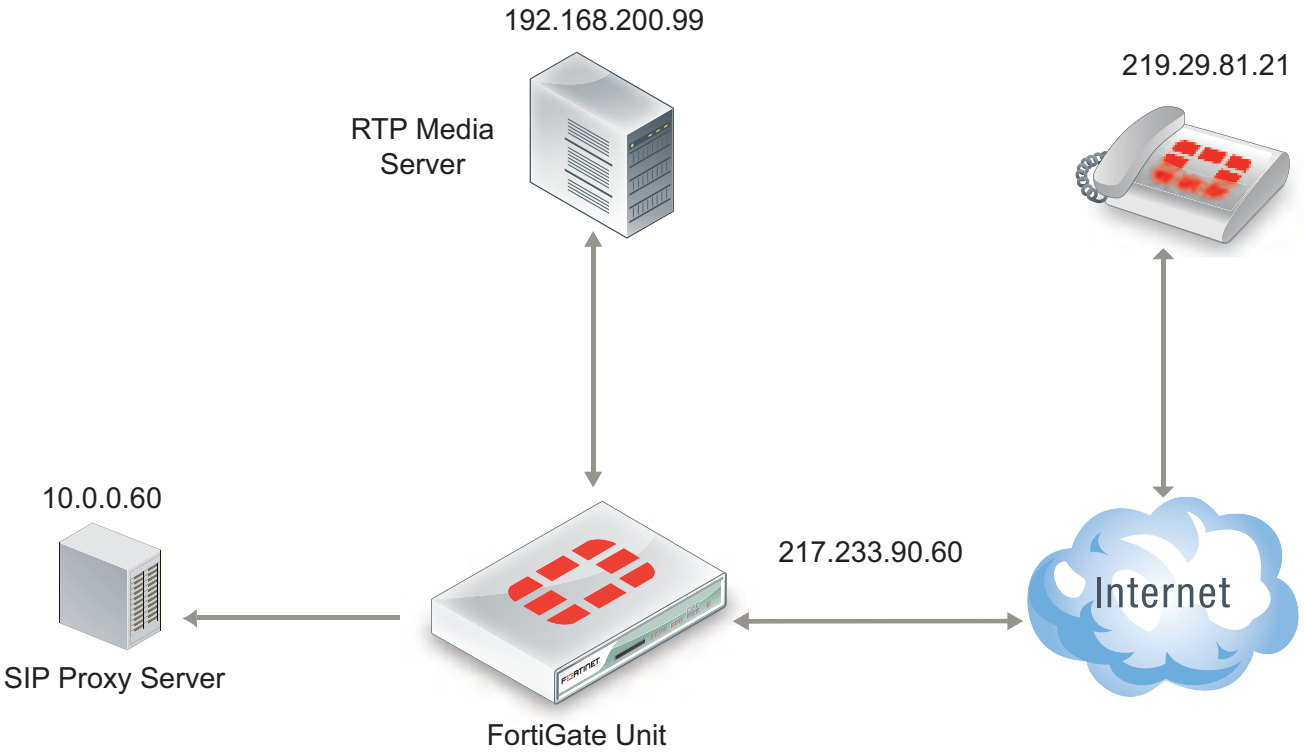
SIP destination NAT



In the scenario, shownabove, the SIP phone connects to a VIP (10.72.0.60). The SIP ALG translates the SIP contact header to 217.10.79.9, opens RTP pinholes, and manages NAT.

The FortiGate unit also supports a variation of this scenario where the RTP media server's IP address is hidden on a private network or DMZ.

SIP destination NAT-RTP media server hidden



In the scenario shown above, a SIP phone connects to the Internet. The VoIP service provider only publishes a single public IP. The FortiGate unit is configured with a firewall VIP. The SIP phone connects to the FortiGate unit (217.233.90.60) and using the VIP the FortiGate unit translates the SIP contact header to the SIP proxy server IP address (10.0.0.60). The SIP proxy server changes the SIP/SDP connection information (which tells the SIP phone which RTP media server IP it should contact) also to 217.233.90.60.

Source NAT with an IP pool

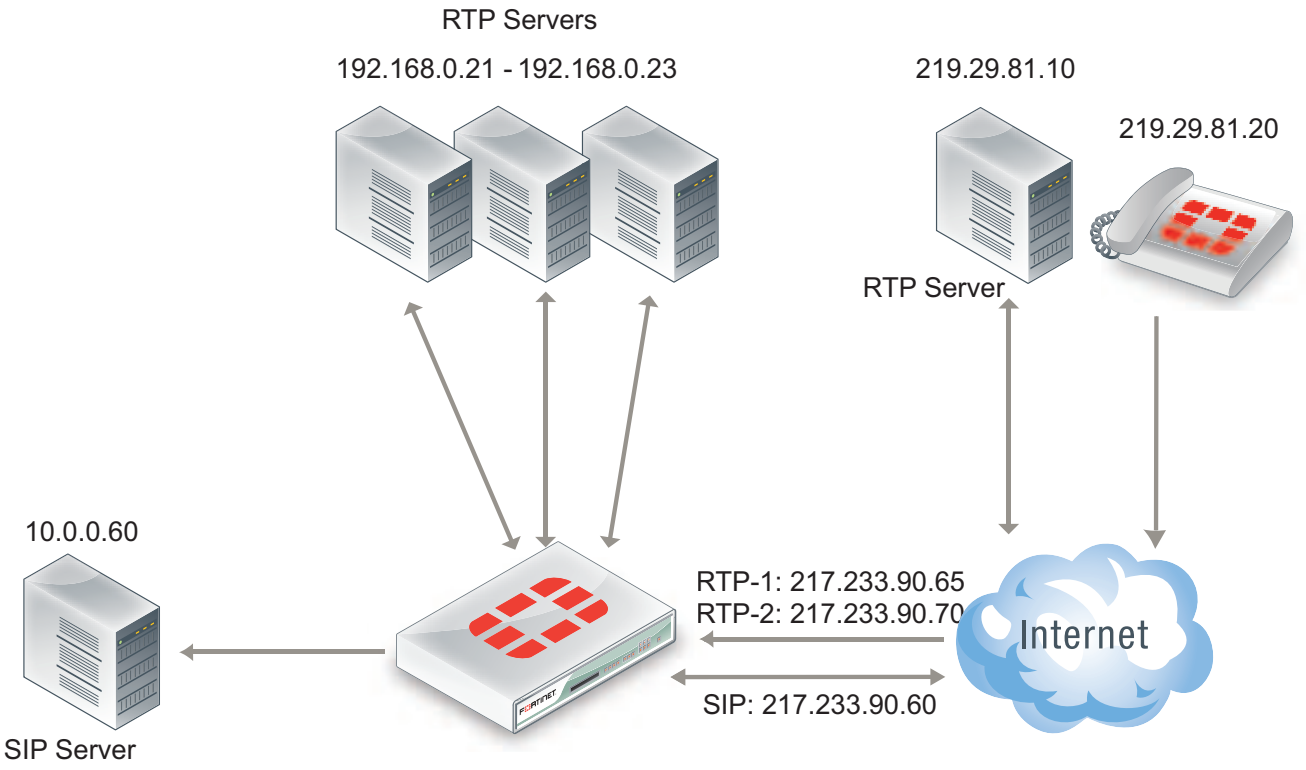
You can choose **NAT** with the **Dynamic IP Pool** option when configuring a security policy if the source IP of the SIP packets is different from the interface IP. The FortiGate ALG interprets this configuration and translates the SIP header accordingly.

This configuration also applies to destination NAT.

Different source and destination NAT for SIP and RTP

This is a more complex scenario that a SIP service provider may use. It can also be deployed in large-scale SIP environments where RTP has to be processed by the FortiGate unit and the RTP server IP has to be translated differently than the SIP serverIP.

Different source and destination NAT for SIP and RTP



In this scenario, shown above, assume there is a SIP server and a separate media gateway. The SIP server is configured so that the SIP phone (219.29.81.20) will connect to 217.233.90.60. The media gateway (RTP server: 219.29.81.10) will connect to 217.233.90.65.

What happens is as follows:

1. The SIP phone connects to the SIP VIP. The FortiGate ALG translates the SIP contact header to the SIP server: 219.29.81.20 > 217.233.90.60 (> 10.0.0.60).
2. The SIP server carries out RTP to 217.233.90.65.
3. The FortiGate ALG opens pinholes, assuming that it knows the ports to be opened.
4. RTP is sent to the RTP-VIP (217.233.90.65.) The FortiGate ALG translates the SIP contact header to 192.168.0.21.

NAT with IP address conservation

In a source or destination NAT security policy that accepts SIP sessions, you can configure the SIP ALG or the SIP session helper to preserve the original source IP address of the SIP message in the i= line of the SDP profile. NAT with IP address conservation (also called SIP NAT tracing) changes the contents of SIP messages by adding the source IP address of the originator of the message into the SDP i= line of the SIP message. The SDP i= line is used for free-form text. However, if your SIP server can retrieve information from the SDP i= line, it can be useful for keeping a record of the source IP address of the originator of a SIP message when operating in a NAT environment. You can use this feature for billing purposes by extracting the IP address of the originator of the message.

Configuring SIP IP address conservation for the SIP ALG

You can use the following command to enable or disable SIP IP address conservation in a VoIP profile for the SIP ALG. SIP IP address conservation is enabled by default in a VoIP profile.

```
config voip profile
   edit VoIP_Pro_1
      config sip
         set nat-trace disable
      end
   end
```

If the SIP message does not include an i= line and if the original source IP address of the traffic (before NAT) was 10.31.101.20 then the FortiGate unit would add the following i= line.

```
i=(o=IN IP4 10.31.101.20)
```

You can also use the `preserve-override` option to configure the SIP ALG to either add the original o= line to the end of the i= line or replace the i= line in the original message with a new i= line in the same form as above for adding a new i= line.

By default, `preserver-override` is disabled and the SIP ALG adds the original o= line to the end of the original i= line. Use the following command to configure the SIP ALG to replace the original i= line:

```
config voip profile
   edit VoIP_Pro_1
      config sip
         set preserve-override enable
      end
   end
```

Configuring SIP IP address conservation for the SIP session helper

You can use the following command to enable or disable SIP IP address conservation for the SIP session helper. IP address conservation is enabled by default for the SIP session helper.

```
config system settings
   set sip-nat-trace disable
end
```

If the SIP message does not include an i= line and if the original source IP address of the traffic (before NAT) was 10.31.101.20 then the FortiGate unit would add the following i= line.

```
i=(o=IN IP4 10.31.101.20)
```

Controlling how the SIP ALG NATs SIP contact header line addresses

You can enable `contact-fixup` so that the SIP ALG performs normal SIP NAT translation to SIP contact headers as SIP messages pass through the FortiGate unit.

Disable `contact-fixup` if you do not want the SIP ALG to perform normal NAT translation of the SIP contact header if a Record-Route header is also available. If `contact-fixup` is disabled, the FortiGate ALG does the following with contact headers:

- For Contact in Requests, if a Record-Route header is present and the request comes from the external network, the SIP Contact header is not translated.
- For Contact in Responses, if a Record-Route header is present and the response comes from the external network, the SIP Contact header is not translated.

If `contact-fixup` is disabled, the SIP ALG must be able to identify the external network. To identify the external network, you must use the `config system interface` command to set the `external` keyword to `enable` for the interface that is connected to the external network.

Enter the following command to perform normal NAT translation of the SIP contact header:

```
config voip profile
   edit VoIP_Pro_1
      config sip
         set contact-fixup enable
      end
   end
```

Controlling NAT for addresses in SDP lines

You can use the `no-sdp-fixup` option to control whether the FortiGate unit performs NAT on addresses in SDP lines in the SIP message body.

The `no-sdp-fixup` option is disabled by default and the FortiGate unit performs NAT on addresses in SDP lines. Enable this option if you don't want the FortiGate unit to perform NAT on the addresses in SDP lines.

```
config voip profile
   edit VoIP_Pro_1
      config sip
         set no-sdp-fixup enable
      end
   end
```

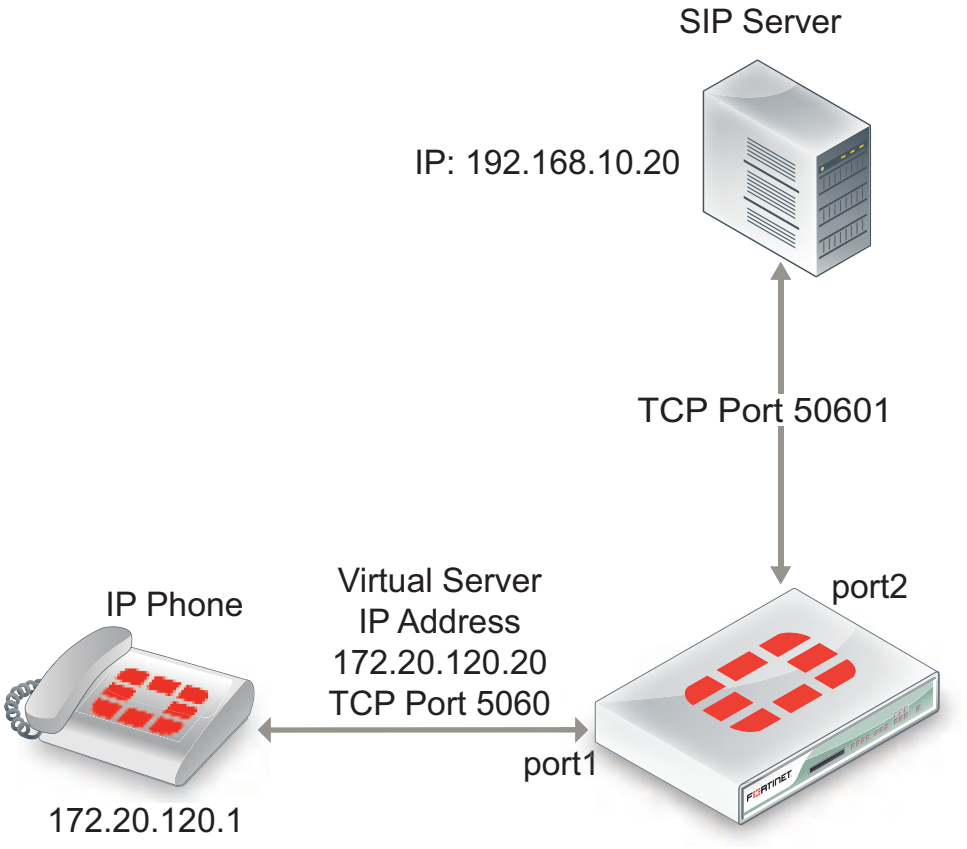
Translating SIP session destination ports

Using port forwarding virtual IPs you can change the destination port of SIP sessions as they pass through the FortiGate unit.

Translating SIP sessions to a different destination port

To configure translating SIP sessions to a different destination port you must add a static NAT virtual IP that translates tie SIP destination port to another port destination. In the example the destination port is translated from 5060 to 50601. This configuration can be used if SIP sessions uses different destination ports on different networks.

Example translating SIP sessions to a different destination port



To translate SIP sessions to a different destination port

1. Add the static NAT virtual IP.

   This virtual IP forwards traffic received at the port1 interface for IP address 172.20.120.20 and destination port 5060 to the SIP server at IP address 192.168.10.20 with destination port 5061.

```
config firewall vip
   edit "sip_port_trans_vip"
      set type static-nat
      set portforward enable
      set protocol tcp
      set extip 172.20.120.20
      set extport 5060
      set extintf "port1"
      set mappedip 192.168.10.20
      set mappedport 50601
      set comment "Translate SIP destination port"
   end
```

2. Add a security policy that includes the virtual IP and the default VoIP profile.

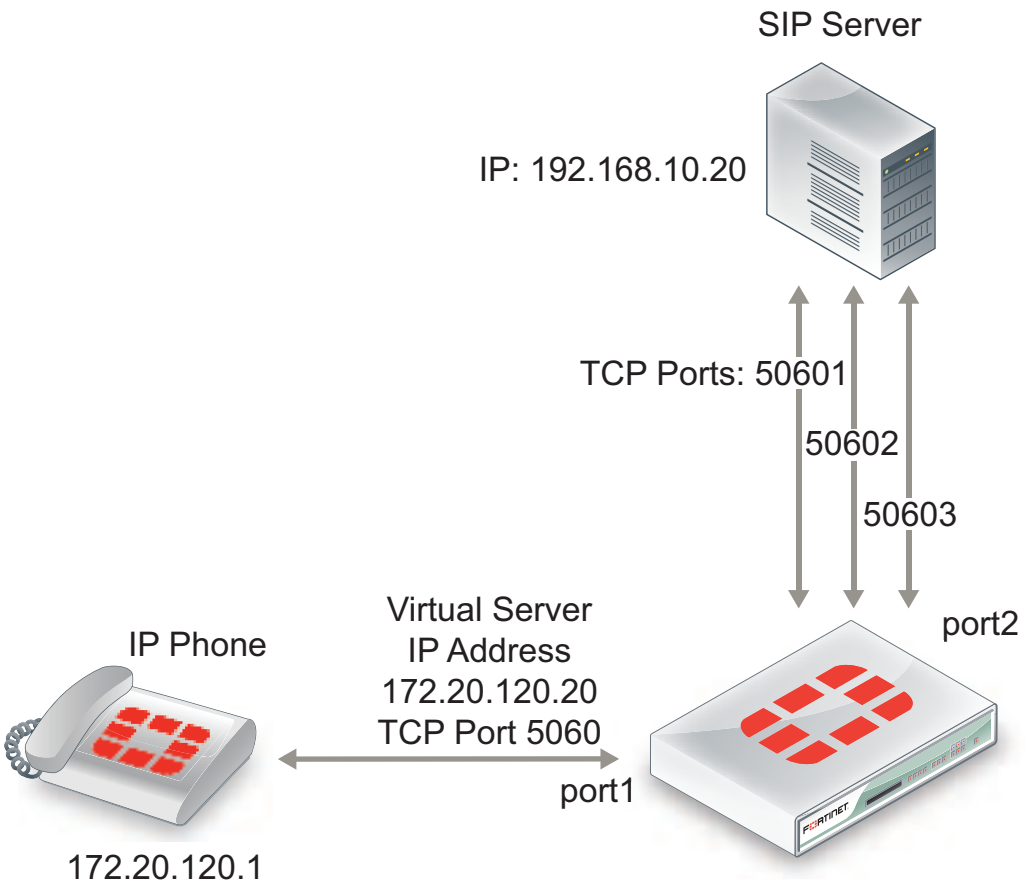
```
config firewall policy
   edit 1
      set srcintf "port1"
```

```
    set dstintf "port2"
    set srcaddr "all"
    set dstaddr "sip_port_trans_vip"
    set action accept
    set schedule "always"
    set service "ANY"
    set utm-status enable
    set profile-protocol-options default
    set comments "Translate SIP destination port"
end
```

Translating SIP sessions to multiple destination ports

You can use a load balance virtual IP to translate SIP session destination ports to a range of destination ports. In this example the destination port is translated from 5060 to the range 50601 to 50603. This configuration can be used if your SIP server is configured to receive SIP traffic on multiple ports.

Example translating SIP traffic to multiple destination ports



To translated SIP sessions to multiple destination ports

1. Add the load balance virtual IP.

   This virtual IP forwards traffic received at the port1 interface for IP address 172.20.120.20 and destination port 5060 to the SIP server at IP address 192.168.10.20 with destination port 5061.

```
config firewall vip
   edit "sip_port_ldbl_vip"
      set type load-balance
      set portforward enable
      set protocol tcp
      set extip 172.20.120.20
      set extport 5060
      set extintf "port1"
      set mappedip 192.168.10.20
      set mappedport 50601-50603
      set comment "Translate SIP destination port range"
   end
```

2. Add a security policy that includes the virtual IP and VoIP profile.

```
config firewall policy
   edit 1
      set srcintf "port1"
      set dstintf "port2"
      set srcaddr "all"
      set dstaddr "sip_port_ldbl_vip"
      set action accept
      set schedule "always"
      set service "ANY"
      set utm-status enable
      set voip-profile default
      set comments "Translate SIP destination port"
   end
```

Adding the original IP address and port to the SIP message header after NAT

In some cases your SIP configuration may require that the original IP address and port from the SIP contact request is kept after NAT. For example, the original SIP contact request could include the following:

```
Contact: <sip:0150302438@172.20.120.110:5060>;
```

After the packet goes through the FortiGate unit and NAT is performed, the contact request could normally look like the following (the IP address translated to a different IP address and the port to a different port):

```
Contact: <sip:0150302438@10.10.10.21:33608>;
```

You can enable `register-contact-trace` in a VoIP profile to have the SIP ALG add the original IP address and port in the following format:

```
Contact: <sip:0150302438@<nated-ip>:<nated-port>;o=<original-ip>: <original-port>>;
```

So the contact line after NAT could look like the following:

```
Contact: <sip:0150302438@10.10.10.21:33608;o=172.20.120.110:5060>;
```

Enter the following command to enable keeping the original IP address and port:

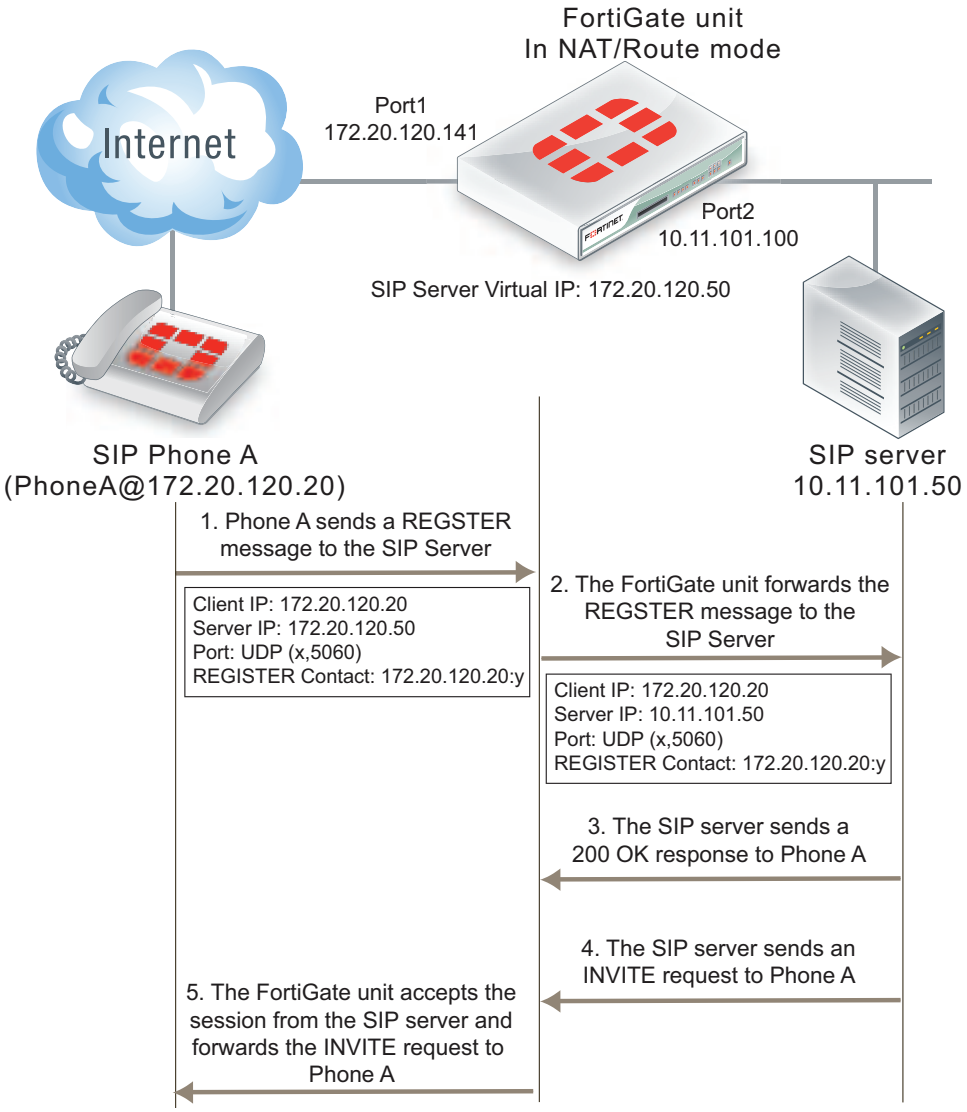
```
config voip profile
   edit Profile_name
      config sip
         set register-contract-trace enable
   end
```

Enhancing SIP pinhole security

You can use the `strict-register` option in a SIP VoIP profile to open smaller pinholes.

As shown below, when FortiGate unit is protecting a SIP server on a private network, the FortiGate unit does not have to open a pinhole for the SIP server to send INVITE requests to a SIP Phone on the Internet after the SIP Phone has registered with the server.

FortiGate unit protecting a SIP server on a private network



In the example, a client (SIP Phone A) sends a REGISTER request to the SIP server with the following information:

```
Client IP: 10.31.101.20
Server IP: 10.21.101.50
Port: UDP (x,5060)
REGISTER Contact: 10.31.101.20:y
```

Where `x` and `y` are ports chosen by Phone A.

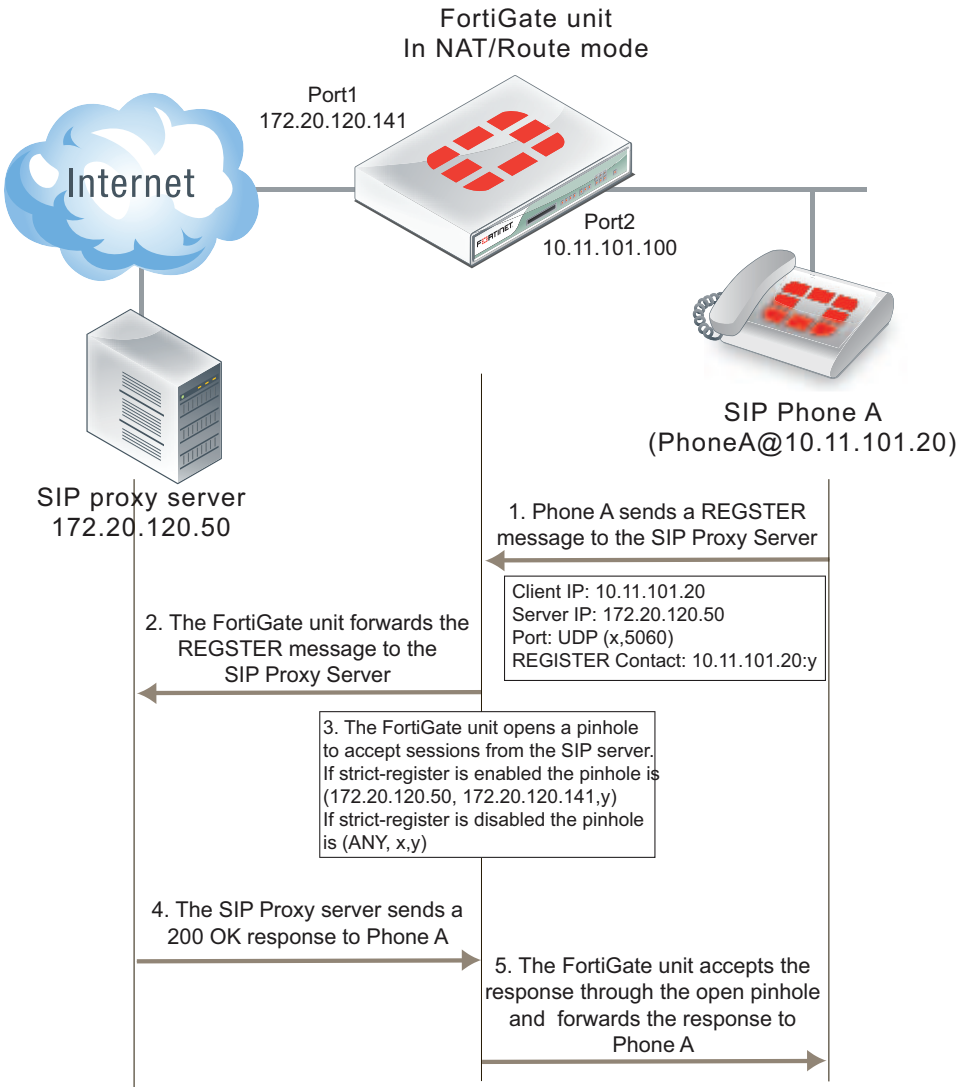
As soon as the server sends the 200 OK reply it can forward INVITE requests from other SIP phones to SIP Phone A. If the SIP proxy server uses the information in the REGISTER message received from SIP Phone A the INVITE messages sent to Phone A f will only get through the FortiGate unit if an policy has been added to allow the

server to send traffic from the private network to the Internet. Or the SIP ALG must open a pinhole to allow traffic from the server to the Internet. In most cases the FortiGate unit is protecting the SIP server so there is no reason not to add a security policy to all the SIP server to send outbound traffic to the Internet.

In a typical SOHO scenario, shown below, SIP Phone A is being protected from the Internet by a FortiGate unit. In most cases the FortiGate unit would not allow incoming traffic from the Internet to reach the private network. So the only way that an INVITE request from the SIP server can reach SIP Phone A is if the SIP ALG creates an incoming pinhole. All pinholes have three attributes:

```
(source address, destination address, destination port)
```

SOHO configuration, FortiGate unit protecting a network with SIP phones



The more specific a pinhole is the more secure it is because it will accept less traffic. In this situation, the pinhole would be more secure if it only accepted traffic from the SIP server. This is what happens if `strict-register` is enabled in the VoIP profile that accepts the REGISTER request from Phone A.

```
(SIP server IP address, client IP address, destination port)
```

If `strict-register` is disabled (the default configuration) the pinhole is set up with the following attributes

```
(ANY IP address, client IP address, destination port)
```

This pinhole allows connections through the FortiGate unit from ANY source address which is a much bigger and less secure pinhole. In most similar network configurations you should enable `strict-register` to improve pinhole security.

Enabling `strict-register` can cause problems when the SIP registrar and SIP proxy server are separate entities with separate IP addresses.

Enter the following command to enable `strict-register` in a VoIP profile.

```
config voip profile
   edit Profile_name
      config sip
         set strict-register enable
   end
```

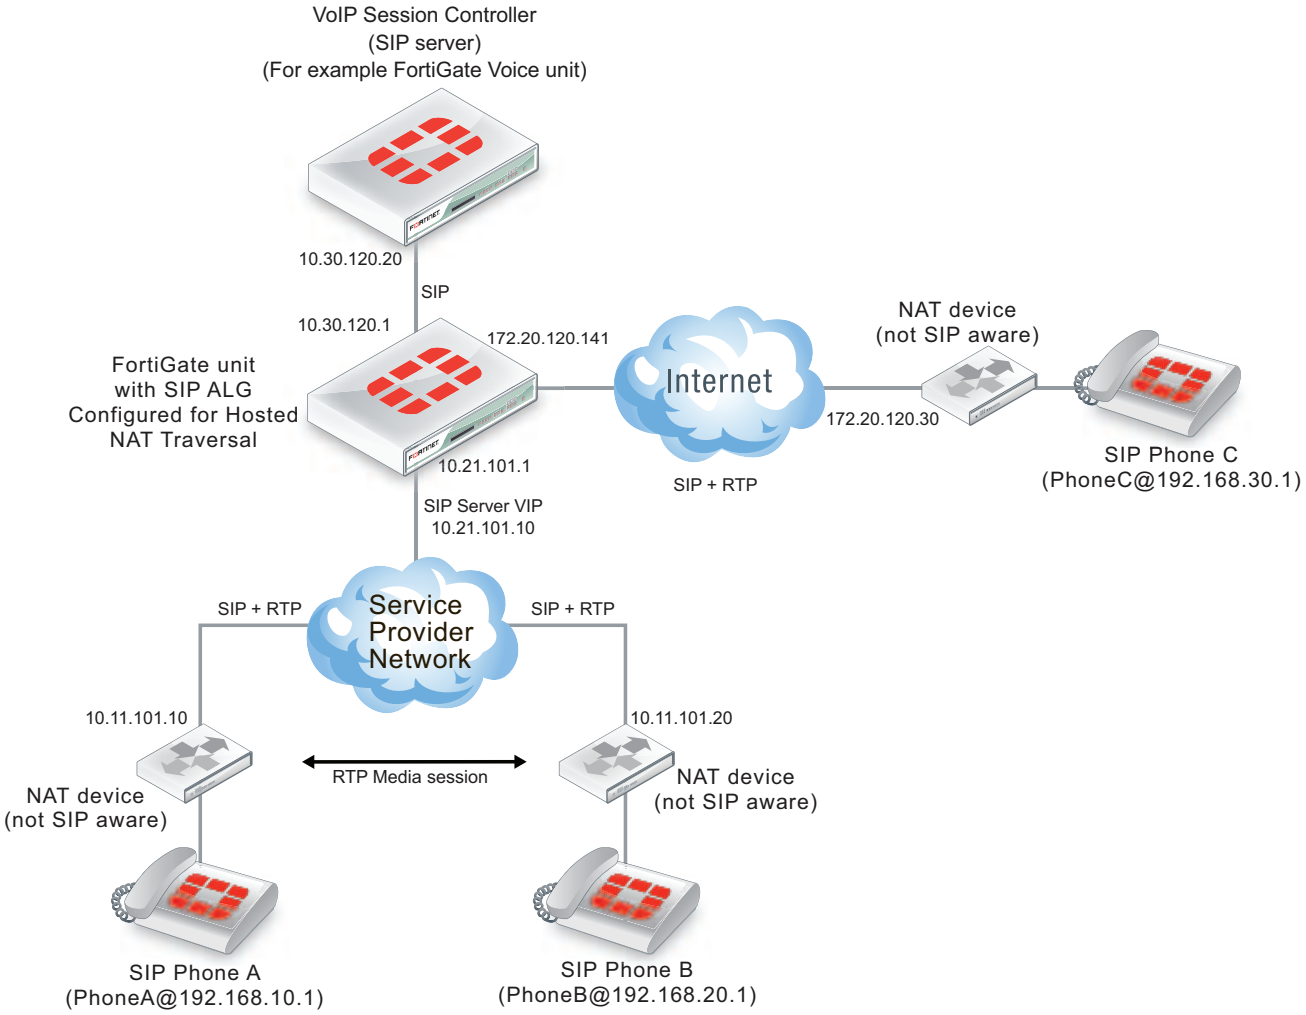
Hosted NAT traversal

With the increase in the use of VoIP and other media traffic over the Internet, service provider network administrators must defend their networks from threats while allowing voice and multimedia traffic to flow transparently between users and servers and among users. A common scenario could involve providing SIP VoIP services for customers with SIP phones installed behind NAT devices that are not SIP aware. NAT devices that are not SIP aware cannot translate IP addresses in SIP headers and SDP lines in SIP packets but can and do perform source NAT on the source or addresses of the packets. In this scenario the user's SIP phones would communicate with a SIP proxy server to set up calls between SIP phones. Once the calls are set up RTP packets would be communicated directly between the phones through each user's NAT device.

The problem with this configuration is that the SIP headers and SDP lines in the SIP packets sent from the phones and received by the SIP proxy server would contain the private network addresses of the VoIP phones that would not be routable on the service provider network or on the Internet. One solution could be to for each customer to install and configure SIP aware NAT devices. If this is not possible, another solution requires implement hosted NAT traversal.

In a hosted NAT traversal (HNT) configuration, a FortiGate unit is installed between the NAT device and the SIP proxy server and configured with a VoIP profile that enables SIP hosted NAT traversal. Security policies that include the VoIP profile also support destination NAT using a firewall virtual IP. When the SIP phones connect to the SIP server IP address the security policy accepts the SIP packets, the virtual IP translates the destination addresses of the packets to the SIP server IP address, and the SIP ALG NAT traversal configuration translates the source IP addresses on the SIP headers and SDP lines to the source address of the SIP packets (which would be the external IP address of the NAT devices). The SIP server then sees the SIP phone IP address as the external IP address of the NAT device. As a result SIP and RTP media sessions are established using the external IP addresses of the NAT devices instead of the actual IP addresses of the SIP phones.

FortiGate SIP Hosted NAT Traversal configuration



Configuration example: Hosted NAT traversal for calls between SIP Phone A and SIP Phone B

The following address translation takes place to allow a SIP call from SIP Phone A to SIP Phone B in the above diagram.

1. SIP Phone A sends a SIP Invite message to the SIP server. Packet source IP address: 192.168.10.1, destination IP address: 10.21.101.10.
2. The SIP packets are received by the NAT device which translates the source address of the SIP packets from 192.168.10.1 to 10.11.101.20.
3. The SIP packets are received by the FortiGate unit which translates the packet destination IP address to 10.30 120.20. The SIP ALG also translates the IP address of the SIP phone in the SIP header and SDP lines from 192.168.10.1 to 10.11.101.20.
4. The SIP server accepts the Invite message and forwards it to SIP Phone B at IP address10.11.101.20. The SIP server has this address for SIP Phone B because SIP packets from SIP Phone B have also been translated using the hosted NAT traversal configuration of the SIP ALG.

5. When the SIP call is established, the RTP session is between 10.11.101.10 and 10.11.101.20 and does not pass through the FortiGate unit. The NAT devices translated the destination address of the RTP packets to the private IP addresses of the SIP phones.

General configuration steps

The following general configuration steps are required for this destination NAT SIP configuration. This example uses the default VoIP profile.

1. Add a VoIP profile that enables hosted NAT translation.
2. Add a SIP proxy server firewall virtual IP.
3. Add a firewall address for the SIP proxy server on the private network.
4. Add a destination NAT security policy that accepts SIP sessions from the Internet destined for the SIP proxy server virtual IP and translates the destination address to the IP address of the SIP proxy server on the private network.
5. Add a security policy that accepts SIP sessions initiated by the SIP proxy server and destined for the Internet.

Configuration steps - web-based manager

To add the SIP proxy server firewall virtual IP

1. Go to **Firewall Objects > Objects > Virtual IPs.**
2. Add the SIP proxy server virtual IP.

Name	SIP_Proxy_VIP
External Interface	port1
Type	Static NAT
External IP Address/Range	172.20.120.50
Mapped IP Address/Range	10.31.101.50

To add a firewall address for the SIP proxy server

1. Go to **Firewall Objects > Address > Addresses**.
2. Add the following for the SIP proxy server:

Category	Address
Name	SIP_Proxy_Server
Type	Subnet
Subnet / IP Range	10.31.101.50/255.255.255.255
Interface	port2

To add the security policies

1. Go to **Policy Objects > Policy > IPv4**.
2. Add a destination NAT security policy that includes the SIP proxy server virtual IP that allows Phone B (and other SIP phones on the Internet) to send SIP request messages to the SIP proxy server.

Incoming Interface	port1
Source Address	all
Outgoing Interface	port2
Destination Address	SIP_Proxy_VIP
Schedule	always
Service	SIP
Action	ACCEPT

3. Select **Enable NAT** and select **Use Destination Interface Address**.
4. Turn on **VoIP** and select the **default** VoIP profile.
5. Select **OK**.
6. Add a source NAT security policy to allow the SIP proxy server to send SIP request messages to Phone B and the Internet:

Incoming Interface	port2
Source Address	SIP_Proxy_Server
Outgoing Interface	port1
Destination Address	all
Schedule	always
Service	SIP
Action	ACCEPT

7. Select **Enable NAT** and select **Use Destination Interface Address**.
8. Turn on **VoIP** and select the **default** VoIP profile.
9. Select **OK**.

Configuration steps - CLI

To add a VoIP profile that enables hosted NAT translation

1. Enter the following command to add a VoIP profile named HNT that enables hosted NAT traversal. This command shows how to clone the default VoIP profile and enable hosted NAT traversal.

```
config voip profile
   clone default to HNT
```

```
edit HNT
   config sip
      set hosted-nat-traversal enable
   end
end
```

To add the SIP proxy server firewall virtual IP and firewall address

1. Enter the following command to add the SIP proxy server firewall virtual IP.

```
config firewall vip
   edit SIP_Proxy_VIP
      set type static-nat
      set extip 10.21.101.10
      set mappedip 10.30.120.20
      set extintf port1
   end
```

2. Enter the following command to add the SIP proxy server firewall address.

```
config firewall address
   edit SIP_Proxy_Server
      set associated interface port2
      set type ipmask
      set subnet 10.30.120.20 255.255.255.255
   end
```

To add security policies

1. Enter the following command to add a destination NAT security policy that includes the SIP proxy server virtual IP that allows Phone A to send SIP request messages to the SIP proxy server.

```
config firewall policy
   edit 0
      set srcintf port1
      set dstintf port2
      set srcaddr all
      set dstaddr SIP_Proxy_VIP
      set action accept
      set schedule always
      set service SIP
      set nat enable
      set utm-status enable
      set profile-protocol-options default
      set voip-profile HNT
   end
```

2. Enter the following command to add a source NAT security policy to allow the SIP proxy server to send SIP request messages to Phone B:

```
config firewall policy
   edit 0
      set srcintf port2
      set dstintf port1
      set srcaddr SIP_Proxy_Server
      set dstaddr all
      set action accept
      set schedule always
      set service SIP
      set nat enable
```

```
      set utm-status enable
      set profile-protocol-options default
      set voip-profile default
   end
```

Hosted NAT traversal for calls between SIP Phone A and SIP Phone C

The following address translation takes place to allow a SIP call from SIP Phone A to SIP Phone C in the previous diagram.

1. SIP Phone A sends a SIP Invite message to the SIP server. Packet source IP address: 192.168.10.1 and destination IP address: 10.21.101.10.
2. The SIP packets are received by the NAT device which translates the source address of the SIP packets from 192.168.10.1 to 10.11.101.20.
3. The SIP packets are received by the FortiGate unit which translates the packet destination IP address to 10.30 120.20. The SIP ALG also translates the IP address of the SIP phone in the SIP header and SDP lines from 192.168.10.1 to 10.11.101.20.
4. The SIP server accepts the Invite message and forwards it to SIP Phone C at IP address 172.20.120.30. The SIP server has this address for SIP Phone C because SIP packets from SIP Phone C have also been translated using the hosted NAT traversal configuration of the SIP ALG.
5. When the SIP call is established, the RTP session is between 10.11.101.10 and 172.20.120.30. The packets pass through the FortiGate unit which performs NAT as required.

Restricting the RTP source IP

Use the following command in a VoIP profile to restrict the RTP source IP to be the same as the SIP source IP when hosted NAT traversal is enabled.

```
config voip profile
   edit VoIP_HNT
      config sip
         set hosted-nat-traversal enable
         set hnt-restrict-source-ip enable
      end
   end
```

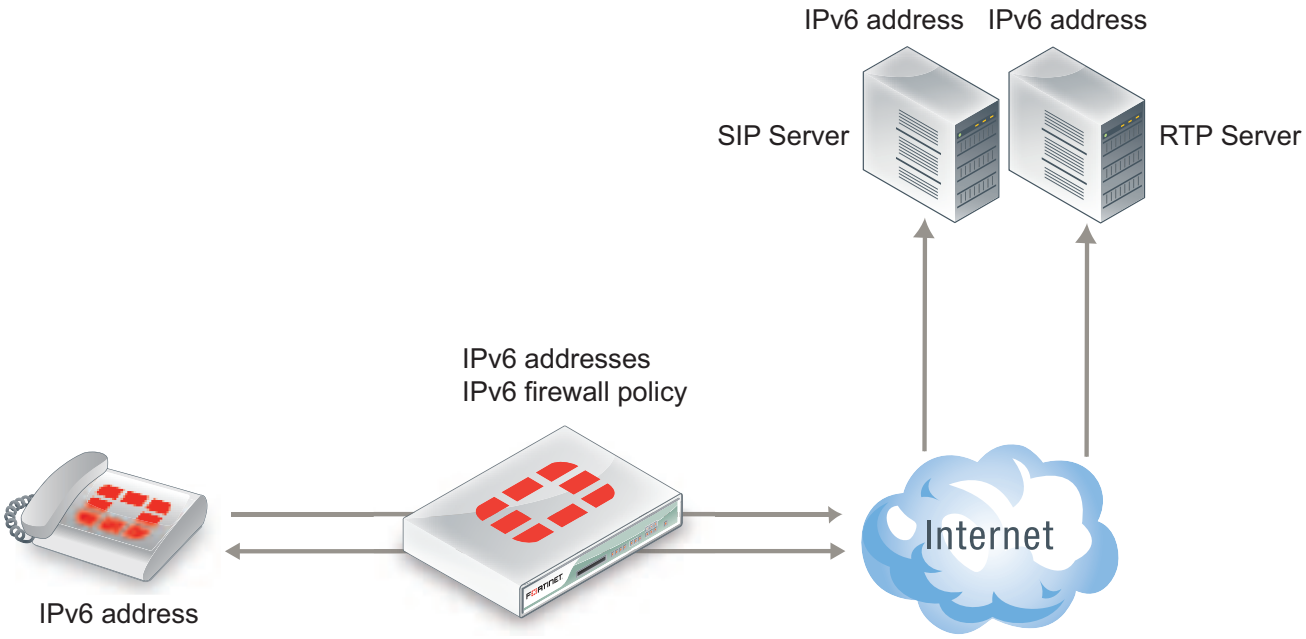
SIP over IPv6

FortiGate units operating in NAT/Route and in Transparent mode support SIP over IPv6. The SIP ALG can process SIP messages that use IPv6 addresses in the headers, bodies, and in the transport stack. The SIP ALG cannot modify the IPv6 addresses in the SIP headers so FortiGate units cannot perform SIP or RTP NAT over IPv6 and also cannot translate between IPv6 and IPv4 addresses.

In the scenario shown inthe figure below, a SIP phone connects to the Internet through a FortiGate unit operating. The phone and the SIP and RTP servers all have IPv6 addresses.

The FortiGate unit has IPv6 security policies that accept SIP sessions. The SIP ALG understands IPv6 addresses and can forward IPv6 sessions to their destinations. Using SIP application control features the SIP ALG can also apply rate limiting and other settings to SIP sessions.

SIP support for IPv6

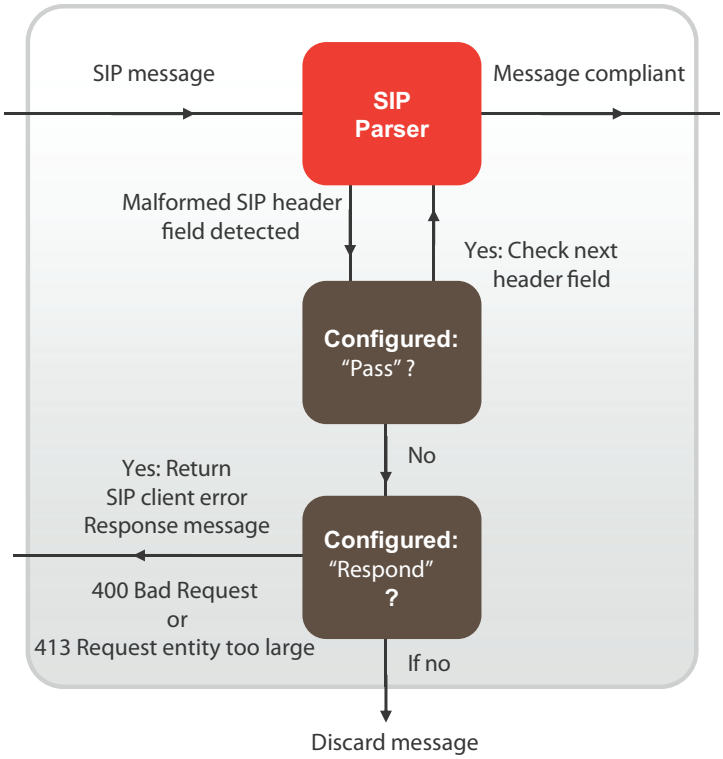


To enable SIP support for IPv6 add an IPv6 security policy that accepts SIP packets and includes a VoIP profile.

Deep SIP message inspection

Deep SIP message syntax inspection (also called Deep SIP header inspection or SIP fuzzing protection) provides protection against malicious SIP messages by applying SIP header and SDP profile syntax checking. SIP Fuzzing attacks can be used by attackers to discover and exploit vulnerabilities of a SIP entity (for example a SIP proxy server). Most often these attacks could crash or compromise the SIP entity.

Deep SIP message inspection



- **Checks the SIP request message Request-line**
- **Checks the following SIP header fields:**
  - **Allow, Call-id, Contact, Content-length, Content-type, CSeq, Expires, From, Max-Forwards, P-asserted-identity, Rack, Record-Route, Route, Rseq, To, Via**
- **Checks all SDP profile lines**
- **Configurable header and body length checks**
- **Optional logging of message violations**

Deep SIP message inspection checks the syntax of each SIP header and SDP profile line to make sure they conform to the syntax defined in the relevant RFC and IETF standard. You can also configure the SIP ALG to inspect for:

- Unknown SIP message types (message types not defined in a SIP RFC) this option is enabled by default and can be disabled. When enabled unknown message types are discarded. Configured using the `block-unknown` option.
- Unknown line types (message line types that are not defined in any SIP or SDP RFC). Configured using the `unknown-header` option.
- Messages that are longer than a configured maximum size. Configured using the `max-body-length` option.
- Messages that contain one or more lines that are longer that a set maximum line length (default 998 characters). Configured using the `max-line-length` option.

Actions taken when a malformed message line is found

When a malformed message line or other error is found the SIP ALG can be configured to discard the message containing the error, pass the message without any other actions, or responding to the message with a 400 Bad Request or 413 Request entity too large client error SIP response message and then discard the message. (For information about client error SIP response messages, see "Client error".)

If a message line is longer than the configured maximum, the SIP ALG sends the following message:

```
SIP/2.0 413 Request Entity Too Large, <optional_info>
```

If a message line is incorrect or in an unknown message line is found, the SIP ALG sends the following message:

```
SIP/2.0 400 Bad Request, <optional_info>
```

The <optional_info> provides more information about why the message was rejected. For example, if the SIP ALG finds a malformed Via header line, the response message may be:

```
SIP/2.0 400 Bad Request, malformed Via header
```

If the SIP ALG finds a malformed message line, and the action for this message line type is discard, the message is discarded with no further checking or responses. If the action is pass, the SIP ALG continues parsing the SIP message for more malformed message lines. If the action is respond, the SIP ALG sends the SIP response message and discards the message containing the malformed line with no further checking or response. If only malformed message line types with action set to pass are found, the SIP ALG extracts as much information as possible from the message (for example for NAT and opening pinholes, and forwards the message to its destination).

If a SIP message containing a malformed line is discarded the SIP ALG will not use the information in the message for call processing. This could result in the call being terminated. If a malformed line in a SIP message includes information required for the SIP call that the SIP ALG cannot interpret (for example, if an IP address required for SIP NAT is corrupted) the SIP ALG may not be able to continue processing the call and it could be terminated. Discarded messages are counted by SIP ALG static message counters.

Logging and statistics

To record a log message each time the SIP ALG finds a malformed header, enable logging SIP violations in a VoIP profile. In all cases, when the SIP ALG finds an error the FortiGate unit records a malformed header log message that contains information about the error. This happens even if the action is set to pass.

If, because of recording log messages for deep message inspection, the CPU performance is affected by a certain amount, the FortiGate unit records a critical log message about this event and stops writing log messages for deep SIP message inspection.

The following information is recorded in malformed header messages:

- The type of message line in which the error was found.
- The content of the message line in which the error was found (it will be truncated if it makes the log message too long)
- The column or character number in which the error was found (to make it easier to determine what caused the error)

Deep SIP message inspection best practices

Because of the risks imposed by SIP header attacks or incorrect data being allowed and because selecting drop or respond does not require more CPU overhead that pass you would want to set all tests to drop or respond. However, in some cases malformed lines may be less of a threat or risk. For example, the SDP i= does not usually contain information that is parsed by any SIP device so a malformed i= line may not pose a threat.

You can also used the pre-defined VoIP profiles to apply different levels of deep message inspection. The default VoIP profile sets all deep message inspection options to pass and the strict VoIP profile sets all deep message inspection options to discard. From the CLI you can use the `clone` command to copy these pre-defined VoIP profiles and then customize them for your requirements.

Configuring deep SIP message inspection

You configure deep SIP message inspection in a VoIP profile. All deep SIP message inspection options are available only from the CLI.

Enter the following command to configure deep SIP message inspection to discard messages with malformed Request-lines (the first line in a SIP request message):

```
config voip profile
   edit VoIP_Pro_Name
      config sip
         set malformed-request-line respond
      end
   end
```

You cannot configure message inspection for the Status-line, which is the first line in a SIP response message.

The following table lists the SIP header lines that the SIP ALG can inspect and the CLI command for configuring the action for each line type. The table also lists the RFC that the header line is defined in.

SIP header lines that the SIP ALG can inspect for syntax errors

SIP Header line	VoIP profile option	RFC
Allow	malformed-header-allow	RFC 3261
Call-ID	malformed-header-call-id	RFC 3261
Contact	malformed-header-contact	RFC 3261
Content-Length	malformed-header-content-length	RFC 3261
Content-Type	malformed-header-content-type	RFC 3261
CSeq	malformed-header-cseq	RFC 3261
Expires	malformed-header-expires	RFC 3261
From	malformed-header-from	RFC 3261
Max-forwards	malformed-header-max-forwards	RFC 3261
P-Asserted-Identity	malformed-header-p-asserted-identity	RFC 3325
RAck	malformed-header-rack	RFC 3262
Record-Route	malformed-header-record-route	RFC 3261
Route	malformed-header-route	RFC 3261
RSeq	malformed-header-rseq	RFC 3262
To	malformed-header-to	RFC 3261
Via	malformed-header-via	RFC 3261

The table below lists the SDP profile lines that the SIP ALG inspects and the CLI command for configuring the action for each line type. SDP profile lines are defined by RFC 4566 and RFC 2327.

SDP profile lines that the SIP ALG can inspect for syntax errors

Attribute	VoIP profile option
a=	malformed-header-sdb-a
b=	malformed-header-sdp-b
c=	malformed-header-sdp-c
i=	malformed-header-sdp-i
k=	malformed-header-sdp-k
m=	malformed-header-sdp-m
o=	malformed-header-sdp-o
r=	malformed-header-sdp-r
s=	malformed-header-sdp-s
t=	malformed-header-sdp-t
v=	malformed-header-sdp-v
z=	malformed-header-sdp-z

Discarding SIP messages with some malformed header and body lines

Enter the following command to configure deep SIP message inspection to discard SIP messages with a malformed Via line, a malformed route line or a malformed m= line but to pass messages with a malformed i= line or a malformed Max-Forwards line

```
config voip profile
   edit VoIP_Pro_Name
      config sip
         set malformed-header-via discard
         set malformed-header-route discard
         set malformed-header-sdp-m discard
         set malformed-header-sdp-i pass
         set malformed-header-max-forwards pass
      end
   end
```

Discarding SIP messages with an unknown SIP message type

Enter the following command to discard SIP messages with an unknown SIP message line type as defined in all current SIP RFCs:

```
config voip profile
   edit VoIP_Pro_Name
      config sip
         set unknown-header discard
      end
   end
```

Discarding SIP messages that exceed a message size

Enter the following command to set the maximum size of a SIP message to 200 bytes. Messages longer than 200 bytes are discarded.

```
config voip profile
   edit VoIP_Pro_Name
      config sip
         set max-body-length 200
      end
   end
```

The `max-body-length` option checks the value in the SIP Content-Length header line to determine body length. The Content-Length can be larger than the actual size of a SIP message if the SIP message content is split over more than one packet. SIP message sizes vary widely. The size of a SIP message can also change with the addition of Via and Record-Route headers as the message is transmitted between users and SIP servers.

Discarding SIP messages with lines longer than 500 characters

Enter the following command to set the length of a SIP message line to 500 characters and to block messages that include lines with 500 or more characters:

```
config voip profile
   edit VoIP_Pro_Name
      config sip
         set max-line-length 500
         set block-long-lines enable
      end
   end
```

Blocking SIP request messages

You may want to block different types of SIP requests:

- to prevent SIP attacks using these messages.
- If your SIP server cannot process some SIP messages because of a temporary issue (for example a bug that crashes or compromises the server when it receives a message of a certain type).
- Your SIP implementation does not use certain message types.

When you enable message blocking for a message type in a VoIP profile, whenever a security policy containing the VoIP profile accepts a SIP message of this type, the SIP ALG silently discards the message and records a log message about the action.

Use the following command to configure a VoIP profile to block SIP CANCEL and Update request messages:

```
config voip profile
   edit VoIP_Pro_Name
      config sip
         set block-cancel enable
         set block-update enable
```

```
        end
    end
```

SIP uses a variety of text-based messages or requests to communicate information about SIP clients and servers to the various components of the SIP network. Since SIP requests are simple text messages and since the requests or their replies can contain information about network components on either side of the FortiGate unit, it may be a security risk to allow these messages to pass through.

The following table lists all of the VoIP profile SIP request message blocking options. All of these options are disabled by default.

Blocking SIP OPTIONS messages may prevent a redundant configuration from operating correctly. See Supporting geographic redundancy when blocking OPTIONS messages on page 2806 for information about resolving this problem.

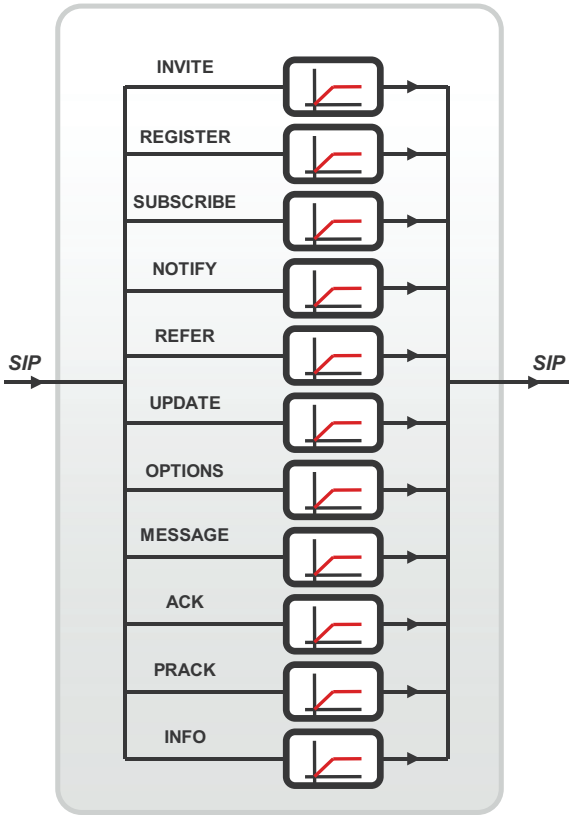
Options for blocking SIP request messages

SIP request message	SIP message blocking CLI Option
ACK	block-ack
BYE	block-bye
Cancel	block-cancel
INFO	block-info
INVITE	block-invite
Message	block-message
Notify	block-notify
Options	block-options
PRACK	block-prack
Publish	block-publish
Refer	block-refer
Register	block-register
Subscribe	block-subscribe
Update	block-update

SIP rate limiting

Configurable threshold for SIP message rates per request method. Protects SIP servers from SIP overload and DoS attacks.

SIP rate limiting



- **SIP message rate limitation**
- **Individually configurable per SIP method**
- **When threshold is hit additional messages with this method will be discarded**
- **Prevents SIP server from getting overloaded by flash crowds or Denial-of-Service attacks.**
- **May block some methods at all** (with extra “block” option)
- **Can be disabled (unlimited rate)**

FortiGate units support rate limiting for the following types of VoIP traffic:

- Session Initiation Protocol (SIP)
- Skinny Call Control Protocol (SCCP) (most versions)
- Session Initiation Protocol for Instant Messaging and Presence Leveraging Extensions (SIMPLE).

You can use rate limiting of these VoIP protocols to protect the FortiGate unit and your network from SIP and SCCP Denial of Service (DoS) attacks. Rate limiting protects against SIP DoS attacks by limiting the number of SIP REGISTER and INVITE requests that the FortiGate unit receives per second. Rate limiting protects against SCCP DoS attacks by limiting the number of SCCP call setup messages that the FortiGate unit receives per minute.

You configure rate limiting for a message type by specifying a limit for the number of messages that can be received per second. The rate is limited per security policy. When VoIP rate limiting is enabled for a message type, if the a single security policy accepts more messages per second than the configured rate, the extra messages are dropped and log messages are written when the messages are dropped.

Use the following command to configure a VoIP profile to limit the number of INVITE messages accepted by each security policy that the VoIP profile is added to 100 INVITE messages a second:

```
config voip profile
   edit VoIP_Pro_Name
      config sip
         set invite-rate 100
      end
   end
```

If you are experiencing denial of service attacks from traffic using these VoIP protocols, you can enable VoIP rate limiting and limit the rates for your network. Limit the rates depending on the amount of SIP and SCCP traffic that you expect the FortiGate unit to be handling. You can adjust the settings if some calls are lost or if the amount of SIP or SCCP traffic is affecting FortiGate unit performance.

The table below lists all of the VoIP profile SIP rate limiting options. All of these options are set to 0 so are disabled by default.

Blocking SIP OPTIONS messages may prevent a redundant configuration from operating correctly. See Supporting geographic redundancy when blocking OPTIONS messages on page 2806 for information about resolving this problem.

Options for SIP rate limiting

SIP request message	Rate Limiting CLI Option
ACK	ack-rate
BYE	bye-rate
Cancel	cancel-rate
INFO	info-rate
INVITE	invite-rate
Message	message-rate
Notify	notify-rate
Options	options-rate
PRACK	prack-rate
Publish	publish-rate
Refer	refer-rate
Register	register-rate
Subscribe	subscribe-rate
Update	update-rate

Limiting the number of SIP dialogs accepted by a security policy

In addition to limiting the rates for receiving SIP messages, you can use the following command to limit the number of SIP dialogs (or SIP calls) that the FortiGate unit accepts.

```
config voip profile
   edit VoIP_Pro_Name
      config sip
         set max-dialogs 2000
      end
   end
```

This command sets the maximum number of SIP dialogs that can be open for SIP sessions accepted by any security policy that you add the VoIP profile to. The default setting of 0 does not limit the number of dialogs. You can add a limit to control the number of open dialogs and raise and lower it as required. You might want to limit the number of open dialogs for protection against SIP-based attackers opening large numbers of SIP dialogs. Every dialog takes memory and FortiGate CPU resources to process. Limiting the number of dialogs may improve the overall performance of the FortiGate unit. Limiting the number of dialogs will not drop calls in progress but may prevent new calls from connecting.

SIP logging and DLP archiving

You can enable SIP logging and logging of SIP violations, and SIP DLP archiving a VoIP profile. To record SIP log messages you must also enable VoIP event logging in the FortiGate unit event logging configuration.

To view SIP log messages go to **Log&Report > Log Access > Event**.

To view SIP DLP archive messages to go **Log&Report > Archive Access > VoIP**.

Use the following command enable SIP logging, SIP archiving, and logging of SIP violations in a VoIP profile:

```
config voip profile
   edit VoIP_Pro_Name
      config sip
         set log-call-summary enable
         set log-violations enable
      end
   end
```

Inspecting SIP over SSL/TLS (secure SIP)

Some SIP phones and SIP servers can communicate using SSL or TLS to encrypt the SIP signalling traffic. To allow SIP over SSL/TLS calls to pass through the FortiGate unit, the encrypted signalling traffic has to be unencrypted and inspected. To do this, the FortiGate SIP ALG intercepts and unencrypts and inspects the SIP packets. The packets are then re-encrypted and forwarded to their destination.

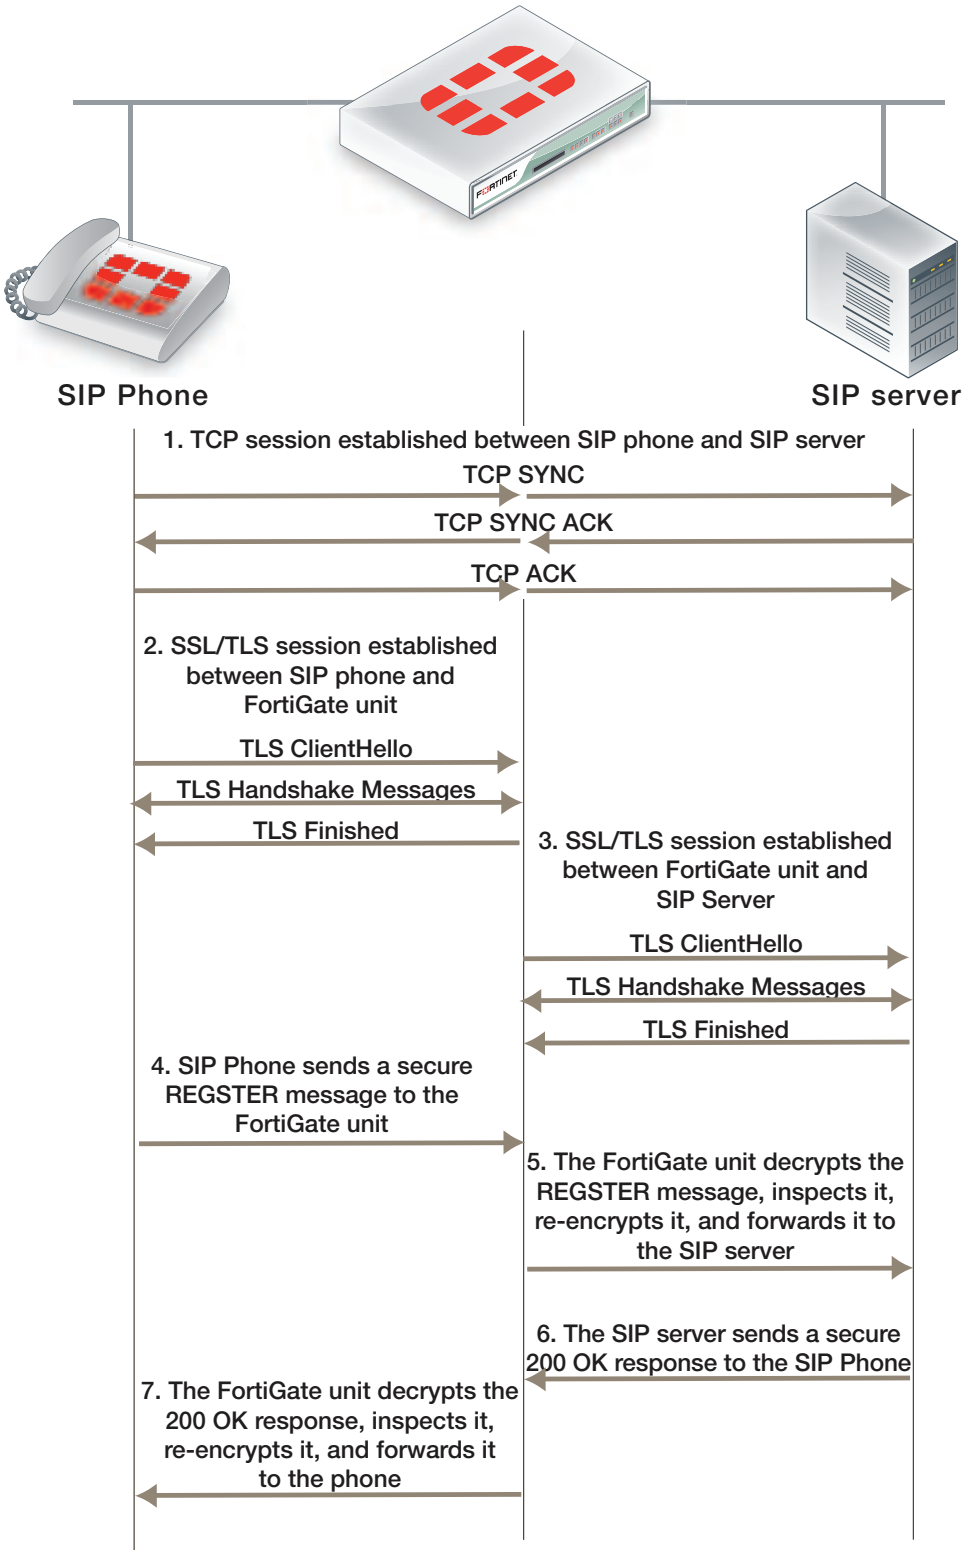
Normally SIP over SSL/TLS uses port 5061. You can use the following command to change the port that the FortiGate listens on for SIP over SSL/TLS sessions to port 5066:

```
config system settings
   set sip-ssl-port 5066
end
```

The SIP ALG supports full mode SSL/TLS only. Traffic between SIP phones and the FortiGate unit and between the FortiGate unit and the SIP server is always encrypted.

You enable SSL/TLS SIP communication by enabling SSL mode in a VoIP profile. You also need to install the SIP server and client certificates on your FortiGate unit and add them to the SSL configuration in the VoIP profile.

SIP over SSL/TLS between a SIP phone and a SIP server



Other than enabling SSL mode and making sure the security policies accept the encrypted traffic, the FortiGate configuration for SSL/TLS SIP is the same as any SIP configuration. SIP over SSL/TLS is supported for all supported SIP configurations.

Adding the SIP server and client certificates

A VoIP profile that supports SSL/TLS SIP requires one certification for the SIP server and one certificate that is used by all of the clients. Use the following steps to add these certificates to the FortiGate unit. Before you start, make sure the client and server certificate files and their key files are accessible from the management computer.

1. Go to **System > Certificates > Local Certificates** and select **Import.**
2. Set **Type** to **Certificate**.
3. Browse to the **Certificate file** and the **Key file** and select **OK**.
4. Enter a password for the certificate and select **OK**.

   The certificate and key are uploaded to the FortiGate unit and added to the **Local Certificates** List.
5. Repeat to upload the other certificate.

The certificates are added to the list of Local Certificates as the filenames you uploaded. You can add comments to make it clear where its from and how it is intended to be used.

Adding SIP over SSL/TLS support to a VoIP profile

Use the following commands to add SIP over SSL/TLS support to the default VoIP profile. The following command enables SSL mode and adds the client and server certificates and passwords, the same ones you entered when you imported the certificates:

```
config voip profile
   edit default
      config sip
         set ssl-mode full
         set ssl-client-certificate "Client_cert"
         set ssl-server-certificate "Server_cert"
         set ssl-auth-client "check-server"
         set ssl-auth-server "check-server-group"
      end
   end
```

Other SSL mode options are also available:

`ssl-send-empty-frags {disable | enable}`	Enable to send empty fragments to avoid CBC IV attacks. Compatible with SSL 3.0 and TLS 1.0 only. Default is `enable`.
`ssl-client-renegotiation {allow | deny | secure}`	Control how the ALG responds when a client attempts to renegotiate the SSL session. You can allow renegotiation or block sessions when the client attempts to renegotiate. You can also select `secure` to reject an SSL connection that does not support RFC 5746 secure renegotiation indication. Default is `allow`.
`ssl-algorithm {high | low | medium}`	Select the relative strength of the algorithms that can be selected. You can select `high`, the default, to allow only AES or 3DES, `medium`, to allow AES, 3DES, or RC4 or `low`, to allow AES, 3DES, RC4, or DES.
`ssl-pfs {allow | deny | regqure}`	Select whether to `allow`, `deny`, or `require` perfect forward secrecy (PFS). Default is `allow`.
`ssl-min-version {ssl-3.0 | tls-1.0 | tls-1.1}`	Select the minimum level of SSL support to allow. The default is `ssl-3.0`.
`ssl-max-version {ssl-3.0 | tls-1.0 | tls-1.1}`	Select the maximum level of SSL support to allow. The default is `tls-1.1`.

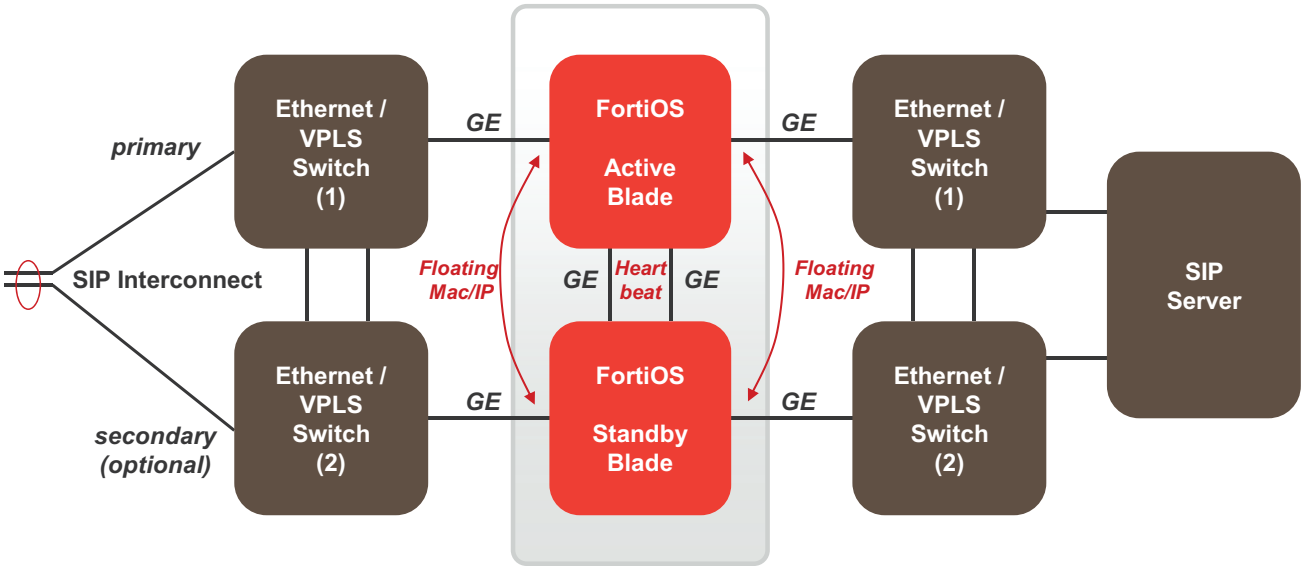
SIP and HA–session failover and geographic redundancy

FortiGate high availability supports SIP session failover (also called stateful failover) for active-passive HA. To support SIP session failover, create a standard HA configuration and select the Enable Session Pick-up option.

SIP session failover replicates SIP states to all cluster units. If an HA failover occurs, all in progress SIP calls (setup complete) and their RTP flows are maintained and the calls will continue after the failover with minimal or no interruption.

SIP calls being set up at the time of a failover may lose signaling messages. In most cases the SIP clients and servers should use message retransmission to complete the call setup after the failover has completed. As a result, SIP users may experience a delay if their calls are being set up when an HA a failover occurs. But in most cases the call setup should be able to continue after the failover.

SIP HA session failover

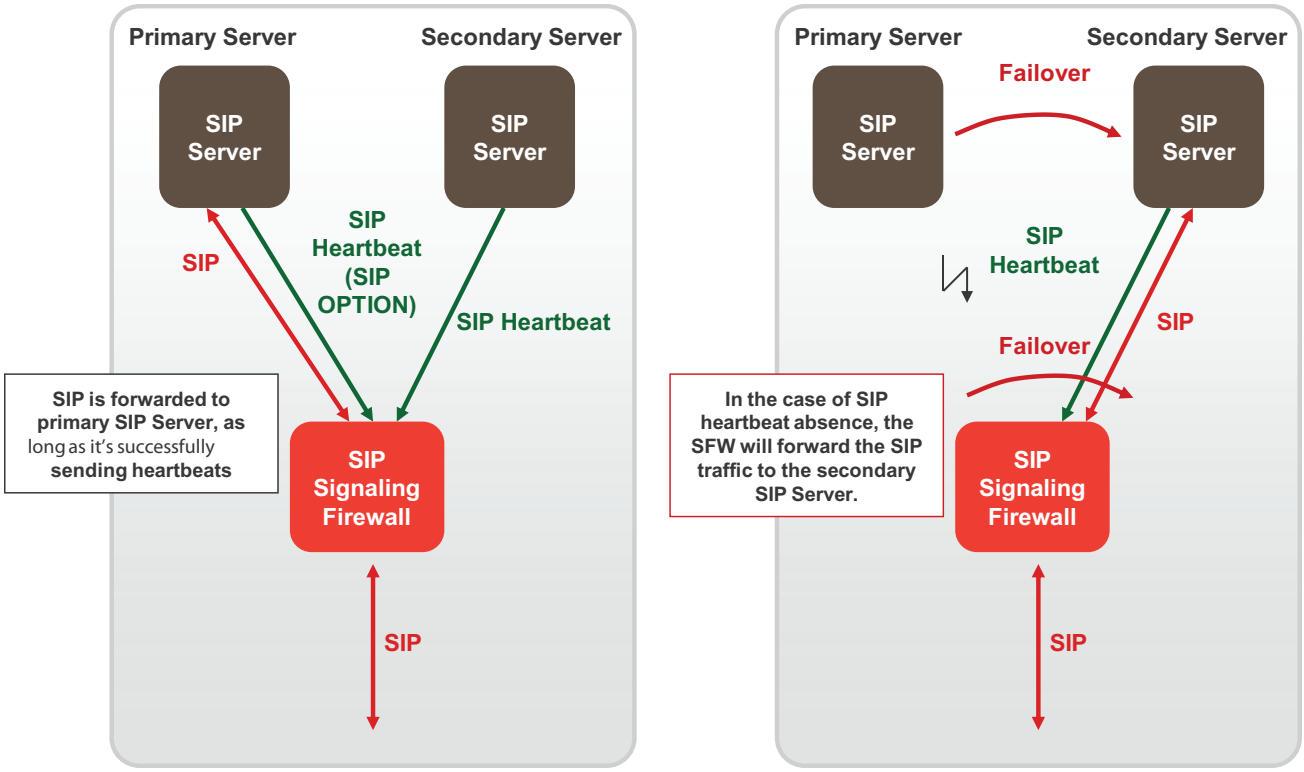


In some cases, failover during call teardown can result in hanging RTP connections which can accumulate over time and use up system memory. If this becomes a problem, you can set a time for the `call-keepalive` SIP VoIP profile setting. The FortiGate will then terminate calls with no activity after the time limit is exceeded. Range is 1 to 10,080 seconds. This options should be used with caution because it results in extra FortiGate CPU overhead and can cause delay/jitter for the VoIP call. Also, the FortiGate unit terminates the call without sending SIP messages to end the call. And if the SIP endpoints send SIP messages to terminate the call they will be blocked by the FortiGate unit if they are sent after the FortiGate unit terminates the call.

SIP geographic redundancy

Maintains a active-standby SIP server configuration, which even supports geographical distribution. If the active SIP server fails (missing SIP heartbeat messages or SIP traffic) FortiOS will redirect the SIP traffic to a secondary SIP server. SIP geographic redundancy

Geographic redundancy



Supporting geographic redundancy when blocking OPTIONS messages

For some geographic redundant SIP configurations, the SIP servers may use SIP OPTIONS messages as heartbeats to notify the FortiGate unit that they are still operating (or alive). This is a kind of passive SIP monitoring mechanism where the FortiGate unit isn't actively monitoring the SIP servers and instead the FortiGate unit passively receives and analyzes OPTIONS messages from the SIP servers.

If FortiGate units block SIP OPTIONS messages because `block-options` is enabled, the configuration may fail to operate correctly because the OPTIONS messages are blocked by one or more FortiGate units.

However, you can work around this problem by enabling the `block-geo-red-options` application control list option. This option causes the FortiGate unit to refresh the local SIP server status when it receives an OPTIONS message before dropping the message. The end result is the heartbeat signals between geographically redundant SIP servers are maintained but OPTIONS messages do not pass through the FortiGate unit.

Use the following command to block OPTIONS messages while still supporting geographic redundancy:

```
config voip profile
   edit VoIP_Pro_Name
      config sip
         set block-options disable
         set block-geo-red-options enable
      end
end
```

The `block-options` option setting overrides the `block-geo-red-options` option. If `block-options` is enabled the FortiGate unit only blocks SIP OPTIONS messages and does not refresh local SIP server status.

Support for RFC 2543-compliant branch parameters

RFC 3261 is the most recent SIP RFC, it obsoletes RFC 2543. However, some SIP implementations may use RFC 2543-compliant SIP calls.

The `rfc2543-branch` VoIP profile option allows the FortiGate unit to support SIP calls that include an RFC 2543-compliant branch parameter in the SIP Via header. This option also allows FortiGate units to support SIP calls that include Via headers that are missing the branch parameter.

```
config voip profile
   edit VoIP_Pro_Name
      config sip
         set rfc2543-branch enable
      end
   end
```

SIP and IPS

You can enable IPS in security policies that also accept SIP sessions to protect the SIP traffic from SIP-based attacks. If you enable IPS in this way then by default the pinholes that the SIP ALG creates to allow RTP and RTCP to flow through the firewall will also have IPS enabled.

This inheritance of the IPS setting can cause performance problems if the RTP traffic volume is high since IPS checking may reduce performance in some cases. Also if you are using network processor (NP) interfaces to accelerate VoIP performance, when IPS is enabled for the pinhole traffic is diverted to the IPS and as a result is not accelerated by the network processors.

You can use the following CLI command to disable IPS for the RTP pinhole traffic.

```
config voip profile
   edit VoIP_Pro_Name
      config sip
         set ips-rtp disable
      end
   end
```

SIP debugging

SIP debug log format

Assuming that `diagnose debug console timestamp` is enabled then the following shows the debug that is generated for an INVITE if `diag debug appl sip -1` is enabled:

```
2010-01-04 21:39:59 sip port 26 locate session for 192.168.2.134:5061 ->

SIP-proxy filter per VDOM

You can use the `diagnose sys sip-proxy xxx` command in a VDOM to get info about how SIP is operating in each VDOM.

SIP-proxy filter command

Use the `diagnose sys sip-proxy filter` to filter diagnose information for the SIP ALG. The following filters are available:

```
diag sys sip-proxy filter vd
diag sys sip-proxy filter dst-addr4
diag sys sip-proxy filter dst-addr6
diag sys sip-proxy filter dst-port
diag sys sip-proxy filter identity-policy
diag sys sip-proxy filter negate
diag sys sip-proxy filter policy
diag sys sip-proxy filter policy-type
diag sys sip-proxy filter profile-group
diag sys sip-proxy filter src-addr4
diag sys sip-proxy filter src-addr6
diag sys sip-proxy filter src-port
diag sys sip-proxy filter vd
diag sys sip-proxy filter voip-profile
```

You can clear, view and negate/invert the sense of a filter using these commands:

```
diag sys sip-proxy filter clear
diag sys sip-proxy filter list
diag sys sip-proxy filter negate
```

SIP debug log filtering

You can filter by VDOM/IP/PORT and by policy and VoIP profile. The filtering can be controlled by:

```
diagnose sys sip-proxy log-filter
```

The list of filters is:

```
diag sys sip-proxy log-filter vd
diag sys sip-proxy log-filter dst-addr4
diag sys sip-proxy log-filter dst-addr6
diag sys sip-proxy log-filter dst-port
diag sys sip-proxy log-filter identity-policy
diag sys sip-proxy log-filter policy
diag sys sip-proxy log-filter policy-type
diag sys sip-proxy log-filter profile-group
diag sys sip-proxy log-filter src-addr4
diag sys sip-proxy log-filter src-addr6
diag sys sip-proxy log-filter src-port
diag sys sip-proxy log-filter vd
diag sys sip-proxy log-filter voip-profile
```

You can clear, view and negate/invert the sense of a filter using these commands:

```
diag sys sip-proxy log-filter clear
diag sys sip-proxy log-filter list
diag sys sip-proxy log-filter negate
```

SIP debug setting

Control of the SIP debug output is governed by the following command

```
diagnose debug application sip <debug_level_int>
```

Where the <debug_level_int> is a bitmask and the individual values determine whether the listed items are logged or not. The <debug_level_int> can be:

1	Configuration changes, mainly addition/deletion/modification of virtual domains.
2	TCP connection accepts or connects, redirect creation.
4	Create or delete a session.
16	Any IO read or write.
32	An ASCII dump of all data read or written.
64	Include HEX dump in the above output.
128	Any activity related to the use of the FortiCarrier dynamic profile feature to determine the correct profile-group to use.
256	Log summary of interesting fields in a SIP call.
1024	Any activity related to SIP geo-redundancy.
2048	Any activity related to HA syncing of SIP calls.

Display SIP rate-limit data

You can use the `diagnose sys sip-proxy meters` command to display SIP rate limiting data.

For the following command output `rate 1` shows that the current (over last second) measured rate for INVITE/ACK and BYTE was 1 per second, the `peak 1` shows that the peak rate recorded is 1 per second, the `max 0` shows that there is no maximum limit set, the `count 18` indicates that 18 messages were received and `drop 0` indicates that none were dropped due to being over the limit.

```
diag sys sip-proxy meters
sip
sip vd: 0
sip policy: 1
sip identity-policy: 0
sip policy-type: IPv4
sip profile-group:
sip dialogs: 18
sip dialog-limit: 0
sip UNKNOWN: rate 0 peak 0 max 0 count 0 drop 0
sip ACK: rate 1 peak 1 max 0 count 18 drop 0
sip BYE: rate 1 peak 1 max 0 count 18 drop 0
sip CANCEL: rate 0 peak 0 max 0 count 0 drop 0
sip INFO: rate 0 peak 0 max 0 count 0 drop 0
sip INVITE: rate 1 peak 1 max 0 count 18 drop 0
sip MESSAGE: rate 0 peak 0 max 0 count 0 drop 0
sip NOTIFY: rate 0 peak 0 max 0 count 0 drop 0
sip OPTIONS: rate 0 peak 0 max 0 count 0 drop 0
sip PRACK: rate 0 peak 0 max 0 count 0 drop 0
sip PUBLISH: rate 0 peak 0 max 0 count 0 drop 0
sip REFER: rate 0 peak 0 max 0 count 0 drop 0
```

```
sip REGISTER: rate 0 peak 0 max 0 count 0 drop 0
sip SUBSCRIBE: rate 0 peak 0 max 0 count 0 drop 0
sip UPDATE: rate 0 peak 0 max 0 count 0 drop 0
sip PING: rate 0 peak 0 max 0 count 0 drop 0
sip YAHOOREF: rate 0 peak 0 max 0 count 0 drop 0
```

Chapter 30 - WAN Optimization, Web Cache, Explicit Proxy, and WCCP

You configure all of these features by creating security policies and adding WAN Optimization, web caching, and proxying to them. These same security policies can also include security profiles that apply UTM and NGFW features to WAN Optimization, web caching, and explicit proxy traffic.

The FortiOS Handbook chapter contains the following sections:

- Example network topologies provides an overview of FortiGate WAN optimization best practices and technologies and some of the concepts and rules for using them. We recommend that you begin with this chapter before attempting to configure your FortiGate unit to use WAN optimization.
- Configuring WAN optimization provides basic configuration for WAN optimization rules, including adding rules, organizing rules in the rule list and using WAN optimization addresses. This chapter also explains how WAN optimization accepts sessions, as well as how and when you can apply security profiles to WAN optimization traffic.
- Peers and authentication groups describes how to use WAN optimization peers and authentication groups to control access to WAN optimization tunnels.
- Configuration examples describes basic active-passive and peer-to-peer WAN optimization configuration examples. This chapter is a good place to start learning how to put an actual WAN optimization network together.
- Web caching and SSL offloading describes how web caching works to cache HTTP and HTTPS, how to use SSL offloading to improved performance of HTTPS websites, and includes web caching configuration examples.
- FortiClient WAN optimization describes how FortiGate and FortiClient WAN optimization work together and includes an example configuration.
- The FortiGate explicit web proxy describes how to configure the FortiGate explicit web proxy, how users connect to the explicit web proxy, and how to add web caching to the explicit web proxy.
- The FortiGate explicit FTP proxy describes how to configure the FortiGate explicit FTP proxy and how users connect to the explicit FTP proxy.
- FortiGate WCCP describes FortiGate WCCP and how to configure WCCP and the WCCP client.
- Diagnose commands describes get and diagnose commands available for troubleshooting WAN optimization, web cache, and WCCP.

Example network topologies

FortiGate WAN optimization consists of a number of techniques that you can apply to improve the efficiency of communication across your WAN. These techniques include protocol optimization, byte caching, web caching, SSL offloading, and secure tunneling. Protocol optimization can improve the efficiency of traffic that uses the CIFS, FTP, HTTP, or MAPI protocol, as well as general TCP traffic. Byte caching caches files and other data on FortiGate units to reduce the amount of data transmitted across the WAN. Web caching stores web pages on FortiGate units to reduce latency and delays between the WAN and web servers. SSL offloading offloads SSL decryption and encryption from web servers onto FortiGate SSL acceleration hardware. Secure tunneling secures traffic as it crosses the WAN.

You can apply different combinations of these WAN optimization techniques to a single traffic stream depending on the traffic type. For example, you can apply byte caching and secure tunneling to any TCP traffic. For HTTP and HTTPS traffic, you can also apply protocol optimization and web caching.

You can configure a FortiGate unit to be an explicit web proxy server for both IPv4 and IPv6 traffic and an explicit FTP proxy server. Users on your internal network can browse the Internet through the explicit web proxy server or connect to FTP servers through the explicit FTP proxy server. You can also configure these proxies to protect access to web or FTP servers behind the FortiGate unit using a reverse proxy configuration.

Web caching can be applied to any HTTP or HTTPS traffic, this includes normal traffic accepted by a security policy, explicit web proxy traffic, and WAN optimization traffic.

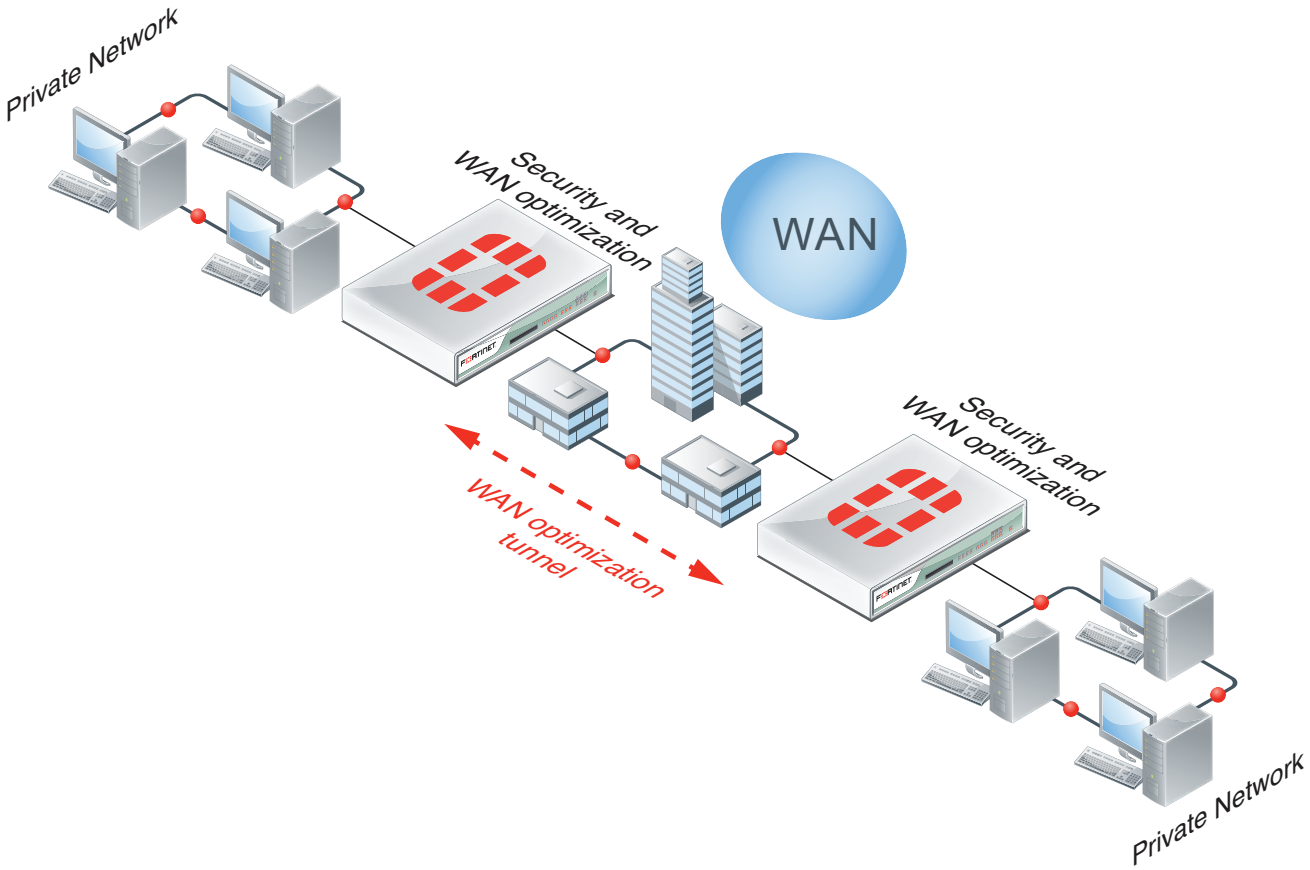
You can also configure a FortiGate unit to operate as a Web Cache Communication Protocol (WCCP) client or server. WCCP provides the ability to offload web caching to one or more redundant web caching servers.

FortiGate units can also apply security profiles to traffic as part of a WAN optimization, explicit web proxy, explicit FTP proxy, web cache and WCCP configuration. Security policies that include any of these options can also include settings to apply all forms of security profiles supported by your FortiGate unit.

Basic WAN optimization topology

The basic FortiGate WAN optimization topology consists of two FortiGate units operating as WAN optimization peers intercepting and optimizing traffic crossing the WAN between the private networks.

Security device and WAN optimization topology



FortiGate units can be deployed as security devices that protect private networks connected to the WAN and also perform WAN optimization. In this configuration, the FortiGate units are configured as typical security devices for the private networks and are also configured for WAN optimization. The WAN optimization configuration intercepts traffic to be optimized as it passes through the FortiGate unit and uses a WAN optimization tunnel with another FortiGate unit to optimize the traffic that crosses the WAN.

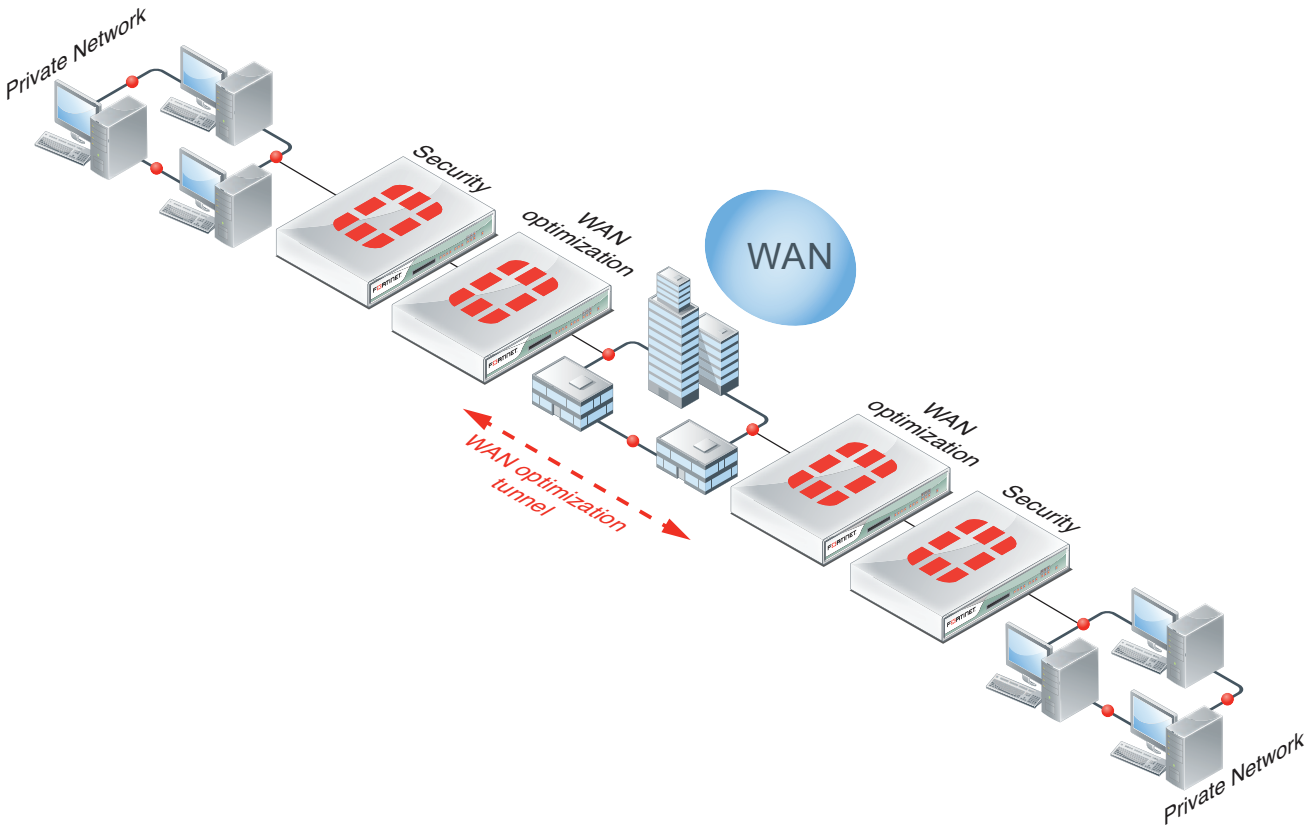
You can also deploy WAN optimization on single-purpose FortiGate units that only perform WAN optimization. In the out of path WAN optimization topology shown below, FortiGate units are located on the WAN outside of the private networks. You can also install the WAN optimization FortiGate units behind the security devices on the private networks.

The WAN optimization configuration is the same for FortiGate units deployed as security devices and for single-purpose WAN optimization FortiGate units. The only differences would result from the different network topologies.

Out-of-path WAN Optimization topology

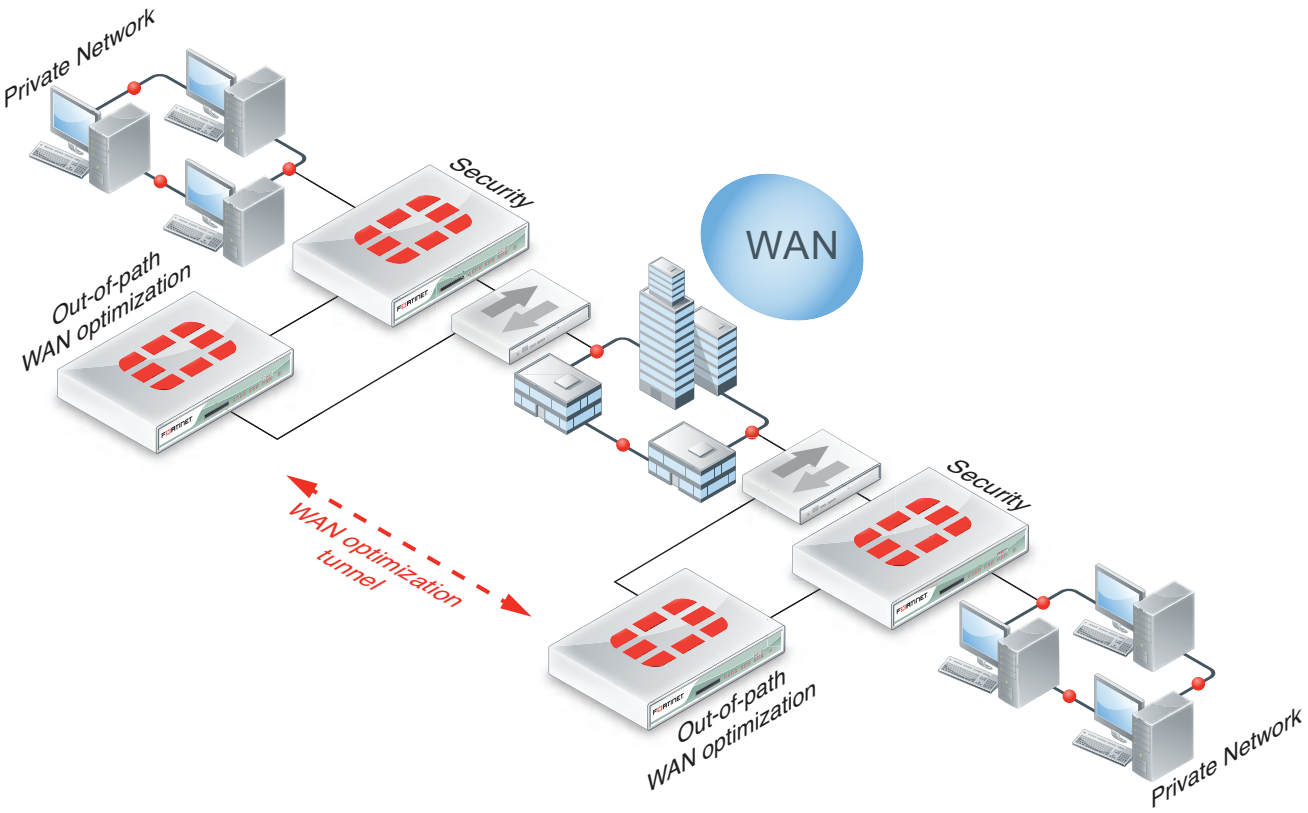
In an out-of-path topology, one or both of the FortiGate units configured for WAN optimization are not directly in the main data path. Instead, the out-of-path FortiGate unit is connected to a device on the data path, and the device is configured to redirect sessions to be optimized to the out-of-path FortiGate unit.

Single-purpose WAN optimization topology



The following out-of-path FortiGate units are configured for WAN optimization and connected directly to FortiGate units in the data path. The FortiGate units in the data path use a method such as policy routing to redirect traffic to be optimized to the out-of-path FortiGate units. The out-of-path FortiGate units establish a WAN optimization tunnel between each other and optimize the redirected traffic.

Out-of-path WAN optimization



One of the benefits of out-of-path WAN optimization is that out-of-path FortiGate units only perform WAN optimization and do not have to process other traffic. An in-path FortiGate unit configured for WAN optimization also has to process other non-optimized traffic on the data path.

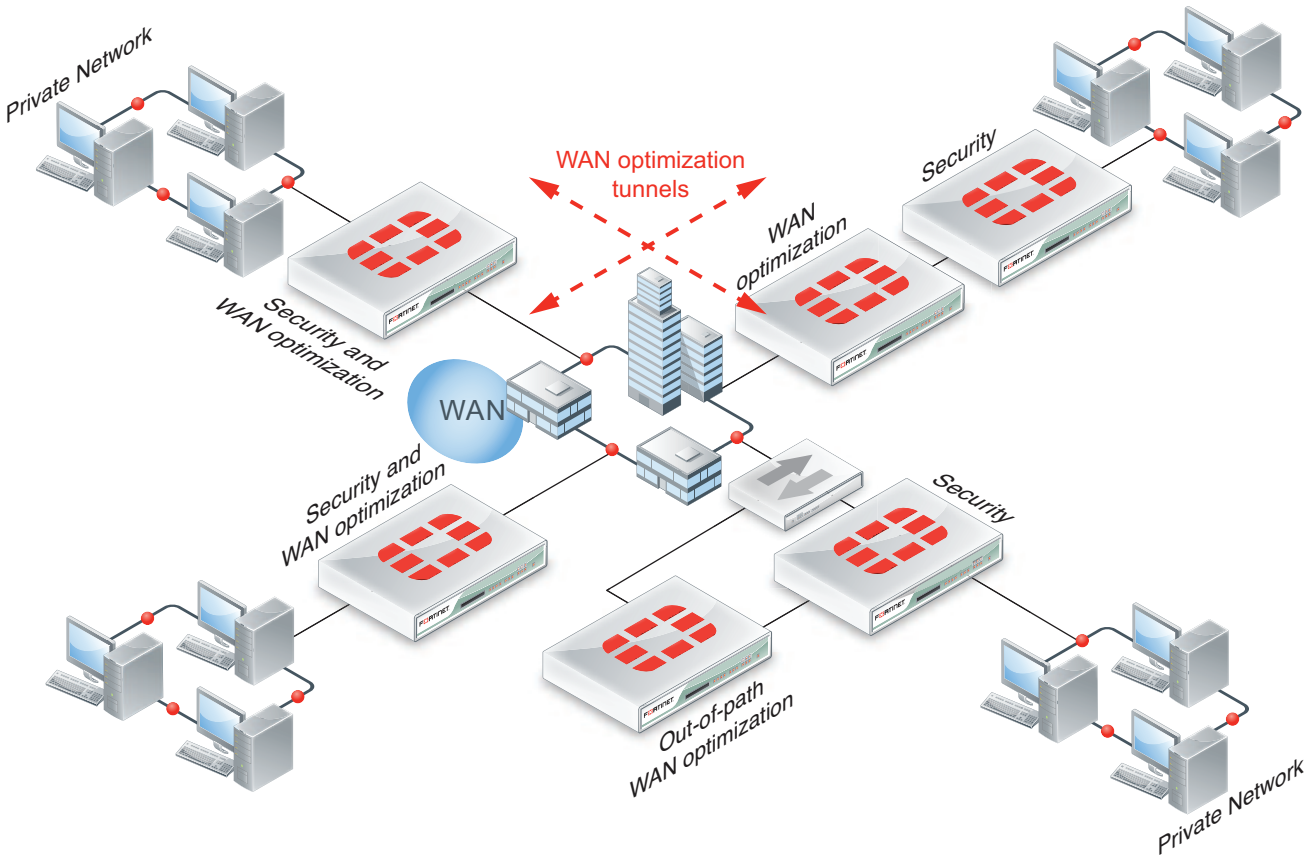
The out-of-path FortiGate units can operate in NAT/Route or Transparent mode.

Other out-of-path topologies are also possible. For example, you can install the out-of-path FortiGate units on the private networks instead of on the WAN. Also, the out-of-path FortiGate units can have one connection to the network instead of two. In a one-arm configuration such as this, security policies and routing have to be configured to send the WAN optimization tunnel out the same interface as the one that received the traffic.

Topology for multiple networks

As shown in below, you can create multiple WAN optimization configurations between many private networks. Whenever WAN optimization occurs, it is always between two FortiGate units, but you can configure any FortiGate unit to perform WAN optimization with any of the other FortiGate units that are part of your WAN.

WAN optimization among multiple networks

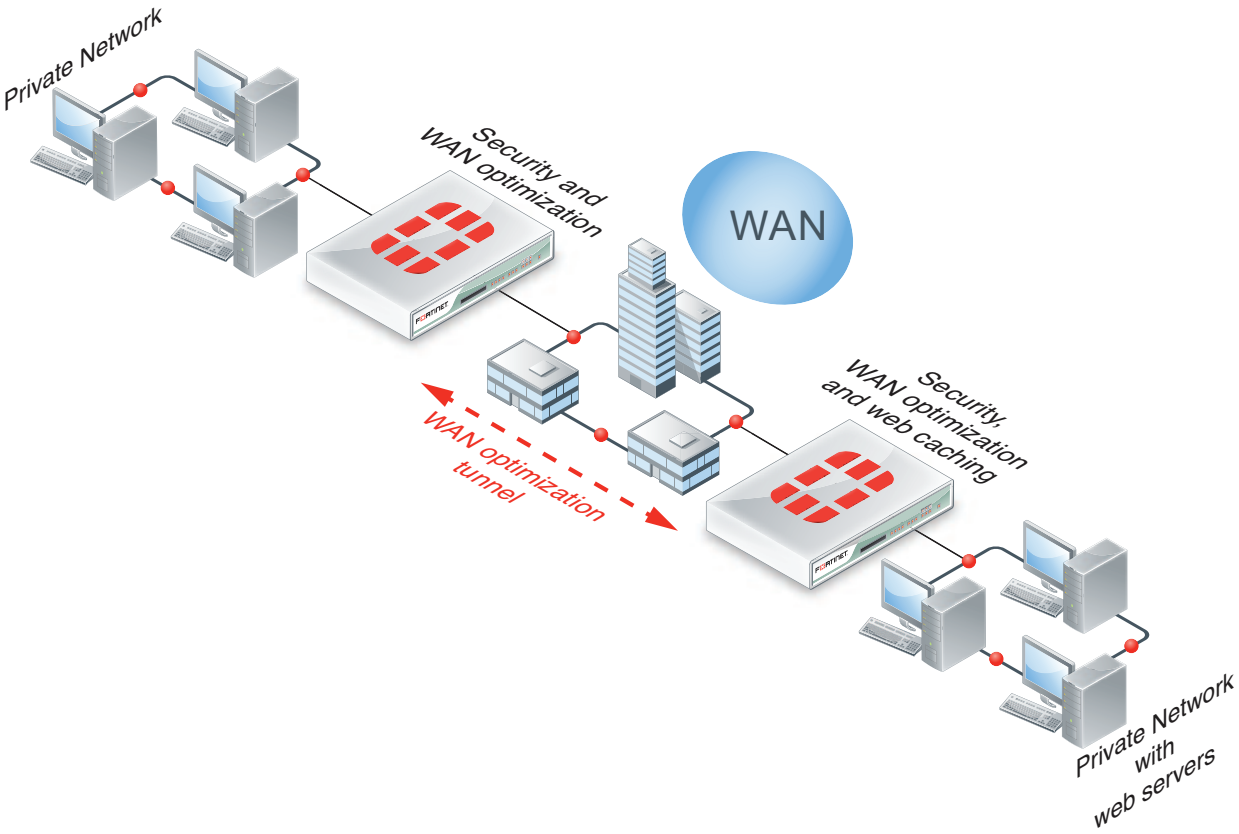


You can also configure WAN optimization between FortiGate units with different roles on the WAN. FortiGate units configured as security devices and for WAN optimization can perform WAN optimization as if they are single-purpose FortiGate units just configured for WAN optimization.

WAN optimization with web caching

You can add web caching to a WAN optimization topology when users on a private network communicate with web servers located across the WAN on another private network.

WAN optimization with web caching topology

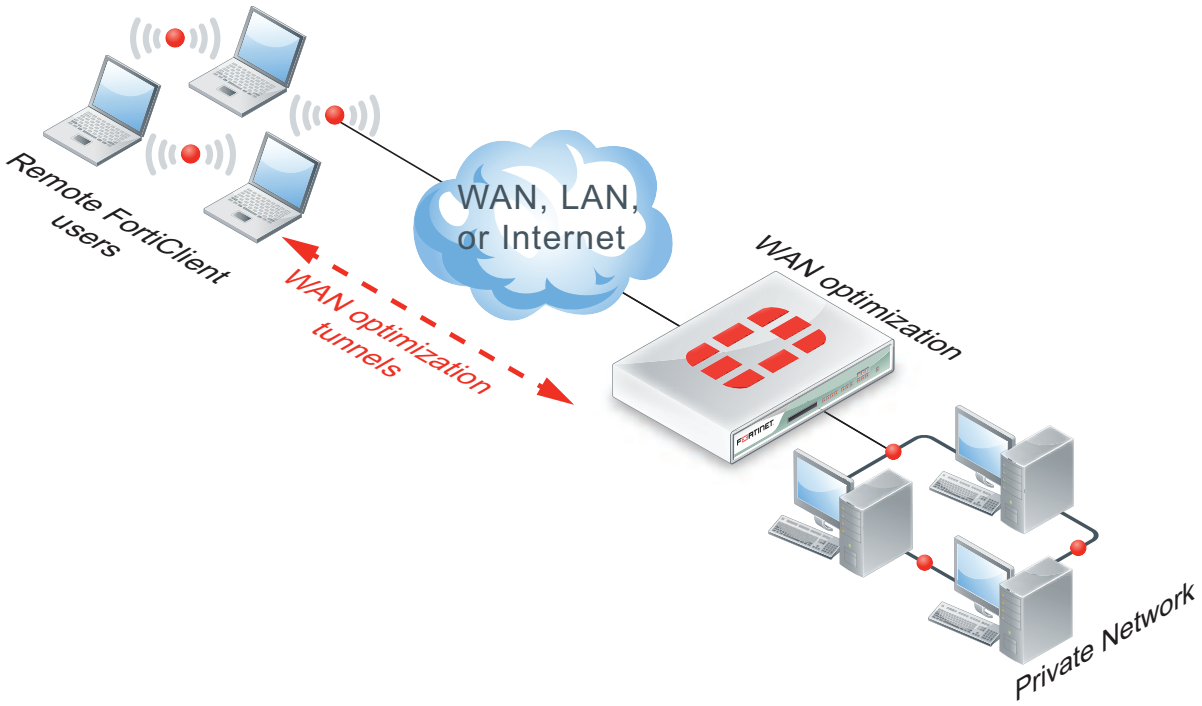


The topology above is the same as that shown in Basic WAN optimization topology on page 2813 with the addition of web caching to the FortiGate unit in front of the private network that includes the web servers. You can also add web caching to the FortiGate unit that is protecting the private network. In a similar way, you can add web caching to any WAN Optimization topology.

WAN optimization and web caching with FortiClient peers

FortiClient WAN optimization works with FortiGate WAN optimization to accelerate remote user access to the private networks behind FortiGate units. The FortiClient application requires a simple WAN optimization configuration to automatically detect if WAN optimization is enabled on the FortiGate unit. Once WAN optimization is enabled, the FortiClient application transparently makes use of the WAN optimization and web caching features available.

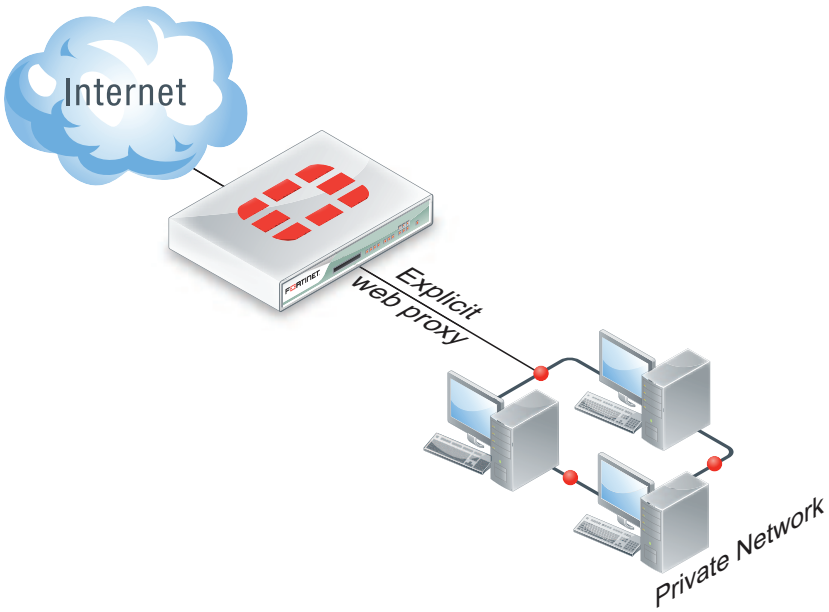
FortiClient WAN optimization topology



Explicit Web proxy topologies

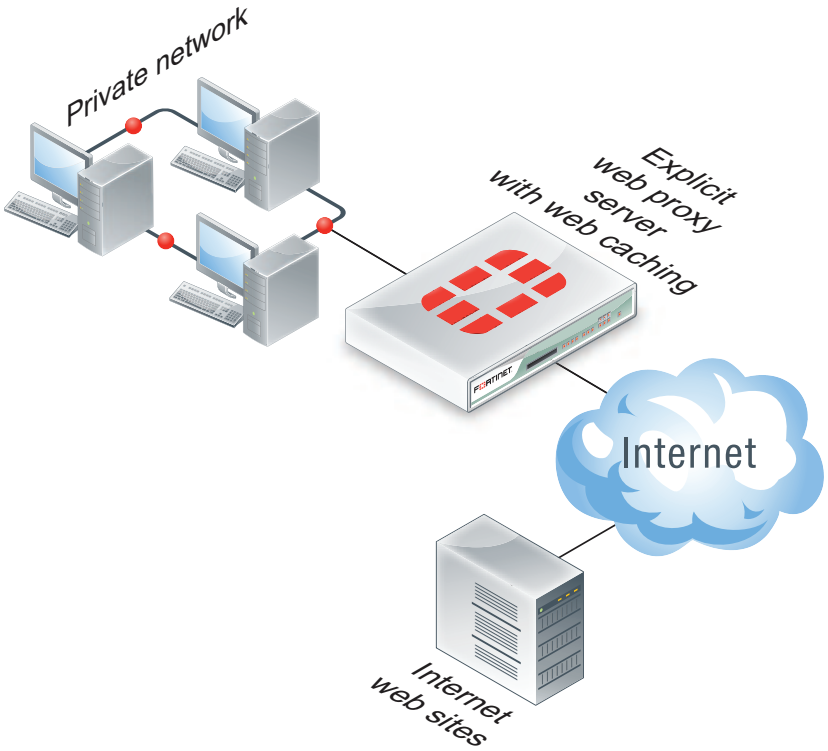
You can configure a FortiGate unit to be an explicit web proxy server for Internet web browsing of IPv4 and IPv6 web traffic. To use the explicit web proxy, users must add the IP address of the FortiGate interface configured for the explicit web proxy to their web browser proxy configuration.

Explicit web proxy topology



If the FortiGate unit supports web caching, you can also add web caching to the security policy that accepts explicit web proxy sessions The FortiGate unit then caches Internet web pages on a hard disk to improve web browsing performance.

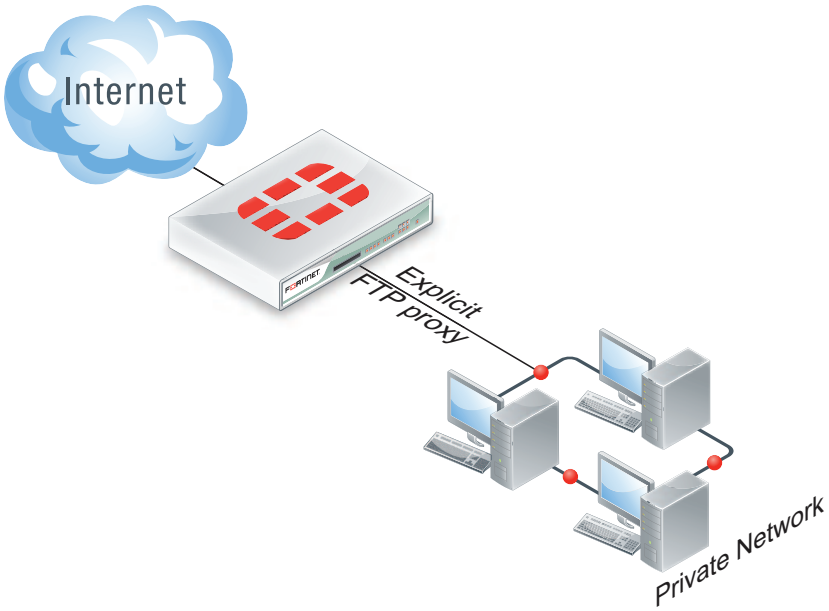
Explicit web proxy with web caching topology



Explicit FTP proxy topologies

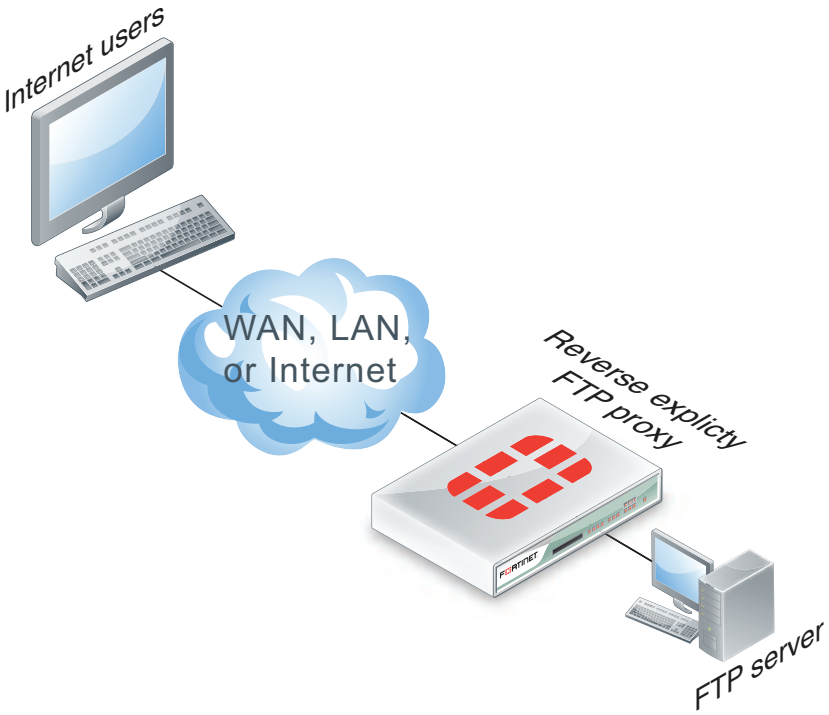
You can configure a FortiGate unit to be an explicit FTP proxy server for FTP users. To use the explicit web proxy, FTP users must connect to and authenticate with the explicit FTP proxy before connecting to an FTP server.

Explicit FTP proxy topology



You can also configure reverse explicit FTP proxy. In this configuration, users on the Internet connect to the explicit web proxy before connecting to an FTP server installed behind a FortiGate unit.

Reverse explicit FTP proxy topology

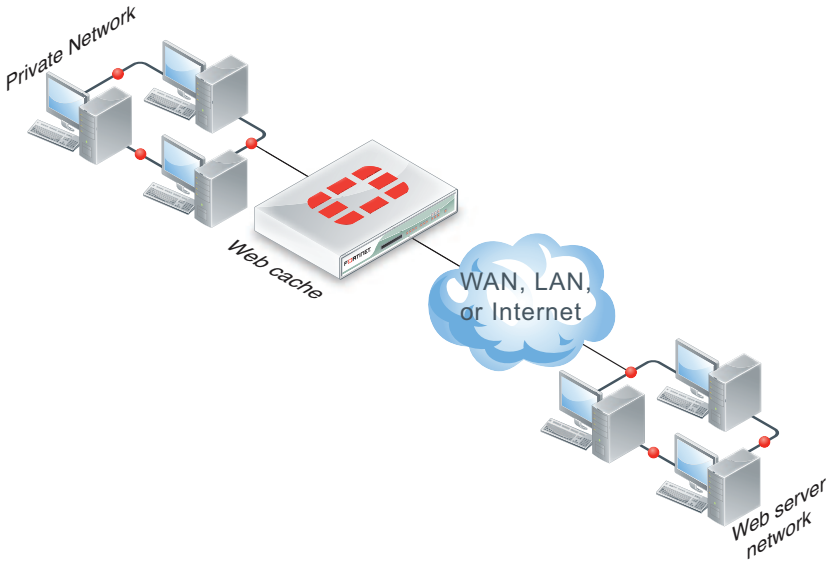


Web caching topologies

FortiGate web caching can be added to any security policy and any HTTP or HTTPS traffic accepted by that security policy can be cached on the FortiGate unit hard disk. This includes WAN optimization and explicit web proxy traffic. The network topologies for these scenarios are very similar. They involved a FortiGate unit installed between users and web servers with web caching enabled.

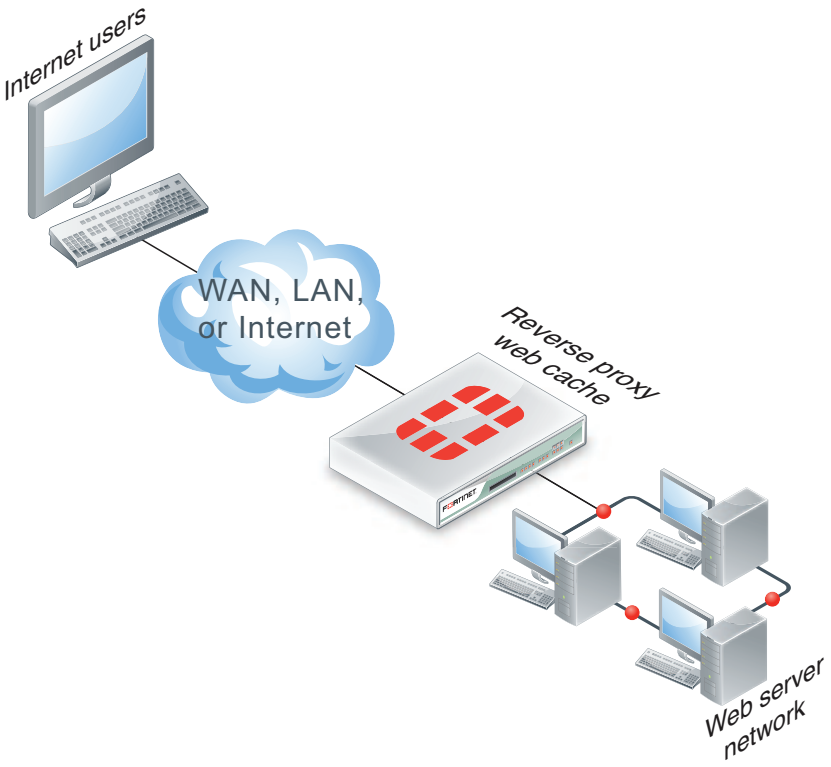
A typical web-caching topology includes one FortiGate unit that acts as a web cache server. Web caching is enabled in a security policy and the FortiGate unit intercepts web page requests accepted by the security policy, requests web pages from the web servers, caches the web page contents, and returns the web page contents to the users. When the FortiGate unit intercepts subsequent requests for cached web pages, the FortiGate unit contacts the destination web server just to check for changes.

Web caching topology



You can also configure reverse proxy web-caching. In this configuration, users on the Internet browse to a web server installed behind a FortiGate unit. The FortiGate unit intercepts the web traffic (HTTP and HTTPS) and caches pages from the web server. Reverse proxy web caching on the FortiGate unit reduces the number of requests that the web server must handle, leaving it free to process new requests that it has not serviced before.

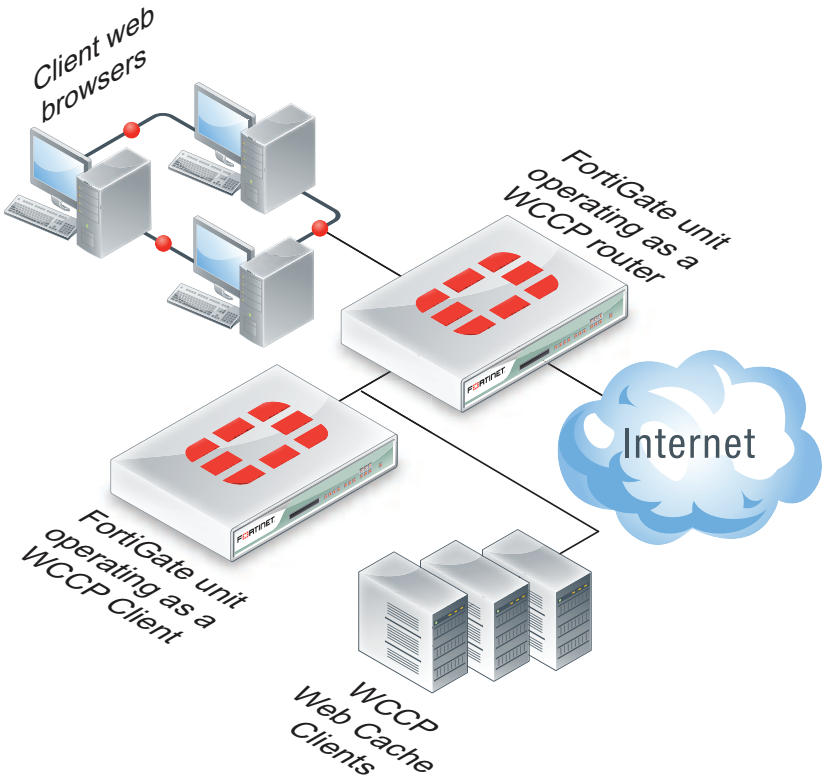
Reverse proxy web caching topology



WCCP topologies

You can operate a FortiGate unit as a Web Cache Communication Protocol (WCCP) router or cache engine. As a router, the FortiGate unit intercepts web browsing requests from client web browsers and forwards them to a WCCP cache engine. The cache engine returns the required cached content to the client web browser. If the cache server does not have the required content it accesses the content, caches it and returns the content to the client web browser.

WCCP topology



FortiGate units can also operate as WCCP cache servers, communicating with WCCP routers, caching web content and providing it to client web browsers as required.

WCCP is transparent to client web browsers. The web browsers do not have to be configured to use a web proxy.

Configuring WAN optimization

This chapter describes FortiGate WAN optimization client server architecture and other concepts you need to understand to be able to configure FortiGate WAN optimization.

Client/server architecture

Traffic across a WAN typically consists of clients on a client network communicating across a WAN with a remote server network. The clients do this by starting communication sessions from the client network to the server network. These communication sessions can be open text over the WAN or they can be encrypted by SSL VPN or IPsec VPN.

To optimize these sessions, you can add **WAN optimization security policies** to the **client-side FortiGate unit** to accept sessions from the client network that are destined for the server network. The client-side FortiGate unit is located between the client network and the WAN. WAN optimization security policies include **WAN optimization profiles** that control how the traffic is optimized.

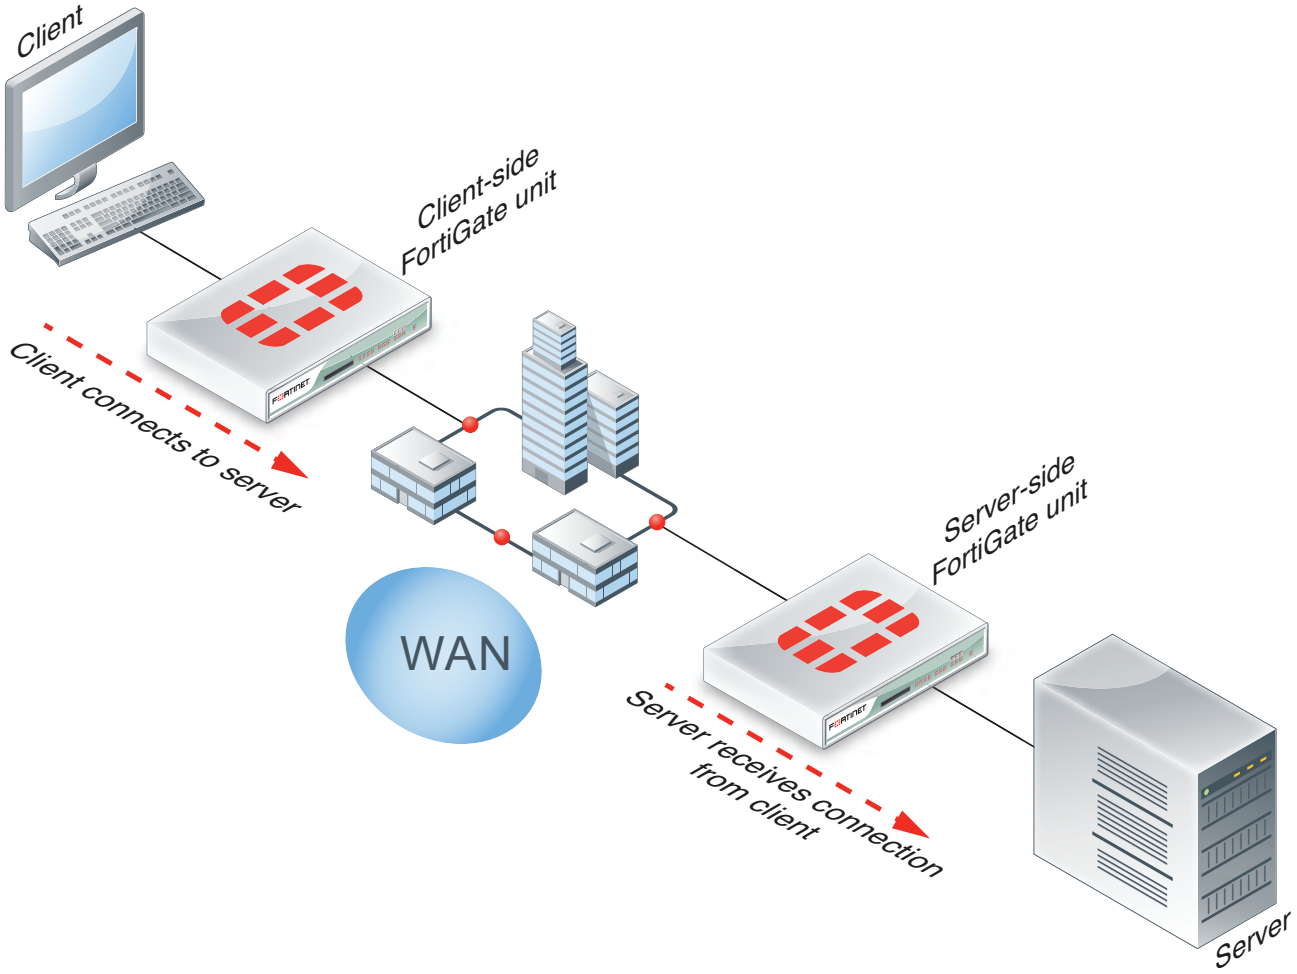
These same security policies can also include security profiles that apply UTM and NGFW features to WAN Optimization traffic.

The client-side FortiGate unit must also include the IP address of the **server-side FortiGate unit** in its WAN optimization **peer** configuration. The server-side FortiGate unit is located between the server network and the WAN, The peer configuration allows the client-side FortiGate unit to find the server-side FortiGate unit and attempt to establish a WAN optimization **tunnel** with it.

For the server-side FortiGate unit you must add a security policy with **wanopt** as the **Incoming Interface**. This security policy allows the FortiGate unit to accept WAN optimization sessions from the client-side FortiGate unit. For the server-side FortiGate unit to accept a WAN optimization connection it must have the client-side FortiGate unit in its WAN optimization peer configuration.

WAN optimization profiles are only added to the client-side WAN optimization security policy. The server-side FortiGate unit employs the WAN optimization settings set in the WAN optimization profile on the client-side FortiGate unit.

Client/server architecture



When both peers are identified the FortiGate units attempt to establish a WAN optimization **tunnel** between them. WAN optimization tunnels use port 7810. All optimized data flowing across the WAN between the client-side and server-side FortiGate units use this tunnel. WAN optimization tunnels can be encrypted use SSL encryption to keep the data in the tunnel secure.

Any traffic can be sent through a WAN optimization tunnel. This includes SSL and IPsec VPN traffic. However, instead of configuring SSL or IPsec VPN for this communication you can add SSL encryption using the WAN optimization tunnel.

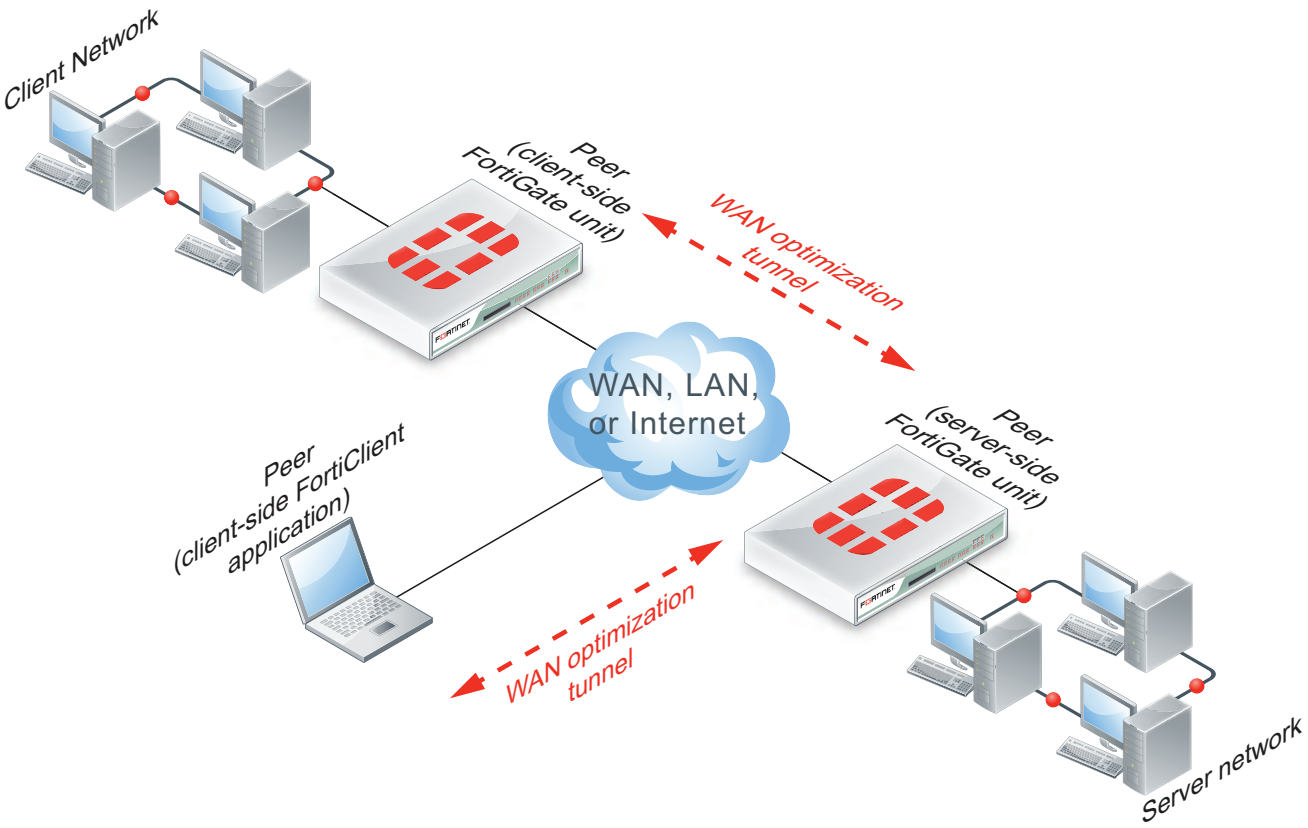
In addition to basic identification by peer host ID and IP address you can configure WAN optimization **authentication** using certificates and pre-shared keys to improve security. You can also configure FortiGate units involved in WAN optimization to accept connections from any identified peer or restrict connections to specific peers.

The FortiClient application can act in the same manner as a client-side FortiGate unit to optimize traffic between a computer running FortiClient and a FortiGate unit.

WAN optimization peers

The client-side and server-side FortiGate units are called WAN optimization peers because all of the FortiGate units in a WAN optimization network have the same peer relationship with each other. The client and server roles just relate to how a session is started. Any FortiGate unit configured for WAN optimization can be a client-side and a server-side FortiGate unit at the same time, depending on the direction of the traffic. Client-side FortiGate units initiate WAN optimization sessions and server-side FortiGate units respond to the session requests. Any FortiGate unit can simultaneously be a client-side FortiGate unit for some sessions and a server-side FortiGate unit for others.

WAN optimization peer and tunnel architecture



To identify all of the WAN optimization peers that a FortiGate unit can perform WAN optimization with, you add host IDs and IP addresses of all of the peers to the FortiGate unit configuration. The peer IP address is actually the IP address of the peer unit interface that communicates with the FortiGate unit.

Manual (peer-to-peer) and active-passive WAN optimization

You can create **manual** (peer-to-peer) and **active-passive** WAN optimization configurations.

Manual (peer to peer) configurations

Manual configurations allow for WAN optimization between one client-side FortiGate unit and one server-side FortiGate unit. To create a manual configuration you add a **manual mode** WAN optimization security policy to

the client-side FortiGate unit. The manual mode policy includes the peer ID of a server-side FortiGate unit.

In a manual mode configuration, the client-side peer can only connect to the named server-side peer. When the client-side peer initiates a tunnel with the server-side peer, the packets that initiate the tunnel include extra information so that the server-side peer can determine that it is a peer-to-peer tunnel request. This extra information is required because the server-side peer does not require a WAN optimization policy; however, you need to add the client peer host ID and IP address to the server-side FortiGate unit peer list.

In addition, from the server-side FortiGate unit CLI you must and an Explicit Proxy security policy with `proxy` set to `wanopt` and the destination interface and network set to the network containing the servers that clients connect to over the WAN optimization tunnel. WAN optimization tunnel requests are accepted by the explicit proxy policy and if the client-side peer is in the server side peer's address list the traffic is forwarded to the servers on the destination network.

Manual mode client-side policy

You must configure manual mode client-side policies from the CLI. From the GUI a manual mode policy has WAN Optimization turned on and includes the following text beside the *WAN optimization* field: *Manual (Profile: <profile-name>. Peer: <peer-name>*.

Add a manual mode policy to the client-side FortiGate unit from the CLI. The policy enables WAN optimization, sets `wanopt-detection` to `off`, and uses the `wanopt-peer` option to specify the server-side peer. The following example uses the default WAN optimization profile.

```
config firewall policy
   edit 2
      set srcintf internal
      set dstintf wan1
      set srcaddr client-subnet
      set dstaddr server-subnet
      set action accept
      set schedule always
      set service ALL
      set wanopt enable
      set wanopt-detection off
      set wanopt-profile default
      set wanopt-peer server
   next
end
```

Manual mode server-side explicit proxy policy

The server-side explicit proxy policy allows connections from the WAN optimization tunnel to the server network by setting the proxy type to `wanopt`. You must add policies that set `proxy` to `wanopt` from the CLI and these policies do not appear on the GUI. The policy should look like the following:

```
configure firewall explicit-proxy-policy
   edit 3
      set proxy wanopt
      set dstintf internal
      set srcaddr all
      set dstaddr server-subnet
      set action accept
      set schedule always
      set service ALL
   next
```

```
end
```

Active-passive configurations

Active-passive WAN optimization requires an **active** WAN optimization policy on the client-side FortiGate unit and a **passive** WAN optimization policy on the server-side FortiGate unit. The server-side FortiGate unit also requires an explicit proxy policy with `proxy` set to `wanopt`.

You can use the passive policy to control WAN optimization address translation by specifying **transparent mode** or non-transparent mode. SeeWAN optimization transparent mode on page 2835. You can also use the passive policy to apply security profiles, web caching, and other FortiGate features at the server-side FortiGate unit. For example, if a server-side FortiGate unit is protecting a web server, the passive policy could enable web caching.

A single passive policy can accept tunnel requests from multiple FortiGate units as long as the server-side FortiGate unit includes their peer IDs and all of the client-side FortiGate units include the server-side peer ID.

Active client-side policy

Add an active policy to the client-side FortiGate unit by turning on **WAN Optimization** and selecting **active**. Then select a WAN optimization **Profile.** From the CLI the policy could look like the following:

```
config firewall policy
   edit 2
      set srcintf internal
      set dstintf wan1
      set srcaddr client-subnet
      set dstaddr server-subnet
      set action accept
      set schedule always
      set service ALL
      set wanopt enable
      set wanopt-detection active
      set wanopt-profile default
   next
end
```

Server-side tunnel policy

The server-side requires an explicit proxy policy that sets the `proxy` to `wanopt`. You must add this policy from the CLI and policies with `proxy` set to `wanopt` do not appear on the GUI. From the CLI the policy could look like the following:

```
configure firewall explicit-proxy-policy
   edit 3
      set proxy wanopt
      set dstintf internal
      set srcaddr all
      set dstaddr server-subnet
      set action accept
      set schedule always
      set service ALL
   next
end
```

Server-side passive policy

Add a passive policy to the server-side FortiGate unit by selecting **Enable WAN Optimization** and selecting **passive**. Then set the **Passive Option** to **transparent**. From the CLI the policy could look like the following:

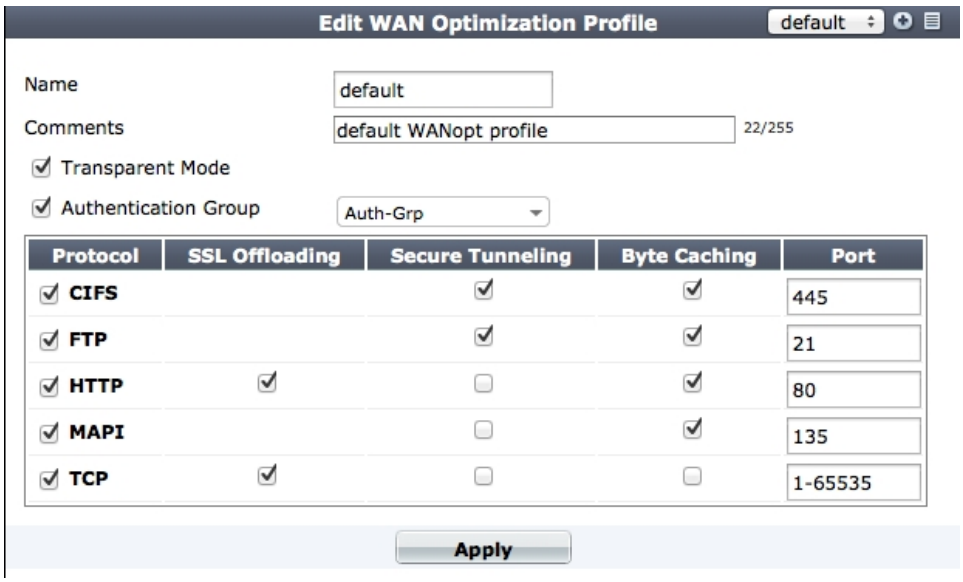
```
config firewall policy
edit 2
      set srcintf "wan1"
      set dstintf "internal"
      set srcaddr "all"
      set dstaddr "all"
      set action accept
      set schedule "always"
      set service "ANY"
      set wanopt enable
      set wanopt-detection passive
      set wanopt-passive-opt transparent
   next
```

WAN optimization profiles

Use WAN optimization profiles to apply WAN optimization techniques to traffic to be optimized. In a WAN optimization profile you can select the protocols to be optimized and for each protocol you can enable SSL offloading (if supported), secure tunneling, byte caching and set the port or port range the protocol uses. You can also enable transparent mode and optionally select an authentication group. You can edit the default WAN optimization profile or create new ones.

To configure a WAN optimization profile go to **WAN Opt & Cache > WAN Opt. Profile > Profiles** and edit a profile or create a new one.

Configuring a WAN optimization profile



From the CLI you can use the following command to configure a WAN optimization profile to optimize HTTP traffic.

```
config wanopt profile
   edit new-profile
      config http
         set status enable
   end
```

Transparent Mode	Servers receiving packets after WAN optimization “see” different source addresses depending on whether or not you select **Transparent Mode**. For more information, see WAN optimization transparent mode on page 2835.
Authentication Group	Select this option and select an authentication group so that the client and server-side FortiGate units must authenticate with each other before starting the WAN optimization tunnel. You must also select an authentication group if you select **Secure Tunneling** for any protocol. You must add identical authentication groups to both of the FortiGate units that will participate in the WAN optimization tunnel. For more information, see Configuring authentication groups on page 2847.
Protocol	Select CIFS, FTP, HTTP or MAPI to apply protocol optimization for the selected protocols. See Protocol optimization on page 2833. Select TCP if the WAN optimization tunnel accepts sessions that use more than one protocol or that do not use the CIFS, FTP, HTTP, or MAPI protocol.
SSL Offloading	Select to apply SSL offloading for HTTPS or other SSL traffic. You can use SSL offloading to offload SSL encryption and decryption from one or more HTTP servers to the FortiGate unit. If you enable this option, you must configure the security policy to accept SSL-encrypted traffic. If you enable SSL offloading, you must also use the CLI command `config firewall ssl-server` to add an SSL server for each HTTP server that you want to offload SSL encryption/decryption for. For more information, see Turning on web caching for HTTPS traffic on page 2876.
Secure Tunnelling	The WAN optimization tunnel is encrypted using SSL encryption. You must also add an authentication group to the profile. For more information, see Secure tunneling on page 2849.
Byte Caching	Select to apply WAN optimization byte caching to the sessions accepted by this rule. For more information, see “Byte caching”.
Port	Enter a single port number or port number range. Only packets whose destination port number matches this port number or port number range will be optimized.

Processing non-HTTP sessions accepted by a WAN optimization profile with HTTP optimization

From the CLI, you can use the following command to configure how to process non-HTTP sessions when a rule configured to accept and optimize HTTP traffic accepts a non-HTTP session. This can occur if an application sends non-HTTP sessions using an HTTP destination port.

```
config wanopt profile
   edit default
      config http
         set status enable
         set tunnel-non-http {disable | enable}
      end
```

To drop non-HTTP sessions accepted by the rule set `tunnel-non-http` to `disable`, or set it to `enable` to pass non-HTTP sessions through the tunnel without applying protocol optimization, byte-caching, or web caching. In this case, the FortiGate unit applies TCP protocol optimization to non-HTTP sessions.

Processing unknown HTTP sessions

Unknown HTTP sessions are HTTP sessions that do not comply with HTTP 0.9, 1.0, or 1.1. From the CLI, use the following command to specify how a rule handles such HTTP sessions.

```
config wanopt profile
   edit default
      config http
         set status enable
         set unknown-http-version {best-effort | reject | tunnel}
      end
```

To assume that all HTTP sessions accepted by the rule comply with HTTP 0.9, 1.0, or 1.1, select `best-effort`. If a session uses a different HTTP version, WAN optimization may not parse it correctly. As a result, the FortiGate unit may stop forwarding the session and the connection may be lost. To reject HTTP sessions that do not use HTTP 0.9, 1.0, or 1.1, select `reject`.

To pass HTTP sessions that do not use HTTP 0.9, 1.0, or 1.1, but without applying HTTP protocol optimization, byte-caching, or web caching, you can also select `tunnel`. TCP protocol optimization is applied to these HTTP sessions.

Protocol optimization

Protocol optimization techniques optimize bandwidth use across the WAN. These techniques can improve the efficiency of communication across the WAN optimization tunnel by reducing the amount of traffic required by communication protocols. You can apply protocol optimization to Common Internet File System (CIFS), FTP, HTTP, MAPI, and general TCP sessions. You can apply general TCP optimization to MAPI sessions.

For example, CIFS provides file access, record locking, read/write privileges, change notification, server name resolution, request batching, and server authentication. CIFS is a fairly “chatty” protocol, requiring many background transactions to successfully transfer a single file. This is usually not a problem across a LAN. However, across a WAN, latency and bandwidth reduction can slow down CIFS performance.

When you select the CIFS protocol in a WAN optimization profile, the FortiGate units at both ends of the WAN optimization tunnel use a number of techniques to reduce the number of background transactions that occur over the WAN for CIFS traffic.

If a policy accepts a range of different types of traffic, you can set **Protocol** to **TCP** to apply general optimization techniques to TCP traffic. However, applying this TCP optimization is not as effective as applying more protocol-specific optimization to specific types of traffic. TCP protocol optimization uses techniques such as TCP SACK support, TCP window scaling and window size adjustment, and TCP connection pooling to remove TCP bottlenecks.

Protocol optimization and MAPI

By default the MAPI service uses port number 135 for RPC port mapping and may use random ports for MAPI messages. The random ports are negotiated through sessions using port 135. The FortiOS DCE-RPC session helper learns these ports and opens pinholes for the messages. WAN optimization is also aware of these ports and attempts to apply protocol optimization to MAPI messages that use them. However, to configure protocol optimization for MAPI you should set the WAN optimization profile to a single port number (usually port 135). Specifying a range of ports may reduce performance.

Byte caching

Byte caching breaks large units of application data (for example, a file being downloaded from a web page) into small chunks of data, labelling each chunk of data with a hash of the chunk and storing those chunks and their hashes in a database. The database is stored on a WAN optimization storage device. Then, instead of sending the actual data over the WAN tunnel, the FortiGate unit sends the hashes. The FortiGate unit at the other end of the tunnel receives the hashes and compares them with the hashes in its local byte caching database. If any hashes match, that data does not have to be transmitted over the WAN optimization tunnel. The data for any hashes that does not match is transferred over the tunnel and added to that byte caching database. Then the unit of application data (the file being downloaded) is reassembled and sent to its destination.

The stored byte caches are not application specific. Byte caches from a file in an email can be used to optimize downloading that same file or a similar file from a web page.

The result is less data transmitted over the WAN. Initially, byte caching may reduce performance until a large enough byte caching database is built up.

To enable byte caching, you select **Byte Caching** in a WAN optimization profile.

Byte caching cannot determine whether or not a file is compressed (for example a zip file), and caches compressed and non-compressed versions of the same file separately.

Dynamic data chunking for byte caching

Dynamic data chunking can improve byte caching by improving detection of data chunks that are already cached in changed files or in data embedded in traffic using an unknown protocol. Dynamic data chunking is available for HTTP, CIFS and FTP.

Use the following command to enable dynamic data chunking for HTTP in the default WAN optimization profile.

```
config wanopt profile
   edit default
        config http
           set prefer-chunking dynamic
      end
```

By default dynamic data chunking is disabled and `prefer-chunking` is set to `fix`.

WAN optimization transparent mode

WAN optimization is transparent to users. This means that with WAN optimization in place, clients connect to servers in the same way as they would without WAN optimization. However, servers receiving packets after WAN optimization "see" different source addresses depending on whether or not transparent mode is selected for WAN optimization. If transparent mode is selected, WAN optimization keeps the original source address of the packets, so servers appear to receive traffic directly from clients. Routing on the server network should be configured to route traffic with client source IP addresses from the server-side FortiGate unit to the server and back to the server-side FortiGate unit.

Some protocols, for example CIFS, may not function as expected if transparent mode is **not** selected. In most cases, for CIFS WAN optimization you should select transparent mode and make sure the server network can route traffic as described to support transparent mode.

If transparent mode is not selected, the source address of the packets received by servers is changed to the address of the server-side FortiGate unit interface that sends the packets to the servers. So servers appear to receive packets from the server-side FortiGate unit. Routing on the server network is simpler in this case because client addresses are not involved. All traffic appears to come from the server-side FortiGate unit and not from individual clients.

Do not confuse WAN optimization transparent mode with FortiGate transparent mode. WAN optimization transparent mode is similar to source NAT. FortiGate Transparent mode is a system setting that controls how the FortiGate unit (or a VDOM) processes traffic.

Configuring Transparent mode

You can configure transparent mode by selecting **Transparent** in a WAN Optimization profile. The profile is added to an active WAN Optimization policy.

When you configure a passive WAN Optmization policy you can accept the active policy transparent setting or you can override the active policy transparent setting. From the GUI you can do this by setting the **Passive Option** as follows:

- **default** use the transparent setting in the WAN Optimization profile added to the active policy (client-side configuration).
- **transparent** impose transparent mode (override the active policy transparent mode setting). Packets exiting the FortiGate keep their original source addresses.
- **non-transparent** impose non-transparent mode (override the active policy transparent mode setting). Packets exiting the FortiGate have their source address changed to the address of the server-side FortiGate unit interface that sends the packets to the servers.

From the CLI you can use the following command:

```
config firewall policy
   set wanopt-passive-opt {default | transparent | non-transparent}
end
```

FortiClient WAN optimization

PCs running the FortiClient application are client-side peers that initiate WAN optimization tunnels with server-side peer FortiGate units. However, you can have an ever-changing number of FortiClient peers with IP addresses that also change regularly. To avoid maintaining a list of such peers, you can instead configure WAN optimization to accept any peer and use authentication to identify FortiClient peers.

Together, the WAN optimization peers apply the WAN optimization features to optimize the traffic flow over the WAN between the clients and servers. WAN optimization reduces bandwidth requirements, increases throughput, reduces latency, offloads SSL encryption/decryption and improves privacy for traffic on the WAN.

For more details, see FortiClient WAN optimization on page 2893.

Operating modes and VDOMs

To use WAN optimization, the FortiGate units can operate in either NAT/Route or Transparent mode. The client-side and server-side FortiGate units do not have to be operating in the same mode.

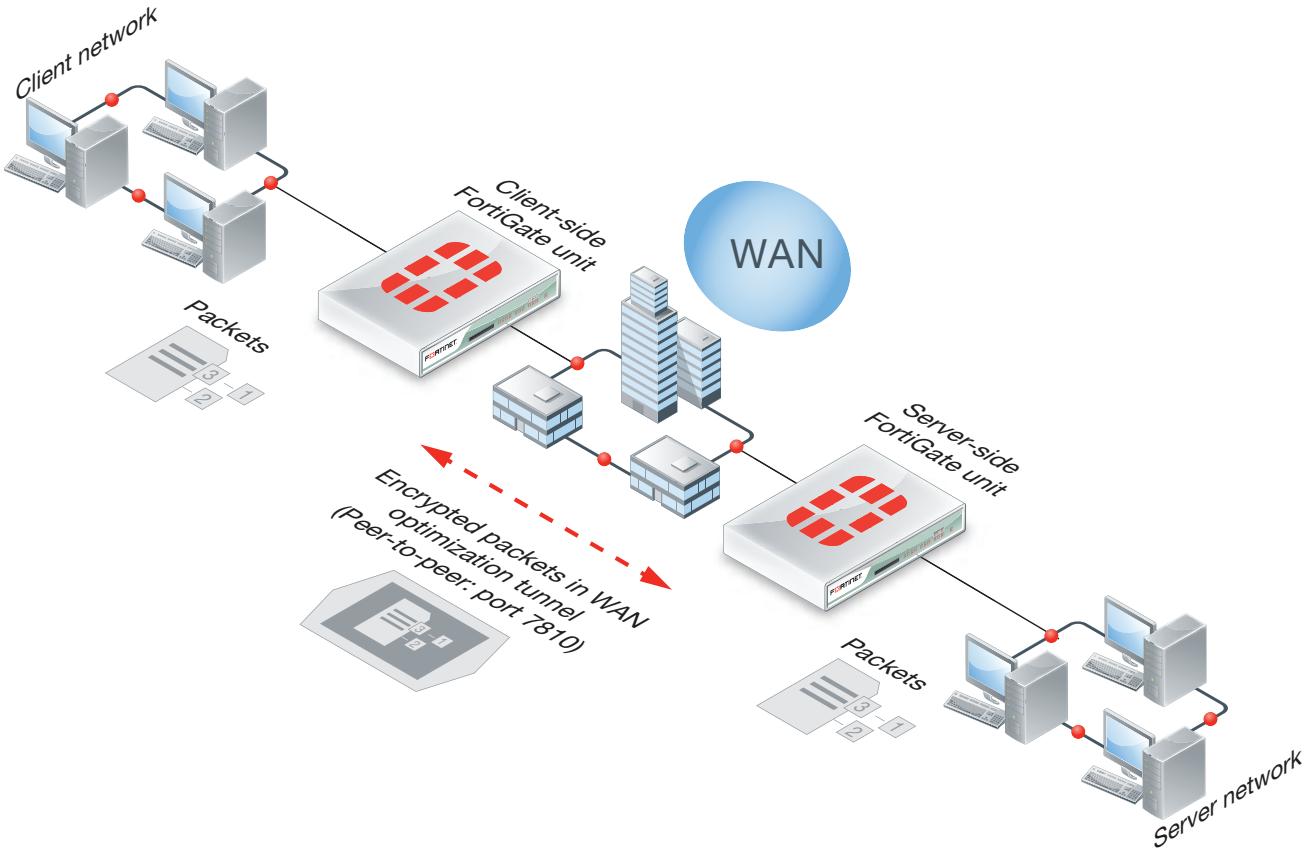
As well, the FortiGate units can be configured for multiple virtual domain (VDOM) operation. You configure WAN optimization for each VDOM and configure one or both of the units to operate with multiple VDOMs enabled.

If a FortiGate unit or VDOM is operating in Transparent mode with WAN optimization enabled, WAN optimization uses the management IP address as the peer IP address of the FortiGate unit instead of the address of an interface.

WAN optimization tunnels

All optimized traffic passes between the FortiGate units or between a FortiClient peer and a FortiGate unit over a WAN optimization tunnel. Traffic in the tunnel can be sent in plain text or encrypted using AES-128bit-CBC SSL.

WAN optimization tunnels



Both plain text and the encrypted tunnels use TCP destination port 7810.

Before a tunnel can be started, the peers must be configured to authenticate with each other. Then, the client-side peer attempts to start a WAN optimization tunnel with the server-side peer. Once the peers authenticate with each other, they bring up the tunnel and WAN optimization communication over the tunnel starts. After a tunnel has been established, multiple WAN optimization sessions can start and stop between peers without restarting the tunnel.

Tunnel sharing

You can use the `tunnel-sharing` WAN optimization profile CLI keyword to configure tunnel sharing for WAN optimization rules. Tunnel sharing means multiple WAN optimization sessions share the same tunnel. Tunnel sharing can improve performance by reducing the number of WAN optimization tunnels between FortiGate units. Having fewer tunnels means less data to manage. Also, tunnel setup requires more than one exchange of information between the ends of the tunnel. Once the tunnel is set up, each new session that shares the tunnel avoids tunnel setup delays.

Tunnel sharing also uses bandwidth more efficiently by reducing the chances that small packets will be sent down the tunnel. Processing small packets reduces network throughput, so reducing the number of small packets improves performance. A shared tunnel can combine all the data from the sessions being processed by the tunnel and send the data together. For example, suppose a FortiGate unit is processing five WAN optimization sessions and each session has 100 bytes to send. If these sessions use a shared tunnel, WAN optimization combines the

packets from all five sessions into one 500-byte packet. If each session uses its own private tunnel, five 100-byte packets will be sent instead. Each packet also requires a TCP ACK reply. The combined packet in the shared tunnel requires one TCP ACK packet. The separate packets in the private tunnels require five.

Use the following command to configure tunnel sharing for HTTP traffic in a WAN optimization profile.

```
config wanopt profile
   edit default
      config http
         set tunnel-sharing {express-shared | private | shared}
      end
```

Tunnel sharing is not always recommended and may not always be the best practice. Aggressive and non-aggressive protocols should not share the same tunnel. An aggressive protocol can be defined as a protocol that is able to get more bandwidth than a non-aggressive protocol. (The aggressive protocols can “starve” the non-aggressive protocols.) HTTP and FTP are considered aggressive protocols. If aggressive and non-aggressive protocols share the same tunnel, the aggressive protocols may take all of the available bandwidth. As a result, the performance of less aggressive protocols could be reduced. To avoid this problem, rules for HTTP and FTP traffic should have their own tunnel. To do this, set `tunnel-sharing` to `private` for WAN optimization rules that accept HTTP or FTP traffic.

It is also useful to set `tunnel-sharing` to `express-shared` for applications, such as Telnet, that are very interactive but not aggressive. Express sharing optimizes tunnel sharing for Telnet and other interactive applications where latency or delays would seriously affect the user’s experience with the protocol.

Set `tunnel-sharing` to `shared` for applications that are not aggressive and are not sensitive to latency or delays. WAN optimization rules set to `sharing` and `express-shared` can share the same tunnel.

WAN optimization and user and device identity policies, load balancing and traffic shaping

Please note the following about WAN optimization and firewall policies:

- WAN optimization is not compatible with firewall load balancing.
- WAN optimization is compatible with source and destination NAT options in firewall policies (including firewall virtual IPs). If a virtual IP is added to a policy the traffic that exits the WAN optimization tunnel has its destination address changed to the virtual IPs mapped to IP address and port.
- WAN optimization is compatible with user identity-based and device identity security policies. If a session is allowed after authentication or device identification the session can be optimized.

Traffic shaping

Traffic shaping works for WAN optimization traffic that is not in a WAN optimization tunnel. So traffic accepted by a WAN optimization security policy on a client-side FortiGate unit can be shaped on ingress. However, when the traffic enters the WAN optimization tunnel, traffic shaping is not applied.

In manual mode:

- Traffic shaping works as expected on the client-side FortiGate unit.
- Traffic shaping cannot be applied to traffic on the server-side FortiGate unit.

In active-passive mode:

- Traffic shaping works as expected on the client-side FortiGate unit.
- If transparent mode is enabled in the WAN optimization profile, traffic shaping also works as expected on the

server-side FortiGate unit.

- If transparent mode is not enabled, traffic shaping works partially on the server-side FortiGate unit.

WAN optimization and HA

You can configure WAN optimization on a FortiGate HA cluster. The recommended best practice HA configuration for WAN optimization is active-passive mode. When the cluster is operating, all WAN optimization sessions are processed by the primary unit only. Even if the cluster is operating in active-active mode, HA does not load-balance WAN optimization sessions.

You can also form a WAN optimization tunnel between a cluster and a standalone FortiGate unit or between two clusters.

In a cluster, only the primary unit stores the byte cache database. This database is not synchronized to the subordinate units. So, after a failover, the new primary unit must rebuild its byte cache. Rebuilding the byte cache can happen relatively quickly because the new primary unit gets byte cache data from the other FortiGate unit that it is participating with in WAN optimization tunnels.

WAN optimization, web caching and memory usage

To accelerate and optimize disk access and to provide better throughput and less latency FortiOS WAN optimization uses provisioned memory to reduce disk I/O and increase disk I/O efficiency. In addition, WAN optimization requires a small amount of additional memory per session for comprehensive flow control logic and efficient traffic forwarding.

When WAN optimization is enabled you will see a reduction in available memory. The reduction increases when more WAN optimization sessions are being processed. If you are thinking of enabling WAN optimization on an operating FortiGate unit, make sure its memory usage is not maxed out during high traffic periods.

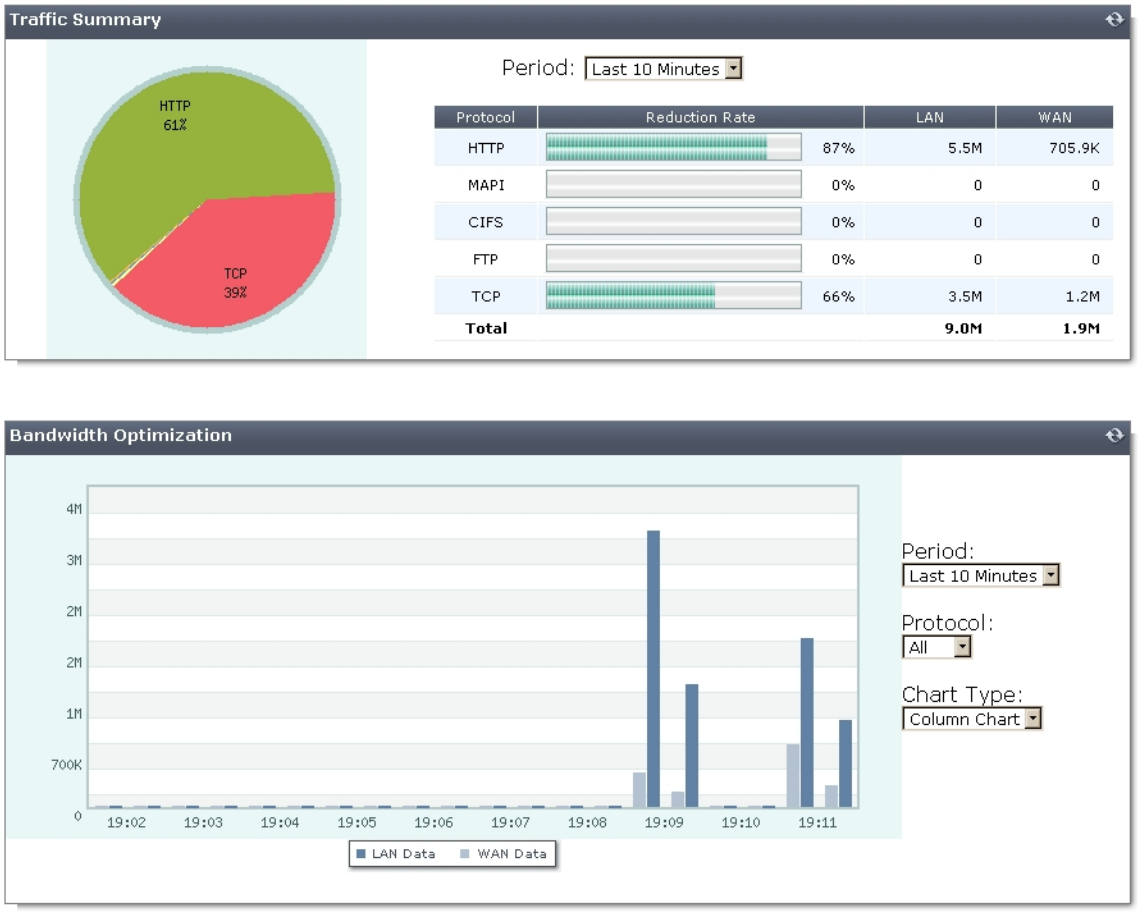
In addition to using the system dashboard to see the current memory usage you can use the `get test wad 2` command to see how much memory is currently being used by WAN optimization. See "get test {wad | wccpd} <test_level>" for more information.

Monitoring WAN optimization performance

Using WAN optimization monitoring, you can confirm that a FortiGate unit is optimizing traffic and view estimates of the amount of bandwidth saved. The WAN optimization monitor presents collected log information in a graphical format to show network traffic summary and bandwidth optimization information.

To view the WAN optimization monitor, go to **WAN Opt. & Cache > Monitor > WAN Opt Monitor**.

WAN optimization monitor



Traffic Summary

The traffic summary shows how WAN optimization is reducing the amount of traffic on the WAN for each WAN optimization protocol by showing the traffic reduction rate as a percentage of the total traffic. The traffic summary also shows the amount of WAN and LAN traffic. If WAN optimization is being effective the amount of WAN traffic should be lower than the amount of LAN traffic.

You can use the refresh icon to update the traffic summary display at any time. You can also set the amount of time for which the traffic summary shows data. The time period can vary from the last 10 minutes to the last month.

Bandwidth Optimization

This section shows network bandwidth optimization per time period. A line or column chart compares an application's pre-optimized size (LAN data) with its optimized size (WAN data). You can select the chart type, the monitoring time period, and the protocol for which to display data. If WAN optimization is being effective the WAN bandwidth should be lower than the LAN bandwidth.

WAN optimization configuration summary

This section includes a client-side and a server-side WAN Optimization configuration summary.:

Client-side configuration summary

WAN optimization profile

Enter the following command to view WAN optimization profile CLI options:

```
tree wanopt profile
-- [profile] --*name (36)
      |- transparent

```

Local host ID and peer settings

```
config wanopt settings
   set host-id client
end
config wanopt peer
   edit server
   set ip 10.10.2.82
end
```

Security policies

Two client-side WAN optimization security policy configurations are possible. One for active-passive WAN optimization and one for manual WAN optimization.

Active/passive mode on the client-side

```
config firewall policy
   edit 2
      set srcintf internal
      set dstintf wan1
      set srcaddr all
      set dstaddr all
      set action accept
      set schedule always
      set service ALL
      set wanopt enable <<< enable WAN optimization
      set wanopt-detection active <<< set the mode to active/passive
      set wanopt-profile "default" <<< select the wanopt profile
   next
end
```

Manual mode on the client-side

```
config firewall policy
   edit 2
      set srcintf internal
      set dstintf wan1
      set srcaddr all
      set dstaddr all
      set action accept
      set schedule always
      set service ALL
      set wanopt enable <<< enable WAN optimization
      set wanopt-detection off <<< sets the mode to manual
      set wanopt-profile "default" <<< select the wanopt profile
      set wanopt-peer "server" <<< set the only peer to do wanopt
                                                    with (required for manual mode)
   next
end
```

server-side configuration summary

Local host ID and peer settings

```
config wanopt settings
   set host-id server
end
config wanopt peer
   edit client
      set ip 10.10.2.81
end
```

Security policies

Two server-side WAN optimization security policy configurations are possible. One for active-passive WAN optimization and one for manual WAN optimization.

Active/passive mode on server-side

```
config firewall policy
edit 2 <<< the passive mode policy
      set srcintf wan1
      set dstintf internal
      set srcaddr all
      set dstaddr all
      set action accept
      set schedule always
      set service ALL
      set wanopt enable
      set wanopt-detection passive
      set wanopt-passive-opt transparent
   end
config firewall explicit-proxy-policy
   edit 3 <<< policy that accepts wanopt tunnel connections from the server
      set proxy wanopt <<< wanopt proxy type
      set dstintf internal
      set srcaddr all
      set dstaddr server-subnet
      set action accept
      set schedule always
      set service ALL
   next
end
```

Manual mode on server-side

```
config firewall explicit-proxy-policy
   edit 3 <<< policy that accepts wanopt tunnel connections from the client
      set proxy wanopt <<< wanopt proxy type
      set dstintf internal
      set srcaddr all
      set dstaddr server-subnet
      set action accept
      set schedule always
      set service ALL
```

```
    next
end
```

Best practices

This is a short list of WAN optimization and explicit proxy best practices.

- WAN optimization tunnel sharing is recommended for similar types of WAN optimization traffic. However, tunnel sharing for different types of traffic is not recommended. For example, aggressive and non-aggressive protocols should not share the same tunnel. See Tunnel sharing on page 2837.
- Active-passive HA is the recommended HA configuration for WAN optimization. See WAN optimization and HA on page 2839.
- Configure WAN optimization authentication with specific peers. Accepting any peer is not recommended as this can be less secure. SeeAccepting any peers on page 2845.
- Set the explicit proxy **Default Firewall Policy Action** to **Deny**. This means that a security policy is required to use the explicit web proxy. See The FortiGate explicit web proxy on page 2897.
- Set the explicit FTP proxy **Default Firewall Policy Action** to **Deny**. This means that a security policy is required to use the explicit FTP proxy. See General explicit FTP proxy configuration steps on page 2926.
- Do not enable the explicit web or FTP proxy on an interface connected to the Internet. This is a security risk because anyone on the Internet who finds the proxy could use it to hide their source address. If you must enable the proxy on such an interface make sure authentication is required to use the proxy. See General explicit web proxy configuration steps on page 2899.

Peers and authentication groups

All communication between WAN optimization peers begins with one WAN optimization peer (or client-side FortiGate unit) sending a WAN optimization tunnel request to another peer (or server-side FortiGate unit). During this process, the WAN optimization peers identify and optionally authenticate each other.

Basic WAN optimization peer requirements

WAN optimization requires the following configuration on each peer. For information about configuring local and peer host IDs, see Configuring peers on page 2846.

- The peer must have a unique host ID.
- Unless authentication groups are used, peers authenticate each other using host ID values. Do not leave the local host ID at its default value.
- The peer must know the host IDs and IP addresses of all of the other peers that it can start WAN optimization tunnels with. This does not apply if you use authentication groups that accept all peers.
- All peers must have the same local certificate installed on their FortiGate units if the units authenticate by local certificate. Similarly, if the units authenticate by pre-shared key (password), administrators must know the password. The type of authentication is selected in the authentication group. This applies only if you use authentication groups.

Accepting any peers

Strictly speaking, you do not need to add peers. Instead you can configure authentication groups that accept any peer. However, for this to work, both peers must have the same authentication group (with the same name) and both peers must have the same certificate or pre-shared key.

Accepting any peer is useful if you have many peers or if peer IP addresses change. For example, you could have many travelling FortiClient peers with IP addresses that are always changing as the users travel to different customer sites. This configuration is also useful if you have FortiGate units with dynamic external IP addresses (using DHCP or PPPoE). For most other situations, this method is not recommended and is not a best practice as it is less secure than accepting defined peers or a single peer. For more information, see Configuring authentication groups on page 2847.

How FortiGate units process tunnel requests for peer authentication

When a client-side FortiGate unit attempts to start a WAN optimization tunnel with a peer server-side FortiGate unit, the tunnel request includes the following information:

- the client-side local host ID
- the name of an authentication group, if included in the rule that initiates the tunnel
- if an authentication group is used, the authentication method it specifies: pre-shared key or certificate
- the type of tunnel (secure or not).

For information about configuring the local host ID, peers and authentication groups, see Configuring peers on page 2846 and Configuring authentication groups on page 2847.

The authentication group is optional unless the tunnel is a secure tunnel. For more information, see Secure tunneling on page 2849.

If the tunnel request includes an authentication group, the authentication will be based on the settings of this group as follows:

- The server-side FortiGate unit searches its own configuration for the name of the authentication group in the tunnel request. If no match is found, the authentication fails.
- If a match is found, the server-side FortiGate unit compares the authentication method in the client and server authentication groups. If the methods do not match, the authentication fails.
- If the authentication methods match, the server-side FortiGate unit tests the peer acceptance settings in its copy of the authentication group.
- If the setting is **Accept Any Peer**, the authentication is successful.
- If the setting is **Specify Peer**, the server-side FortiGate unit compares the client-side local host ID in the tunnel request with the peer name in the server-side authentication group. If the names match, authentication is successful. If a match is not found, authentication fails.
- If the setting is **Accept Defined Peers**, the server-side FortiGate unit compares the client-side local host ID in the tunnel request with the server-side peer list. If a match is found, authentication is successful. If a match is not found, authentication fails.

If the tunnel request does not include an authentication group, authentication will be based on the client-side local host ID in the tunnel request. The server-side FortiGate unit searches its peer list to match the client-side local host ID in the tunnel request. If a match is found, authentication is successful. If a match is not found, authentication fails.

If the server-side FortiGate unit successfully authenticates the tunnel request, the server-side FortiGate unit sends back a tunnel setup response message. This message includes the server-side local host ID and the authentication group that matches the one in the tunnel request.

The client-side FortiGate unit then performs the same authentication procedure as the server-side FortiGate unit did. If both sides succeed, tunnel setup continues.

Configuring peers

When you configure peers, you first need to add the local host ID that identifies the FortiGate unit for WAN optimization and then add the peer host ID and IP address of each FortiGate unit with which a FortiGate unit can create WAN optimization tunnels.

To configure WAN optimization peers - web-based manager:

1. Go to **Wan Opt. & Cache > WAN Opt. Peers > Peers**.
2. For **Local Host ID**, enter the local host ID of **this** FortiGate unit and select **Apply**. If you add this FortiGate unit as a peer to another FortiGate unit, use this ID as its **peer** host ID.

   The local or host ID can contain up to 25 characters and can include spaces.
3. Select **Create New** to add a new peer.
4. For **Peer Host ID**, enter the peer host ID of the peer FortiGate unit. This is the local host ID added to the peer FortiGate unit.
5. For **IP Address**, add the IP address of the peer FortiGate unit. This is the source IP address of tunnel requests sent by the peer, usually the IP address of the FortiGate interface connected to the WAN.
6. Select **OK**.

To configure WAN optimization peers - CLI:

In this example, the local host ID is named `HQ_Peer` and has an IP address of `172.20.120.100`. Three peers are added, but you can add any number of peers that are on the WAN.

1. Enter the following command to set the local host ID to `HQ_Peer`.

```
config wanopt settings
   set host-id HQ_peer
end
```

2. Enter the following commands to add three peers.

```
config wanopt peer
   edit Wan_opt_peer_1
      set ip 172.20.120.100
   next
   edit Wan_opt_peer_2
      set ip 172.30.120.100
   next
   edit Wan_opt_peer_3
      set ip 172.40.120.100
   end
```

Configuring authentication groups

You need to add authentication groups to support authentication and secure tunneling between WAN optimization peers.

To perform authentication, WAN optimization peers use a certificate or a pre-shared key added to an authentication group so they can identify each other before forming a WAN optimization tunnel. Both peers must have an authentication group with the same name and settings. You add the authentication group to a peer-to-peer or active rule on the client-side FortiGate unit. When the server-side FortiGate unit receives a tunnel start request from the client-side FortiGate unit that includes an authentication group, the server-side FortiGate unit finds an authentication group in its configuration with the same name. If both authentication groups have the same certificate or pre-shared key, the peers can authenticate and set up the tunnel.

Authentication groups are also required for secure tunneling.

To add authentication groups, go to **WAN Opt. & Cache > WAN Opt. Peers > Authentication Groups**.

To add an authentication group - web-based manager:

Use the following steps to add any kind of authentication group. It is assumed that if you are using a local certificate to authenticate, it is already added to the FortiGate unit

1. Go to **Wan Opt. & Cache > WAN Opt. Peers > Authentication Groups**.
2. Select **Create New**.
3. Add a **Name** for the authentication group.

   You will select this name when you add the authentication group to a WAN optimization rule.
4. Select the **Authentication Method**.

   Select **Certificate** if you want to use a certificate to authenticate and encrypt WAN optimization tunnels. You must select a local certificate that has been added to this FortiGate unit. (To add a local certificate, go to **System > Certificates > Local Certificates**.) Other FortiGate units that participate in WAN optimization tunnels with this

FortiGate unit must have an authentication group with the same name and certificate.

Select **Pre-shared key** if you want to use a pre-shared key or password to authenticate and encrypt WAN optimization tunnels. You must add the **Password** (or pre-shared key) used by the authentication group. Other FortiGate units that participate in WAN optimization tunnels with this FortiGate unit must have an authentication group with the same name and password. The password must contain at least 6 printable characters and should be known only by network administrators. For optimum protection against currently known attacks, the key should consist of a minimum of 16 randomly chosen alphanumeric characters.

5. Configure **Peer Acceptance** for the authentication group.

   Select **Accept Any Peer** if you do not know the peer host IDs or IP addresses of the peers that will use this authentication group. This setting is most often used for WAN optimization with the FortiClient application or with FortiGate units that do not have static IP addresses, for example units that use DHCP.

   Select **Accept Defined Peers** if you want to authenticate with peers added to the peer list only.

   Select **Specify Peer** and select one of the peers added to the peer list to authenticate with the selected peer only.

6. Select **OK**.
7. Add the authentication group to a WAN optimization rule to apply the authentication settings in the authentication group to the rule.

To add an authentication group that uses a certificate- CLI:

Enter the following command to add an authentication group that uses a certificate and can authenticate all peers added to the FortiGate unit configuration.

In this example, the authentication group is named `auth_grp_1` and uses a certificate named `Example_Cert`.

```
config wanopt auth-group
   edit auth_grp_1
      set auth-method cert
      set cert Example_Cert
      set peer-accept defined
   end
```

To add an authentication group that uses a pre-shared key - CLI:

Enter the following command to add an authentication group that uses a pre-shared key and can authenticate only the peer added to the authentication group.

In this example, the authentication group is named `auth_peer`, the peer that the group can authenticate is named `Server_net`, and the authentication group uses `123456` as the pre-shared key. In practice you should use a more secure pre-shared key.

```
config wanopt auth-group
   edit auth_peer
      set auth-method psk
      set psk 123456
      set peer-accept one
      set peer Server_net
   end
```

To add an authentication group that accepts WAN optimization connections from any peer - web-based manager

Add an authentication group that accepts any peer for situations where you do not have the **Peer Host IDs** or **IP Addresses** of the peers that you want to perform WAN optimization with. This setting is most often used for WAN optimization with the FortiClient application or with FortiGate units that do not have static IP addresses, for example units that use DHCP. An authentication group that accepts any peer is less secure than an authentication group that accepts defined peers or a single peer.

The example below sets the authentication method to **Pre-shared key**. You must add the same password to all FortiGate units using this authentication group.

1. Go to Wan Opt. & Cache > WAN Opt. Peer > Authentication Group.
2. Select **Create New** to add a new authentication group.
3. Configure the authentication group:

Name	Specify any name.
Authentication Method	Pre-shared key
Password	Enter a pre-shared key.
Peer Acceptance	Accept Any Peer

To add an authentication group that accepts WAN optimization connections from any peer - CLI:

In this example, the authentication group is named `auth_grp_1`. It uses a certificate named `WAN_Cert` and accepts any peer.

```
config wanopt auth-group
   edit auth_grp_1
      set auth-method cert
      set cert WAN_Cert
      set peer-accept any
   end
```

Secure tunneling

You can configure WAN optimization rules to use AES-128bit-CBC SSL to encrypt the traffic in the WAN optimization tunnel. WAN optimization uses FortiASIC acceleration to accelerate SSL decryption and encryption of the secure tunnel. Peer-to-peer secure tunnels use the same TCP port as non-secure peer-to-peer tunnels (TCP port 7810).

To use secure tunneling, you must select **Enable Secure Tunnel** in a WAN optimization rule and add an authentication group. The authentication group specifies the certificate or pre-shared key used to set up the secure tunnel. The **Peer Acceptance** setting of the authentication group does not affect secure tunneling.

The FortiGate units at each end of the secure tunnel must have the same authentication group with the same name and the same configuration, including the same pre-shared key or certificate. To use certificates you must install the same certificate on both FortiGate units.

For active-passive WAN optimization you can select **Enable Secure Tunnel** only in the active rule. In peer-to-peer WAN optimization you select **Enable Secure Tunnel** in the WAN optimization rule on both FortiGate units.

For information about active-passive and peer-to-peer WAN optimization, see Manual (peer-to-peer) and active-passive WAN optimization on page 2828

For a secure tunneling configuration example, see Example Adding secure tunneling to an active-passive WAN optimization configuration on page 2866.

Monitoring WAN optimization peer performance

The WAN optimization peer monitor lists all of the WAN optimization peers that a FortiGate unit can perform WAN optimization with. These include peers manually added to the configuration as well as discovered peers.

The monitor lists each peer's name, IP address, and peer type. The peer type indicates whether the peer was manually added or discovered. To show WAN optimization performance, for each peer the monitor lists the percent of traffic reduced by the peer in client-side WAN optimization configurations and in server-side configurations (also called gateway configurations).

To view the peer monitor, go to **WAN Opt. & Cache > Monitor > Peer Monitor**.

Configuration examples

This chapter provides the basic examples to illustrate WAN optimization configurations introduced in the previous chapters.

Example Basic manual (peer-to-peer) WAN optimization configuration

In a manual (peer to peer) configuration the WAN optimization tunnel can be set up between one client-side FortiGate unit and one server-side FortiGate unit. The peer ID of the server-side FortiGate unit is added to the client-side WAN optimization policy. When the client-side FortiGate unit initiates a tunnel with the server-side FortiGate unit, the packets that initiate the tunnel include information that allows the server-side FortiGate unit to determine that it is a manual tunnel request. The server-side FortiGate unit does not require a WAN optimization profile; you just need to add the client peer host ID and IP address to the server-side FortiGate unit peer list and from the CLI an explicit proxy policy to accept WAN optimization tunnel connections.

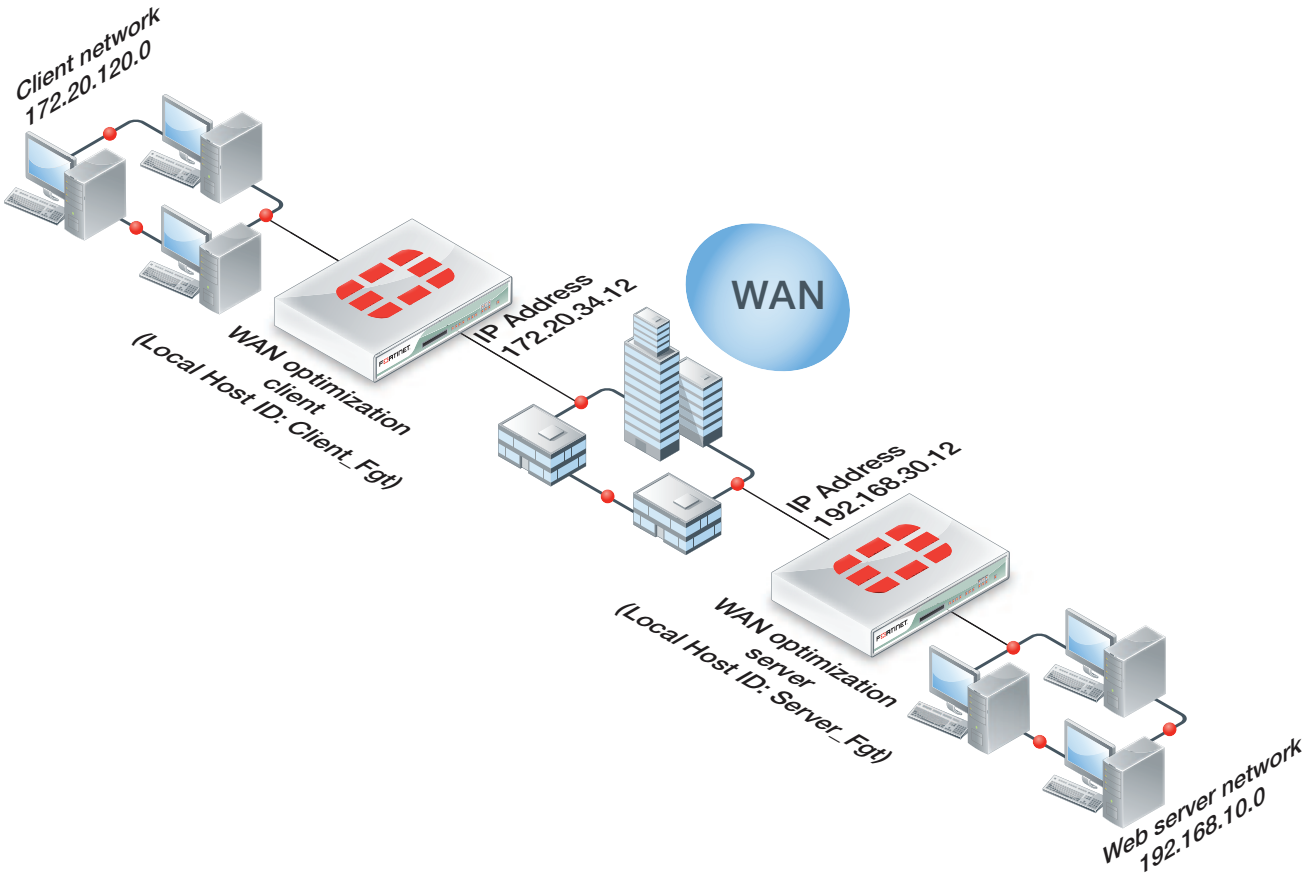
In a manual WAN optimization configuration, you create a manual WAN optimization security policy on the client-side FortiGate unit. To do this you must use the CLI to set `wanopt-detection` to `off` and to add the peer host ID of the server-side FortiGate unit to the WAN optimization security policy.

Network topology and assumptions

This example configuration includes a client-side FortiGate unit called Peer-Fgt-1 with a WAN IP address of 172.20.34.12. This unit is in front of a network with IP address 172.20.120.0. The server-side FortiGate unit is called Peer-Fgt-2 with a WAN IP address of 192.168.30.12. This unit is in front of a web server network with IP address 192.168.10.0.

This example customizes the default WAN optimization profile on the client-side FortiGate unit and adds it to the WAN optimization policy. You can also create a new WAN optimization profile.

Example manual (peer-to-peer) topology



General configuration steps

This section breaks down the configuration for this example into smaller procedures. For best results, follow the procedures in the order given:

1. Configure the client-side FortiGate unit:
   - Add peers.
   - Configure the default WAN optimization profile to optimize HTTP traffic.
   - Add a manual WAN optimization security policy.
2. Configure the server-side FortiGate unit:
   - Add peers.
   - Add a WAN optimization tunnel policy.

Configuring basic peer-to-peer WAN optimization - web-based manager

Use the following steps to configure the example configuration from the web-based manager.

To configure the client-side FortiGate unit

1. Go to **WAN Opt. & Cache > WAN Opt. Peers > Peers** and enter a **Local Host ID** for the client-side FortiGate unit:

Local Host ID	Client-Fgt

2. Select **Apply**.
3. Select **Create New** and add the server-side FortiGate unit **Peer Host ID** and **IP Address** for the server-side FortiGate:

Peer Host ID	Server-Fgt
IP Address	192.168.30.12

4. Select **OK**.
5. Go to **Policy & Objects > Objects > Addresses** and select **Create New** to add a firewall address for the client network.

Category	Address
Name	Client-Net
Type	Subnet
Subnet / IP Range	172.20.120.0/24
Interface	port1

6. Select **Create New** to add a firewall address for the web server network.

Category	Address
Name	Web-Server-Net
Type	Subnet
Subnet / IP Range	192.168.10.0/24
Interface	port2

7. Go to **WAN Opt. & Cache > WAN Opt. Profiles > Profiles** and edit the default profile.
8. Select **Transparent Mode**.
9. Under Protocol, select **HTTP** and for HTTP select **Byte Caching**. Leave the HTTP **Port** set to 80.
10. Select **Apply** to save your changes.
11. Go to **Policy& Objects > Policy > IPv4** and add a WAN optimization security policy to the client-side FortiGate unit that accepts traffic to be optimized:

Incoming Interface	port1
Source Address	all
Outgoing Interface	port2
Destination Address	all
Schedule	always
Service	ALL
Action	ACCEPT

12. Select **Enable WAN Optimization** and configure the following settings:

Enable WAN Optimization	active
Profile	default

13. Select **OK**.
14. Edit the policy from the CLI to turn off `wanopt-detection`, add the peer ID of the server-side FortiGate unit, and the default WAN optimization profile. The following example assumes the ID of the policy is 5:

```
config firewall policy
  edit 5
    set wanopt-detection off
    set wanopt-peer Server-Fgt
    set wanopt-profile default
  end
```

When you set the detection mode to `off` the policy becomes a manual mode WAN optimization policy. On the web-based manager the WAN optimization part of the policy changes to the following:

Enable WAN Optimization	Manual (Profile: default, Peer: Peer-Fgt-2)

To configure the server-side FortiGate unit

1. Go to **WAN Opt. & Cache > WAN Opt. Peers > Peers** and enter a **Local Host ID** for the server-side FortiGate unit:

Local Host ID	Server-Fgt

2. Select **Apply**.
3. Select **Create New** and add a **Peer Host ID** and the **IP Address** for the client-side FortiGate unit:

Peer Host ID	Client-Fgt
IP Address	172.20.34.12

4. Select **OK**.
5. Enter the following CLI command to add an explicit proxy policy to accept WAN optimization tunnel connections.

```
configure firewall explicit-proxy-policy
```

```
    edit 0
      set proxy wanopt
      set dstintf port1
      set srcaddr all
      set dstaddr all
      set action accept
      set schedule always
      set service ALL
    next
end
```

Configuring basic peer-to-peer WAN optimization - CLI

Use the following steps to configure the example WAN optimization configuration from the client-side and server-side FortiGate unit CLI.

To configure the client-side FortiGate unit

1. Add the Local Host ID to the client-side FortiGate configuration:

```
config wanopt settings
  set host-id Client-Fgt
end
```

2. Add the server-side Local Host ID to the client-side peer list:

```
config wanopt peer
  edit Server-Fgt
  set ip 192.168.30.12
end
```

3. Add a firewall address for the client network.

```
config firewall address
  edit Client-Net
    set type ipmask
    set subnet 172.20.120.0 255.255.255.0
    set associated-interface port1
  end
```

4. Add a firewall address for the web server network.

```
config firewall address
  edit Web-Server-Net
    set type ipmask
    set subnet 192.168.10.0 255.255.255.0
    set associated-interface port2
  end
```

5. Edit the default WAN optimization profile, select transparent mode, enable HTTP WAN optimization and enable byte caching for HTTP. Leave the HTTP Port set to 80.

```
config wanopt profile
  edit default
    set transparent enable
      config http
        set status enable
        set byte-caching enable
      end
  end
```

6. Add a WAN optimization security policy to the client-side FortiGate unit to accept the traffic to be optimized:

```
config firewall policy
   edit 0
      set srcintf port1
      set dstintf port2
      set srcaddr all
      set dstaddr all
      set action accept
      set service ALL
      set schedule always
      set wanopt enable
      set wanopt-profile default
      set wanopt-detection off
      set wanopt-peer Server-Fgt
   end
```

To configure the server-side FortiGate unit

1. Add the Local Host ID to the server-side FortiGate configuration:

```
config wanopt settings
   set host-id Server-Fgt
end
```

2. Add the client-side Local Host ID to the server-side peer list:

```
config wanopt peer
   edit Client-Fgt
   set ip 192.168.30.12
end
```

3. Add a WAN optimization tunnel explicit proxy policy.

```
configure firewall explicit-proxy-policy
   edit 0
      set proxy wanopt
      set dstintf port1
      set srcaddr all
      set dstaddr all
      set action accept
      set schedule always
      set service ALL
   next
end
```

Testing and troubleshooting the configuration

To test the configuration attempt to start a web browsing session between the client network and the web server network. For example, from a PC on the client network browse to the IP address of a web server on the web server network, for example http://192.168.10.100. Even though this address is not on the client network you should be able to connect to this web server over the WAN optimization tunnel.

If you can connect, check WAN optimization monitoring (go to **WAN Opt. & Cache > Monitor > Monitor**). If WAN optimization has been forwarding the traffic the WAN optimization monitor should show the protocol that has been optimized (in this case HTTP) and the reduction rate in WAN bandwidth usage.

If you can't connect you can try the following to diagnose the problem:

- Review your configuration and make sure all details such as address ranges, peer names, and IP addresses are correct.
- Confirm that the security policy on the client-side FortiGate unit is accepting traffic for the 192.168.10.0 network. You can do this by checking the policy monitor (**Policy & Objects > Monitor > Policy Monitor**). Look for sessions that use the policy ID of this policy.
- Check routing on the FortiGate units and on the client and web server networks to make sure packets can be forwarded as required. The FortiGate units must be able to communicate with each other, routing on the client network must allow packets destined for the web server network to be received by the client-side FortiGate unit, and packets from the server-side FortiGate unit must be able to reach the web servers.

You can use the following `get` and `diagnose` commands to display information about how WAN optimization is operating.

Enter the following command to list all of the running WAN optimization tunnels and display information about each one. The command output for the client-side FortiGate unit shows 10 tunnels all created by peer-to-peer WAN optimization rules (auto-detect set to off).

```
diagnose wad tunnel list

Tunnel: id=100 type=manual
   vd=0 shared=no uses=0 state=3
   peer name=Web-servers id=100 ip=192.168.30.12
   SSL-secured-tunnel=no auth-grp=

   bytes_in=1228 bytes_out=1264

Tunnels total=10 manual=10 auto=0
```

Example Active-passive WAN optimization

In active-passive WAN optimization you add an active WAN optimization policy to the client-side FortiGate unit and you add a WAN optimization tunnel policy and a passive WAN optimization policy to the server-side FortiGate unit.

The active policy accepts the traffic to be optimized and sends it down the WAN optimization tunnel to the server-side FortiGate unit. The active policy can also apply security profiles and other features to traffic before it exits the client-side FortiGate unit.

A tunnel explicit proxy policy on the sever-side FortiGate unit allows the server-side FortiGate unit to form a WAN optimization tunnel with the client-side FortiGate unit. The passive WAN optimization policy is required because of the active policy on the client-side FortiGate unit. You can also use the passive policy to apply WAN optimization transparent mode and features such as security profiles, logging, traffic shaping and web caching to the traffic before it exits the server-side FortiGate unit.

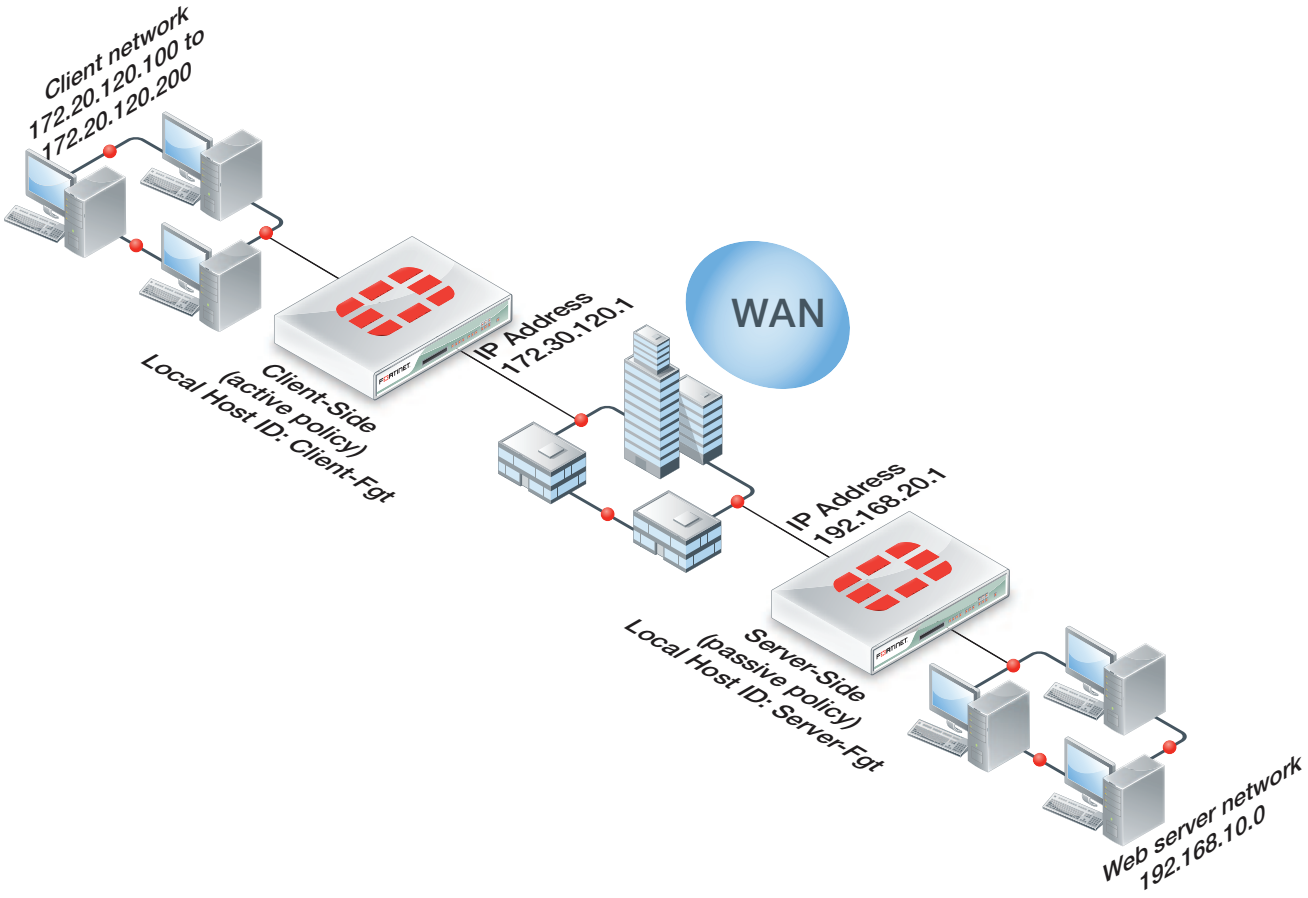
Network topology and assumptions

On the client-side FortiGate unit this example configuration includes a WAN optimization profile that optimizes CIFS, HTTP, and FTP traffic and an active WAN optimization policy. The active policy also applies virus scanning to the WAN optimization traffic.

On the server-side FortiGate unit, the passive policy applies application control to the WAN optimization traffic.

In this example, WAN optimization transparent mode is selected in the WAN optimization profile and the passive WAN optimization policy accepts this transparent mode setting. This means that the optimized packets maintain their original source and destination addresses. As a result, routing on the client network must be configured to route packets for the server network to the client-side FortiGate unit. Also the routing configuration on the server network must be able to route packets for the client network to the server-side FortiGate unit.

Example active-passive WAN optimization topology



General configuration steps

This section breaks down the configuration for this example into smaller procedures. For best results, follow the procedures in the order given:

1. Configure the client-side FortiGate unit:
   - Add peers.
   - Add a WAN optimization profile to optimize CIFS, FTP, and HTTP traffic.
   - Add firewall addresses for the client and web server networks.
   - Add an active WAN optimization policy.
2. Configure the server-side FortiGate unit by:
   - Add peers.
   - Add firewall addresses for the client and web server networks.
   - Add a passive WAN optimization policy.
   - Add a WAN optimization tunnel policy.

Configuring basic active-passive WAN optimization - web-based manager

Use the following steps to configure the example WAN optimization configuration from the client-side and server-side FortiGate unit web-based manager.

To configure the client-side FortiGate unit

1. Go to **WAN Opt. & Cache > WAN Opt. Peers > Peers** and enter a **Local Host ID** for the client-side FortiGate unit:

Local Host ID	Client-Fgt

2. Select **Apply**.
3. Select **Create New** and add a Peer Host ID and the **IP Address** for the server-side FortiGate unit:

Peer Host ID	Server-Fgt
IP Address	192.168.20.1

4. Select **OK**.
5. Go to **WAN Opt. & Cache > WAN Opt. Profiles > Profiles** and select Create New to add a WAN optimization profile to optimize CIFS, HTTP, and FTP traffic:

Name	Custom-wan-opt-pro
Transparent Mode	Select

6. Select the **CIFS** protocol, select **Byte Caching** and set the **Port** to 445.
7. Select the **FTP** protocol, select **Byte Caching** and set the **Port** to 21.
8. Select the **HTTP** protocol, select **Byte Caching** and set the **Port** to 80.
9. Select **OK**.
10. Go to **Policy & Objects > Objects > Addresses** and select **Create New** to add an address for the client network.

Category	Address
Address Name	Client-Net
Type	IP Range
Subnet / IP Range	172.20.120.100-172.20.120.200
Interface	port1

11. Select **Create New** to add an address for the web server network.

Category	Address

Address Name	Web-Server-Net
Type	Subnet
Subnet / IP Range	192.168.10.0/24
Interface	port2

12. Go to **Policy & Objects > Policy > IPv4** and select **Create New** to add an active WAN optimization security policy:

Incoming Interface	port1
Source Address	Client-Net
Outgoing Interface	port2
Destination Address	Web-Server-Net
Schedule	always
Service	HTTP FTP SMB
Action	ACCEPT

13. Turn on **WAN Optimization** and configure the following settings:

WAN Optimization	active
Profile	Custom-wan-opt-pro

14. Turn on Antivirus and select the **default** antivirus profile.
15. Select **OK**.

To configure the server-side FortiGate unit

1. Go to **WAN Opt. & Cache > WAN Opt. Peers > Peers** and enter a **Local Host ID** for the server-side FortiGate unit:

Local Host ID	Server-Fgt

2. Select **Apply**.
3. Select **Create New** and add a **Peer Host ID** and the **IP Address** for the client-side FortiGate unit:

Peer Host ID	Client-Fgt
IP Address	172.30.120.1

4. Select **OK**.
5. Go to **Policy & Objects > Objects > Addresses** and select **Create New** to add an address for the client network.

Category	Address
Address Name	Client-Net
Type	IP Range
Subnet / IP Range	172.20.120.100-172.20.120.200
Interface	port1

6. Select **Create New** to add a firewall address for the web server network.

Category	Address
Address Name	Web-Server-Net
Type	Subnet
Subnet / IP Range	192.168.10.0/24
Interface	port2

7. Select **OK**.
8. Select **Policy & Objects > Policy > IPv4** and select **Create New** to add a passive WAN optimization policy that applies application control.

Incoming Interface	port2
Source Address	Client-Net
Outgoing Interface	port1
Destination Address	Web-Server-Net
Schedule	always
Service	ALL
Action	ACCEPT

9. Turn on **WAN Optimization** and configure the following settings:

WAN Optimization	passive
Passive Option	default

10. Select **OK**.
11. From the CLI enter the following command to add a WAN optimization tunnel explicit proxy policy.

```
configure firewall explicit-proxy-policy
```

```
    edit 0
      set proxy wanopt
      set dstintf port1
      set srcaddr all
      set dstaddr all
      set action accept
      set schedule always
      set service ALL
    next
end
```

Configuring basic active-passive WAN optimization - CLI

Use the following steps to configure the example WAN optimization configuration from the client-side and server-side FortiGate unit CLI.

To configure the client-side FortiGate unit

1. Add the Local Host ID to the client-side FortiGate configuration:

```
config wanopt settings
  set host-id Client-Fgt
end
```

2. Add the server-side Local Host ID to the client-side peer list:

```
config wanopt peer
  edit Server-Fgt
  set ip 192.168.20.1
end
```

3. Add a WAN optimization profile to optimize CIFS, HTTP, and FTP traffic.

```
config wanopt profile
  edit Custom-wan-opt-pro
    config cifs
      set status enable
      set byte-caching enable
      set port 445
    end
    config http
      set status enable
      set byte-caching enable
      set port 80
    end
    config ftp
      set status enable
      set byte-caching enable
      set port 21
    end
  end
```

4. Add a firewall address for the client network.

```
config firewall address
  edit Client-Net
    set type iprange
    set start-ip 172.20.120.100
    set end-ip 172.20.120.200
    set associated-interface port1
  end
```

5. Add a firewall address for the web server network.

```
config firewall address
   edit Web-Server-Net
      set type ipmask
      set subnet 192.168.10.0 255.255.255.0
      set associated-interface port2
   end
```

6. Add an active WAN optimization security policy that applies virus scanning:

```
config firewall policy
   edit 0
      set srcintf port1
      set dstintf port2
      set srcaddr Client-net
      set dstaddr Web-Server-Net
      set action accept
      set service HTTP FTP SMB
      set schedule always
      set wanopt enable
      set wanopt-detection active
      set wanopt-profile Custom-wan-opt-pro
   end
```

To configure the server-side FortiGate unit

1. Add the Local Host ID to the server-side FortiGate configuration:

```
config wanopt settings
   set host-id Server-Fgt
end
```

2. Add the client-side Local Host ID to the server-side peer list:

```
config wanopt peer
   edit Client-Fgt
   set ip 172.20.120.1
end
```

3. Add a firewall address for the client network.

```
config firewall address
   edit Client-Net
      set type iprange
      set start-ip 172.20.120.100
      set end-ip 172.20.120.200
      set associated-interface port1
   end
```

4. Add a firewall address for the web server network.

```
config firewall address
   edit Web-Server-Net
      set type ipmask
      set subnet 192.168.10.0 255.255.255.0
      set associated-interface port2
   end
```

5. Add a passive WAN optimization policy.

```
config firewall policy
   edit 0
      set srcintf port1
      set dstintf port2
      set srcaddr Client-Net
      set dstaddr Web-Server-Net
      set action accept
```

```
      set service ALL
      set schedule always
      set wanopt enable
      set wanopt-detection passive
      set wanopt-passive-opt default
    end
```

6. Add a WAN optimization tunnel explicit proxy policy.

```
configure firewall explicit-proxy-policy
   edit 0
      set proxy wanopt
      set dstintf port1
      set srcaddr all
      set dstaddr all
      set action accept
      set schedule always
      set service ALL
   next
end
```

Testing and troubleshooting the configuration

To test the configuration attempt to start a web browsing session between the client network and the web server network. For example, from a PC on the client network browse to the IP address of a web server on the web server network, for example http://192.168.10.100. Even though this address is not on the client network you should be able to connect to this web server over the WAN optimization tunnel.

If you can connect, check WAN optimization monitoring (go to **WAN Opt. & Cache > Monitor > Monitor**). If WAN optimization has been forwarding the traffic the WAN optimization monitor should show the protocol that has been optimized (in this case HTTP) and the reduction rate in WAN bandwidth usage.

If you can't connect you can try the following to diagnose the problem:

- Review your configuration and make sure all details such as address ranges, peer names, and IP addresses are correct.
- Confirm that the security policy on the Client-Side FortiGate unit is accepting traffic for the 192.168.10.0 network and that this security policy does not include security profiles. You can do this by checking the FortiGate session table from the dashboard. Look for sessions that use the policy ID of this policy.
- Check routing on the FortiGate units and on the client and web server networks to make sure packets can be forwarded as required. The FortiGate units must be able to communicate with each other, routing on the client network must allow packets destined for the web server network to be received by the client-side FortiGate unit, and packets from the server-side FortiGate unit must be able to reach the web servers etc.

You can use the following `get` and `diagnose` commands to display information about how WAN optimization is operating

Enter the following command to list all of the running WAN optimization tunnels and display information about each one. The command output shows 3 tunnels all created by peer-to-peer WAN optimization rules (auto-detect set to on).

```
diagnose wad tunnel list

Tunnel: id=139 type=auto
   vd=0 shared=no uses=0 state=1
   peer name= id=0 ip=unknown
   SSL-secured-tunnel=no auth-grp=test
```

```
   bytes_in=744 bytes_out=76

Tunnel: id=141 type=auto
   vd=0 shared=no uses=0 state=1
   peer name= id=0 ip=unknown
   SSL-secured-tunnel=no auth-grp=test
   bytes_in=727 bytes_out=76

Tunnel: id=142 type=auto
   vd=0 shared=no uses=0 state=1
   peer name= id=0 ip=unknown
   SSL-secured-tunnel=no auth-grp=test
   bytes_in=727 bytes_out=76

Tunnels total=3 manual=0 auto=3
```

Example Adding secure tunneling to an active-passive WAN optimization configuration

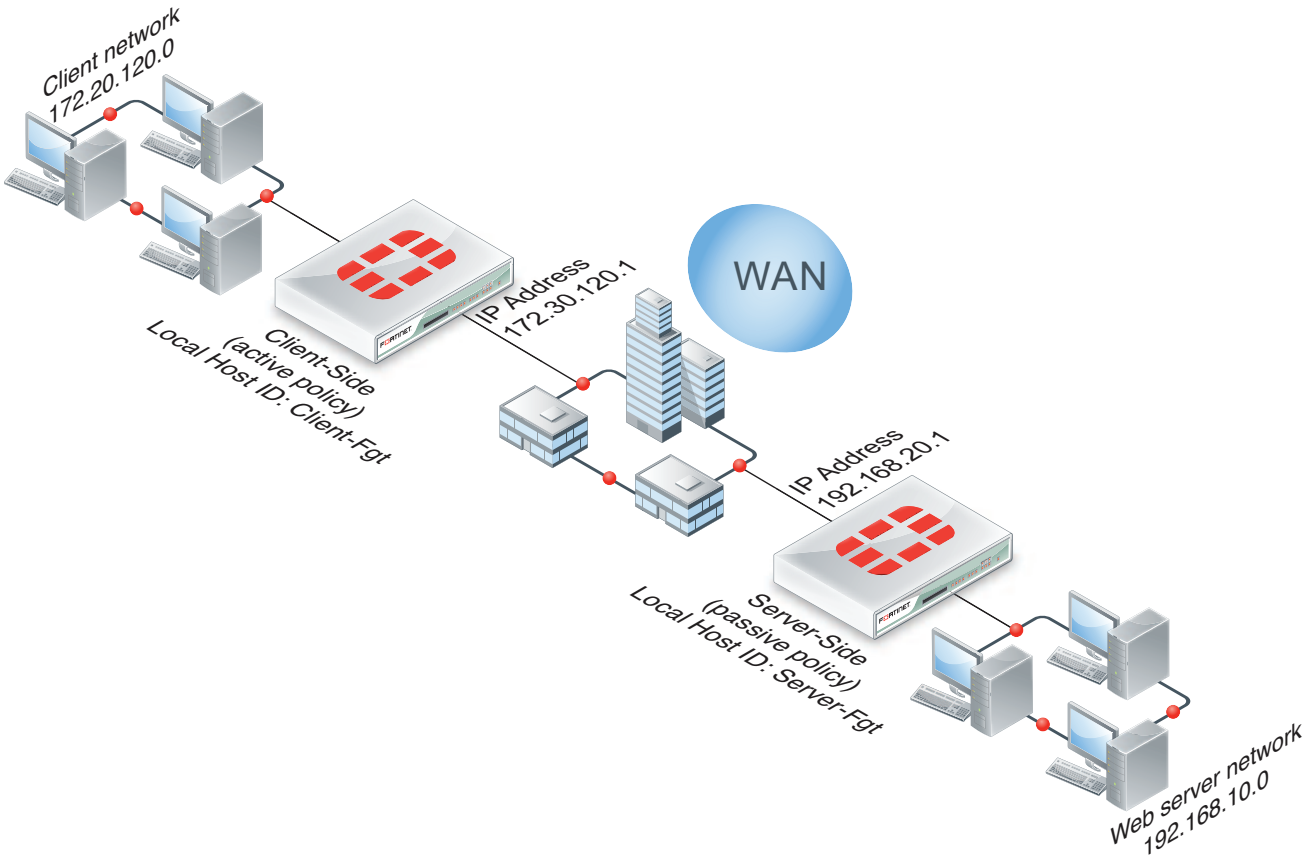
This example shows how to configure two FortiGate units for active-passive WAN optimization with secure tunneling. The same authentication group is added to both FortiGate units. The authentication group includes a password (or pre-shared key) and has **Peer Acceptance** set to **Accept any Peer**. An active policy is added to the client-side FortiGate unit and a passive policy to the server-side FortiGate unit. The active policy includes a profile that performs secure tunneling, optimizes HTTP traffic, and uses Transparent Mode and byte caching.

The authentication group is named **Auth-Secure-Tunnel** and the password for the pre-shared key is **2345678**. The topology for this example is shown below. This example includes web-based manager configuration steps followed by equivalent CLI configuration steps. For information about secure tunneling, see Secure tunneling on page 2849.

Network topology and assumptions

This example configuration includes a client-side FortiGate unit called Client-net with a WAN IP address of 172.30.120.1.This unit is in front of a network with IP address 172.20.120.0. The server-side FortiGate unit is called Web-servers and has a WAN IP address of 192.168.20.1. This unit is in front of a web server network with IP address 192.168.10.0.

Example active-passive WAN optimization and secure tunneling topology



General configuration steps

This section breaks down the configuration for this example into smaller procedures. For best results, follow the procedures in the order given:

1. Configure the client-side FortiGate unit:
   - Add peers.
   - Add an authentication group.
   - Add an active WAN optimization policy.
2. Configure the server-side FortiGate unit.
   - Add peers.
   - Add the same authentication group
   - Add a passive WAN optimization policy that applies application control.
   - Add a WAN optimization tunnel policy.

Also note that if you perform any additional actions between procedures, your configuration may have different results.

Configuring WAN optimization with secure tunneling - web-based manager

Use the following steps to configure the example WAN optimization configuration from the client-side and server-side FortiGate unit web-based manager. (CLI steps follow.)

To configure the client-side FortiGate unit

1. Go to **WAN Opt. & Cache > WAN Opt. Peers > Peers** and enter a **Local Host ID** for the client-side FortiGate unit:

Local Host ID	Client-Fgt

2. Select **Apply** to save your setting.
3. Select **Create New** and add a **Peer Host ID** and the **IP Address** for the server-side FortiGate unit:

Peer Host ID	Server-Fgt
IP Address	192.168.20.1

4. Select **OK**.
5. Go to **Wan Opt. & Cache > WAN Opt. Peers > Authentication Groups** and select **Create New** to add the authentication group to be used for secure tunneling:

Name	Auth-Secure-Tunnel
Authentication Method	Pre-shared key
Password	2345678
Peer Acceptance	Accept Any Peer

6. Select **OK**.
7. Go to **Wan Opt. & Cache > WAN Opt. Profiles > Profiles** and select **Create New** to add a WAN optimization profile that enables secure tunneling and includes the authentication group:

Name	Secure-wan-op-pro
Transparent Mode	Select
Authentication Group	Auth-Secure-tunnel

8. Select the **HTTP** protocol, select Secure Tunneling and **Byte Caching** and set the **Port** to 80.
9. Select **OK**.
10. Go to Policy & **Objects > Objects > Addresses** and select **Create New** to add a firewall address for the client network.

Category	Address

Name	Client-Net
Type	Subnet
Subnet / IP Range	172.20.120.0/24
Interface	port1

11. Select **Create New** to add a firewall address for the web server network.

Category	Address
Address Name	Web-Server-Net
Type	Subnet
Subnet / IP Range	192.168.10.0/24
Interface	port2

12. Go to **Policy & Objects > Policy > IPv4** and select **Create New** to add an active WAN optimization security policy:

Incoming Interface	port1
Source Address	Client-Net
Outgoing Interface	port2
Destination Address	Web-Server-Net
Schedule	always
Service	HTTP
Action	ACCEPT

13. Turn on **WAN Optimization** and configure the following settings:

WAN Optimization	active
Profile	Secure-wan-opt-pro

14. Select **OK**.

To configure the server-side FortiGate unit

1. Go to **WAN Opt. & Cache > WAN Opt. Peers > Peers** and enter a **Local Host ID** for the server-side FortiGate unit:

Local Host ID	Server-Fgt

2. Select **Apply** to save your setting.
3. Select **Create New** and add a **Peer Host ID** and the **IP Address** for the client-side FortiGate unit:

Peer Host ID	Client-Fgt
IP Address	172.30.120.1

4. Select **OK**.
5. Go to **Wan Opt. & Cache > WAN Opt. Peers > Authentication Groups** and select **Create New** and add an authentication group to be used for secure tunneling:

Name	Auth-Secure-Tunnel
Authentication Method	Pre-shared key
Password	2345678
Peer Acceptance	Accept Any Peer

6. Select **OK**.
7. Go to **Policy & Objects > Objects > Addresses** and select **Create New** to add a firewall address for the client network.

Category	Address
Name	Client-Net
Type	Subnet
Subnet / IP Range	172.20.120.0/24
Interface	port1

8. Select **Create New** to add a firewall address for the web server network.

Category	Address
Address Name	Web-Server-Net
Type	Subnet
Subnet / IP Range	192.168.10.0/24
Interface	port2

9. Select **OK**.
10. Select **Create New** to add a passive WAN optimization policy that applies application control.

Incoming Interface	port2

Source Address	Client-Net
Outgoing Interface	port1
Destination Address	Web-Server-Net
Schedule	always
Service	ALL
Action	ACCEPT

11. Turn on **WAN Optimization** and configure the following settings:

WAN Optimization	passive
Passive Option	default

12. Select **OK**.
13. From the CLI enter the following command to add a WAN optimization tunnel explicit proxy policy.

```
configure firewall explicit-proxy-policy
   edit 0
      set proxy wanopt
      set dstintf port1
      set srcaddr all
      set dstaddr all
      set action accept
      set schedule always
      set service ALL
   next
end
```

Configuring WAN optimization with secure tunneling - CLI

Use the following steps to configure the example WAN optimization configuration from the client-side and server-side FortiGate unit CLI.

To the client-side FortiGate unit

1. Add the Local Host ID to the client-side FortiGate configuration:

```
config wanopt settings
   set host-id Client-Fgt
end
```

2. Add the server-side Local Host ID to the client-side peer list:

```
config wanopt peer
   edit Server-Fgt
   set ip 192.168.20.1
end
```

3. Add a new authentication group to be used for secure tunneling:

```
config wanopt auth-group
   edit Auth-Secure-Tunnel
      set auth-method psk
```

```
      set psk 2345678
   end
```

Leave `peer-accept` at its default value.

4. Add a WAN optimization profile that enables secure tunneling and includes the authentication group, enables HTTP protocol optimization, and enables secure tunneling and byte caching for HTTP traffic:

```
config wanopt profile
   edit Secure-wan-op-pro
      set auth-group Auth-Secure-Tunnel
      config http
         set status enable
         set secure-tunnel enable
         set byte-caching enable
         set port 80
      end
   end
```

5. Add a firewall address for the client network.

```
config firewall address
   edit Client-Net
      set type ipmask
      set subnet 172.20.120.0 255.255.255.0
      set associated-interface port1
   end
```

6. Add a firewall address for the web server network.

```
config firewall address
   edit Web-Server-Net
      set type ipmask
      set subnet 192.168.10.0 255.255.255.0
      set associated-interface port2
   end
```

7. Add an active WAN optimization security policy that includes the WAN optimization profile that enables secure tunneling and that applies virus scanning:

```
config firewall policy
   edit 0
      set srcintf port1
      set dstintf port2
      set srcaddr Client-Net
      set dstaddr Web-Server-Net
      set action accept
      set service HTTP
      set schedule always
      set wanopt enable
      set wanopt-detection active
      set wanopt-profile Secure-wan-opt-pro
   end
```

To configure the server-side FortiGate unit

1. Add the Local Host ID to the server-side FortiGate configuration:

```
config wanopt settings
   set host-id Server-Fgt
end
```

2. Add the client-side Local Host ID to the server-side peer list:

```
config wanopt peer
   edit Client-Fgt
   set ip 172.20.120.1
end
```

3. Add an authentication group to be used for secure tunneling:

```
config wanopt auth-group
   edit Auth-Secure-Tunnel
      set auth-method psk
      set psk 2345678
   end
```

   Leave `peer-accept` at its default value.

4. Add a firewall address for the client network.

```
config firewall address
   edit Client-Net
      set type ipmask
      set subnet 172.20.120.0 255.255.255.0
      set associated-interface port1
   end
```

5. Add a firewall address for the web server network.

```
config firewall address
   edit Web-Server-Net
      set type ipmask
      set subnet 192.168.10.0 255.255.255.0
      set associated-interface port2
   end
```

6. Add a passive WAN optimization policy.

```
config firewall policy
   edit 0
      set srcintf port1
      set dstintf port2
      set srcaddr Client-Net
      set dstaddr Web-Server-Net
      set action accept
      set service ALL
      set schedule always
      set wanopt enable
      set wanopt-detection passive
      set wanopt-passive-opt default
   end
```

7. Add a WAN optimization tunnel explicit proxy policy.

```
configure firewall explicit-proxy-policy
   edit 0
      set proxy wanopt
      set dstintf port1
      set srcaddr all
      set dstaddr all
      set action accept
      set schedule always
      set service ALL
```

```
    next
  end
```

Web caching and SSL offloading

FortiGate web caching is a form of object caching that accelerates web applications and web servers by reducing bandwidth usage, server load, and perceived latency. Web caching supports caching of HTTP 1.0 and HTTP 1.1 web sites. See RFC 2616 for information about web caching for HTTP 1.1.

Web caching supports caching of Flash content over HTTP but does not cache audio and video streams including Flash videos and streaming content that use native streaming protocols such as RTMP.

The first time a file is received by web caching it is cached in the format it is received in, whether it be compressed or uncompressed. When the same file is requested by a client but in a different compression format, the cached file is converted to the new compressed format before being sent to the client.

There are three significant advantages to using web caching to improve HTTP and WAN performance:

- reduced bandwidth consumption because fewer requests and responses go over the WAN or Internet.
- reduced web server load because there are fewer requests for web servers to handle.
- reduced latency because responses for cached requests are available from a local FortiGate unit instead of from across the WAN or Internet.

You can use web caching to cache any web traffic that passes through the FortiGate unit, including web pages from web servers on a LAN, WAN or on the Internet. You apply web caching by enabling the web caching option in any security policy. When enabled in a security policy, web caching is applied to all HTTP sessions accepted by the security policy. If the security policy is an explicit web proxy security policy, the FortiGate unit caches explicit web proxy sessions.

Turning on web caching for HTTP and HTTPS traffic

Web caching can be applied to any HTTP or HTTPS traffic by enabling web caching in a security policy that accepts the traffic. This includes IPv4, IPv6, WAN optimization and explicit web proxy traffic. Web caching caches all HTTP traffic accepted by a policy on TCP port 80.

You can add web caching to a policy to:

- Cache Internet HTTP traffic for users on an internal network to reduce Internet bandwidth use. Do this by selecting the web cache option for security policies that allow users on the internal network to browse web sites on the Internet.
- Reduce the load on a public facing web server by caching objects on the FortiGate unit. This is a reverse proxy with web caching configuration. Do this by selecting the web cache option for a security policy that allows users on the Internet to connect to the web server.
- Cache outgoing explicit web proxy traffic when the explicit proxy is used to proxy users in an internal network who are connecting to the web servers on the Internet. Do this by selecting the web cache option for explicit web proxy security policies that allow users on the internal network to browse web sites on the Internet.
- Combine web caching with WAN optimization. You can enable web caching in any WAN optimization security policy. This includes manual, active, and passive WAN optimization policies and WAN optimization tunnel policies. You can enable web caching on both the client-side and the server-side FortiGate units or on just one or the other.

For optimum performance you can enable web caching on both the client-side and server-side FortiGate units. In this way only uncached content is transmitted through the WAN optimization tunnel. All cached content is access locally by clients from the client side FortiGate unit.

One important use for web caching is to cache software updates (for example, Windows Updates or iOS updates. When updates occur a large number of users may all be trying to download these updates at the same time. Caching these updates will be a major performance improvement and also have a potentially large impact on reducing Internet bandwidth use. You may want to adjust the maximum cache object size to make sure these updates are cached. SeeMax cache object size on page 2880.

Turning on web caching for HTTPS traffic

Web caching can also cache the content of HTTPS traffic on TCP port 443. With HTTPS web caching, the FortiGate unit receives the HTTPS traffic on behalf of the client, opens up the encrypted traffic and extracts content to be cached. Then FortiGate unit re-encrypts the traffic and sends it on to its intended recipient. It is very similar to a man-in-the-middle attack.

You enable HTTPS web caching from the CLI in a security policy or an explicit proxy policy that accepts the traffic to be cached using `webcache-https`. For a firewall policy:

```
config firewall policy
   edit 0
      .
      .
      .
      set webcache enable
      set webcache-https any
      .
      .
      .
   end
```

For an explicit web proxy policy:

```
config firewall policy
   edit 0
      set proxy web
      .
      .
      .
      set webcache enable
      set webcache-https any
      .
      .
      .
   end
```

Web caching for HTTPS traffic is not supported if WAN optimization is enabled.

The `any` setting causes the FortiGate unit to re-encrypt the traffic with the FortiGate unit's certificate rather than the original certificate. This configuration can cause errors for HTTPS clients because the name on the certificate does not match the name on the web site.

You can stop these errors from happening by configuring HTTPS web caching to use the web server's certificate by setting `webcache-https` to `ssl-server`. This option is available for both firewall policies and explicit web proxy policies.

```
config firewall policy
   edit 0
      .
      .
      .
      set webcache enable
      set webcache-https ssl-server
      .
      .
      .
   end
```

The `ssl-server` option causes the FortiGate unit to re-encrypt the traffic with a certificate that you imported into the FortiGate unit. You can add certificates using the following command:

```
config firewall ssl-server
   edit corporate-server
      set ip <Web-Server-IP>
      set port 443
      set ssl-mode { full | half}
      set ssl-cert <Web-Server-Cert>
   end
```

Where:

`Web-Server-IP` is the web server's IP address.

`Web-Server-Cert` is a web server certificate imported into the FortiGate unit.

The SSL server configuration also determines whether the SSL server is operating in half or full mode and the port used for the HTTPS traffic.

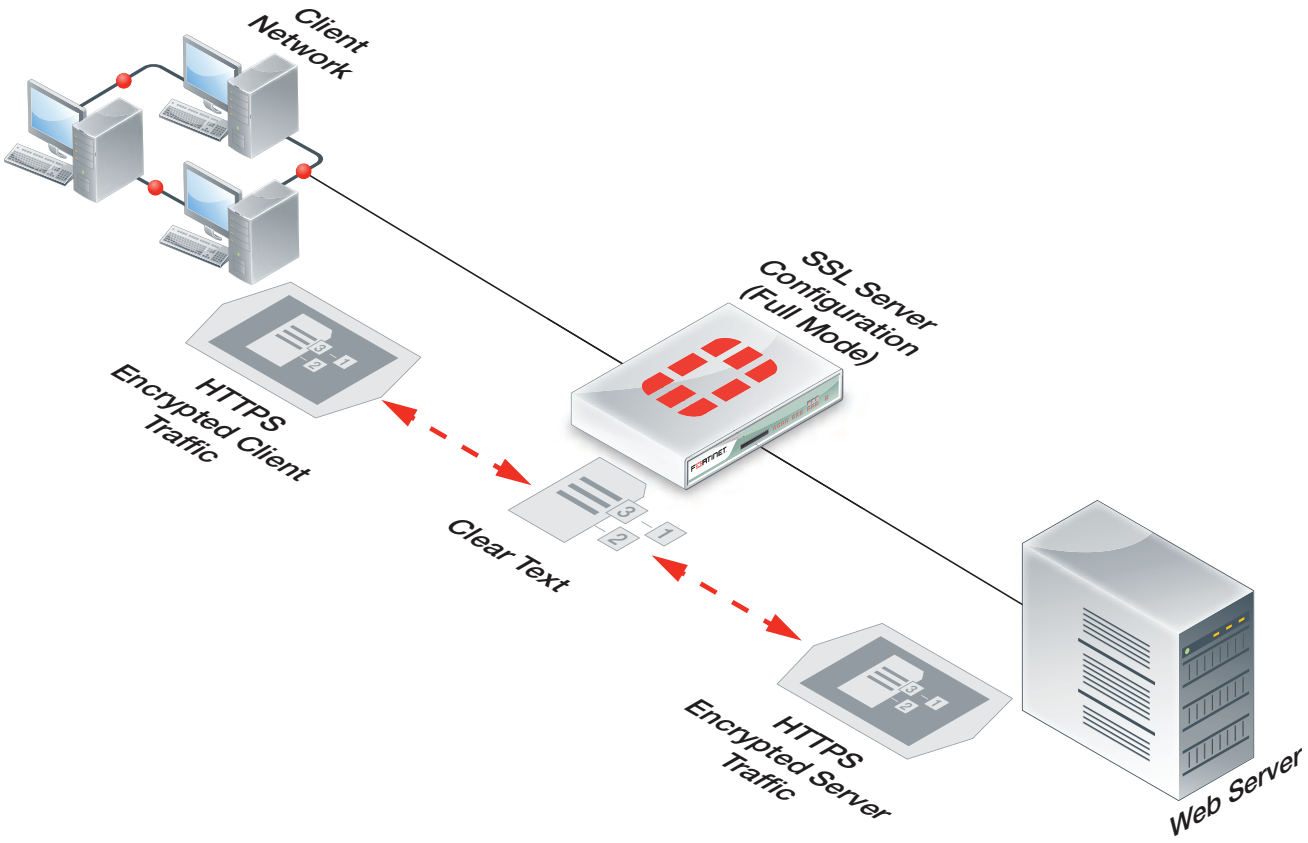
You can add multiple SSL server certificates in this way. When web caching processing an SSL stream if it can find a certificate that matches the web server IP address and port of one of the added SSL servers; that certificate is used to encrypt the SSL traffic before sending it to the client. As a result the client does not generate SSL certificate errors.

Web caching uses the FortiGate unit's FortiASIC to accelerate SSL decryption/encryption performance.

Full mode SSL server configuration

The `ssl-mode` option determines whether the SSL server operates in half or full mode. In full mode the FortiGate unit performs both decryption and encryption of the HTTPS traffic. The full mode sequence is shown below.

Full mode SSL server configuration



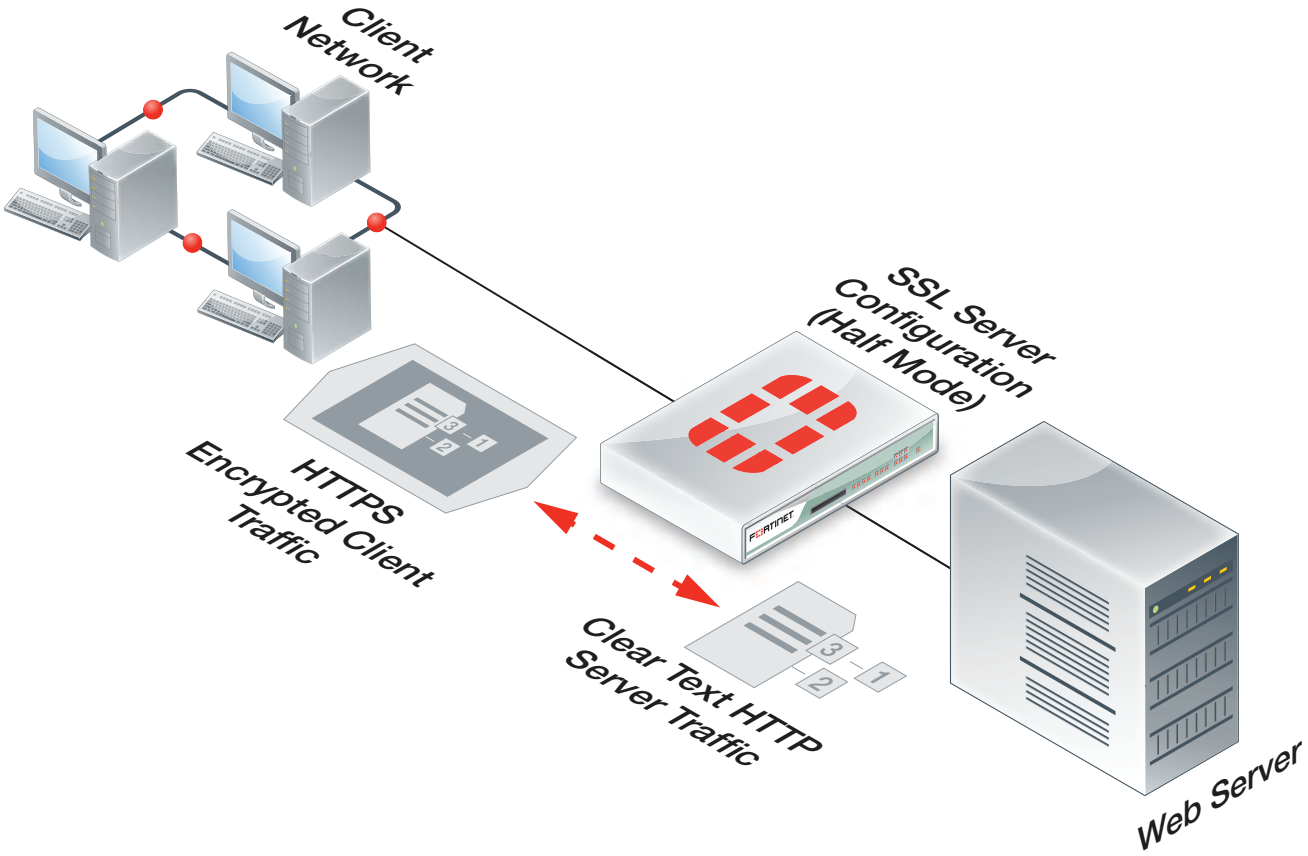
In full mode the FortiGate unit is acting as a man in the middle, decrypting and encrypting the traffic. So both the client and the web server see encrypted packets.

Usually the port of the encrypted HTTPS traffic is always 443. However, in the SSL server configuration you can set the port used for HTTPS traffic. This port is not altered by the SSL Server. So for example, if the SSL Server receives HTTPS traffic on port 443, the re-encrypted traffic forwarded to the FortiGate unit to the server or client will still use port 443.

Half mode SSL server configuration

In half mode, the FortiGate unit only performs one encryption or decryption action. If HTTP packets are received, the half mode SSL server encrypts them and converts them to HTTPS packets. If HTTPS packets are received, the SSL server decrypts them and converts them to HTTP packets.

Half mode SSL server configuration



In half mode, the FortiGate unit is acting like an SSL accelerator, offloading HTTPS decryption from the web server to the FortiGate unit. Since FortiGate units can accelerate SSL processing, the end result could be improved web site performance.

Usually the port of the encrypted traffic is always 443. However, in the SSL server configuration you can set the port used for HTTPS traffic. No matter what port is used for the HTTPS traffic, the decrypted HTTP traffic uses port 80.

Changing the ports on which to look for HTTP and HTTPS traffic to cache

By default FortiOS assumes HTTP traffic uses TCP port 80 and HTTPS traffic uses port 443. So web caching caches all HTTP traffic accepted by a policy on TCP port 80 and all HTTPS traffic on TCP port 443. If you want to cache HTTP or HTTPS traffic on other ports, you can enable security profiles for the security policy and configure a proxy options profile to that looks for HTTP and HTTPS traffic on other TCP ports. To configure a proxy options profile go to **Policy & Options > Policy > Proxy Options**.

Setting the HTTP port to **Any** in a proxy options profile is not compatible with web caching. If you set the HTTP port to any, web caching only caches HTTP traffic on port 80.

Web caching and HA

You can configure web caching on a FortiGate HA cluster. The recommended best practice HA configuration for web caching is active-passive mode. When the cluster is operating, all web caching sessions are processed by the primary unit only. Even if the cluster is operating in active-active mode, HA does not load-balance web caching sessions.

In a cluster, only the primary unit stores the web cache database. The databases is not synchronized to the subordinate units. So, after a failover, the new primary unit must build its web cache.

Web caching and memory usage

To accelerate and optimize disk access and to provide better throughput and less latency, web caching uses provisioned memory to reduce disk I/O and increase disk I/O efficiency. In addition, web caching requires a small amount of additional memory per session for comprehensive flow control logic and efficient traffic forwarding.

When web caching is enabled you will see a reduction in available memory. The reduction increases when more web caching sessions are being processed. If you are thinking of enabling web caching on an operating FortiGate unit, make sure its memory usage is not maxed out during high traffic periods.

In addition to using the system dashboard to see the current memory usage you can use the `get test wad 2` command to see how much memory is currently being used by web caching. See get test {wad | wccpd} <test_level> on page 2947 for more information.

Changing web cache settings

In most cases, the default settings for the WAN optimization web cache are acceptable. However, you may want to change them to improve performance or optimize the cache for your configuration. To change these settings, go to **WAN Opt. & Cache > Cache > Settings.**

From the FortiGate CLI, you can use the `config wanopt webcache` command to change these WAN optimization web cache settings.

For more information about many of these web cache settings, see RFC 2616.

Always revalidate

Select to always revalidate requested cached objects with content on the server before serving them to the client.

Max cache object size

Set the maximum size of objects (files) that are cached. The default size is 512000 KB and the range is 1 to 4294967 KB. This setting determines the maximum object size to store in the web cache. Objects that are larger than this size are still delivered to the client but are not stored in the FortiGate web cache.

For most web traffic the default maximum cache object size is recommended. However, since web caching can also cache larger objects such as Windows updates, Mac OS updates, iOS updates or other updates delivered using HTTP you might want to increase the object size to make sure these updates are cached. Caching these

updates can save a lot of Internet bandwidth and improve performance when major updates are released by these vendors.

Negative response duration

Set how long in minutes that the FortiGate unit caches error responses from web servers. If error responses are cached, then subsequent requests to the web cache from users will receive the error responses regardless of the actual object status.

The default is 0, meaning error responses are not cached. The content server might send a client error code (4xx HTTP response) or a server error code (5xx HTTP response) as a response to some requests. If the web cache is configured to cache these negative responses, it returns that response in subsequent requests for that page or image for the specified number of minutes.

Fresh factor

Set the fresh factor as a percentage. The default is 100, and the range is 1 to 100%. For cached objects that do not have an expiry time, the web cache periodically checks the server to see if the objects have expired. The higher the **Fresh Factor** the less often the checks occur.

For example, if you set the **Max TTL** value and **Default TTL** to 7200 minutes (5 days) and set the **Fresh Factor** to 20, the web cache check the cached objects 5 times before they expire, but if you set the **Fresh Factor** to 100, the web cache will check once.

Max TTL

The maximum amount of time (Time to Live) an object can stay in the web cache without the cache checking to see if it has expired on the server. The default is 7200 minutes (120 hours or 5 days) and the range is 1 to 5256000 minutes (5256000 minutes in a year).

Min TTL

The minimum amount of time an object can stay in the web cache before the web cache checks to see if it has expired on the server. The default is 5 minutes and the range is 1 to 5256000 minutes (5256000 minutes in a year).

Default TTL

The default expiry time for objects that do not have an expiry time set by the web server. The default expiry time is 1440 minutes (24 hours) and the range is 1 to 5256000 minutes (5256000 minutes in a year).

Proxy FQDN

The fully qualified domain name (FQDN) for the proxy server. This is the domain name to enter into browsers to access the proxy server. This field is for information only can be changed from the explicit web proxy configuration.

Max HTTP request length

The maximum length of an HTTP request that can be cached. Larger requests will be rejected. This field is for information only can be changed from the explicit web proxy configuration.

Max HTTP message length

The maximum length of an HTTP message that can be cached. Larger messages will be rejected. This field is for information only can be changed from the explicit web proxy configuration.

Ignore

Select the following options to ignore some web caching features.

If-modified-since	By default, if the time specified by the if-modified-since (IMS) header in the client's conditional request is greater than the last modified time of the object in the cache, it is a strong indication that the copy in the cache is stale. If so, HTTP does a conditional GET to the Overlay Caching Scheme (OCS), based on the last modified time of the cached object. Enable ignoring if-modified-since to override this behavior.
HTTP 1.1 conditionals	HTTP 1.1 provides additional controls to the client over the behavior of caches toward stale objects. Depending on various cache-control headers, the FortiGate unit can be forced to consult the OCS before serving the object from the cache. For more information about the behavior of cache-control header values, see RFC 2616.Enable ignoring HTTP 1.1 Conditionals to override this behavior.
Pragma-no-cache	Typically, if a client sends an HTTP GET request with a pragma no-cache (PNC) or cache-control no-cache header, a cache must consult the OCS before serving the content. This means that the FortiGate unit always re-fetches the entire object from the OCS, even if the cached copy of the object is fresh.Because of this behavior, PNC requests can degrade performance and increase server-side bandwidth utilization. However, if you enable ignoring Pragma-no-cache, then the PNC header from the client request is ignored. The FortiGate unit treats the request as if the PNC header is not present.
IE Reload	Some versions of Internet Explorer issue Accept / header instead of Pragma no-cache header when you select **Refresh**. When an Accept header has only the / value, the FortiGate unit treats it as a PNC header if it is a type-N object. Enable ignoring IE reload to cause the FortiGate unit to ignore the PNC interpretation of the Accept / header.

Cache Expired Objects

Applies only to type-1 objects. When this option is selected, expired type-1 objects are cached (if all other conditions make the object cacheable).

Revalidated Pragma-no-cache

The pragma-no-cache (PNC) header in a client's request can affect how efficiently the FortiGate unit uses bandwidth. If you do not want to completely ignore PNC in client requests (which you can do by selecting to ignore Pragma-no-cache, above), you can nonetheless lower the impact on bandwidth usage by selecting **Revalidate Pragma-no-cache**.

When you select **Revalidate Pragma-no-cache**, a client's non-conditional PNC-GET request results in a conditional GET request sent to the OCS if the object is already in the cache. This gives the OCS a chance to return the 304 Not Modified response, which consumes less server-side bandwidth, because the OCS has not been forced to otherwise return full content.

By default, **Revalidate Pragma-no-cache** is disabled and is not affected by changes in the top-level profile.

Most download managers make byte-range requests with a PNC header. To serve such requests from the cache, you should also configure byte-range support when you configure the **Revalidate pragma-no-cache** option.

Forwarding URLs to forwarding servers and exempting web sites from web caching

You can go to **System > Network > Explicit Proxy** and use the URL match list to forward URL patterns to forwarding servers and create a list of URLs that are exempt from web caching.

Forwarding URLs and URL patterns to forwarding servers

As part of configuring the explicit web proxy you can configure proxy chaining by adding web proxy forwarding servers. See "Proxy chaining (web proxy forwarding servers) ".

You can then use the URL match list to always forward explicit web proxy traffic destined for configured URLs or URL patterns to one of these forwarding servers. For example, you might want to forward all traffic for a specific country to a proxy server located in that country.

To forward traffic destined for a URL to a forwarding server that you have already added, go to **System > Network > Explicit Proxy** and select **Create New**. Add a name for the URL match entry and enter the URL or URL pattern. You can use wildcards such as * and ? and you can use a numeric IP address. Select **Forward to Server** and select a web proxy forwarding server from the list.

You can also exempt the URL or URL pattern from web caching.

Use the following command to forward all .ca traffic to a proxy server and all .com traffic to another proxy server.

```
config web-proxy url-match
   edit "com"
      set forward-server "server-commercial"
      set url-pattern "com"
   next
   edit "ca"
      set forward-server "server-canada"
      set url-pattern "ca"
   next
   edit "www.google.ca"
      set cache-exemption enable
      set url-pattern "www.google.ca"
   next
end
```

Exempting web sites from web caching

You may want to exempt some URLs from web caching for a number of reasons. For example, if your users access websites that are not compatible with FortiGate web caching you can add the URLs of these web sites to the web caching exempt list. You can add URLs and numeric IP addresses to the web cache exempt list.

You can also add URLs to the web cache exempt list by going to **System > Network > Explicit Proxy** and selecting **Create New**. Add a URL pattern to be exempt and select **Exempt from Cache**.

You can also add URLs and addresses to be exempt from the CLI. Enter the following command to add www.example.com to the web cache exempt list.

```
config web-proxy url-match
   set cache-exemption enable
```

```
      set url-pattern www.example.com
   end
```

Exempting specific files from caching

You can exempt files from being cached, so long as you specify its full URL. Enter the following command to add the URL, with the file extension (in this example, `.exe`), to the web cache exempt list:

```
config web-proxy url-match
   edit "exe"
      set url-pattern "iavs9x.u.avast.com/custom/iavs9x/20160613t1237z/avast_free_
          antivirus_setup_online.exe"
      set cache-exemption enable
   next
end
```

You cannot use wildcards to exempt file extensions in general from caching.

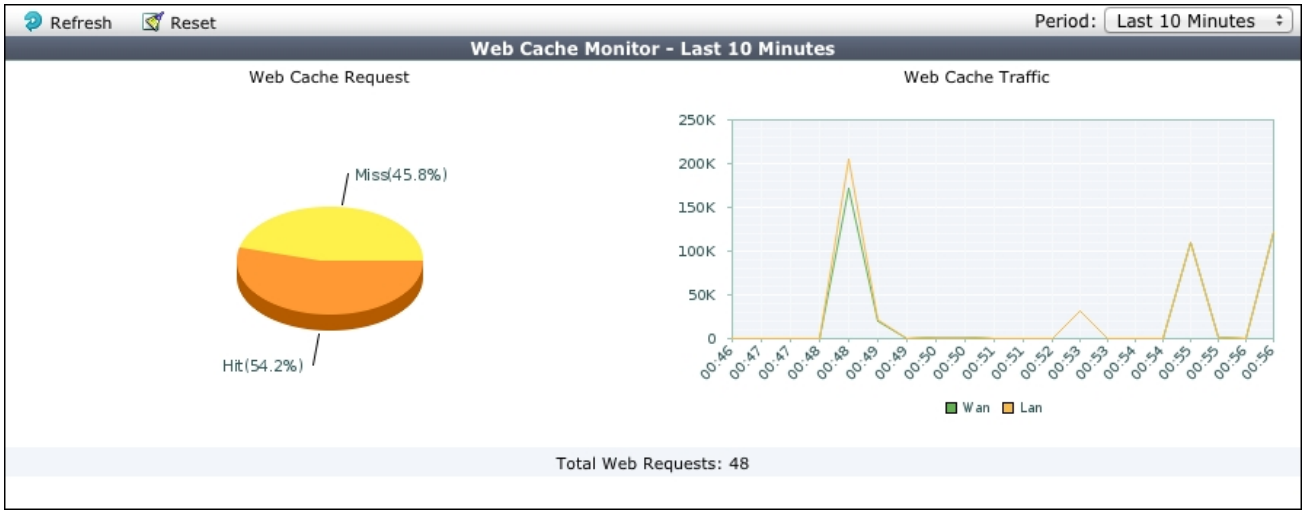
Monitoring Web caching performance

The web cache monitor shows the percentage of web cache requests that retrieved content from the cache (hits) and the percentage that did not receive content from the cache (misses). A higher the number of hits usually indicates that the web cache is being more effective at reducing WAN traffic.

The web cache monitor also shows a graph of web traffic on the WAN and LAN. A lower WAN line on the graph indicates the web cache is reducing traffic on the WAN. The web cache monitor also displays the total number of web requests processed by the web cache.

To view the web cache monitor, go to **WAN Opt. & Cache > Monitor > Cache Monitor**.

Web cache monitor



Example Web caching of HTTP and HTTPS Internet content for users on an internal network

This example describes how to configure web caching of HTTP and HTTPS for users on a private network connecting to the Internet.

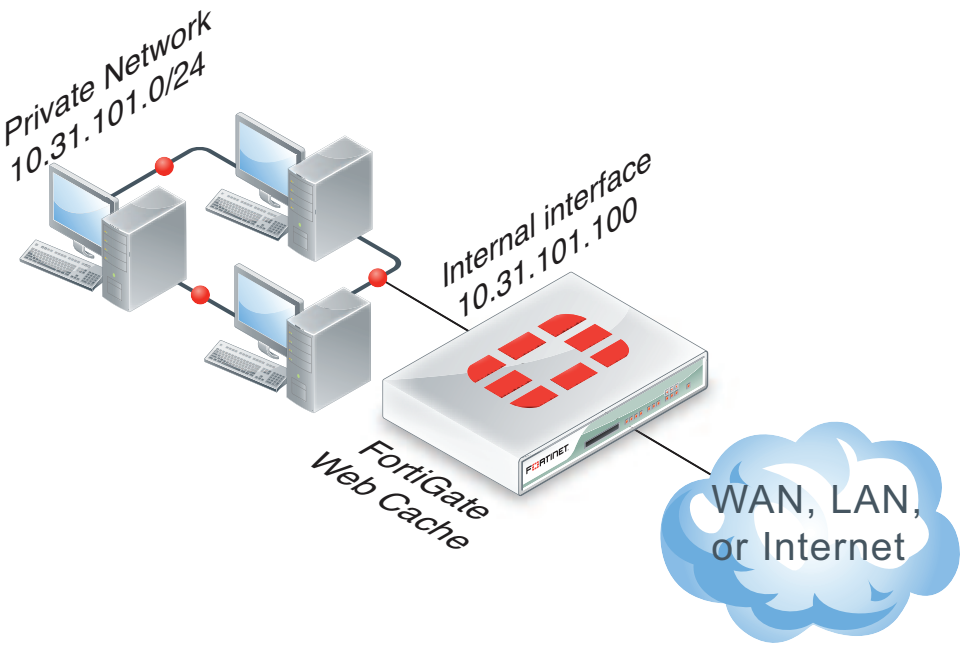
Network topology and assumptions

This example includes a client network with subnet address 10.31.101.0 connecting to web servers on the Internet. All of the users on the private network access the Internet though a single general security policy on the FortiGate unit that accepts all sessions connecting to the Internet. Web caching for HTTP and HTTPS traffic is added to this security policy.

Since users on the private network have unrestricted access to the Internet and can be accessing many web servers the `webcache-https` is set to `any` and users may see error messages on their web browsers when accessing HTTPS content.

Initially, security profiles are not selected so the example caches all HTTP traffic on TCP port 80 and HTTPS traffic on port 443. The example also describes how to configure the security policy to cache HTTP traffic on port 80 and 8080 by adding a proxy options profile that looks for HTTP traffic on TCP ports 80 and 8080. The example also describes how to configure the security policy to cache HTTPS traffic on port 443 and 8443 using the same proxy options profile.

Example web caching topology



General configuration steps

This section breaks down the configuration for this example into smaller procedures. For best results, follow the procedures in the order given:

1. Add HTTP web caching to the security policy that all users on the private network use to connect to the Internet.
2. Add HTTPS web caching.
3. Add a protocol options profile to look for HTTP traffic on ports 80 and 8080 and HTTPS traffic on ports 443 and 8443 and add this protocol options profile to the security policy.

If you perform any additional actions between procedures, your configuration may have different results.

Configuration Steps - web-based manager

Use the following steps to configure the example configuration from the FortiGate web-based manager.

To add HTTP web caching to a security policy

1. Go to **Policy & Objects > Policy > IPv4** and add a security policy that allows all users on the internal network to access the Internet.

Incoming Interface	Internal
Source Address	all
Outgoing Interface	wan1
Destination Address	all
Schedule	always
Service	ALL
Action	ACCEPT

2. Select **Enable NAT** and select **Use Destination Interface Address**.
3. Turn on **Web cache**.
4. Select **OK**.

To add HTTPS web caching

1. From the CLI enter the following command to add HTTPS web caching to the policy.

   Assume the index number of the policy is 5.

```
config firewall policy
  edit 5
    set webcache-https any
  end
```

To cache HTTP traffic on port 80 and 8080

1. Go to **Policy & Objects > Policy > Proxy Options** and edit the **default** proxy options profile.

   You could also add a new profile.
2. Under **Protocol Port Mapping** enable **HTTP** and under **Inspection Ports** enter **80,8080**.
3. Go to Policy & Objects > Policy > IPv4, edit the security policy and

To cache HTTPS traffic on ports 443 and 8443

1. Go to **Policy & Objects > Policy > SSL/SSH Inspection** and edit the **certificate-inspection** SSL/SSH inspection profile.

   You could also use the **deep-inspection** profile or add a new profile.
2. Under **SSL Inspection Options** select **Multiple Clients Connecting to Multiple Servers**.
3. Make sure **Inspect All Ports** is not selected.
4. Make sure **HTTPS** is turned on and enter **443,8443**.
5. From the CLI, enter the following command to add the **default** proxy options profile and the **certificate-inspection** SSL SSH profile to the firewall policy.

```
config firewall policy
   edit 5
      set utm-status enable
      set profile-protocol-options default
      set ssl-ssh-profile certificate-inspection
   end
```

You need to use the CLI to add the protocol options profile unless you also add a security profile that uses proxy-based inspection.

Configuration Steps - CLI

Use the following steps to configure the example configuration from the FortiGate CLI.

To add HTTP and HTTPS web caching to a security policy

1. Enter the following command to add a security policy that allows all users on the internal network to access the Internet and that includes web caching of HTTP and HTTPS traffic.

```
config firewall policy
   edit 0
      set srcintf internal
      set srcaddr all
      set dstintf wan1
      set distinf all
      set schedule always
      set service ANY
      set action accept
      set nat enable
      set webcache enable
      set webcache-https any
   end
```

To cache HTTP traffic on port 80 and 8080 and HTTPS traffic on ports 443 and 8443

1. Enter the following command to edit the **default** proxy options profile to configure it to look for HTTP traffic on ports 80 and 8080:

```
config firewall profile-protocol-options
   edit default
      config http
```

```
      set status enable
      set ports 80 8080
   end
```

2. Enter the following command to edit the **certification-inspection** SSL SSH options profile to configure it to look for HTTPS traffic on ports 443 and 8443:

```
config firewall ssl-ssh-profile
   edit certificate-inspection
      config https
         set status certificate-inspection
         set ports 443 8443
      end
```

3. Enter the following command to add the **default** proxy options profile and the **certificate-inspection** SSL SSH profile to the firewall policy.

```
config firewall policy
   edit 5
      set utm-status enable
      set profile-protocol-options default
      set ssl-ssh-profile certificate-inspection
   end
```

Example reverse proxy web caching and SSL offloading for an Internet web server using a static one-to-one virtual IP

This section describes configuring SSL offloading for a reverse proxy web caching configuration using a static one-to-one firewall virtual IP (VIP). While the static one-to-one configuration described in this example is valid, its also common to change the destination port of the unencrypted HTTPS traffic to a commonly used HTTP port such as 8080 using a port forwarding virtual IP.

Network topology and assumptions

In this configuration, clients on the Internet use HTTP and HTTPS to browse to a web server that is behind a FortiGate unit. A policy added to the FortiGate unit forwards the HTTP traffic to the web server. The policy also offloads HTTPS decryption and encryption from the web server so the web server only sees HTTP traffic.

The FortiGate unit also caches HTTP and HTTPS pages from the web server so when users access cached pages the web server does not see the traffic. Replies to HTTPS sessions are encrypted by the FortiGate unit before returning to the clients.

In this configuration, the FortiGate unit is operating as a web cache in reverse proxy mode. Reverse proxy caches can be placed directly in front of a web server. Web caching on the FortiGate unit reduces the number of requests that the web server must handle, therefore leaving it free to process new requests that it has not serviced before.

Using a reverse proxy configuration:

- avoids the capital expense of additional web servers by increasing the capacity of existing servers
- serves more requests for static content from web servers
- serves more requests for dynamic content from web servers
- reduces operating expenses including the cost of bandwidth required to serve content
- accelerates the response time of web servers and of page download times to end users.

When planning a reverse proxy implementation, the web server's content should be written so that it is “cache aware” to take full advantage of the reverse proxy cache.

In reverse proxy mode, the FortiGate unit functions more like a web server for clients on the Internet. Replicated content is delivered from the proxy cache to the external client without exposing the web server or the private network residing safely behind the firewall.

In this example, the site URL translates to IP address 192.168.10.1, which is the port2 IP address of the FortiGate unit. The port2 interface is connected to the Internet.

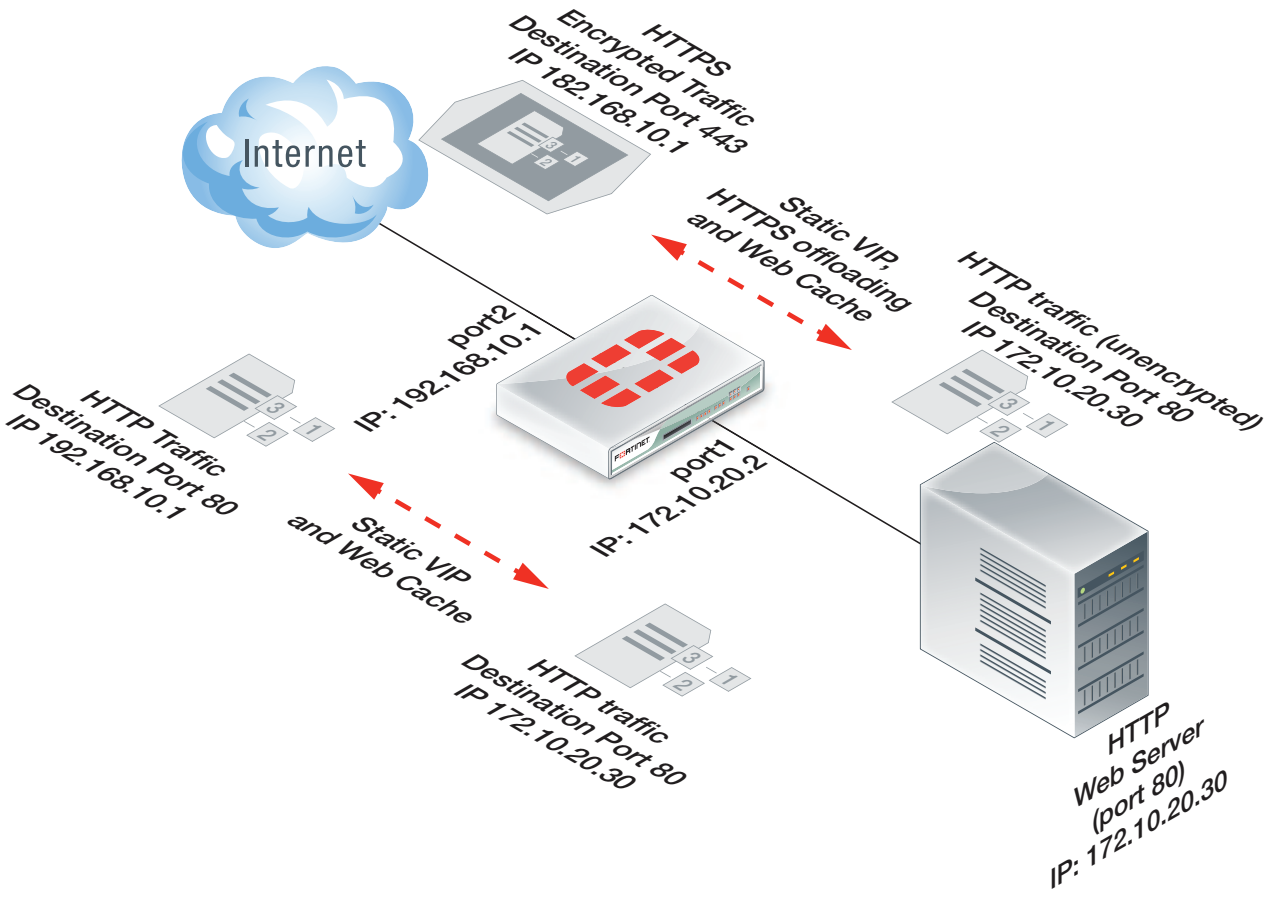
This example assumes that all HTTP traffic uses port 80 and all HTTPS traffic uses port 443.

The FortiGate unit includes the web server CA and an SSL server configuration for IP address 172.10.20.30 and port to 443. The name of the file containing the CA is Rev_Proxy_Cert_1.crt.

The destination address of incoming HTTP and HTTPS sessions is translated to the IP address of the web server using a static one-to-one virtual IP that performs destination address translation (DNAT) for the HTTP packets. The DNAT translates the destination address of the packets from 192.168.10.1 to 172.10.20.30 but does not change the destination port number.

When the SSL server on the FortiGate unit decrypts the HTTPS packets their destination port is changed to port 80.

Reverse proxy web caching and SSL offloading for an Internet web server using static one-to-one virtual IPs



General configuration steps

This section breaks down the configuration for this example into smaller procedures. For best results, follow the procedures in the order given:

1. Configure the FortiGate unit as a reverse proxy web cache server.
2. Configure the FortiGate unit for SSL offloading of HTTPS traffic.
3. Add an SSL server to offload SSL encryption and decryption for the web server.

Also note that if you perform any additional actions between procedures, your configuration may have different results.

Configuration steps - web-based manager

To configure the FortiGate unit as a reverse proxy web cache server

1. Go to **Policy & Objects > Objects > Virtual IPs** and select **Create New** to add a static NAT virtual IP that translates destination IP addresses from 192.168.10.1 to 172.10.20.30 (and does not translate destination ports):

VIP Type	IPv4 VIP
Name	Reverse_proxy_VIP
Interface	port2
Type	Static NAT
Source Address Filter	Do not select.
External IP Address/Range	192.168.10.1
Mapped IP Address/Range	172.10.20.30
Port Forwarding	Do not select.

2. Select **OK**.
3. Go to **Policy & Objects > Objects > IPv4** and select **Create New** to add a port2 to port1 security policy that accepts HTTP and HTTPS traffic from the Internet.

   Do not select security profiles. Set the destination address to the virtual IP. You do not have to enable NAT.

Incoming Interface	port2
Source Address	all
Outgoing Interface	port1
Destination Address	Reverse_proxy_VIP
Schedule	always

Service	HTTP HTTPS
Action	ACCEPT

4. Turn on **Web Cache**.
5. Select **OK**.
6. From the CLI enter the following command to add HTTPS web caching to the security policy

   Assume the index number of the policy is 5.

```
config firewall policy
   edit 5
      set webcache-https ssl-server
   end
```

To configure the FortiGate unit to offload SSL encryption and cache HTTPS content

1. Go to **System > Certificates > Local Certificates** and select **Import** to import the web server's CA.

   For **Type**, select **Local Certificate**. Select the **Browse** button to locate the file (example file name: Rev_Proxy_Cert_1.crt).

   The certificate key size must be 1024 or 2048 bits. 4096-bit keys are not supported.
2. Select **OK** to import the certificate.
3. From the CLI, enter the following command to add the SSL server and to add the server's certificate to the SSL server.

   The SSL server `ip` must match the destination address of the SSL traffic after being translated by the virtual IP (172.10.20.30) and the SSL server `port` must match the destination port of the SSL traffic (443). The SSL server operates in half mode since it performs a single-step conversion (HTTPS to HTTP or HTTP to HTTPS).

```
config firewall ssl-server
   edit rev_proxy_server
      set ip 172.10.20.30
      set port 443
      set ssl-mode half
      set ssl-cert Rev_Proxy_Cert_1
   end
```

Configuration steps - CLI

To configure the FortiGate unit as a reverse proxy web cache server

1. Enter the following command to add a static NAT virtual IP that translates destination IP addresses from 192.168.10.1 to 172.10.20.30 (and does not translate destination ports):

```
config firewall vip
   edit Reverse_proxy_VIP
      set extintf port2
      set type static-nat
      set extip 192.168.10.1
      set mappedip 172.10.20.30
   end
```

2. Enter the following command to add a port2 to port1 security policy that accepts HTTP and HTTPS traffic from the Internet. Enable web caching and HTTPS web caching.

   Do not select security profiles. Set the destination address to the virtual IP. You do not have to enable NAT.

```
config firewall policy
   edit 0
      set srcintf port2
      set srcaddr all
      set dstintf port1
      set dstaddr Reverse_proxy_VIP
      set schedule always
      set service HTTP HTTPS
      set action accept
      set webcache enable
      set webcache-https ssl-server
   end
```

To add an SSL server to offload SSL encryption and decryption for the web server

1. Place a copy of the web server's CA (file name Rev_Proxy_Cert_1.crt) in the root folder of a TFTP server.
2. Enter the following command to import the web server's CA from a TFTP server. The IP address of the TFTP server is 10.31.101.30:

```
execute vpn certificate local import tftp Rev_Proxy_Cert_1.crt 10.31.101.30
```

   The certificate key size must be 1024 or 2048 bits. 4096-bit keys are not supported.

3. From the CLI, enter the following command to add the SSL server.

   The SSL server `ip` must match the destination address of the SSL traffic after being translated by the virtual IP (172.10.20.30) and the SSL server `port` must match the destination port of the SSL traffic (443). The SSL server operates in half mode since it performs a single-step conversion (HTTPS to HTTP or HTTP to HTTPS).

```
config firewall ssl-server
   edit rev_proxy_server
      set ip 172.10.20.30
      set port 443
      set ssl-mode half
      set ssl-cert Rev_Proxy_Cert_1
   end
```

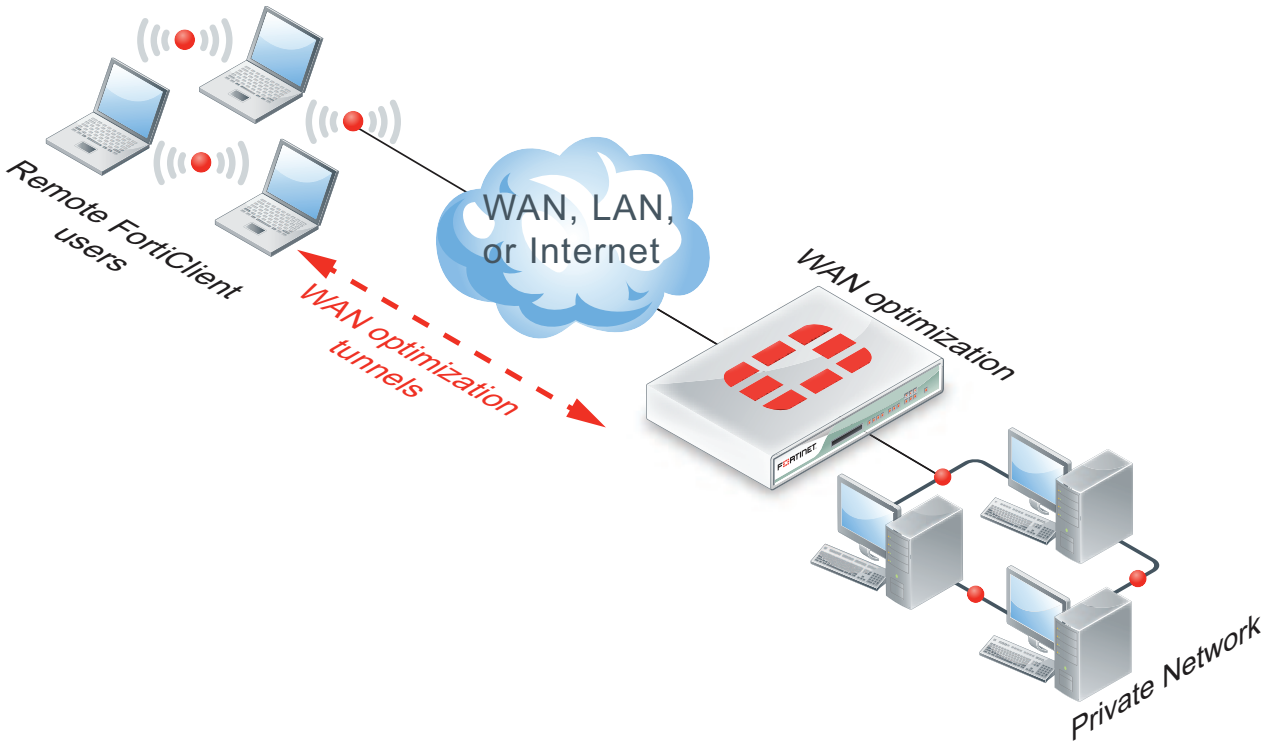
4. Configure other `ssl-server` settings that you may require for your configuration.

FortiClient WAN optimization

FortiClient WAN optimization supports protocol optimization and byte caching in IPsec VPN and SSL VPN tunnels between FortiClient and a FortiGate unit. To add WAN optimization to FortiClient, configure FortiClient Advanced settings and enable WAN optimization. This setting can then apply WAN optimization to any IPsec or SSL VPN tunnel between FortiClient and FortiGate, if the FortiGate IPsec or SSL VPN configuration also includes WAN optimization.

When FortiClient with WAN optimization enabled attempts to connect a server-side FortiGate unit, FortiClient automatically detects if WAN optimization has been added to the FortiGate tunnel configuration. If WAN optimization is detected and FortiClient can successfully negotiate with the FortiGate unit, WAN optimization starts.

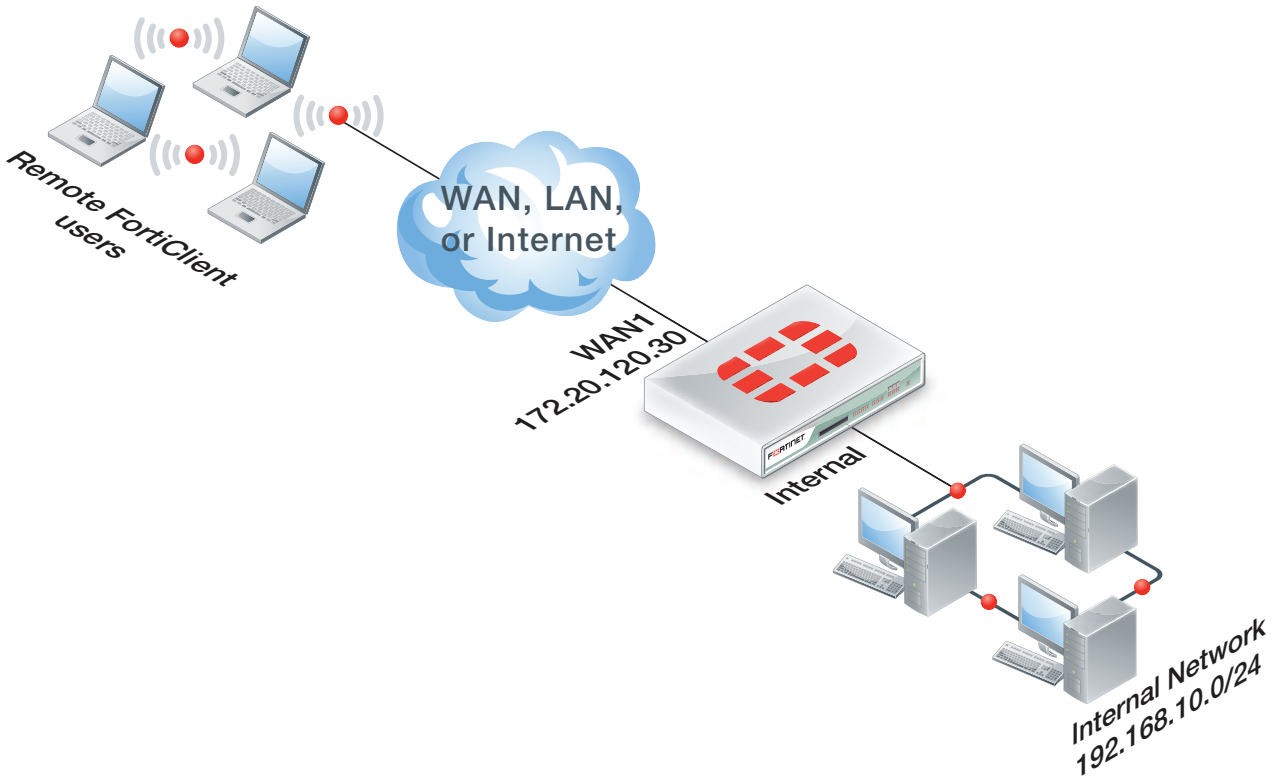
FortiClient WAN optimization topology



FortiClient WAN optimization over IPsec VPN configuration example

This example shows how to add WAN optimization to a FortiClient IPsec VPN. The IPsec VPN tunnel allows remote FortiClient users to connect to the internal network behind the FortiGate unit.

Example FortiClient WAN optimization configuration



To configure the FortiGate unit

Because computers running FortiClient can have IP addresses that change often, it is usually not practical to add FortiClient peers to the FortiGate WAN optimization peer list. Instead, a FortiGate unit that accepts WAN optimization tunnel requests from FortiClient is usually configured to accept any peer. This example does this by adding a WAN optimization authentication group with **Peer acceptance** set to **Accept Any Peer**.

In addition this example includes a **wanopt** to **internal** policy to allow WAN optimization traffic reach the internal network. Finally passive WAN optimization is added to the ssl.root policy because WAN optimization is accepting traffic from the IPsec VPN tunnel.

1. Go to **WAN Opt. & Cache > WAN Opt. Peers > Authentication Groups** and select **Create New**.
2. Configure the WAN optimization authentication group:

Name	auth-fc
Authentication Method	Certificate
Certificate	Fortinet_Firmware
Peer Acceptance	Accept Any Peer

3. Select **OK**.

4. Go to **WAN Opt. & Cache > WAN Opt. Profiles > Profiles** and select **Create New** (select the + button).
5. Add a profile for FortiClient WAN optimization sessions:

Name	Fclient_Pro
Transparent Mode	Select
Authentication Group	auth-fc

6. Select any Protocols and any settings for each protocol.
7. Select **OK**.
8. Go to **Policy& Objects > Objects > Addresses** and select **Create New** to add a firewall address for the internal network that FortiClient users can access.

Category	Address
Address Name	Internal-Server-Net
Type	IP Range
Subnet / IP Range	192.168.10.0/24
Interface	internal

9. Enter the following CLI command to add an explicit proxy policy to accept WAN optimization tunnel connections.

```
configure firewall explicit-proxy-policy
   edit 0
      set proxy wanopt
      set dstintf internal
      set srcaddr all
      set dstaddr all
      set action accept
      set schedule always
      set service ALL
   next
end
```

To set up IPsec VPN to support WAN optimization

1. Go to **VPN > IPsec > Wizard**, enter a **Name** for the IPsec VPN and select **Dialup - FortiClient (Windows, Mac OS, Android)**.
2. Follow the wizard steps to configure the VPN. No special WAN optimization settings are required.
3. Go to **Policy & Objects > Policy > IPv4** and edit the policy created by the wizard.

   This policy has the IPsec VPN interface created by the wizard as the source interface.
4. Turn on **WAN Optimization** and configure the following settings:

Enable WAN Optimization	passive
Passive Option	default

5. Select **OK**.

To configure FortiClient and start the WAN optimization SSL VPN connection

1. Open FortiClient, configure **Advanced** settings, and select **Enable WAN optimization**.
2. Add a new IPsec VPN connection.

   Set the Server to the WAN1 IP address of the FortiGate unit (172.20.120.30 in this example).

   No other settings are required for this example. You can add authentication in the form of a user name and password if required by the FortiGate unit.
3. Start the IPsec VPN tunnel.

   You should be connected to the IPsec VPN tunnel and traffic in it should be optimized.

The FortiGate explicit web proxy

You can use the FortiGate explicit web proxy to enable explicit proxying of IPv4 and IPv6 HTTP, and HTTPS traffic one or more FortiGate interfaces. The explicit web proxy also supports proxying FTP sessions from a web browser and proxy auto-config (PAC) to provide automatic proxy configurations for explicit web proxy users. From the CLI you can also configure the explicit web proxy to support SOCKS sessions from a web browser.

The explicit web and FTP proxies can be operating at the same time on the same or on different FortiGate interfaces.

If explicit web proxy options are not visible on the web-based manager, go to **System > Config > Features** and turn on **Explicit Proxy**.

In most cases you would configure the explicit web proxy for users on a network by enabling the explicit web proxy on the FortiGate interface connected to that network. Users on the network would configure their web browsers to use a proxy server for HTTP and HTTPS, FTP, or SOCKS and set the proxy server IP address to the IP address of the FortiGate interface connected to their network. Users could also enter the PAC URL into their web browser PAC configuration to automate their web proxy configuration using a PAC file stored on the FortiGate unit.

Enabling the explicit web proxy on an interface connected to the Internet is a security risk because anyone on the Internet who finds the proxy could use it to hide their source address.

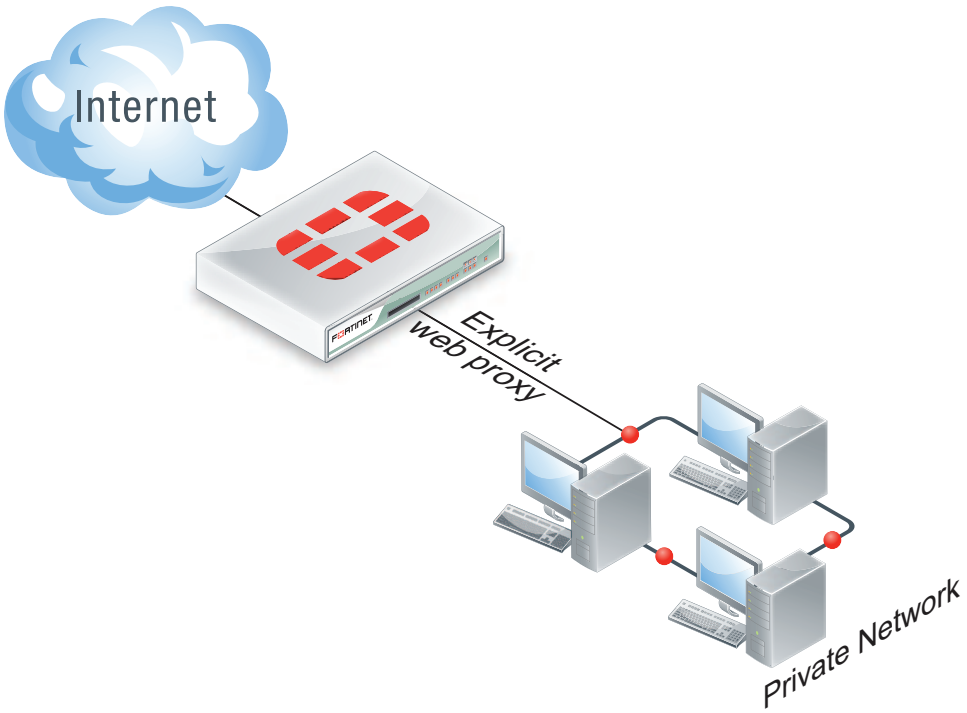
If the FortiGate unit is operating in Transparent mode, users would configure their browsers to use a proxy server with the FortiGate management IP address.

If the FortiGate unit is operating with multiple VDOMs the explicit web proxy is configured for each VDOM.

The web proxy receives web browser sessions to be proxied at FortiGate interfaces with the explicit web proxy enabled. The web proxy uses FortiGate routing to route sessions through the FortiGate unit to a destination interface. Before a session leaves the exiting interface, the explicit web proxy changes the source addresses of the session packets to the IP address of the exiting interface. When the FortiGate unit is operating in Transparent mode the explicit web proxy changes the source addresses to the management IP address. You can configure the explicit web proxy to keep the original client IP address. See Preventing the explicit web proxy from changing source addresses on page 2914.

For more information about explicit web proxy sessions, see Explicit web proxy sessions and user limits on page 2920.

Example explicit web proxy topology



To allow all explicit web proxy traffic to pass through the FortiGate unit you can set the explicit web proxy default firewall policy action to accept. However, in most cases you would want to use security policies to control explicit web proxy traffic and apply security features such as access control/authentication, virus scanning, web filtering, application control, and traffic logging. You can do this by keeping the default explicit web proxy security policy action to deny and then adding web-proxy security policies.

You can also change the explicit web proxy default security policy action to accept and add explicit web proxy security policies. If you do this, sessions that match web-proxy security policies are processed according to the security policy settings. Connections to the explicit web proxy that do not match a web-proxy security policy are allowed with no restrictions or additional security processing. This configuration is not recommended and is not a best practice.

Web-proxy policies can selectively allow or deny traffic, apply authentication, enable traffic logging, and use security profiles to apply virus scanning, web filtering, IPS, application control, DLP, and SSL/SSH inspection to explicit web proxy traffic.

You cannot configure IPsec, SSL VPN, or Traffic shaping for explicit web proxy traffic. Web Proxy policies can only include firewall addresses not assigned to a FortiGate unit interface or with interface set to **Any**. (On the web-based manager you must set the interface to **Any**. In the CLI you must `unset` the `associated-interface`.)

Authentication of explicit web proxy sessions uses HTTP authentication and can be based on the user's source IP address or on cookies from the user's web browser. For more information, see Explicit web proxy authentication on page 2909.

To use the explicit web proxy, users must add the IP address of a FortiGate interface on which the explicit web proxy is enabled and the explicit web proxy port number (default 8080) to the proxy configuration settings of their web browsers.

On FortiGate units that support it, you can also enable web caching for explicit web proxy sessions.

General explicit web proxy configuration steps

You can use the following general steps to configure the explicit web proxy.

To enable the explicit web proxy - web-based manager:

1. Go to **System > Network > Explicit Proxy**. Select **HTTP/HTTPS** beside **Enable Explicit Web Proxy** to turn on the explicit web proxy for IPv4 HTTP and HTTPS traffic.

   You can also select FTP to enable the web proxy for FTP over HTTP sessions in a web browser (not an FTP client) and PAC to enable automatic proxy configuration.

   You can also optionally change the HTTP port that the proxy listens on (the default is 8080) and optionally specify different ports for HTTPS, FTP, and PAC.
2. Optionally select **Enable IPv6 Explicit Proxy** to turn on the explicit web proxy for IPv6 traffic.

If you enable both the IPv4 and the IPv6 explicit web proxy you can combine IPv4 and IPv6 addresses in a single explicit web proxy policy to allow both IPv4 and IPv6 traffic through the proxy.

3. Select **Apply**.

   The default explicit web proxy configuration has **Default Firewall Policy Action** set to Deny and requires you to add a security policy to allow access to the explicit web proxy. This configuration is recommended as a best practice because you can use security policies to control access to the explicit web proxy and also apply security features such as logging, UTM, and authentication (by adding identity-based policies).
4. Go to **System > Network > Interface** and select one or more interfaces for which to enable the explicit web proxy. Edit the interface and select **Enable Explicit Web Proxy**.

Enabling the explicit web proxy on an interface connected to the Internet is a security risk because anyone on the Internet who finds the proxy could use it to hide their source address. If you enable the proxy on such an interface make sure authentication is required to use the proxy.

5. Go to **Policy & Objects > Objects > Addresses** and select **Create New** to add a firewall address that matches the source address of packets to be accepted by the explicit proxy.

Category	Address
Name	Internal_subnet
Type	IP Range

Subnet / IP Range	10.31.101.1 - 10.31.101.255
Interface	any*

*The **Interface** must be set to **Any**.

You can also set the **Type** to **URL Pattern (Explicit Proxy)** to add a destination URL that is only used by the explicit proxy. For example, to create an explicit policy that only allows access to Fortinet.com:

Category	Address
Name	Fortinet-web-sites
Type	URL Pattern (Explicit Proxy)
URL Pattern	fortinet.com
Interface	any

6. Go to **Policy & Objects > Policy > Explicit Proxy** and select **Create New.** Configure the policy as required to accept the traffic that you want to be allowed to use the explicit web proxy.

   The source address of the policy must match the client's source IP addresses. The interface of this firewall address must be set to **any**.

   The destination address of the policy should match the IP addresses of web sites that clients are connecting to. Usually the destination address would be **all** if proxying Internet web browsing. You could also specify a URL firewall address to limit the policy to allowing access to this URL.

   If **Default Firewall Policy Action** is set to **Deny**, traffic sent to the explicit web proxy that is not accepted by a web-proxy policy is dropped. If **Default Firewall Policy Action** is set to **Allow** then all web-proxy sessions that don't match with a security policy are allowed.

   For example, the following security policy allows users on an internal network to access fortinet.com websites through the wan1 interface of a FortiGate unit.

Explicit Proxy Type	Web
Source Address	Internal_subnet
Outgoing Interface	wan1
Destination Address	Fortinet-web-sites
Schedule	always
Action	ACCEPT

   Add security profiles as required.

7. Select Create New to add another explicit web proxy and set the **Action** to **AUTHENTICATE** to require authentication to access the explicit web proxy. For example:

Explicit Proxy Type	Web
Source Address	Internal_subnet
Outgoing Interface	wan1
Destination Address	Fortinet-web-sites
Schedule	always
Action	AUTHENTICATE

Select **Create New** to add an **Authentication Rule** and configure the rule as follows:

Groups	Proxy-Group
Source User(s)	(optional)
Schedule	always

Add security profiles as required and select **OK**.

You can add multiple user identity policies to apply different authentication for different user groups and users and also apply different UTM and logging settings for different user groups.

You can change the **User Authentication Options** if required. In most cases you can accept the defaults.

8. Optionally enable Web Caching.
9. Select **OK**.

To enable the explicit web proxy - CLI:

1. Enter the following command to turn on the IPv4 and IPv6 explicit web proxy for HTTP and HTTPS traffic.

```
config web-proxy explicit
   set status enable
   set ipv6-status enable
end
```

You can also enter the following command to enable the web proxy for FTP sessions in a web browser.

```
config web-proxy explicit
   set ftp-over-http enable
end
```

The default explicit web proxy configuration has `sec-default-action` set to `deny` and requires you to add a security policy to allow access to the explicit web proxy.

2. Enter the following command to enable the explicit web proxy for the internal interface.

```
config system interface
   edit internal
      set explicit-web-proxy enable
   end
end
```

3. Use the following command to add a firewall address that matches the source address of users who connect to the explicit web proxy.

```
config firewall address
   edit Internal_subnet
      set type iprange
      set start-ip 10.31.101.1
      set end-ip 10.31.101.255
   end
```

The source address for a web-proxy security policy cannot be assigned to a FortiGate interface.

4. Optionally use the following command to add a destination URL that is only used by the explicit proxy. For example, to create an explicit policy that only allows access to Fortinet.com:

```
config firewall address
   edit Fortinet-web-sites
      set type url
      set url fortinet.com
   end
```

5. Use the following command to add an explicit web proxy policy that allows all users on the internal subnet to use the explicit web proxy for connections through the wan1 interface to the Internet.

```
config firewall explicit-proxy-policy
   edit 0
      set proxy web
      set dstintf wan1
      set scraddr Internal_subnet
      set dstaddr all
      set action accept
      set service webproxy
      set schedule always
end
```

6. Use the following command to add an explicit web proxy policy that allows authenticated users on the internal subnet to use the explicit web proxy for connections through the wan1 interface to the Internet.

```
config firewall explicit-proxy-policy
   edit 0
      set proxy web
      set dstintf wan1
      set scraddr Internal_subnet
      set dstaddr Fortinet-web-sites
      set action accept
      set service webproxy
      set schedule always
      set identity-based enable
         config identity-based-policy
            edit 1
               set groups Proxy-group
               set schedule always
      end
end
```

7. Use the following command to change global web proxy settings, for example to set the maximum request length for the explicit web proxy to 10:

```
config web-proxy global
   set max-request-length 10
end
```

Proxy auto-config (PAC) configuration

A proxy auto-config (PAC) file defines how web browsers can choose a proxy server for receiving HTTP content. PAC files include the FindProxyForURL(url, host) JavaScript function that returns a string with one or more access method specifications. These specifications cause the web browser to use a particular proxy server or to connect directly.

To configure PAC for explicit web proxy users, you can use the port that PAC traffic from client web browsers use to connect to the explicit web proxy. explicit web proxy users must configure their web browser's PAC proxy settings to use the PAC port.

PAC File Content

You can edit the default PAC file from the web-based manager or use the following command to upload a custom PAC file:

```
config web-proxy explicit
   set pac-file-server-status enable
   set pac-file-data <pac_file_str>
end
```

Where <pac_file_str> is the contents of the PAC file. Enter the PAC file text in quotes. You can copy the contents of a PAC text file and paste the contents into the CLI using this option. Enter the command followed by two sets of quotes then place the cursor between the quotes and paste the file content.

The maximum PAC file size is 256 kbytes. If your FortiGate unit is operating with multiple VDOMs each VDOM has its own PAC file. The total amount of FortiGate memory available to store all of these PAC files 2 MBytes. If this limit is reached you will not be able to load any additional PAC files.

You can use any PAC file syntax that is supported by your users's browsers. The FortiGate unit does not parse the PAC file.

To use PAC, users must add an automatic proxy configuration URL (or PAC URL) to their web browser proxy configuration. The default FortiGate PAC file URL is:

```
http://<interface_ip>:<PAC_port_int>/<pac_file_str>
```

For example, if the interface with the explicit web proxy has IP address 172.20.120.122, the PAC port is the same as the default HTTP explicit web proxy port (8080) and the PAC file name is proxy.pac the PAC file URL would be:

```
http://172.20.120.122:8080/proxy.pac
```

From the CLI you can use the following command to display the PAC file URLs:

```
get web-proxy explicit
```

Unknown HTTP version

You can select the action to take when the proxy server must handle an unknown HTTP version request or message. Set unknown HTTP version to Reject or Best Effort. Best Effort attempts to handle the HTTP traffic as best as it can. Reject treats known HTTP traffic as malformed and drops it. The Reject option is more secure.

Authentication realm

You can enter an authentication realm to identify the explicit web proxy. The realm can be any text string of up to 63 characters. If the realm includes spaces enclose it in quotes. When a user authenticates with the explicit web

proxy the HTTP authentication dialog includes the realm so you can use the realm to identify the explicitly web proxy for your users.

Other explicit web proxy options

You can change the following explicit web proxy options as required by your configuration.

HTTP port, HTTPS port, FTP port, PAC port	The TCP port that web browsers use to connect to the explicit proxy for HTTP, HTTPS, FTP and PAC services. The default port is 8080 for all services. By default HTTPS, FTP. and PAC use the same port as HTTP. You can change any of these ports as required. Users configuring their web browsers to use the explicit web proxy should add the same port numbers to their browser configurations.
Proxy FQDN	Enter the fully qualified domain name (FQDN) for the proxy server. This is the domain name to enter into browsers to access the proxy server.
Max HTTP request length	Enter the maximum length of an HTTP request in Kbytes. Larger requests will be rejected.
Max HTTP message length	Enter the maximum length of an HTTP message in Kbytes. Larger messages will be rejected.

Configuring an external IP address for the IPv4 explicit web proxy

You can use the following command to set an external IP address (or pool) that will be used by the explicit web proxy policy.

```
config web-proxy explicit
   set status enable
   set outgoing-ip <ip1> <ip2> ... <ipN>
end
```

Configuring an external IP address for the IPv6 explicit web proxy

You can use the following command to set an external IP address (or pool) that will be used by the explicit web proxy policy.

```
config web-proxy explicit
   set status enable
   set outgoing-ipv6 <ip1> <ip2> ... <ipN>
end
```

Restricting the IP address of the IPv4 explicit web proxy

You can use the following command to restrict access to the explicit web proxy using only one IP address. The IP address that you specify must be the IP address of an interface that the explicit HTTP proxy is enabled on. You might want to use this option if the explicit FTP proxy is enabled on an interface with multiple IP addresses.

For example, to require uses to connect to the IP address 10.31.101.100 to connect to the explicit HTTP proxy:

```
config web-proxy explicit
   set incoming-ip 10.31.101.100
end
```

Restricting the outgoing source IP address of the IPv4 explicit web proxy

You can use the following command to restrict the source address of outgoing web proxy packets to a single IP address. The IP address that you specify must be the IP address of an interface that the explicit HTTP proxy is enabled on. You might want to use this option if the explicit HTTP proxy is enabled on an interface with multiple IP addresses.

For example, to restrict the outgoing packet source address to 172.20.120.100:

```
config http-proxy explicit
   set outgoing-ip 172.20.120.100
end
```

Restricting the IP address of the explicit IPv6 web proxy

You can use the following command to restrict access to the IPv6 explicit web proxy to use only one IP6 IP address. The IPv6 address that you specify must be the IPv6 address of an interface that the explicit HTTP proxy is enabled on. You might want to use this option if the explicit web proxy is enabled on an interface with multiple IPv6 addresses.

For example, to require uses to connect to the IPv6 address 2001:db8:0:2::30 to connect to the explicit IPv6 HTTP proxy:

```
config web-proxy explicit
   set incoming-ipv6 2001:db8:0:2::30
end
```

Restricting the outgoing source IP address of the IPv6 explicit web proxy

You can use the following command to restrict the source address of outgoing web proxy packets to a single IPv6 address. The IP address that you specify must be the IPv6 address of an interface that the explicit HTTP proxy is enabled on. You might want to use this option if the explicit HTTP proxy is enabled on an interface with multiple IPv6 addresses.

For example, to restrict the outgoing packet source address to 2001:db8:0:2::50:

```
config http-proxy explicit
   set outgoing-ip6 2001:db8:0:2::50
end
```

Proxy chaining (web proxy forwarding servers)

For the explicit web proxy you can configure web proxy forwarding servers to use proxy chaining to redirect web proxy sessions to other proxy servers. Proxy chaining can be used to forward web proxy sessions from the FortiGate unit to one or more other proxy servers on your network or on a remote network. You can use proxy chaining to integrate the FortiGate explicit web proxy with an web proxy solution that you already have in place.

A FortiGate unit can forward sessions to most web proxy servers including a remote FortiGate unit with the explicit web proxy enabled. No special configuration of the explicit web proxy on the remote FortiGate unit is required.

You can deploy the explicit web proxy with proxy chaining in an enterprise environment consisting of small satellite offices and a main office. If each office has a FortiGate unit, users at each of the satellite offices can use

their local FortiGate unit as an explicit web proxy server. The satellite office FortiGate units can forward explicit web proxy sessions to an explicit web proxy server at the central office. From here the sessions can connect to web servers on the Internet.

FortiGate proxy chaining does not support authenticating with the remote forwarding server.

Adding a web proxy forwarding server

To add a forwarding server, select **Create New** in the **Web Proxy Forwarding Servers** section of the **Explicit Proxy** page by going to **System > Network > Explicit Proxy**.

Server Name	Enter the name of the forwarding server.
Proxy Address	Enter the IP address of the forwarding server.
Proxy Address Type	Select the type of IP address of the forwarding server. A forwarding server can have an FQDN or IP address.
Port	Enter the port number on which the proxy receives connections. Traffic leaving the FortiGate explicit web proxy for this server has its destination port number changed to this number.
Server Down action	Select what action the explicit web proxy to take if the forwarding server is down. **Block** means if the remote server is down block traffic. **Use Original Server** means do not forward traffic to the forwarding sever but instead forward it from the FortiGate to its destination. In other words operate as if there is no forwarding server configured.
Enable Health Monitor	Select to enable health check monitoring and enter the address of a remote site. See "Web proxy forwarding server monitoring and health checking".
Health Check Monitor Site	

Use the following CLI command to add a web proxy forwarding server named `fwd-srv` at address `proxy.example.com` and port 8080.

```
config web-proxy forward-server
   edit fwd-srv
      set addr-type fqdn
      set fqdn proxy.example.com

      set port 8080
   end
```

Web proxy forwarding server monitoring and health checking

By default, a FortiGate unit monitors web proxy forwarding server by forwarding a connection to the remote server every 10 seconds. If the remote server does not respond it is assumed to be down. Checking continues and when the server does send a response the server is assumed to be back up. If you configure health checking, every 10

seconds the FortiGate unit attempts to get a response from a web server by connecting through the remote forwarding server.

You can configure health checking for each remote server and specify a different website to check for each one.

If the remote server is found to be down you can configure the FortiGate unit to block sessions until the server comes back up or to allow sessions to connect to their destination, bypassing the remote forwarding server. You cannot configure the FortiGate unit to fail over to another remote forwarding server.

Configure the server down action and enable health monitoring from the web-based manager by going to **System > Network > Explicit Proxy**, selecting a forwarding server, and changing the server down action and changing the health monitor settings.

Use the following CLI command to enable health checking for a web proxy forwarding server and set the server down option to bypass the forwarding server if it is down.

```
config web-proxy forward-server
   edit fwd-srv
      set healthcheck enable
      set monitor http://example.com
      set server-down-option pass
   end
```

Grouping forwarding servers and load balancing traffic to them

You can add multiple web proxy forwarding servers to a forwarding server group and then add the server group to an explicit web proxy policy instead of adding a single server. Forwarding server groups are created from the FortiGate CLI but can be added to policies from the web-based manager (or from the CLI).

When you create a forwarding server group you can select a load balancing method to control how sessions are load balanced to the forwarding servers in the server group. Two load balancing methods are available:

- **Weighted** load balancing sends more sessions to the servers with higher weights. You can configure the weight for each server when you add it to the group.
- **Least-session** load balancing sends new sessions to the forwarding server that is processing the fewest sessions.

When you create a forwarding server group you can also enable **affinity**. Enable affinity to have requests from the same client processed by the same server. This can reduce delays caused by using multiple servers for a single multi-step client operation. Affinity takes precedence over load balancing.

You can also configure the behavior of the group if all of the servers in the group are down. You can select to **block** traffic or you can select to have the traffic **pass** through the FortiGate explicit proxy directly to its destination instead of being sent to one of the forwarding servers.

Use the following command to add a forwarding server group that users weighted load balancing to load balance traffic to three forwarding servers. Server weights are configured to send most traffic to server2. The group has affinity enabled and blocks traffic if all of the forward servers are down:

```
config web-proxy forward-server
   edit server_1
      set ip 172.20.120.12
      set port 8080
   next
   edit server_2
      set ip 172.20.120.13
      set port 8000
   next
   edit server_3
```

```
        set ip 172.20.120.14
        set port 8090
    next
    end
config web-proxy forward-server-group
    edit New-fwd-group
        set affinity enable
        set ldb-method weight
        set group-down-option block
            config server-list
                edit server_1
                    set weight 10
                next
                edit server_2
                    set weight 40
                next
                edit server_3
                    set weight 10
                next
    end
```

Adding proxy chaining to an explicit web proxy policy

You enable proxy chaining for web proxy sessions by adding a web proxy forwarding server or server group to an explicit web proxy policy. In a policy you can select one web proxy forwarding server or server group. All explicit web proxy traffic accepted by this security policy is forwarded to the specified web proxy forwarding server or server group.

To add an explicit web proxy forwarding server - web-based manager:

1. Go to **Policy & Objects > Policy > Explicit Proxy** and select **Create New**.
2. Configure the policy:

Explicit Proxy Type	Web
Source Address	Internal_subnet
Outgoing Interface	wan1
Destination Address	all
Schedule	always
Action	ACCEPT
Web Proxy Forwarding Server	Select, fwd-srv

3. Select **OK** to save the security policy.

To add an explicit web proxy forwarding server - CLI:

1. Use the following command to add a security policy that allows all users on the 10.31.101.0 subnet to use the explicit web proxy for connections through the wan1 interface to the Internet. The policy forwards web proxy sessions to a remote forwarding server named `fwd-srv`

```
config firewall explicit-proxy-policy
   edit 0
      set proxy web
      set dstintf wan1
      set scraddr Internal_subnet
      set dstaddr all
      set action accept
      set schedule always
      set webproxy-forward-server fwd-srv
   end
```

Explicit web proxy authentication

You can add authentication to explicit web proxy policies to control access to the explicit web proxy and to identify users and apply different UTM features to different users.

Authentication of web proxy sessions uses HTTP basic and digest authentication as described in RFC 2617 (HTTP Authentication: Basic and Digest Access Authentication) and prompts the user for credentials from the browser allowing individual users to be identified by their web browser instead of IP address. HTTP authentication allows the FortiGate unit to distinguish between multiple users accessing services from a shared IP address.

You can also select IP-based authentication to authenticate users according to their source IP address in the same way as normal firewall policies.

IP-Based authentication

IP-based authentication applies authentication by source IP address. For the explicit web proxy, IP authentication is compatible with basic, digest, NTLM, FSSO, or RSSO authentication methods. Once a user authenticates, all sessions to the explicit web proxy from that user's IP address are assumed to be from that user and are accepted until the authentication timeout ends or the session times out.

This method of authentication is similar to standard (non-web proxy) firewall authentication and may not produce the desired results if multiple users share IP addresses (such as in a network that uses virtualization solutions or includes a NAT device between the users and the explicit web proxy).

To configure IP-based authentication, add an explicit web proxy security policy, set the **Action to AUTHENTICATION**, and select **Enable IP Based Authentication** is selected.

Use the following CLI command to add IP-based authentication to a web proxy security policy. IP-based authentication is selected by setting `ip-based` to `enable`.

```
config firewall explicit-proxy-policy
   edit 0
      set proxy web
      set scraddr User_network
      set dstintf port1
      set dstaddr all
      set action accept
      set identity-based enable
      set ip-based enable
         config identity-based-policy
            edit 0
               set groups Internal_users
               set users dwhite rlee
               set schedule always
            end
```

Per session authentication

If you don't select **IP Based** the explicit web proxy applies HTTP authentication per session. This authentication is browser-based. When a user enters a user name and password in their browser to authenticate with the explicit web proxy, this information is stored by the browser in a session cookie. Each new session started by the same web browser uses the session cookie for authentication. When the session cookie expires the user has to re-authenticate. If the user starts another browser on the same PC or closes and then re-opens their browser they have to authenticate again.

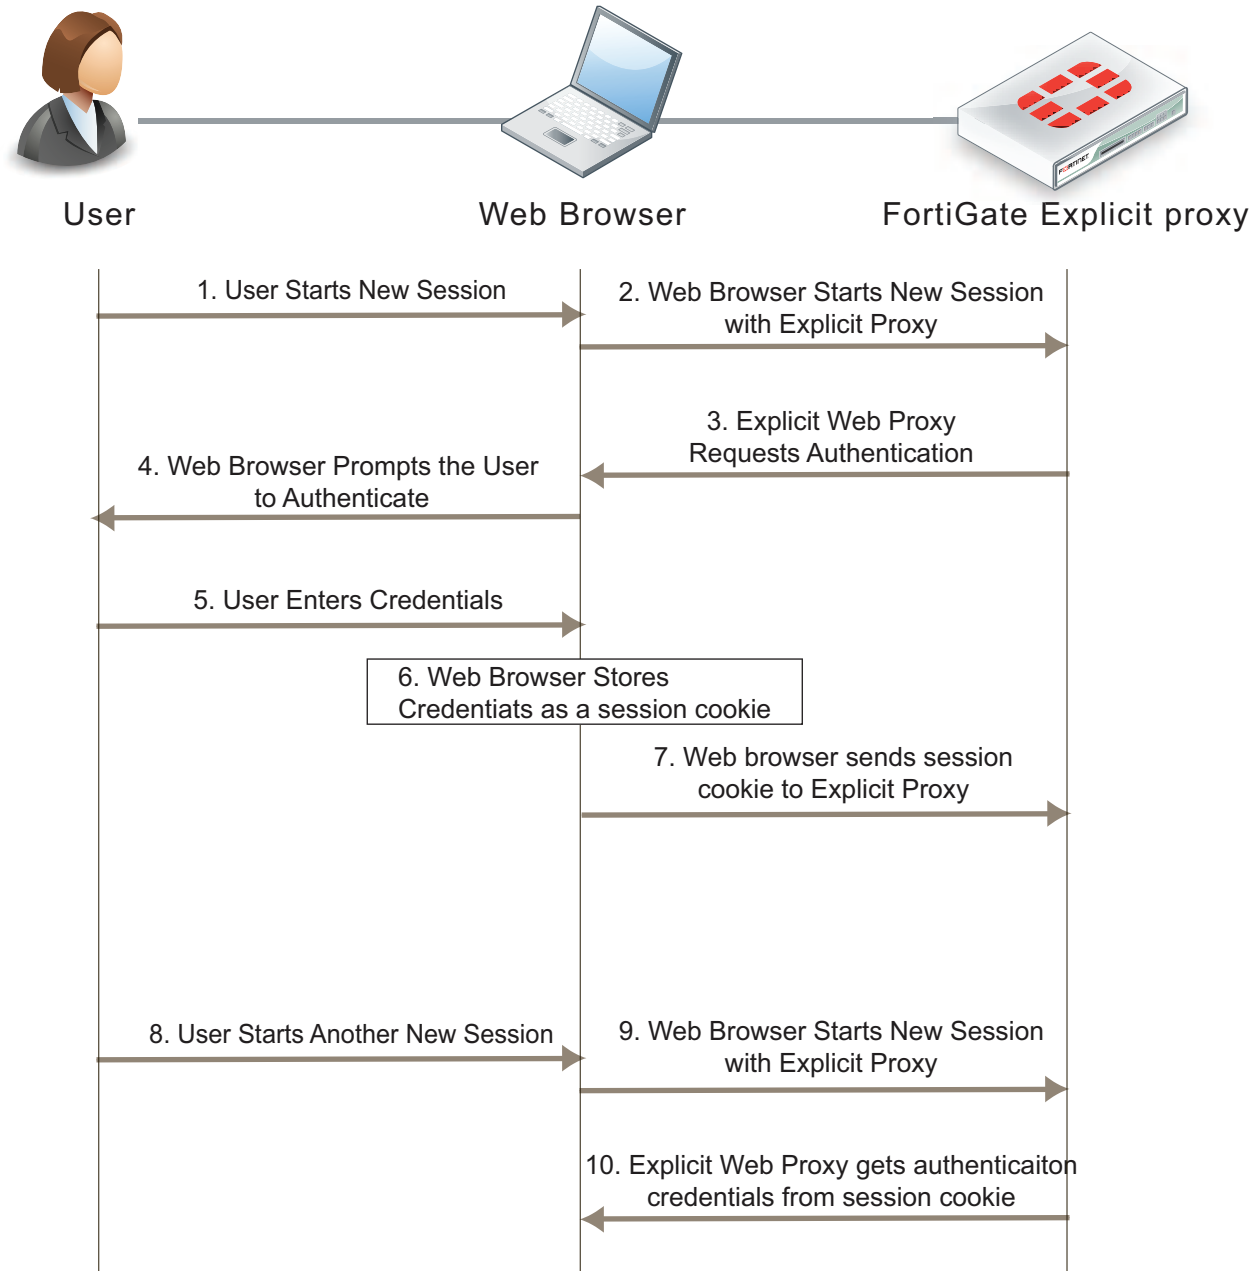
Since the authentication is browser-based, multiple clients with the same IP address can authenticate with the proxy using their own credentials. HTTP authentication provides authentication for multiple user sessions from the same source IP address. This can happen if there is a NAT device between the users and the FortiGate unit. HTTP authentication also supports authentication for other configurations that share one IP address among multiple users. These includes Citrix products and Windows Terminal Server and other similar virtualization solutions.

To configure per session authentication, add a explicit web proxy policy, set the **Action** to **AUTHENTICATE**, and make sure **Enable IP Based Authentication** is not selected.

Use the following CLI command to add per session authentication to a security policy. Per session authentication is selected by setting `ip-based` to `disable`.

```
config firewall explicit-proxy-policy
   edit 0
      set proxy web
      set scraddr User_network
      set dstintf port1
      set dstaddr all
      set action accept
      set identity-based enable
      set ip-based disable
         config identity-based-policy
            edit 0
               set groups Internal_users
               set users dwhite rlee
               set schedule always
            end
   end
```

Per session HTTP authentication



Transaction-based authentication

Multiple HTTP transactions (request/response) may be pipelined in the same TCP connection. Typically, all HTTP transactions of a TCP connection are considered as belonging to the same user. However, some devices (e.g., load balancers) may send HTTP transactions of different users to the same TCP connection and to explicit proxy. In order to support this deployment case, transaction-based authentication can be implemented to require each HTTP transaction to be authenticated separately.

To implement transaction-based authentication in the CLI:

```
config firewall explicit-proxy-policy
   edit <id>
      set transaction-based enable
   next
end
```

Security profiles, threat weight, device identification, and the explicit web proxy

You can apply all security profiles to explicit web proxy sessions. This includes antivirus, web filtering, intrusion protection (IPS), application control, data leak prevention (DLP), and SSL/SSH inspection. Security profiles are applied by selecting them in an explicit web proxy policy or in authentication rules added to web proxy policies.

Traffic accepted by explicit web proxy policies contributes to threat weight data.

The explicit web proxy is not compatible with device identification.

Since the traffic accepted by the explicit web proxy is known to be either HTTP, HTTPS, or FTP over HTTP and since the ports are already known by the proxy, the explicit web proxy does not use all of the SSL/SSH inspection options. The explicit web proxy does support the following proxy options:

- Enable chunked bypass
- HTTP oversized file action and threshold

The explicit web proxy does not support the following proxy options:

- Client comforting
- Server comforting
- Monitor content information from dashboard. URLs visited by explicit web proxy users are not added to dashboard usage and log and archive statistics widgets.

For explicit web proxy sessions, the FortiGate unit applies antivirus scanning to HTTP POST requests and HTTP responses. The FortiGate unit starts virus scanning a file in an HTTP session when it receives a file in the body of an HTML request. The explicit web proxy can receive HTTP responses from either the originating web server or the FortiGate web cache module.

Web Proxy firewall services and service groups

Configure web proxy services by selecting **Explicit Proxy** when configuring a service. Web proxy services can be selected in a explicit web proxy policy when adding one from the CLI. If you add a policy from the web-based manager the service is set to the **webproxy** service. The webproxy service should be used in most cases, it matches with any traffic with any port number. However, if you have special requirements, such as using a custom protocol type or a reduced port range or need to add an IP/FQDN to an explicit proxy service you can create custom explicit web proxy services.

Web proxy services are similar to standard firewall services. You can configure web proxy services to define one or more protocols and port numbers that are associated with each web proxy service. Web proxy services can also be grouped into web proxy service groups.

One way in which web proxy services differ from firewall services is the protocol type you can select. The following protocol types are available:

- ALL
- CONNECT
- FTP

- HTTP
- SOCKS-TCP
- SOCKS-UDP

To add a web proxy service go to **Policy & Objects > Objects > Services** and select **Create New**. Set **Service Type** to **Explicit Proxy** and configure the service as required.

To add a web proxy service from the CLI enter:

```
config firewall service custom
   edit my-socks-service
      set explicit-proxy enable
      set category Web Proxy
      set protocol SOCKS-TCP
      set tcp-portrange 3450-3490
   end
```

To add a web proxy service group go to **Policy & Objects > Objects > Services** and select **Create New > Service Group**. Set **Type** to **Explicit Proxy** and add web proxy services to the group as required.

To add a web proxy service group from the CLI enter:

```
config firewall service group
   edit web-group
      set explicit-proxy enable
      set member webproxy my-socks-service
   end
```

Explicit web proxy firewall address URL patterns

You can add URL pattern addresses and address groups to control the destination URLs that explicit proxy users can connect to. To add a URL pattern to go to **Policy & Objects > Objects > Addresses**, select **Create New** and set the Type to **URL Pattern (Explicit Proxy)**. Add a URL or URL pattern that defines the URL or URLs that explicit proxy users should be limited to. Set the **Interface** to **any**.

For example to limit access to a single website:

www.fortinet.com

To limit access to websites from the same domain:

google.com

To limit access to a part of a website:

www.apple.com/ipad/

To add a URL pattern group, create several URL pattern addresses then go to **Policy & Objects > Objects > Addresses**, select **Create New > Group** and add URL patterns to the address group.

Then when creating explicit web proxy policies, select the URL pattern addresses or groups as the destination address.

URL patterns and HTTPS scanning

For HTTPS traffic, URL patterns can only be matched up to the root path. For example, consider the following URL pattern:

www.apple.com/ipad/

If a proxy user browses using HTTP, this URL pattern limits their access the iPad pages of www.apple.com. However, if a proxy user browses using HTTPS, they will be able to access all pages on www.apple.com.

Changing HTTP headers

You can create explicit web proxy profiles that can add, remove and change HTTP headers. The explicit web proxy profile can be added to a web explicit proxy policy and will be applied to all of the HTTP traffic accepted by that policy.

You can change the following HTTP headers:

- client-ip
- via header for forwarded requests
- via header for forwarded responses
- x-forwarded-for
- front-end-https

For each of these headers you can set the action to:

- Pass to forward the traffic without changing the header
- Add to add the header
- Remove to remove the header

You can also configure how the explicit web proxy handles custom headers. The proxy can add or remove custom headers from requests or responses. If you are adding a header you can specify the content to be included in the added header.

Create web proxy profiles from the CLI:

```
config web-proxy profile
   edit <name>
      set header-client-ip {add | pass | remove}
      set header-via-request {add | pass | remove}
      set header-via-response {add | pass | remove}
      set header-x-forwarded-for {add | pass | remove}
      set header-front-end-https {add | pass | remove}
         config headers
            edit <id>
               set action {add-to-request | add-to-response | remove-from-request |
                   remove-from-response}
               set content <string>
               set name <name>
            end
   end
```

Use the following command to add a web proxy profile to an explicit proxy policy:

```
config firewall explicit-proxy-policy
   edit <id>
      set webproxy-profile <name>
   end
```

Preventing the explicit web proxy from changing source addresses

By default in NAT/Route mode the explicit web proxy changes the source address of packets leaving the FortiGate to the IP address of the FortiGate interface that the packets are exiting from. In Transparent mode the

source address is changed to the management IP.

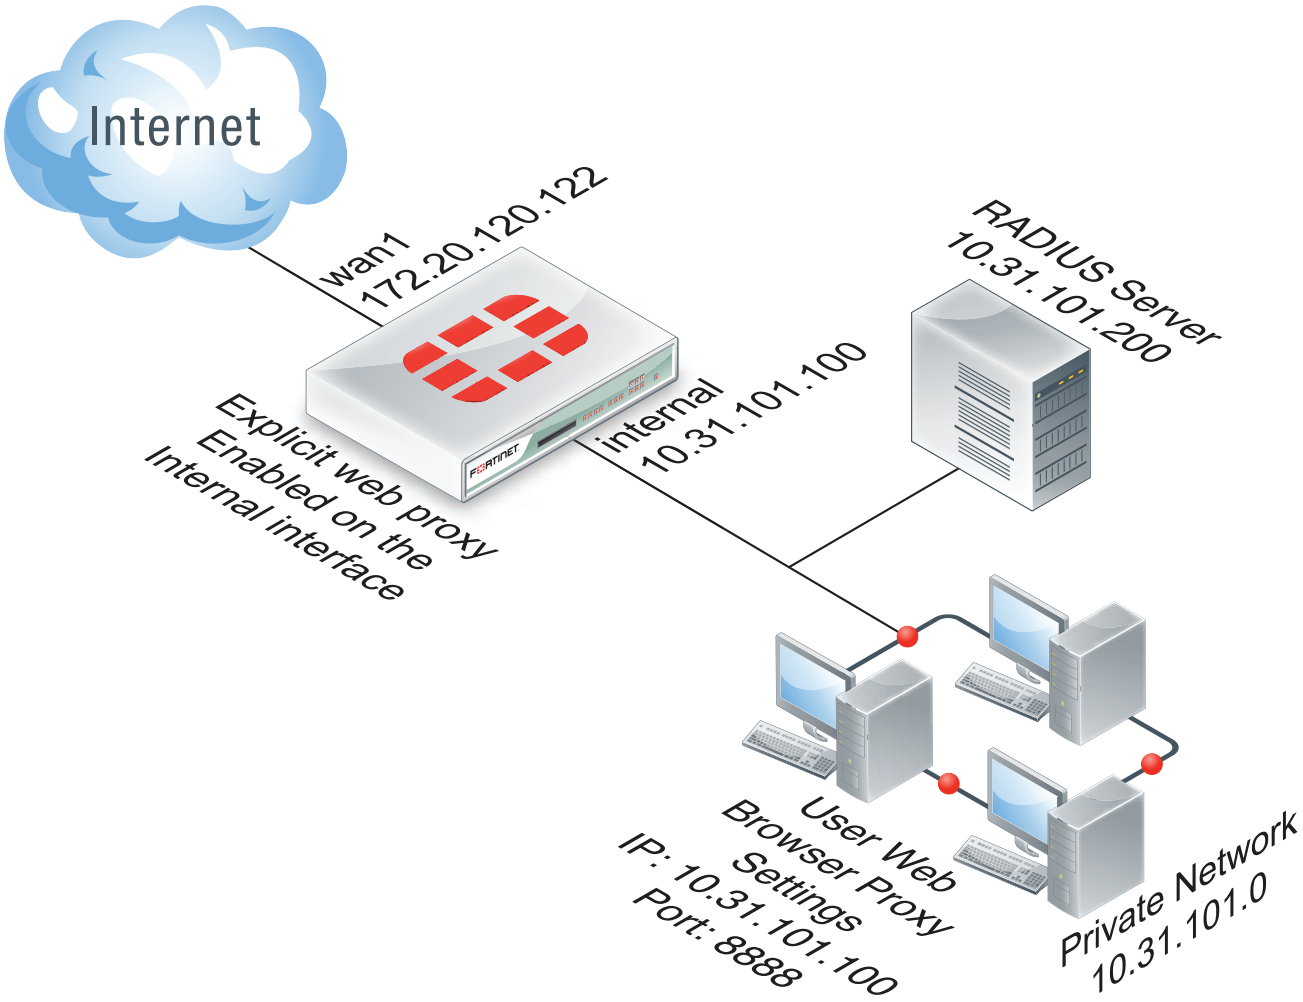
This configuration hides the IP addresses of clients and allows packets to return to the FortiGate unit interface without having to route packets from clients. You can use the following command to configure the explicit web proxy to keep the original client's source IP address:

```
config firewall explicit-proxy-policy
   edit 0
      set proxy web
      set transparent enable
   end
```

Example users on an internal network browsing the Internet through the explicit web proxy with web caching, RADIUS authentication, web filtering and virus scanning

This example describes how to configure the explicit web proxy for the example network shown below. In this example, users on the internal network connect to the explicit web proxy through the Internal interface of the FortiGate unit. The explicit web proxy is configured to use port 8888 so users must configure their web browser proxy settings to use port 8888 and IP address 10.31.101.100.

Example explicit web proxy network topology



Explicit web proxy users must authenticate with a RADIUS server before getting access to the proxy. The explicit proxy policy that accepts explicit web proxy traffic applies per session authentication and includes a RADIUS server user group. The authentication rule also applies web filtering and virus scanning.

General configuration steps

This section breaks down the configuration for this example into smaller procedures. For best results, follow the procedures in the order given:

1. Enable the explicit web proxy for HTTP and HTTPS and change the HTTP and HTTPS ports to 8888.
2. Enable the explicit web proxy on the internal interface.
3. Add a RADIUS server and user group for the explicit web proxy.
4. Add an authentication explicit proxy policy. Enable web caching. Add an authentication rule and enable antivirus and web filtering.

Configuring the explicit web proxy - web-based manager

Use the following steps to configure the explicit web proxy.

To enable and configure the explicit web proxy

1. Go to **System > Config > Features** and turn on the **Explicit Proxy** feature.
2. Go to **System > Network > Explicit Proxy** and change the following settings:

Enable Explicit Web Proxy	Select **HTTP/HTTPS**.
Listen on Interfaces	No change. This field will eventually show that the explicit web proxy is enabled for the Internal interface.
HTTP Port	8888
HTTPS Port	0
Realm	You are authenticating with the explicit web proxy.
Default Firewall Policy Action	Deny

3. Select **Apply**.

To enable the explicit web proxy on the Internal interface

1. Go to **System > Network > Interfaces**.
2. Edit the internal interface.
3. Select **Enable Explicit Web Proxy.**
4. Select **OK**.

To add a RADIUS server and user group for the explicit web proxy

1. Go to **User & Device > Authentication > RADIUS Servers** and select **Create New** to add a new RADIUS server:

Name	RADIUS_1
Primary Server Name/IP	10.31.101.200
Primary Server Secret	RADIUS_server_secret

2. Select **OK**.
3. Go to **User & Device > User > User Groups** and select **Create New** to add a new user group.

Name	Explict_proxy_user_group
Type	Firewall
Remote Groups	RADIUS_1
Group Name	Any

4. Select **OK**.

To add an explicit proxy policy

1. Go to **Policy & Objects > Objects > Addresses** and select **Create New**.
2. Add a firewall address for the internal network:

Category	Address
Name	Internal_subnet
Type	Subnet / IP Range
Subnet / IP Range	10.31.101.0
Interface	Any

3. Go to **Policy & Objects > Policy > Explicit Proxy** and select **Create New**.
4. Configure the explicit web proxy policy.

Explicit Proxy Type	Web
Source Address	Internal_subnet
Outgoing Interface	wan1
Destination Address	all
Action	AUTHENTICATE

5. Under **Configure Authentication Rules** select **Create New** to add an authentication rule:

Groups	Explicit_policy

Source User(s)	Leave blank
Schedule	always

6. Turn on **Antivirus** and **Web Filter** and select the **default** profiles for both.
7. Select the **default** proxy options profile.
8. Select **OK**.
9. Make sure **Enable IP Based Authentication** is not selected.
10. Turn on **Web Cache**.
11. Select **OK**.

Configuring the explicit web proxy - CLI

Use the following steps to configure the example explicit web proxy configuration from the CLI.

To enable the explicit web proxy on the Internal interface

1. Enter the following command to enable the explicit web proxy on the internal interface.

```
config system interface
   edit internal
      set explicit-web-proxy enable
end
```

To enable and configure the explicit web proxy

1. Enter the following command to enable the explicit web proxy and set the TCP port that proxy accepts HTTP and HTTPS connections on to 8888.

```
config web-proxy explicit
   set status enable
   set http-incoming-port 8888
   set https-incoming-port 8888
   set realm "You are authenticating with the explicit web proxy"
   set sec-default-action deny
end
```

To add a RADIUS server and user group for the explicit web proxy

1. Enter the following command to add a RADIUS server:

```
config user radius
   edit RADIUS_1
      set server 10.31.101.200
      set secret RADIUS_server_secret
end
```

2. Enter the following command to add a user group for the RADIUS server.

```
config user group
   edit Explicit_proxy_user_group
      set group-type firewall
      set member RADIUS_1
end
```

To add a security policy for the explicit web proxy

1. Enter the following command to add a firewall address for the internal subnet:

```
config firewall address
   edit Internal_subnet
      set type iprange
      set start-ip 10.31.101.1
      set end-ip 10.31.101.255
end
```

2. Enter the following command to add the explicit web proxy security policy:

```
config firewall explicit-proxy-policy
   edit 0
      set proxy web
      set dstintf wan1
      set srcaddr Internal_subnet
      set dstaddr all
      set action accept
      set service webproxy
      set webcache enable
      set identity-based enable
      set ipbased disable
      set active-auth-method basic
         config identity-based-policy
            edit 0
               set groups Explicit_Proxy_user_group
               set schedule always
               set utm-status enable
               set av-profile default
               set webfilter-profile default
               set profile-protocol-options default
            end
end
```

Testing and troubleshooting the configuration

You can use the following steps to verify that the explicit web proxy configuration is working as expected:

To test the explicit web proxy configuration

1. Configure a web browser on the internal subnet to use a web proxy server at IP address 10.31.101.100 and port 8888.
2. Browse to an Internet web page.
   The web browser should pop up an authentication window that includes the phrase that you added to the Realm option.
3. Enter the username and password for an account on the RADIUS server.
   If the account is valid you should be allowed to browse web pages on the Internet.
4. Close the browser and clear its cache and cookies.
5. Restart the browser and connect to the Internet.
   You could also start a second web browser on the same PC. Or you could start a new instance of the same browser as long as the browser asks for a user name and password again.

   You should have to authenticate again because identity-based policies are set to session-based authentication.

6. If this basic functionality does not work, check your FortiGate and web browser configuration settings.
7. Browse to a URL on the URL filter list and confirm that the web page is blocked.
8. Browse to http://eicar.org and attempt to download an anti-malware test file.
   The antivirus configuration should block the file.
   Sessions for web-proxy security policies do not appear on the Top Sessions dashboard widget and the count column for security policies does not display a count for explicit web proxy security policies.
9. You can use the following command to display explicit web proxy sessions

```
get test wad 60
IP based users:

Session based users:
   user:0x9c20778, username:User1, vf_id:0, ref_cnt:9

Total allocated user:1

Total user count:3, shared user quota:50, shared user count:3
```

   This command output shows one explicit proxy user with user name `User1` authenticated using session-based authentication.

Explicit web proxy sessions and user limits

Web browsers and web servers open and close multiple sessions with the explicit web proxy. Some sessions open and close very quickly. HTTP 1.1 keepalive sessions are persistent and can remain open for long periods of time. Sessions can remain on the explicit web proxy session list after a user has stopped using the proxy (and has, for example, closed their browser). If an explicit web proxy session is idle for more than 3600 seconds it is torn down by the explicit web proxy. See RFC 2616 for information about HTTP keepalive/persistent HTTP sessions.

This section describes proxy sessions and user limits for both the explicit web proxy and the explicit FTP proxy. Session and user limits for the two proxies are counted and calculated together. However, in most cases if both proxies are active there will be many more web proxy sessions than FTP proxy sessions.

The FortiGate unit adds two sessions to its session table for every explicit proxy session started by a web browser and every FTP session started by an FTP client. An entry is added to the session table for the session from the web browser or client to the explicit proxy. All of these sessions have the same destination port as the explicit web proxy port (usually 8080 for HTTP and 21 for FTP). An entry is also added to the session table for the session between the exiting FortiGate interface and the web or FTP server destination of the session. All of these sessions have a FortiGate interface IP address and the source address of the session and usually have a destination port of 80 for HTTP and 21 for FTP.

Proxy sessions that appear in FortiView do not include the Policy ID of the web-proxy or ftp-proxy security policy that accepted them. However, the explicit proxy sessions include a destination port that matches the explicit proxy port number (usually 8080 for the web proxy and 21 for the FTP proxy). The proxied sessions from the FortiGate unit have their source address set to the IP address of the FortiGate unit interface that the sessions use to connect to their destinations (for example, for connections to the Internet the source address would be the IP address of the FortiGate interface connected to the Internet).

FortiOS limits the number of explicit proxy users. This includes both explicit FTP proxy and explicit web proxy users. The number of users varies by FortiGate model from as low as 10 to up to 18000 for high end models. You cannot raise this limit.

If your FortiGate unit is configured for multiple VDOMs you can go to **System > VDOM > Global Resources** to view the maximum number of **Concurrent explicit proxy users** and optionally reduce the limit. You can also use the following command:

```
config global
   config system resource-limits
      set proxy 50
   end
end
```

To limit the number of explicit proxy users for a VDOM, from the web-based manager enable multiple VDOMs and go to **System > VDOM > VDOM** and edit a VDOM or use the following command to change the number of explicit web proxy users for VDOM_1:

```
config global
   config system vdom-property
      edit VDOM_1
         set proxy 25
   end
end
```

You can use the `diagnose wad user list` command to view the number of explicit web proxy users. Users may be displayed with this command even if they are no longer actively using the proxy. All idle sessions time out after 3600 seconds.

You can use the command `diagnose wad user clear` to clear current explicit proxy users. You can also use the command `diagnose wad user clear <user-name>` to clear individual users. This means delete information about all users and force them re-authenticate.

Users that authenticate with explicit web-proxy or ftp-proxy security policies do not appear in the **User & Device > Monitor > Firewall** list and selecting **De-authenticate All Users** has no effect on explicit proxy users.

How the number of concurrent explicit proxy users is determined depends on their authentication method:

- For session-based authenticated users, each authenticated user is counted as a single user. Since multiple users can have the same user name, the proxy attempts to identify users according to their authentication membership (based upon whether they were authenticated using RADIUS, LADAP, FSAE, local database etc.). If a user of one session has the same name and membership as a user of another session, the explicit proxy assumes this is one user.
- For IP Based authentication, or no authentication, or if no web-proxy security policy has been added, the source IP address is used to determine a user. All sessions from a single source address are assumed to be from the same user.

The explicit proxy does not limit the number of active sessions for each user. As a result the actual explicit proxy session count is usually much higher than the number of explicit web proxy users. If an excessive number of explicit web proxy sessions is compromising system performance you can limit the amount of users if the FortiGate unit is operating with multiple VDOMs.

The FortiGate explicit FTP proxy

You can use the FortiGate explicit FTP proxy to enable explicit FTP proxying on one or more FortiGate interfaces. The explicit web and FTP proxies can be operating at the same time on the same or on different FortiGate interfaces.

Explicit FTP proxies are configured for each VDOM when multiple VDOMs are enabled.

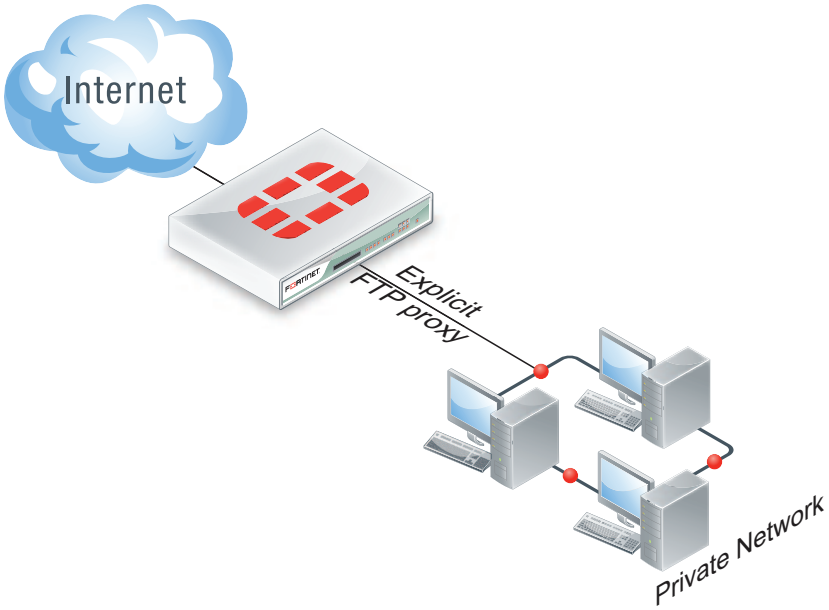
In most cases you would configure the explicit FTP proxy for users on a network by enabling the explicit FTP proxy on the FortiGate interface connected to that network. Users on the network would connect to and authenticate with the explicit FTP proxy before connecting to an FTP server. In this case the IP address of the explicit FTP proxy is the IP address of the FortiGate interface on which the explicit FTP proxy is enabled.

Enabling the explicit FTP proxy on an interface connected to the Internet is a security risk because anyone on the Internet who finds the proxy could use it to hide their source address.

If the FortiGate unit is operating in Transparent mode, users would configure their browsers to use a proxy server with the FortiGate unit management IP address.

The FTP proxy receives FTP sessions to be proxied at FortiGate interfaces with the explicit FTP proxy enabled. The FTP proxy uses FortiGate routing to route sessions through the FortiGate unit to a destination interface. Before a session leaves the exiting interface, the explicit FTP proxy changes the source addresses of the session packets to the IP address of the exiting interface. When the FortiGate unit is operating in Transparent mode the explicit web proxy changes the source addresses to the management IP address.

Example explicit FTP proxy topology



To allow anyone to anonymously log into explicit FTP proxy and connect to any FTP server you can set the explicit FTP proxy default firewall proxy action to accept. When you do this, users can log into the explicit FTP proxy with any username and password.

In most cases you would want to use explicit proxy policies to control explicit FTP proxy traffic and apply security features, access control/authentication, and logging. You can do this by keeping the default explicit FTP proxy firewall policy action to deny and then adding explicit FTP proxy policies. In most cases you would also want users to authenticate with the explicit FTP proxy. By default an anonymous FTP login is required. Usually you would add authentication to explicit FTP proxy policies. Users can then authenticate with the explicit FTP proxy according to users or user groups added to the policies. User groups added to explicit FTP proxy policies can use any authentication method supported by FortiOS including the local user database and RADIUS and other remote servers.

If you leave the default firewall policy action set to deny and add explicit FTP proxy policies, all connections to the explicit FTP proxy must match an or else they will be dropped. Sessions that are accepted are processed according to the ftp-proxy security policy settings.

You can also change the explicit FTP proxy default firewall policy action to accept and add explicit FTP proxy policies. If you do this, sessions that match explicit FTP proxy policies are processed according to the policy settings. Connections to the explicit FTP proxy that do not match an explicit FTP proxy policy are allowed and the users can authenticate with the proxy anonymously.

There are some limitations to the security features that can be applied to explicit FTP proxy sessions. See Security profiles, threat weight, device identification, and the explicit FTP proxy on page 2929.

You cannot configure IPsec, SSL VPN, or Traffic shaping for explicit FTP proxy traffic. Explicit FTP proxy policies can only include firewall addresses not assigned to a FortiGate unit interface or with interface set to **any**. (On the web-based manager you must set the interface to **Any**. In the CLI you must `unset` the `associated-interface`.)

How to use the explicit FTP proxy to connect to an FTP server

To connect to an FTP server using the explicit FTP proxy, users must run an FTP client and connect to the IP address of a FortiGate interface on which the explicit FTP proxy is enabled. This connection attempt must use the configured explicit FTP proxy port number (default 21).

The explicit FTP proxy is not compatible with using a web browser as an FTP client. To use web browsers as FTP clients configure the explicit web proxy to accept FTP sessions.

The following steps occur when a user starts an FTP client to connect to an FTP server using the explicit FTP proxy. Any RFC-compliant FTP client can be used. This example describes using a command-line FTP client. Some FTP clients may require a custom FTP proxy connection script.

1. The user enters a command on the FTP client to connect to the explicit FTP proxy.

   For example, if the IP address of the FortiGate interface on which the explicit FTP proxy is enabled is 10.31.101.100, enter:

   ```
   ftp 10.31.101.100
   ```

2. The explicit FTP proxy responds with a welcome message and requests the user's FTP proxy user name and password and a username and address of the FTP server to connect to:

   ```
   Connected to 10.31.101.100.
   220 Welcome to Fortigate FTP proxy
   Name (10.31.101.100:user):
   ```

   You can change the message by editing the FTP Explicit Banner Message replacement message.

3. At the prompt the user enters their FTP proxy username and password and a username and address for the FTP server. The FTP server address can be a domain name or numeric IP address. This information is entered using the following syntax:

   ```
   <proxy-user>:<proxy-password>:<server-user>@<server-address>
   ```

   For example, if the proxy username and password are `p-name` and `p-pass` and a valid username for the FTP server is `s-name` and the server's IP address is `ftp.example.com` the syntax would be:

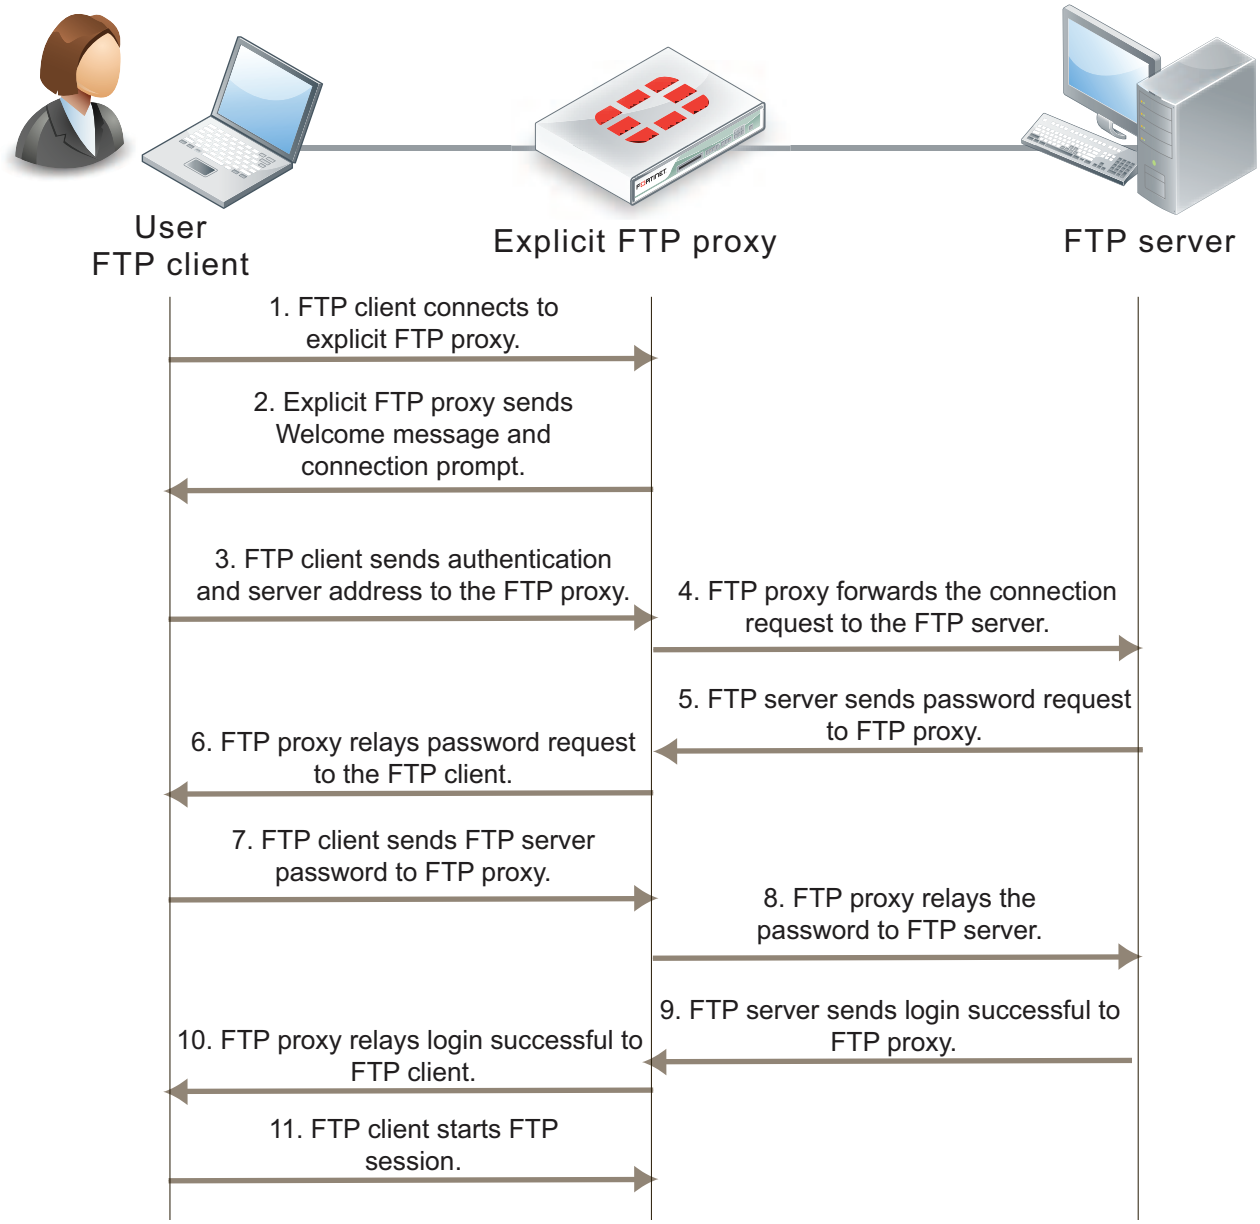
   ```
   p-name:p-pass:s-name@ftp.example.com
   ```

If the FTP proxy accepts anonymous logins `p-name` and `p-pass` can be any characters.

4. The FTP proxy forwards the connection request, including the user name, to the FTP server.
5. If the user name is valid for the FTP server it responds with a password request prompt.
6. The FTP proxy relays the password request to the FTP client.
7. The user enters the FTP server password and the client sends the password to the FTP proxy.
8. The FTP proxy relays the password to the FTP server.
9. The FTP server sends a login successful message to the FTP proxy.
10. The FTP proxy relays the login successful message to the FTP client.
11. The FTP client starts the FTP session.

    All commands entered by the client are relayed by the proxy to the server. Replies from the server are relayed back to the FTP client.

Explicit FTP proxy session



From a simple command line FTP client connecting to an the previous sequence could appear as follows:

```
ftp 10.31.101.100 21
Connected to 10.31.101.100.
220 Welcome to Fortigate FTP proxy
Name (10.31.101.100:user): p-name:p-pass:s-name@ftp.example.com
331 Please specify the password.
Password: s-pass
230 Login successful.
Remote system type is UNIX
Using binary mode to transfer files.
ftp>
```

General explicit FTP proxy configuration steps

You can use the following general steps to configure the explicit FTP proxy.

To enable the explicit FTP proxy - web-based manager:

1. Go to **System > Network > Explicit Proxy > Explicit FTP Proxy Options**. Select **Enable Explicit FTP Proxy** to turn on the explicit FTP proxy.
2. Select Apply.

   The **Default Firewall Policy Action** is set to **Deny** and requires you to add a explicit FTP proxy policy to allow access to the explicit FTP proxy. This configuration is recommended and is a best practice because you can use policies to control access to the explicit FTP proxy and also apply security features and authentication.
3. Go to **System > Network > Interface** and select one or more interfaces for which to enable the explicit web proxy. Edit the interface and select **Enable Explicit FTP Proxy**.

Enabling the explicit FTP proxy on an interface connected to the Internet is a security risk because anyone on the Internet who finds the proxy could use it to hide their source address. If you enable the proxy on such an interface make sure authentication is required to use the proxy.

4. Go to **Policy & Objects > Policy > Explicit Proxy** and select **Create New** and set the **Explicit Proxy Type** to **FTP.**

   You can add multiple explicit FTP proxy policies.
5. Configure the policy as required to accept the traffic that you want to be processed by the explicit FTP proxy.

   The source address of the policy should match client source IP addresses. The firewall address selected as the source address cannot be assigned to a FortiGate interface. The Interface field of the firewall address must be blank or it must be set to **Any**.

   The destination address of the policy should match the IP addresses of FTP servers that clients are connecting to. The destination address could be **all** to allow connections to any FTP server.

   If **Default Firewall Policy Action** is set to Deny, traffic sent to the explicit FTP proxy that is not accepted by an explicit FTP proxy policy is dropped. If **Default Firewall Policy Action** is set to Allow then all FTP proxy sessions that don't match a policy are allowed.

   For example the following explicit FTP proxy policy allows users on an internal network to access FTP servers on the Internet through the wan1 interface of a FortiGate unit.

Explicit Proxy Type	FTP
Source Address	Internal_subnet
Outgoing Interface	wan1
Destination Address	all

Schedule	always
Action	ACCEPT

The following explicit FTP proxy policy requires users on an internal network to authenticate with the FortiGate unit before accessing FTP servers on the Internet through the wan1 interface.

Explicit Proxy Type	FTP
Source Address	Internal_subnet
Outgoing Interface	wan1
Destination Address	all
Action	AUTHENTICATE

6. Select **Create New** to add an **Authentication Rule** and configure the rule as follows:

Groups	Proxy-Group
Source Users	(optional)
Schedule	always

7. Add security profiles as required and select **OK**.
8. You can add multiple authentication rules to apply different authentication for different user groups and users and also apply different security profiles and logging settings for different users.
9. Select **OK**.

To enable the explicit FTP proxy - CLI:

1. Enter the following command to turn on the explicit FTP proxy. This command also changes the explicit FTP proxy port to 2121.

```
config ftp-proxy explicit
   set status enable
   set incoming-port 2121
end
```

The default explicit FTP proxy configuration has `sec-default-action` set to `deny` and requires you to add a security policy to allow access to the explicit FTP proxy.

2. Enter the following command to enable the explicit FTP proxy for the internal interface.

```
config system interface
   edit internal
      set explicit-ftp-proxy enable
   end
end
```

3. Use the following command to add a firewall address that matches the source address of users who connect to the explicit FTP proxy.

```
config firewall address
   edit Internal_subnet
      set type iprange
```

```
      set start-ip 10.31.101.1
      set end-ip 10.31.101.255
   end
```

The source address for a ftp-proxy security policy cannot be assigned to a FortiGate unit interface.

4. Use the following command to add an explicit FTP proxy policy that allows all users on the internal subnet to use the explicit FTP proxy for connections through the wan1 interface to the Internet.

```
config firewall explicit-proxy-policy
   edit 0
      set proxy ftp
      set dstintf wan1
      set scraddr Internal_subnet
      set dstaddr all
      set action accept
      set schedule always
end
```

5. Use the following command to add an explicit FTP proxy policy that allows authenticated users on the internal subnet to use the explicit FTP proxy for connections through the wan1 interface to the Internet.

```
config firewall explicit-proxy-policy
   edit 0
      set proxy ftp
      set dstintf wan1
      set scraddr Internal_subnet
      set dstaddr Fortinet-web-sites
      set action accept
      set schedule always
      set identity-based enable
         config identity-based-policy
            edit 1
               set groups Proxy-group
               set schedule always
 end
end
```

Restricting the IP address of the explicit FTP proxy

You can use the following command to restrict access to the explicit FTP proxy using only one IP address. The IP address that you specify must be the IP address of an interface that the explicit FTP proxy is enabled on. You might want to use this option if the explicit FTP proxy is enabled on an interface with multiple IP addresses.

For example, to require uses to connect to the IP address 10.31.101.100 to connect to the explicit FTP proxy:

```
config ftp-proxy explicit
   set incoming-ip 10.31.101.100
end
```

Restricting the outgoing source IP address of the explicit FTP proxy

You can use the following command to restrict the source address of outgoing FTP proxy packets to a single IP address. The IP address that you specify must be the IP address of an interface that the explicit FTP proxy is enabled on. You might want to use this option if the explicit FTP proxy is enabled on an interface with multiple IP addresses.

For example, to restrict the outgoing packet source address to 172.20.120.100:

```
config ftp-proxy explicit
   set outgoing-ip 172.20.120.100
end
```

Security profiles, threat weight, device identification, and the explicit FTP proxy

You can apply antivirus, data leak prevention (DLP), and SSL/SSH inspection to explicit FTP proxy sessions. Security profiles are applied by selecting them in an explicit FTP proxy policy or an authentication rule in an FTP proxy security policy.

Traffic accepted by explicit FTP proxy policies contributes to threat weight data.

The explicit FTP proxy is not compatible with device identification.

Explicit FTP proxy options and SSL/SSH inspection

Since the traffic accepted by the explicit FTP proxy is known to be FTP and since the ports are already known by the proxy, the explicit FTP proxy does not use the FTP port proxy options settings.

When adding UTM features to an FTP proxy security policy, you must select a proxy options profile. In most cases you can select the default proxy options profile. You could also create a custom proxy options profile.

The explicit FTP proxy supports the following proxy options:

- Block Oversized File and oversized file limit

The explicit FTP proxy does not support the following protocol options:

- Client comforting

Explicit FTP proxy sessions and antivirus

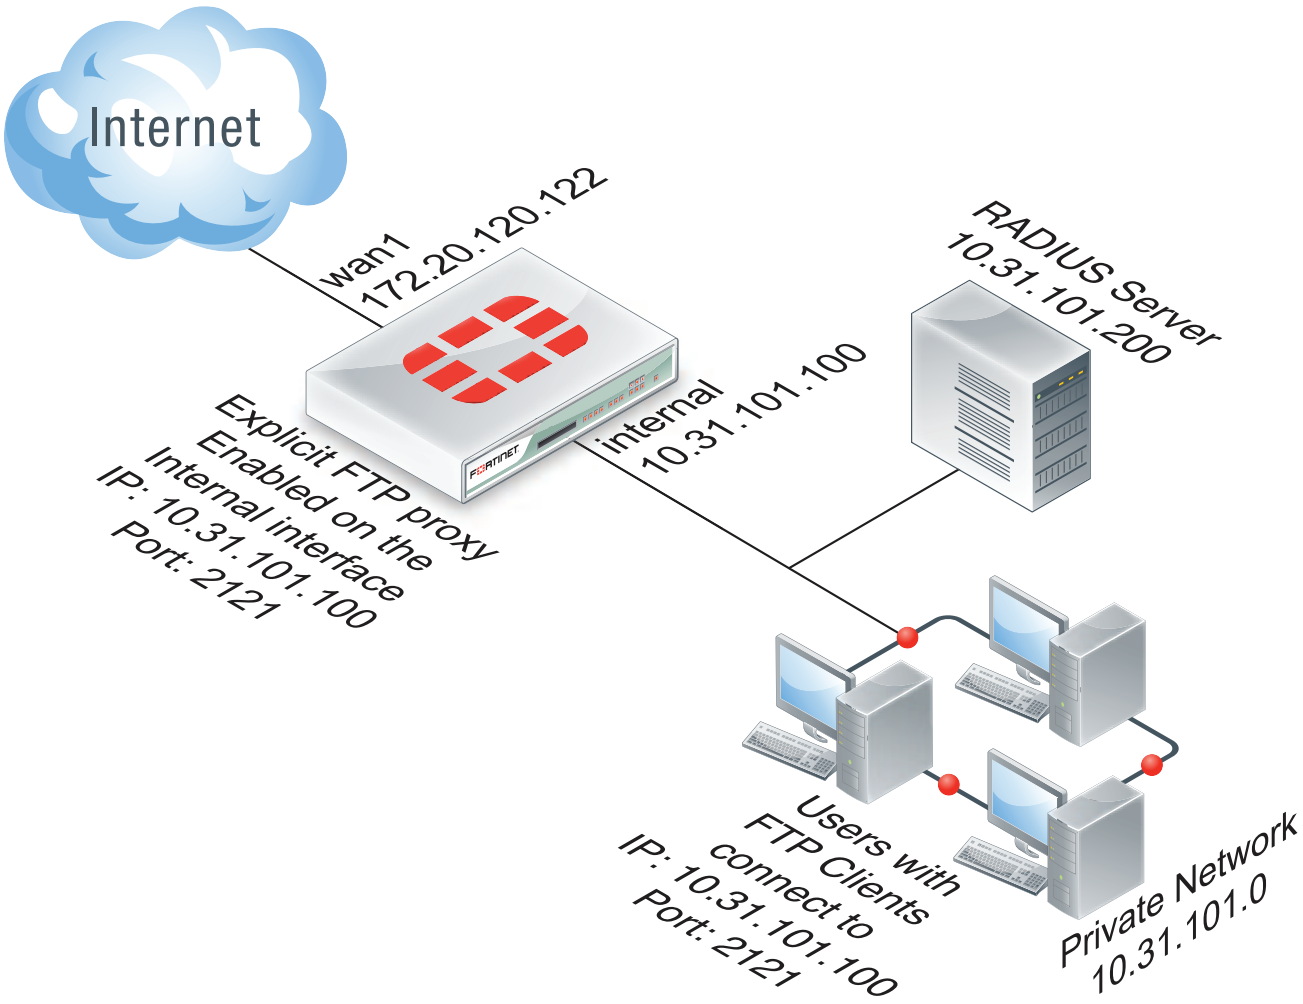
For explicit FTP proxy sessions, the FortiGate unit applies antivirus scanning to FTP file GET and PUT requests. The FortiGate unit starts virus scanning a file in an FTP session when it receives a file in the body of an FTP request.

Flow-based virus scanning is not available for explicit FTP proxy sessions. Even if the FortiGate unit is configured to use flow-based antivirus, explicit FTP proxy sessions use the regular virus database.

Example users on an internal network connecting to FTP servers on the Internet through the explicit FTP with RADIUS authentication and virus scanning

This example describes how to configure the explicit FTP proxy for the example network shown below. In this example, users on the internal network connect to the explicit FTP proxy through the Internal interface with IP address 10.31.101.100. The explicit web proxy is configured to use port 2121 so to connect to an FTP server on the Internet users must first connect to the explicit FTP proxy using IP address 10.31.101.100 and port 2121.

Example explicit FTP proxy network topology



In this example, explicit FTP proxy users must authenticate with a RADIUS server before getting access to the proxy. To apply authentication, the security policy that accepts explicit FTP proxy traffic includes an identity based policy that applies per session authentication to explicit FTP proxy users and includes a user group with the RADIUS server in it. The identity based policy also applies UTM virus scanning and DLP.

General configuration steps

This section breaks down the configuration for this example into smaller procedures. For best results, follow the procedures in the order given:

1. Enable the explicit FTP proxy and change the FTP port to 2121.
2. Enable the explicit FTP proxy on the internal interface.
3. Add a RADIUS server and user group for the explicit FTP proxy.
4. Add a user identity security policy for the explicit FTP proxy.
5. Enable antivirus and DLP features for the identity-based policy.

Configuring the explicit FTP proxy - web-based manager

Use the following steps to configure the explicit FTP proxy from FortiGate web-based manager.

To enable and configure the explicit FTP proxy

1. Go to **System > Network > Explicit Proxy > Explicit FTP Proxy Options** and change the following settings:

Enable Explicit FTP Proxy	Select.
Listen on Interface	No change. This field will eventually show that the explicit web proxy is enabled for the Internal interface.
FTP Port	2121
Default Firewall Policy Action	Deny

2. Select **Apply**.

To enable the explicit FTP proxy on the Internal interface

1. Go to **System > Network > Interface**, edit the Internal interface and select **Enable Explicit FTP Proxy**.

To add a RADIUS server and user group for the explicit FTP proxy

1. Go to **User & Device > Authentication > RADIUS Servers**.
2. Select **Create New** to add a new RADIUS server:

Name	RADIUS_1
Primary Server Name/IP	10.31.101.200
Primary Server Secret	RADIUS_server_secret

3. Go to **User > User > User Groups** and select **Create New**.

Name	Explict_proxy_user_group
Type	Firewall
Remote groups	RADIUS_1
Group Name	ANY

4. Select **OK**.

To add a security policy for the explicit FTP proxy

1. Go to **Policy &Objects > Objects > Addresses** and select **Create New**.
2. Add a firewall address for the internal network:

Address Name	Internal_subnet
Type	Subnet
Subnet / IP Range	10.31.101.0
Interface	Any

3. Go to **Policy & Objects > Policy > Explicit Proxy** and select **Create New**.
4. Configure the explicit FTP proxy security policy.

Explicit Proxy Type	FTP
Source Address	Internal_subnet
Outgoing Interface	wan1
Destination Address	all
Action	AUTHENTICATE

5. Under **Configure Authentication Rules** select **Create New** to add an authentication rule:

Groups	Explicit_policy
Users	Leave blank
Schedule	always

6. Turn on **Antivirus** and **Web Filter** and select the **default** profiles for both.
7. Select the **default** proxy options profile.
8. Select **OK**.
9. Make sure **Enable IP Based Authentication** is not selected and **Default Authentication Method** is set to **Basic**.
10. Select **OK**.

Configuring the explicit FTP proxy - CLI

Use the following steps to configure the example explicit web proxy configuration from the CLI.

To enable and configure the explicit FTP proxy

1. Enter the following command to enable the explicit FTP proxy and set the TCP port that proxy accepts FTP connections on to 2121.

```
config ftp-proxy explicit
   set status enable
   set incoming-port 2121
   set sec-default-action deny
end
```

To enable the explicit FTP proxy on the Internal interface

1. Enter the following command to enable the explicit FTP proxy on the internal interface.

```
config system interface
   edit internal
      set explicit-ftp-proxy enable
end
```

To add a RADIUS server and user group for the explicit FTP proxy

1. Enter the following command to add a RADIUS server:

```
config user radius
   edit RADIUS_1
      set server 10.31.101.200
      set secret RADIUS_server_secret
end
```

2. Enter the following command to add a user group for the RADIUS server.

```
config user group
   edit Explicit_proxy_user_group
      set group-type firewall
      set member RADIUS_1
end
```

To add a security policy for the explicit FTP proxy

1. Enter the following command to add a firewall address for the internal subnet:

```
config firewall address
   edit Internal_subnet
      set type iprange
      set start-ip 10.31.101.1
      set end-ip 10.31.101.255
end
```

2. Enter the following command to add the explicit FTP proxy security policy:

```
config firewall explicit-proxy-policy
   edit 0
      set proxy ftp
      set dstintf wan1
      set srcaddr Internal_subnet
      set dstaddr all
      set action accept
      set identity-based enable
      set ipbased disable
      set active-auth-method basic
         config identity-based-policy
            edit 0
               set groups Explicit_Proxy_user_group
               set schedule always
               set utm-status enable
               set av-profile default
               set profile-protocol-options default
            end
   end
```

Testing and troubleshooting the configuration

You can use the following steps to verify that the explicit FTP proxy configuration is working as expected. These steps use a command line FTP client.

To test the explicit web proxy configuration

1. From a system on the internal network start an FTP client and enter the following command to connect to the FTP proxy:

   ```
   ftp 10.31.101.100
   ```

   The explicit FTP proxy should respond with a message similar to the following:

   ```
   Connected to 10.31.101.100.
   220 Welcome to Fortigate FTP proxy
   Name (10.31.101.100:user):
   ```

2. At the prompt enter a valid username and password for the RADIUS server followed by a user name for an FTP server on the Internet and the address of the FTP server. For example, if a valid username and password on the RADIUS server is ex_name and ex_pass and you attempt to connect to an FTP server at ftp.example.com with user name s_name, enter the following at the prompt:

   ```
   Name (10.31.101.100:user):ex_name:ex_pass:s_name@ftp.example.com
   ```

3. You should be prompted for the password for the account on the FTP server.
4. Enter the password and you should be able to connect to the FTP server.
5. Attempt to explore the FTP server file system and download or upload files.
6. To test UTM functionality, attempt to upload or download an ECAR test file. Or upload or download a tex file containing text that would be matched by the DLP sensor.

   For eicar test files, go to http://eicar.org.

Explicit FTP proxy sessions and user limits

FTP clients do not open large numbers of sessions with the explicit FTP proxy. Most sessions stay open for a short while depending on how long a user is connected to an FTP server and how large the file uploads or downloads are. So unless you have large numbers of FTP users, the explicit FTP proxy should not be adding large numbers of sessions to the session table.

Explicit FTP proxy sessions and user limits are combined with explicit web proxy session and user limits. For information about explicit proxy session and user limits, see Explicit web proxy sessions and user limits on page 2920.

FortiGate WCCP

The Web Cache Communication Protocol (WCCP) can be used to provide web caching with load balancing and fault tolerance. In a WCCP configuration, a WCCP server receives HTTP requests from user's web browsers and redirects the requests to one or more WCCP clients. The clients either return cached content or request new content from the destination web servers before caching it and returning it to the server which in turn returns the content to the original requestor. If a WCCP configuration includes multiple WCCP clients, the WCCP server load balances traffic among the clients and can detect when a client fails and failover sessions to still operating clients. WCCP is described by the Web Cache Communication Protocol Internet draft.

The sessions that are cached by WCCP depend on the configuration of the WCCP clients. If the client is a FortiGate unit, you can configure the port numbers and protocol number of the sessions to be cached. For example, to cache HTTPS traffic on port 443 the WCCP client port must be set to 443 and protocol must be set to 6. If the WCCP client should also cache HTTPS traffic on port 993 the client ports option should include both port 443 and 993.

On a FortiGate unit, WCCP sessions are accepted by a security policy before being cached. If the security policy that accepts sessions that do not match the port and protocol settings in the WCCP clients the traffic is dropped.

WCCP is configured per-VDOM. A single VDOM can operate as a WCCP server or client (not both at the same time). FortiGate units are compatible with third-party WCCP clients and servers. If a FortiGate unit is operating as an Internet firewall for a private network, you can configure it to cache and serve some or all of the web traffic on the private network using WCCP by adding one or more WCCP clients, configuring WCCP server settings on the FortiGate unit and adding WCCP security policies that accept HTTP session from the private network.

FortiGate units support WCCPv1 and WCCPv2. A FortiGate unit in NAT/Route or transparent mode can operate as a WCCP server. To operate as a WCCP client a FortiGate unit must be in NAT/Route mode. FortiGate units communicate between WCCP servers and clients over UDP port 2048. This communication can be encapsulated in a GRE tunnel or just use layer 2 forwarding.

A WCCP server can also be called a WCCP router. A WCCP client can also be called a WCCP cache engine.

WCCP service groups, service numbers, service IDs and well known services

A FortiGate unit configured as a WCCP server or client can include multiple server or client configurations. Each of these configurations is called a WCCP service group. A service group consists of one or more WCCP servers (or routers) and one or more WCCP clients working together to cache a specific type of traffic. The service group configuration includes information about the type of traffic to be cached, the addresses of the WCCP clients and servers and other information about the service.

A service group is identified with a numeric WCCP service ID (or service number) in the range 0 to 255. All of the servers and clients in the same WCCP service group must have service group configurations with the same WCCP service ID.

The value of the service ID provides some information about the type of traffic to be cached by the service group. Service IDs in the range 0 to 50 are reserved for well known services. A well known service is any service that is

defined by the WCCP standard as being well known. Since the service is well known, just the service ID is required to identify the traffic to be cached.

Even though the well known service ID range is 0 to 50, at this time only one well known service has been defined. Its service ID 0, which is used for caching HTTP (web) traffic.

So to configure WCCP to cache HTTP sessions you can add a service group to the WCCP router and WCCP clients with a service ID of 0. No other information about the type of traffic to cache needs to be added to the service group.

Since service IDs 1 to 50 are reserved for well know services and since these services are not defined yet, you should not add service groups with IDs in the range 1 to 50.

FortiOS does allow you to add service groups with IDs between 1 and 50. Since these service groups have not been assigned well known services, however, they will not cache any sessions. Service groups with IDs 51 to 255 allow you to set the port numbers and protocol number of the traffic to be cached. So you can use service groups with IDs 51 to 255 to cache different kinds of traffic based on port numbers and protocol number of the traffic. Service groups 1 to 50; however, do not allow you to set port numbers or protocol numbers so cannot be used to cache any traffic.

To cache traffic other than HTTP traffic you must add service groups with IDs in the range 51 to 255. These service group configurations must include the port numbers and protocol number of the traffic to be cached. It is the port and protocol number configuration in the service group that determines what traffic will be cached by WCCP.

Example WCCP server and client configuration for caching HTTP sessions (service ID = 0)

Enter the following command to add a WCCP service group to a WCCP server that caches HTTP sessions. The IP address of the server is 10.31.101.100 and the WCCP clients are on the 10.31.101.0 subnet. The service

ID of this service group is 0.

```
config system wccp
   edit 0
      set router-id 10.31.101.100
      set server-list 10.31.101.0 255.255.255.0
   end
```

Enter the following commands to configure a FortiGate unit to operate as a WCCP client and add a service group that configures the client to cache HTTP sessions. The IP address of the server is 10.31.101.100 and IP address of this WCCP clients is 10.31.101.1 subnet. The service ID of this service group is 0.

```
config system settings
   set wccp-cache-engine enable
end

config system wccp
   edit 0
      set cache-id 10.31.101.1
      set router-list 10.31.101.100
   end
```

You cannot enter the `wccp-cache-engine enable` command if you have already added a WCCP service group. When you enter this command an interface named w.<vdom_name> is added to the FortiGate configuration (for example w.root). All traffic redirected from a WCCP router is considered to be received at this interface of the FortiGate unit operating as a WCCP client. A default route to this interface with lowest priority is added.

Example WCCP server and client configuration for caching HTTPS sessions

Enter the following command to add a service group to a WCCP server that caches HTTPS content on port 443 and protocol 6. The IP address of the server is 10.31.101.100 and the WCCP clients are on the 10.31.101.0 subnet. The service ID of this service group is 80.

```
config system wccp
   edit 80
      set router-id 10.31.101.100
      set server-list 10.31.101.0 255.255.255.0
      set ports 443

      set protocol 6
   end
```

Enter the following commands to configure a FortiGate unit to operate as a WCCP client and add a service group that configures client to cache HTTPS sessions on port 443 and protocol 6. The IP address of the server is 10.31.101.100 and IP address of this WCCP clients is 10.31.101.1 subnet. The service ID of this service group must be 80 to match the service ID added to the server.

```
config system settings
   set wccp-cache-engine enable
end

config system wccp
   edit 80
      set cache-id 10.31.101.1
      set router-list 10.31.101.100
      set ports 443
      set protocol 6
   end
```

Example WCCP server and client configuration for caching HTTP and HTTPS sessions

You could do this by configuring two WCCP service groups as described in the previous examples. Or you could use the following commands to configure one service group for both types of traffic. The example also caches HTTP sessions on port 8080.

Enter the following command to add a service group to a WCCP server that caches HTTP sessions on ports 80 and 8080 and HTTPS sessions on port 443. Both of these protocols use protocol number 6. The IP address of the server is 10.31.101.100 and the WCCP clients are on the 10.31.101.0 subnet. The service ID of this service group is 90.

```
config system wccp
   edit 90
      set router-id 10.31.101.100
      set server-list 10.31.101.0 255.255.255.0
      set ports 443 80 8080
      set protocol 6
   end
```

Enter the following commands to configure a FortiGate unit to operate as a WCCP client and add a service group that configures client to cache HTTP sessions on port 80 and 8080 and HTTPS sessions on port 443. The IP address of the server is 10.31.101.100 and IP address of this WCCP clients is 10.31.101.1 subnet. The service ID of this service group must be 90 to match the service ID added to the server.

```
config system settings
   set wccp-cache-engine enable
end
config system wccp
   edit 90
      set cache-id 10.31.101.1
      set router-list 10.31.101.100
      set ports 443 80 8080
      set protocol 6
   end
```

Other WCCP service group options

In addition to using WCCP service groups to define the types of traffic to be cached by WCCP the following options are available for servers and clients.

Server configuration options

The server configuration must include the `router-id`, which is the WCCP server IP address. This is the IP address of the interface that the server uses to communicate with WCCP clients.

The `group-address` is used for multicast WCCP configurations to specify the multicast addresses of the clients.

The `server-list` defines the IP addresses of the WCCP clients that the server can connect to. Often the server list can be the address of the subnet that contains the WCCP clients.

The `authentication` option enables or disables authentication for the WCCP service group. Authentication must be enabled on all servers and clients in a service group and members of the group must have the same `password`.

The `forward-method` option specifies the protocol used for communication between the server and clients. The default forwarding method is GRE encapsulation. If required by your network you can also select to use unencapsulated layer-2 packets instead of GRE or select any to allow both. The `return-method` allows you to specify the communication method from the client to the server. Both GRE and layer-2 are supported.

The `assignment-method` determines how the server load balances sessions to the clients if there are multiple clients. Load balancing can be done using hashing or masking.

Client configuration options

The client configuration includes the `cache-id` which is the IP address of the FortiGate interface of the client that communicates with WCCP server. The `router-list` option is the list of IP addresses of the WCCP servers in the WCCP service group.

The `ports` option lists the port numbers of the sessions to be cached by the client and the `protocol` sets the protocol number of the sessions to be cached. For TCP sessions the protocol is 6.

The `service-type` option can be auto, dynamic or standard. Usually you would not change this setting.

The client configuration also includes options to influence load balancing including the `primary-hash`, `priority`, `assignment-weight` and `assignment-bucket-format`.

WCCP configuration overview

To configure WCCP you must create a service group that includes WCCP servers and clients. WCCP servers intercept sessions to be cached (for example, sessions from users browsing the web from a private network). To intercept sessions to be cached the WCCP server must include a security policy that accepts sessions to be cached and WCCP must be enabled in this security policy.

The server must have an interface configured for WCCP communication with WCCP clients. That interface sends and receives encapsulated GRE traffic to and from WCCP clients. The server must also include a WCCP service group that includes a service ID and the addresses of the WCCP clients as well as other WCCP configuration options.

To use a FortiGate unit as a WCCP client, the FortiGate unit must be set to be a WCCP client (or cache engine). You must also configure an interface on the client for WCCP communication. The client sends and receives encapsulated GRE traffic to and from the WCCP server using this interface.

The client must also include a WCCP service group with a service ID that matches a service ID on the server. The client service group also includes the IP address of the servers in the service group and specifies the port numbers and protocol number of the sessions that will be cached on the client.

When the client receives sessions from the server on its WCCP interface, it either returns cached content over the WCCP interface or connects to the destination web servers using the appropriate interface depending on the client routing configuration. Content received from web servers is then cached by the client and returned to the WCCP server over the WCCP link. The server then returns the received content to the initial requesting user web browser.

Finally you may also need to configure routing on the server and client FortiGate units and additional security policies may have to be added to the server to accept sessions not cached by WCCP.

Example caching HTTP sessions on port 80 using WCCP

In this example configuration (shown below), a FortiGate unit with host name WCCP_srv is operating as an Internet firewall for a private network is also configured as a WCCP server. The port1 interface of WCCP_srv is connected to the Internet and the port2 interface is connected to the internal network.

All HTTP traffic on port 80 that is received at the port2 interface of WCCP_srv is accepted by a port2 to port1 security policy with WCCP enabled. All other traffic received at the port2 interface is allowed to connect to the Internet by adding a general port2 to port1 security policy below the HTTP on port 80 security policy.

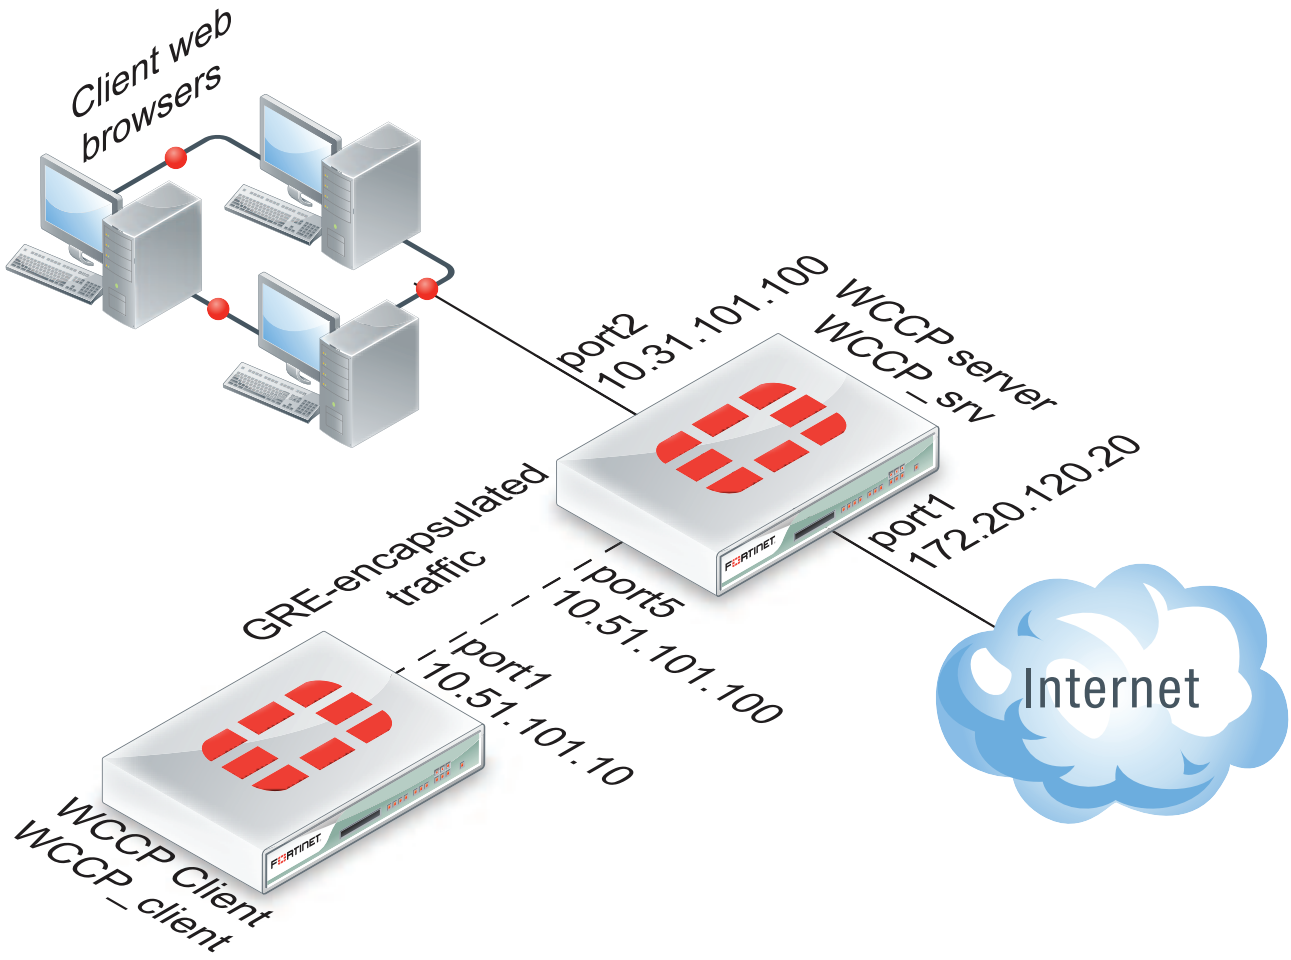
A WCCP service group is added to WCCP_srv with a service ID of 0 for caching HTTP traffic on port 80. The port5 interface of WCCP_srv is configured for WCCP communication.

A second FortiGate unit with host name WCCP_client is operating as a WCCP client. The port1 interface of WCCP_client is connected to port5 of WCCP_srv and is configured for WCCP communication.

WCCP_client is configured to cache HTTP traffic because it also has a WCCP service group with a service ID of 0.

WCCP_client connects to the Internet through WCCP_srv. To allow this, a port5 to port1 security policy is added to WCCP_srv.

FortiGate WCCP server and client configuration



Configuring the WCCP server (WCCP_srv)

Use the following steps to configure WCCP_srv as the WCCP server for the example network. The example steps only describe the WCCP-related configuration.

To configure WCCP_srv as a WCCP server

1. Add a port2 to port1 security policy that accepts HTTP traffic on port 80 and is configured for WCCP:

```
config firewall policy
   edit 0
      set srtintf port2
      set dstintf port1
      set srcaddr all
      set dstaddr all
      set action accept
      set schedule always
      set service HTTP
      set wccp enable
      set nat enable
   end
```

2. Add another port2 to port1 security policy to allow all other traffic to connect to the Internet.

```
config firewall policy
   edit 0
      set srtintf port2
      set dstintf port1
      set srcaddr all
      set dstaddr all
      set action accept
      set schedule always
      set service ANY
      set nat enable
   end
```

3. Move this policy below the WCCP policy in the port2 to port1 policy list.
4. Enable WCCP on the port5 interface.

```
config system interface
   edit port5
      set wccp enable
   end
```

5. Add a WCCP service group with service ID 0.

```
config system wccp
   edit 0
      set router-id 10.51.101.100
      set server-list 10.51.101.0 255.255.255.0
   end
```

6. Add a firewall address and security policy to allow the WCCP_client to connect to the internet.

```
config firewall address
   edit WCCP_client_addr
      set subnet 10.51.101.10
end
config firewall policy
   edit 0
      set srtintf port5
      set dstintf port1
      set srcaddr WCCP_client_addr
      set dstaddr all
      set action accept
      set schedule always
      set service ANY
      set nat enable
   end
```

Configuring the WCCP client (WCCP_client)

Use the following steps to configure WCCP_client as the WCCP client for the example network. The example steps only describe the WCCP-related configuration.

To configure WCCP_client as a WCCP client

1. Configure WCCP_client to operate as a WCCP client.

```
config system settings
   set wccp-cache-engine enable
```

```
end
```

You cannot enter the `wccp-cache-engine enable` command if you have already added a WCCP service group. When you enter this command an interface named w.<vdom_name> is added to the FortiGate configuration (for example w.root). All traffic redirected from a WCCP router is considered to be received at this interface of the FortiGate unit operating as a WCCP client. A default route to this interface with lowest priority is added.

2. Enable WCCP on the port1 interface.

```
config system interface
   edit port1
      set wccp enable
end
```

3. Add a WCCP service group with service ID 0.

```
config system wccp
   edit 0
      set cache-id 10.51.101.10
      set router-list 10.51.101.100
end
```

Example caching HTTP sessions on port 80 and HTTPS sessions on port 443 using WCCP

This example configuration is the same as thatdescribed in Example caching HTTP sessions on port 80 using WCCP on page 2939 except that WCCP now also cached HTTPS traffic on port 443. To cache HTTP and HTTPS traffic the WCCP service group must have a service ID in the range 51 to 255 and you must specify port 80 and 443 and protocol 6 in the service group configuration of the WCCP client.

Also the security policy on the WCCP_srv that accepts sessions from the internal network to be cached must accept HTTP and HTTPS sessions.

Configuring the WCCP server (WCCP_srv)

Use the following steps to configure WCCP_srv as the WCCP server for the example network. The example steps only describe the WCCP-related configuration.

To configure WCCP_srv as a WCCP server

1. Add a port2 to port1 security policy that accepts HTTP traffic on port 80 and HTTPS traffic on port 443 and is configured for WCCP:

```
config firewall policy
   edit 0
      set srtintf port2
      set dstintf port1
      set srcaddr all
      set dstaddr all
      set action accept
      set schedule always
      set service HTTP HTTPS
      set wccp enable
      set nat enable
```

```
end
```

2. Add another port2 to port1 security policy to allow all other traffic to connect to the Internet.

```
config firewall policy
   edit 0
      set srtintf port2
      set dstintf port1
      set srcaddr all
      set dstaddr all
      set action accept
      set schedule always
      set service ANY

      set nat enable
   end
```

3. Move this policy below the WCCP policy in the port2 to port1 policy list.
4. Enable WCCP on the port5 interface.

```
config system interface
   edit port5
      set wccp enable
   end
```

5. Add a WCCP service group with service ID 90 (can be any number between 51 and 255).

```
config system wccp
   edit 90
      set router-id 10.51.101.100
      set server-list 10.51.101.0 255.255.255.0
   end
```

6. Add a firewall address and security policy to allow the WCCP_client to connect to the internet.

```
config firewall address
   edit WCCP_client_addr
      set subnet 10.51.101.10
   end
config firewall policy
   edit 0
      set srtintf port5
      set dstintf port1
      set srcaddr WCCP_client_addr
      set dstaddr all
      set action accept
      set schedule always
      set service ANY
      set nat enable
   end
```

Configuring the WCCP client (WCCP_client)

Use the following steps to configure WCCP_client as the WCCP client for the example network. The example steps only describe the WCCP-related configuration.

To configure WCCP_client as a WCCP client

1. Configure WCCP_client to operate as a WCCP client.

```
config system settings
   set wccp-cache-engine enable
end
```

You cannot enter the `wccp-cache-engine enable` command if you have already added a WCCP service group. When you enter this command an interface named w.<vdom_name> is added to the FortiGate configuration (for example w.root). All traffic redirected from a WCCP router is considered to be received at this interface of the FortiGate unit operating as a WCCP client. A default route to this interface with lowest priority is added.

2. Enable WCCP on the port1 interface.

```
config system interface
   edit port1
      set wccp enable
   end
```

3. Add a WCCP service group with service ID 90. This service group also specifies to cache sessions on ports 80 and 443 (for HTTP and HTTPS) and protocol number 6.

```
config system wccp
   edit 90
      set cache-id 10.51.101.10
      set router-list 10.51.101.100
      ports 80 443
      set protocol 6
   end
```

WCCP packet flow

The following packet flow sequence assumes you have configured a FortiGate unit to be a WCCP server and one or more FortiGate units to be WCCP clients.

1. A user's web browser sends a request for web content.
2. The FortiGate unit configured as a WCCP server includes a security policy that intercepts the request and forwards it to a WCCP client.

   The security policy can apply UTM features to traffic accepted by the policy.
3. The WCCP client receives the WCCP session.
4. The client either returns requested content to the WCCP server if it is already cached, or connects to the destination web server, receives and caches the content and then returns it to the WCCP server.
5. The WCCP server returns the requested content to the user's web browser.
6. The WCCP router returns the request to the client web browser.

   The client we browser is not aware that all this is taking place and does not have to be configured to use a web proxy.

Configuring the forward and return methods and adding authentication

The WCCP forwarding method determines how intercepted traffic is transmitted from the WCCP router to the WCCP cache engine. There are two different forwarding methods:

- GRE forwarding (the default) encapsulates the intercepted packet in an IP GRE header with a source IP address of the WCCP router and a destination IP address of the target WCCP cache engine. The results is a tunnel that allows the WCCP router to be multiple hops away from the WCCP cache server.
- L2 forwarding rewrites the destination MAC address of the intercepted packet to match the MAC address of the target WCCP cache engine. L2 forwarding requires that the WCCP router is Layer 2 adjacent to the WCCP client.

You can use the following command on a FortiGate unit configured as a WCCP router to change the forward and return methods to L2:

```
config system wccp
   edit 1
      set forward-method L2
      set return-method L2
end
```

You can also set the forward and return methods to any in order to match the cache server configuration.

By default the WCCP communication between the router and cache servers is unencrypted. If you are concerned about attackers sniffing the information in the WCCP stream you can use the following command to enable hash-based authentication of the WCCP traffic. You must enable authentication on the router and the cache engines and all must have the same password.

```
config system wccp
   edit 1
      set authentication enable
      set password <password>
end
```

WCCP Messages

When the WCCP service is active on a web cache server it periodically sends a WCCP HERE I AM broadcast or unicast message to the FortiGate unit operating as a WCCP router. This message contains the following information:

- Web cache identity (the IP address of the web cache server).
- Service info (the service group to join).

If the information received in the previous message matches what is expected, the FortiGate unit replies with a WCCP I SEE YOU message that contains the following details:

- Router identity (the FortiGate unit's IP address.
- Sent to IP (the web cache IP addresses to which the packets are addressed)

When both ends receive these two messages the connection is established, the service group is formed and the designated web cache is elected.

Troubleshooting WCCP

Two types of debug commands are available for debugging or troubleshooting a WCCP connection between a FortiGate unit operating as a WCCP router and its WCCP cache engines.

Real time debugging

The following commands can capture live WCCP messages:

```
diag debug en
diag debug application wccpd <debug level>
```

Application debugging

The following commands display information about WCCP operations:

```
get test wccpd <integer>
diag test application wccpd <integer>
```

Where `<integer>` is a value between 1 and 6:

1. Display WCCP stats
2. Display WCCP config
3. Display WCCP cache servers
4. Display WCCP services
5. Display WCCP assignment
6. Display WCCP cache status

Enter the following command to view debugging output:

```
diag test application wccpd 3
```

Sample output from a successful WCCP connection:

```
service-0 in vdom-root: num=1, usable=1
cache server ID:
len=44, addr=172.16.78.8, weight=4135, status=0
rcv_id=6547, usable=1, fm=1, nq=0, dev=3(k3),
to=192.168.11.55
ch_no=0, num_router=1:
192.168.11.55
```

Sample output from the same command from an unsuccessful WCCP connection (because of a service group password mismatch):

```
service-0 in vdom-root: num=0, usable=0
diag debug application wccpd -1
Sample output:
wccp_on_recv()-98: vdom-root recv: num=160, dev=3(3),
172.16.78.8->192.168.11.55
wccp2_receive_pkt()-1124: len=160, type=10, ver=0200,
length=152
wccp2_receive_pkt()-1150: found component:t=0, len=20
wccp2_receive_pkt()-1150: found component:t=1, len=24
wccp2_receive_pkt()-1150: found component:t=3, len=44
wccp2_receive_pkt()-1150: found component:t=5, len=20
wccp2_receive_pkt()-1150: found component:t=8, len=24
wccp2_check_security_info()-326: MD5 check failed
```

Diagnose commands

The following get and diagnose commands are available for troubleshooting WAN optimization, web cache, explicit proxy and WCCP.

get test {wad | wccpd} <test_level>

Display usage information about WAN optimization, explicit proxy, web cache, and WCCP applications. Use `<test_level>` to display different information.

```
get test wad <test_level>
get test wccpd <test_level>
```

Variable	Description
wad	Display information about WAN optimization, web caching, the explicit web proxy, and the explicit FTP proxy.
wccpd	Display information about the WCCP application.

Examples

Enter the following command to display WAN optimization tunnel protocol statistics. The http tunnel and tcp tunnel parts of the command output below shows that WAN optimization has been processing HTTP and TCP packets.

```
get test wad 1
WAD manager process status: pid=113 n_workers=1 ndebug_workers=0
```

Enter the following command to display all test options:

```
get test wad

WAD process 82 test usage:
   1: display process status
   2: display total memory usage.
   99: restart all WAD processes
   1000: List all WAD processes.
   1001: dispaly debug level name and values
   1002: dispaly status of WANOpt storages
   1068: Enable debug for all WAD workers.
   1069: Disable debug for all WAD workers.
   2yxx: Set No. xx process of type y as diagnosis process.
   3: display all fix-sized advanced memory stats
   4: display all fix-sized advanced memory stats in details
   500000..599999: cmem bucket stats (599999 for usage)
   800..899: mem_diag commands (800 for help & usage)
   800000..899999: mem_diag commands with 1 arg (800 for help & usage)
   80000000..89999999: mem_diag commands with 2 args (800 for help & usage)
   60: show debug stats.
   61: discard all wad debug info that is currently pending
   62xxx: set xxxM maximum ouput buffer size for WAD debug. 0, set back to default.
   68: Enable process debug
```

```
    69: Disable process debug
    98: gracefully stopping WAD process
    9xx: Set xx workers(0: default based on user configuration.)
```

diagnose wad

Display diagnostic information about the WAN optimization daemon (wad).

```
diagnose wad console-log {disable | enable)
diagnose wad debug-url {disable | enable)
diagnose wad filter {clear | dport | dst | list | negate | protocol | sport | src | vd}
diagnose wad history {clear | list}
diagnose wad session {clear | list}
diagnose wad stats {cache | cifs | clear | crypto | ftp | http | list | mapi | mem |
    scan | scripts | summary | tcp | tunnel}
diagnose wad user {clear | list}
diagnose wad tunnel {clear | list}1
diagnose wad webcache {clear | list} {10min | hour | day | 30days}
```

Variable	Description
`console-log`	Enable or disable displaying WAN optimization log messages on the CLI console.
`filter`	Set a filter for listing WAN optimization daemon sessions or tunnels. `clear` reset or clear the current log filter settings. `dport` enter the destination port range to filter by. `dst` enter the destination address range to filter by. `list` display the current log filter settings
`history`	Display statistics for one or more WAN optimization protocols for a specified period of time (the last 10 minutes, hour, day or 30 days).
`session`	Display diagnostics for WAN optimization sessions or clear active sessions.
`stats`	Display statistics for various parts of WAN optimization such as cache statistics, CIFS statistics, MAPI statistics, HTTP statistics, tunnel statistics etc. You can also clear WAN optimization statistics and display a summary.
`tunnel`	Display diagnostic information for one or all active WAN optimization tunnels. Clear all active tunnels. Clear all active tunnels.
`webcache`	Display web cache activity for the specified time period.

Example diagnose wad tunnel list

Enter the following command to list all of the running WAN optimization tunnels and display information about each one. The command output shows 10 tunnels all created by peer-to-peer WAN optimization rules (auto-detect set to off).

```
diagnose wad tunnel list

Tunnel: id=100 type=manual
   vd=0 shared=no uses=0 state=3
   peer name=Web_servers id=100 ip=172.20.120.141
   SSL-secured-tunnel=no auth-grp=
   bytes_in=348 bytes_out=384

Tunnel: id=99 type=manual
   vd=0 shared=no uses=0 state=3
   peer name=Web_servers id=99 ip=172.20.120.141
   SSL-secured-tunnel=no auth-grp=
   bytes_in=348 bytes_out=384

Tunnel: id=98 type=manual
   vd=0 shared=no uses=0 state=3
   peer name=Web_servers id=98 ip=172.20.120.141
   SSL-secured-tunnel=no auth-grp=
   bytes_in=348 bytes_out=384

Tunnel: id=39 type=manual
   vd=0 shared=no uses=0 state=3
   peer name=Web_servers id=39 ip=172.20.120.141
   SSL-secured-tunnel=no auth-grp=
   bytes_in=1068 bytes_out=1104

Tunnel: id=7 type=manual
   vd=0 shared=no uses=0 state=3
   peer name=Web_servers id=7 ip=172.20.120.141
   SSL-secured-tunnel=no auth-grp=
   bytes_in=1228 bytes_out=1264

Tunnel: id=8 type=manual
   vd=0 shared=no uses=0 state=3
   peer name=Web_servers id=8 ip=172.20.120.141
   SSL-secured-tunnel=no auth-grp=
   bytes_in=1228 bytes_out=1264

Tunnel: id=5 type=manual
   vd=0 shared=no uses=0 state=3
   peer name=Web_servers id=5 ip=172.20.120.141
   SSL-secured-tunnel=no auth-grp=
   bytes_in=1228 bytes_out=1264

Tunnel: id=4 type=manual
   vd=0 shared=no uses=0 state=3

Example diagnose wad webcache list

This following command displays the web caching stats for the last 10 minutes of activity. The information displayed is divided into 20 slots and each slot contains stats for 30 seconds:

20 * 30 seconds = 600 seconds = 10 minutes

```
diagnose wad webcache list 10min
web cache history vd=0 period=last 10min
```

The first 20 slots are for HTTP requests in the last 10 minutes. Each slot of stats has four numbers, which is the total number of HTTP requests, the number of cacheable HTTP requests, the number of HTTP requests that are processed by the web cache (hits), and the number of HTTP requests that are processed without checking the web cache (bypass). There are many reasons that a HTTP request may bypass web cache.

```
total        cacheable     hits          bypass
------------ ------------- ------------ -------------
36           10            3            1
128          92            1            10
168          97            2            3
79           56            0            3
106          64            5            3
180          118           6            11
88           53            7            3
80           43            4            4
107          44            9            2
84           12            0            2
228          139           52           10

```

diagnose wacs

Display diagnostic information for the web cache database daemon (wacs).

```
diagnose wacs clear
diagnose wacs recents
diagnose wacs restart
diagnose wacs stats
```

Variable	Description
clear	Remove all entries from the web cache database.
recents	Display recent web cache database activity.
restart	Restart the web cache daemon and reset statistics.
stats	Display web cache statistics.

diagnose wadbd

Display diagnostic information for the WAN optimization database daemon (waddb).

```
diagnose wadbd {check | clear | recents | restart | stats}
```

Variable	Description
check	Check WAN optimization database integrity.
clear	Remove all entries from the WAN optimization database.
recents	Display recent WAN optimization database activity.
restart	Restart the WAN optimization daemon and reset statistics.
stats	Display WAN optimization statistics.

diagnose debug application {wad | wccpd} [<debug_level>]

View or set the debug level for displaying WAN optimization and web cache-related daemon debug messages. Include a <debug_level> to change the debug level. Leave the <debug_level> out to display the current debug level. Default debug level is 0.

```
diagnose debug application wad [<debug_level>]
diagnose debug application wccpd [<debug_level>]
```

Variable	Description
wad	Set the debug level for the WAN optimization daemon.
wccpd	Set the debug level for the WCCP daemon.

diagnose test application wad 2200

The debug level 2200 switches the debug to explicit proxy mode. You have to enter this debug level first. After that you have to type the command again with a different debug level to check the different explicit proxy statistics. To list what each debug level shows, follow these steps in any FortiGate device:

1. Enable explicit proxy globally and in one interface, to start the wad process. If the wad process is *not* running, you *cannot* list the options.
2. Once the wad process starts, type:

```
diagnose test application wad 2200
diagnose test application wad  ///// Do not type any debug level value to list all the options.
```

This is the output you will get:

```
# diagnose test application wad 2200
Set diagnosis process: type=wanopt index=0 pid=114
# diagnose test application wad
WAD process 114 test usage:
1: display process status
2: display total memory usage
99: restart all WAD processes
1000: List all WAD processes
1001: dispaly debug level name and values
1002: dispaly status of WANOpt storages
1068: Enable debug for all WAD workers
1069: Disable debug for all WAD workers
2yxx: Set No. xx process of type y as diagnosis process
3: display all fix-sized advanced memory stats
4: display all fix-sized advanced memory stats in details
500000..599999: cmem bucket stats (599999 for usage)
800..899: mem_diag commands (800 for help & usage)
800000..899999: mem_diag commands with 1 arg (800 for help & usage)
80000000..89999999: mem_diag commands with 2 args (800 for help & usage)
60: show debug stats
61: discard all wad debug info that is currently pending
62xxx: set xxxM maximum ouput buffer size for WAD debug (0: set back to default)
68: Enable process debug
69: Disable process debug
98: gracefully stopping WAD process
20: display all listeners
21: display TCP port info
22: display SSL stats
23: flush SSL stats
24: display SSL mem stats
70: display av memory usage
71xxxx: set xxxxMiB maximum AV memory (0: set back to default)
72: toggle av memory protection
73: toggle AV conserve mode (for debug purpose)
90: set to test disk failure
91: unset to test disk failure
92: trigger a disk failure event
100: display explicit proxy settings
101: display firewall policies
102: display security profile mapping for regular firewall policy
103: display Web proxy forwarding server and group
104: display DNS stats
105: display proxy redirection scan stats
106: list all used fqdns
107: list all firewall address
110: display current web proxy users
111: flush current web proxy users
112: display current web proxy user summary
```

```
113: display WAD fsso state
114: display HTTP digest stats
115: display URL patterns list of cache exemption or forward server
116: toggle dumping URL when daemon crashes
120: display Web Cache stats
121: flush Web Cache stats
122: flush idle Web cache objects
123: display web cache cache sessions
130: display ftpproxy stats
131: clear ftpproxy stats
132: list all current ftpproxy sessions
133: display all catched webfilter profiles
200: display WANopt profiles
201: display all peers
202: display video cache rules (patterns)
203: display all ssl servers
210: toggle disk-based byte-cache
211: toggle memory-based byte-cache
212: toggle cifs read-ahead
221: display tunnel protocol stats
222: flush tunnel protocol stats
223: display http protocol stats
224: flush http protocol stats
225: display cifs protocol stats
226: flush cifs protocol stats
227: display ftp protocol stats
228: flush ftp protocol stats
229: display mapi protocol stats
230: flush mapi protocol stats
231: display tcp protocol stats
232: flush tcp protocol stats
233: display all protocols stats
234: flush all protocols stats
240: display WAD tunnel stats
241: display tunnel compressor state
242: flush tunnel compressor stats
243: display Byte Cache DB state
244: flush Byte Cache DB stats
245: display Web Cache DB state
246: flush Web Cache DB stats
247: display cache state
248: flush cache stats
249: display memory cache state
250: flush memory cache stats
261yxxx: set xxx concurrent Web Cache session for object storage y
262yxxx: set xxxK(32K, 64K,...) unconfirmed write/read size per Web Cache object for
    object storage y
263yxxxx: set xxxxK maximum ouput buffer size for object storage y
264yxx: set lookup lowmark (only if more to define busy status) to be xx for object
    storage y
265yxxx: set xxxK maximum ouput buffer size for byte storage y
266yxxx: set number of buffered add requests to be xxx for byte storage y
267yxxxx: set number of buffered query requests to be xxxx for byte storage y
268yxxxxx: set number of concurrent query requests to be xxxxx for byte storage y
```

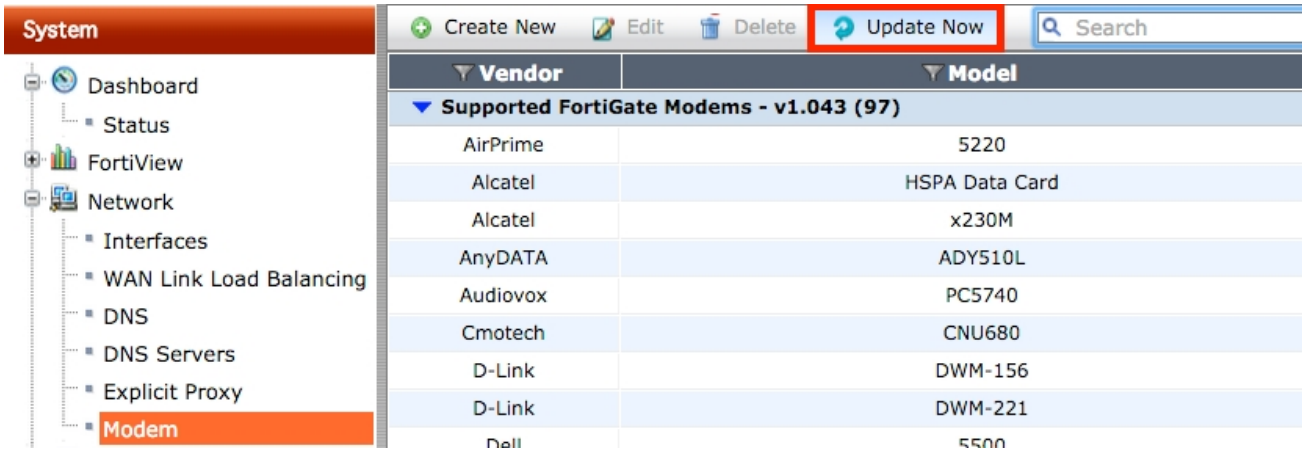
Appendix B - FortiGate Modem Compatibility Matrix

FortiGate Modem Compatibility Matrix

The list of supported modems below depends on the modem database version and not on the version of FortiOS. You can also find the list in the FortiOS web-based interface, however this document may include more recent updates before they appear in the web-based interface list.

To find the modem list (FortiOS 5.2) - web-based manager:

1. Go to **System > Network > Modem** and under **External Modem** select **[Configure Modem]**.
2. Click the **Update Now** button to get the latest version of the **Supported FortiGate Modems** list.



3. Verify that the version number has updated, and select a list to open it.

The modems are listed in alphabetical order.

CHANGE LOG

March 17, 2016	Updated release for Supported FortiGate Modem list v.1.043. Updated 4G supported modems list to reflect new changes (Internal tracking no. 0248344). The new supported 4G modems now include: Sierra AirCard 313U, Huawei K5150, Huawei K4201, Huawei E303, Huawei E3276, Huawei E586 and the ZTE MF667. This update also includes removal of certain models from the 4G category based on compatibility issues.

CHANGE LOG

Nov 2, 2015	Updated to include 3G or 4G capabilities for each modem.
May 21, 2015	Updated release for Supported FortiGate Modems list v1.031.
October 29, 2014	Updated to include FortiGate supported modems.
September 5, 2014	Initial release.

Appendix C - FortiExtender Modem Compatibility Matrix

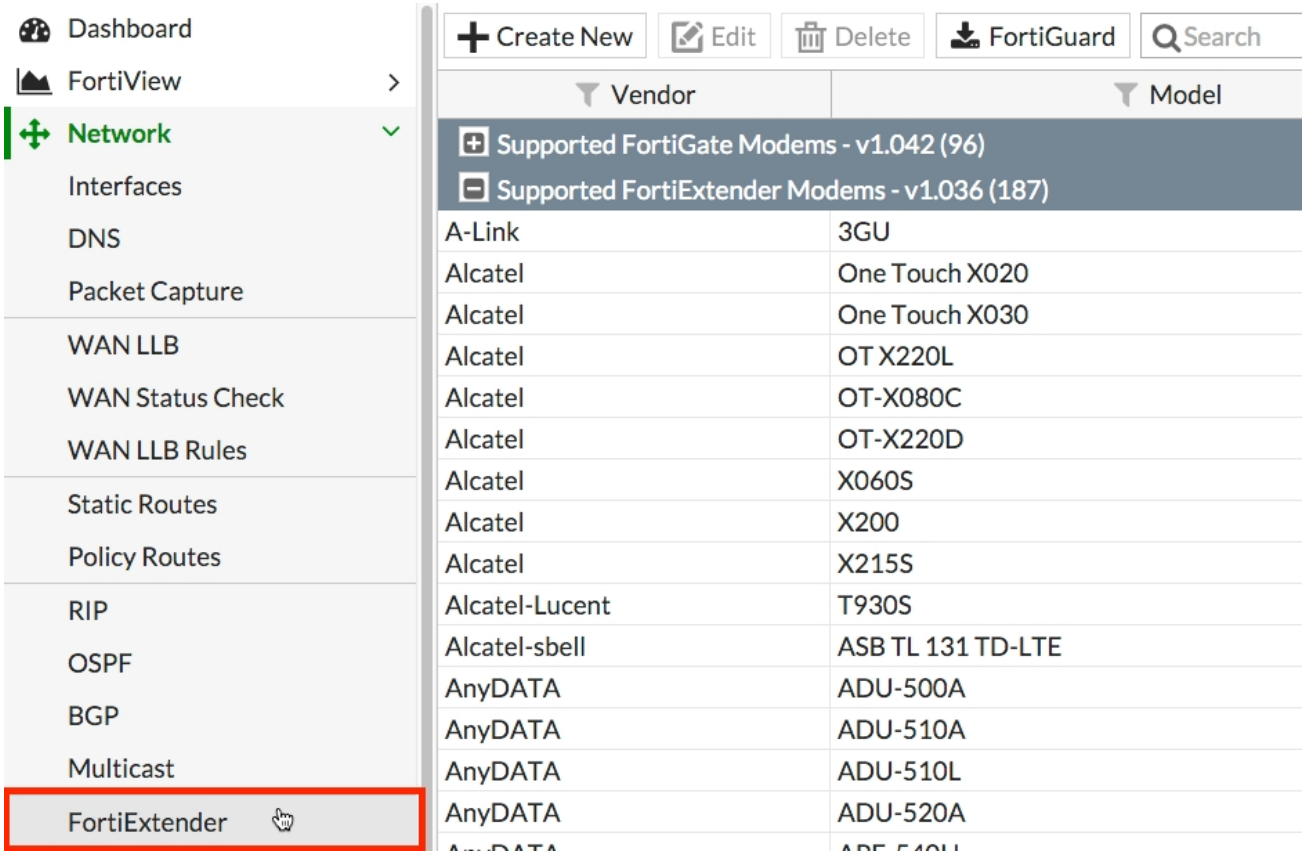
FortiExtender Modem Compatibility Matrix

The following table lists the USB modems currently supported by FortiExtender.The list of supported modems below depends on the modem database version and not on the version of FortiOS. They are listed in alphabetical order. You can also find the list in the FortiOS web-based interface, however this document may include more recent updates before they appear in the web-based interface list.

Note: FEX-100A has an internal modem, and therefore doesn't support external USB modems.

To find the FortiExtender Modem list (FortiOS 5.2) - web-based manager:

1. Go to **System > Feature Select** and enable **FortiExtender**.
2. Go to **Network > FortiExtender** and select **Configure Settings.**
3. Under **Modem Settings**, select **[Supported Modems]**.
4. Click the **Update Now** button to get the latest version of the **Supported FortiGate Modems** list.



5. Verify that the version number has updated, and select **Supported FortiExtender Modems**.

Fortinet®, FortiGate®, FortiCare® and FortiGuard®, and certain other marks are registered trademarks of Fortinet, Inc., in the U.S. and other jurisdictions, and other Fortinet names herein may also be registered and/or common law trademarks of Fortinet. All other product or company names may be trademarks of their respective owners. Performance and other metrics contained herein were attained in internal lab tests under ideal conditions, and actual performance and other results may vary. Network variables, different network environments and other conditions may affect performance results. Nothing herein represents any binding commitment by Fortinet, and Fortinet disclaims all warranties, whether express or implied, except to the extent Fortinet enters a binding written contract, signed by Fortinet's General Counsel, with a purchaser that expressly warrants that the identified product will perform according to certain expressly-identified performance metrics and, in such event, only the specific performance metrics expressly identified in such binding written contract shall be binding on Fortinet. For absolute clarity, any such warranty will be limited to performance in the same ideal conditions as in Fortinet's internal lab tests. In no event does Fortinet make any commitment related to future deliverables, features, or development, and circumstances may change such that any forward-looking statements herein are not accurate. Fortinet disclaims in full any covenants, representations, and guarantees pursuant hereto, whether express or implied. Fortinet reserves the right to change, modify, transfer, or otherwise revise this publication without notice, and the most current version of the publication shall be applicable.
